
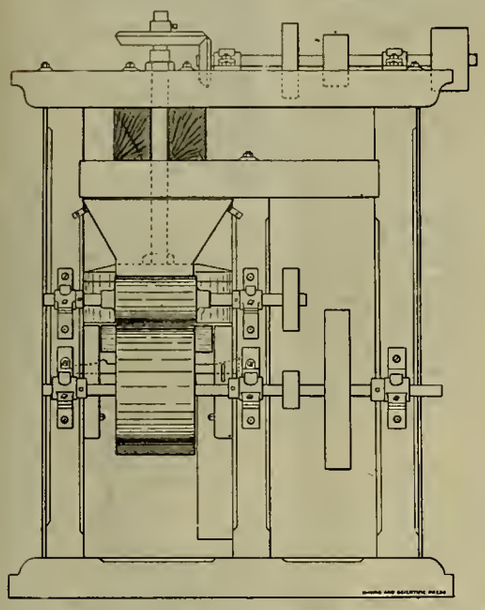

Fig. 2.—Front View of Magnetic Separator.

wheel action of the heavy magnets, the inertia of which keeps them in motion and allows energy to be stored up, when the load lightens, due to irregularity in feed or a change in the character of the mineral fed.

The strength of the current fed to the magnet is, in the order of separation, three-quarters and six and one-half amperes at ninety volts, respectively.

In the Joplin mill the ore is roasted in hand-raked

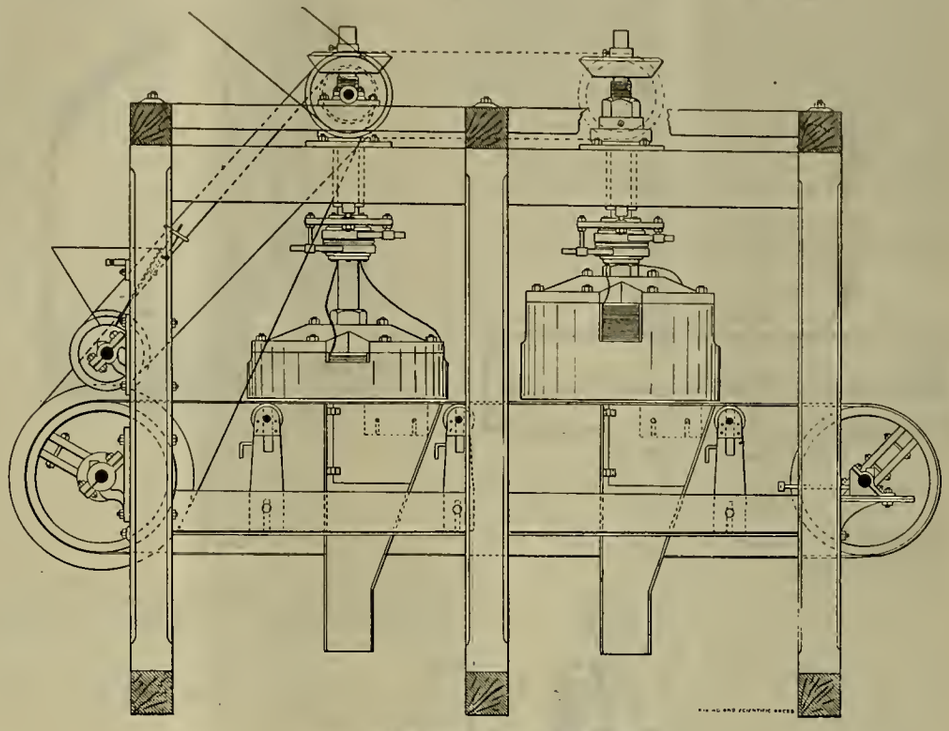

Fig. 3.—Side View of Magnetic Separator.

to the top of the machine, as stated above, by the rubbing connection on the supporting journals.

The two magnets in a unit are made of different strengths in order to subject the mineral treated to an increasing tractive force. This is accomplished by giving to the magnet adjacent to the feed end of the separator only one coil, and to the second two coils. The former magnet is then only about one half as high as the latter or the one at the discharge end. The field of the two magnets will then be as 1 : 2, provided the exciting coils are similar, but a still further variation can be effected by varying the number of ampere turns, i. e., increasing or decreasing the strength of the current and the size of the wires put into the coils. The coils must, however, remain the same size. The simplicity of construction of the magnets permits such a change to be readily made if desired.

At the feed end of the separator is situated the feed hopper, which stands directly above the pulley over which the feed belt runs. Mineral is drawn from the hopper and its discharge regulated by a corrugated drum revolving within a circular housing, which is a continuation of the hopper above. By means of this feed a continuous stream of mineral, uniform in thickness, is delivered to the feed belt, which in turn passes it close to the faces of the magnets, and that not acted upon by the magnets is discharged at the opposite end of the separator. Both feed belt and feed are driven by belt from above, as shown in Fig. 2.

The feed belt has a speed of about 100 linear feet per minute, while the magnets revolve at or close to fifty revolutions per minute, i. e., the peripheral speed is very close to the speed of the feed belt.

The separator works as follows: The mixed mineral fed into the feed and carrying belt, as it advances, comes under the influence of the weaker magnet first, which has, however, a moderately strong field. Here the more highly magnetic portion of the mineral is picked off the belt and attaches itself to the face of the revolving magnet. Still adhering to the magnet, it is rotated from over the belt to a point over the receiving hopper situated below, when it comes in contact with the scraper and is by it worked off latterly to the extreme edge of the face, where it accumulates and falls off in a constant stream as the magnet revolves. That part of the mineral which is magnetic, and yet not enough so as to be removed on passing the first magnet, is passed on to the second and stronger, where it is subjected to the same although a much more intense action. That attracted is discharged into the hopper below, while the non or feebly magnetic portion is discharged by the feed belt to the receiving box at the end of the separator.

The objection might be raised that, due to the method of removing the mineral attached to the magnets, considerable power would be necessary, which is partly true, but is largely overcome by the fly-

kilns for five to ten minutes, which renders the iron sufficiently magnetic to ensure separation. It is claimed that fully 95% to 98% of the pyritic content of the zinc ores handled can readily be extracted by this separator. The iron (largely in the form of pyrite) still remaining in an ore, which formerly had .5%, would range between .5% and 1.25%. This, especially the former, is considerably below what many ores sent to the smelters show.

The following outline of the method of treatment in the Joplin mill gives an idea of the general scheme followed in such mills :

Ore by wagon to 1.

1—Platform by shovel to 2.

2—Hand-raked kiln by elevator to 3.

3—Roasted ore bin to 4.

4—Magnetic separator: tailings (iron) to 5; middlings (mixed iron and blende) to 6; and heads (blende) to 7.

5—Waste bank.

6—Rolls reducing from 8 to 20 mesh by elevator to 8.

7—Ore bin, blende, finished product.

8—Middlings bin to 4.

That the Cleveland-Knowles separator has proven to be a fairly successful machine is shown by the quantity of ore handled and by its almost continuous operation from its installment up to the present time. The large banks of iron oxide piled up about the mill also attest to the successful operation of the separator.

Concrete in Mining and Metallurgical Engineering.*

NUMBER II.

Written by H. W. EDWARDS.

For the best and strongest work it is usual to have the cement about 15% of the total quantity of the ingredients. Generally, however, there should be three different classes of concrete, according to the use for which the work is designed.

1. Strong, containing about 15% of cement, retaining walls, flues, culverts, arches and walls for dust chambers. Arch work in general and foundations in wet places.

2. Medium, containing about 10% of cement, engine and machinery foundations on good, dry ground, floors, bottom of flues and dust chambers, stack and furnace foundations.

3. Poor, containing about 7% or 8% of cement, for leveling the bottoms of excavations previous to commencing foundation proper. For all foundations and below ground work where the weight to be supported is not to exceed 6 tons per square foot.

Both medium and poor grades may be diluted still further, without diminishing the ultimate strength,

*Abstract Trans. Am. Inst. Min. Engs.

by embedding large boulders, provided the concrete be well rammed around them.

For testing purposes it is only necessary to work upon one of the above-named varieties, usually the strong. At the end of one week one or two test blocks from each series may be tested, leaving others to be tested at the end of four weeks.

In an article on the subject of concrete in the Architects and Builders' Magazine, C. R. Neher says, in speaking of concrete made from a mixture of copper slag and gravel :

"My first tests of the slag mixture gave only about 80 tons per square foot in seven days, and appeared to demonstrate a low value for the slag, but examination of the fracture showed an excess of gravel and a fracture through the spaces where the most gravel existed. A slight diminution in the quantity of gravel gave results of over 140 tons in seven days."

Neher refers to compression tests on a 12-inch cube.

This statement is quoted in order to show that I am not alone in urging the importance of testing various proportions of the ingredients at hand before beginning the work. This condition is one of the cases in which haste must be made slowly.

The search for ingredients for concrete is generally limited to material found in the immediate vicinity of the work. It would not be of much use to go into the question of absolute figures on typical crushing weights, and as the figures sought for are comparative only, the experimenter is confined to seeking the best material attainable in his vicinity. Any block standing up to a 2-ton tensile breaking test as above described can be pronounced very good, although a 4-ton test after drying for several months is not too much to expect. Hence, the whole question is concentrated to, "How little cement can be used to obtain the desired strength?" It is to be noted that the cement is the most costly ingredient of the concrete mixture.

Concerning the total quantity of material required to fill a given space, this case is one in which two and two do not make four. For example, two parts of sand and four parts of crushed rock mixed together do not give six volumes of mixture, for the reason that a portion of the sand will fill up the spaces between the larger pieces of rocks. Moreover, on adding one part of cement it passes entirely into the voids between the sand and rock particles, and adds nothing to the total bulk. Also, on wetting and thoroughly ramming the concrete in place, it will pack to a bulk of four parts—or, approximately, equal to the original bulk of the crushed rock. Therefore, in estimating the quantity of ingredients required for a piece of work, it is necessary to provide a cubic foot of crushed rock for each cubic foot of completed structure, counting that the sand and cement do not in any way contribute to the final bulk.

The use of lime as well as cement is the subject of much difference of opinion. My experience is that it is quite neuter, appearing merely to delay the setting of the concrete.

As a general rule it may be stated that the effect of an excess of fine material is weakening, but gives a good, smooth, finished appearance to the work.

Before leaving the subject of ingredients I ought to point out a curious property of Portland cement which is of importance, especially if the work is to be let out on contract, the contractor providing the

materials. When a package of cement is opened and emptied it can be dusted out so that the bulk is increased quite one-third. I will defy anyone having once emptied a barrel of cement to replace the whole of it in the same barrel without considerable effort.

At first, until confidence is gained with unaccustomed material, the best way to measure the sand and the rock is to use one or more empty cement barrels, having the heads and bottoms knocked out. When placed upon the ground and filled, the barrel can be lifted off and the operation repeated until the desired volumes of sand and rock have been measured; then a barrel of cement in the original package can be added to the mixture. This procedure prevents the buying of cement in sacks, for the reason that it would be almost impossible to empty the sacks into the barrel without largely increasing the bulk, unless, of course, the exact number of sacks per barrel has been accurately ascertained beforehand.

During the whole process of making concrete it is essential to avoid admixture with earth, clay, dirt, sawdust, chips or other undesirable material.

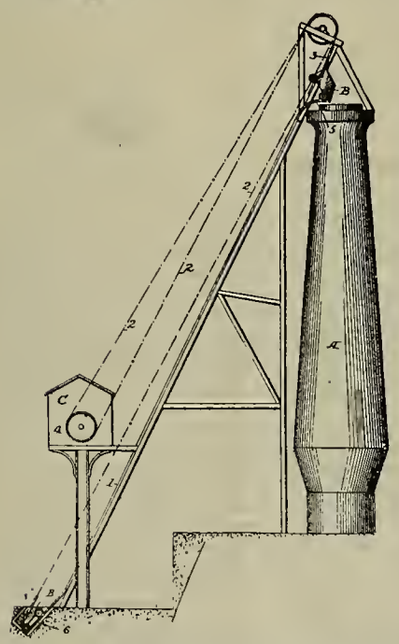
(TO BE CONTINUED.)

Mining and Metallurgical Patents.

PATENTS ISSUED APRIL 19, 1904.

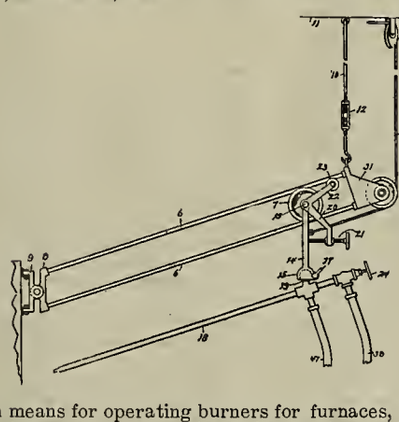
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

HOISTING EQUIPMENT.—No. 756,821; G. W. Bollman, Pittsburg, Pa.



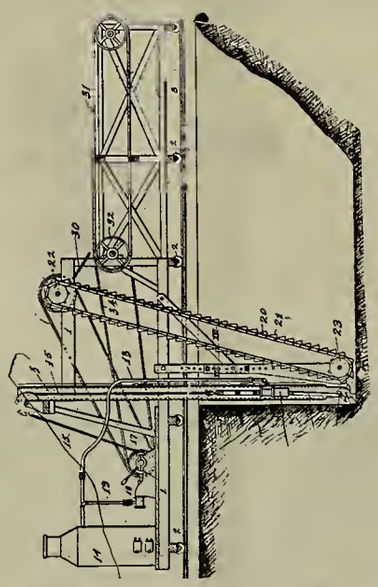
Combination with double tracks of lifting apparatus and with cars traveling thereon, of cable connected to each car, means for driving cable alternately in opposite directions and upper and lower inclined track sections, of lower grade diverging from main tracks, lower inclined sections diverging at lower grade in opposite direction, cars running on tracks and each connected near rear with one end of lifting cable, and engine driving lifting cable.

MEANS FOR OPERATING HYDROCARBON BURNERS FOR METALLURGICAL FURNACES.—No. 757,606; H. W. Falk, Milwaukee, Wis.



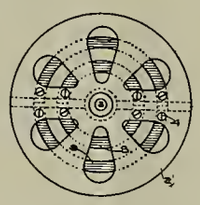
In means for operating burners for furnaces, combination of furnace provided with opening, rail extending from furnace, carriage adapted to travel on rail, burner carried by carriage, means for permitting angular adjustment of burner and means for causing carriage to travel inwardly on the rail so as to carry burner to opening of furnace.

TRENCH DIGGER.—No. 757,459; J. Helm, St Louis, Mo.



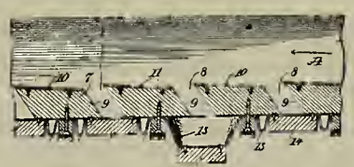
Trench digger comprising main frame having vertical guideways, elongated framework movably mounted in guideways, engine mounted on framework and cutter-head arranged to be actuated by engine.

WINDING OR HOISTING DRUM.—No. 757,622; H. F. James, Franklin, Pa.



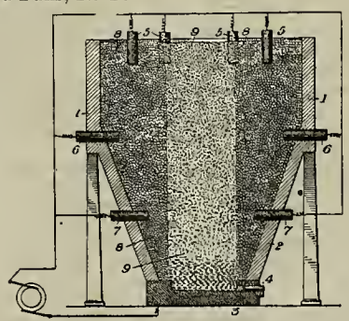
In hoisting or winding drum, primary drum having flange at each end thereof, radial beads upon flanges, holes formed in flanges adapted for reception of bolts or screws, in combination with semi-cylindrical shells, having flange at each end thereof adapted to be received between flanges of primary drum, and be attached thereto by means of screws or bolts, means of relieving shearing strain upon bolts or screws.

CONCENTRATING SLUICE BOX.—No. 757,176; C. M. Carter, Sultan, Wash.



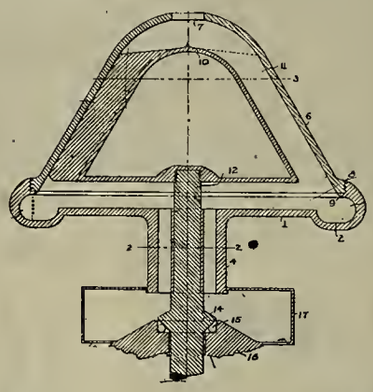
Sluice box having series of bottomless riffles in lower portion, series of pliable chutes spanning open lower sides of riffles and adapted to be lowered to inclined positions and false bottom members attached individually to pliable chutes and arranged to span lower open sides of riffles and thereby close latter.

ELECTRIC HEATING.—No. 757,633; E. F. Price, Niagara Falls, N. Y.



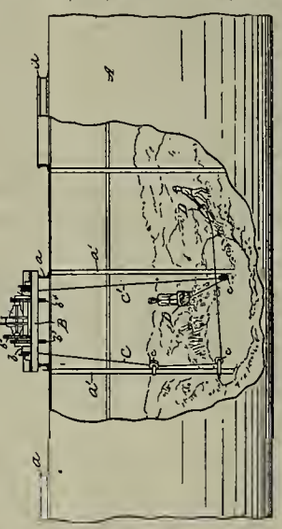
Process of heating materials by placing material in proximity to stable resistance conductor, and passing superposed electric currents through conductor, thereby increasing current density along path of current, through portion of conductor in proximity to material.

CENTRIFUGAL ORE CONCENTRATOR.—No. 757,699; E. R. Week, Spokane, Wash.



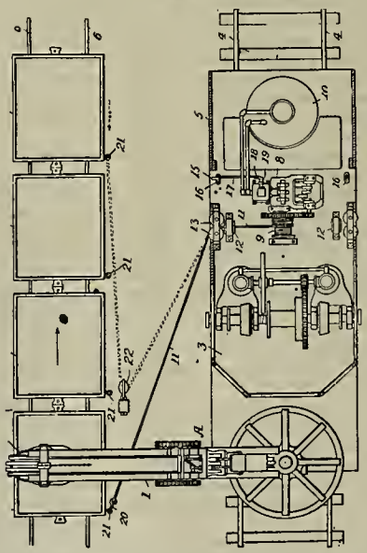
Centrifugal ore concentrator and amalgamator, comprising rotatable base having water-escape openings and annular trough, outer cone having lower edge concentric with trough, and provided with inlet opening in upper end, inner concentric cone supported above base, and one or more radial wings extending across annular space between cones.

APPARATUS FOR SCRAPING ORE FROM WINGS OF VESSELS.—No. 757,858; M. Andrews, Cleveland, O.



Combination, with hull of vessel having suitable hatchways, of frame carrying winding drum, frame being adapted to span hatchways and rest upon hatch coaming, means for anchoring frame, and scrapers within hold of vessel arranged to be operated by wind drum.

CAR PLACING ATTACHMENT FOR EXCAVATORS.—No. 757,450; H. H. George, Jr., Richmond, Va.



Combination with power excavator and its sustaining car or platform, of track adjacent to excavator and adapted to sustain cars to be filled by excavator platform and independent of excavating apparatus, drum operated by engine, cable connected with drum, and means for connecting cable with dump-cars on track, whereby cars may be successively located in position to be filled by excavator.

Mining Summary.

Specially Compiled and Reported for the Mining and Scientific Press.

ALASKA.

The report of the Alaska Treadwell mines for month of March shows 240-stamp mill ran 18¼ days, crushing 20,027 tons ore; value of bullion, $49,524; saved 525 tons sulphurets, value $42,876. Working expenses for month, $54,712.

ARIZONA.

Cochise County.

(Special Correspondence).—At Pearce, work in the Commonwealth mine, other than running of a drift, has been suspended. The mill has not been operated since December last. Swatling & Smith have leased the tailings dump and are putting up a cyanide plant. It is estimated there are 300,000 tons of tailings which, while not high grade, will pay to cyanide. As a beginning, four leaching tanks are being set up below the mill and a tram has been built to elevate the material to them. The mill engines will supply power and crude oil is used for fuel.

W. Pearce is developing the Horn Spoon property, an extension of the Commonwealth ledge. At a depth of 75 feet he is crosscutting.

Three miles east of Pearce is the Fluorine of P. S. Simmons, et al., which has been bonded by W. C. Greene for $100,000. S. King, superintendent, is sinking a shaft. The locators have considerable ore sacked for shipment that was taken out before the property was bonded.

Seven miles west of Pearce the Middlemarch C. Co. is developing its copper mine, H. B. Ellis of Los Angeles, Cal., president, with M. M. O'Gorman vice-president and resident manager. Development work has been carried on for several years. A smelting plant was built three years ago, but discontinued on account of lack of proper fluxes. Recently a concentrating plant was built and is being operated on the sulphide ore. Two tables are used and others will be added. Underground, they are working the fifth level. The work is done at present by contract, principally Mexican labor.

Three miles south of the Middlemarch, the Black Diamond C. Co. has been operating a smelting plant for two years, and 150 tons of ore per day are handled. The mine is on the mountain side a mile west of the mill and an aerial tram conveys the ore to the smelter. The mine is worked with power drills.——Over the ridge from the Diamond, west, is the Dragoon C. M. & S. Co. group, not operating at present, but Superintendent Henry says work will be resumed by May 15th. They have bodies of sulphide ores.

Fourteen miles south of Pearce, at Gleeson, the Copper Belle M. Co. is again starting operations, with thirty-five men at work in the mine. The smelter is being overhauled and will be blown in in May, says Superintendent W. Kemp.——Near the Silver Belle are other properties that have formerly been producers of high-grade copper and silver ores, among which are the Silver Bill, the Turquoise M. & S. Co., and Gleeson mine.

Three miles from Gleeson, northeast, are several copper companies, the Butte & Arizona, L. W. Grow of Tombstone, president; the Great Western, P. B. Warnecross of Tombstone, president; the Leadville, owned by Fitch, Holmes, Storheck, McKean & Shattuck, and now under option for bond; and some turquoise mines which are being operated by a company with Superintendent R. O'Leary in charge. D. W. Brown owns a group in this section, not operating at present. All these properties are tributary to the Pearce terminus of the Cananea, Yaqui River & Pacific Railroad, which branches south from the main S. P. line at Cochise. This branch is finally to be extended to connect at Naco with the Cananea section of same road.

Pearce, April 24.

(Special Correspondence).—The smelter at Benson is completed. With the 100-ton furnace designed to use either coke or oil as fuel is to be, in addition, a 200-ton blast furnace. Both of these furnaces are the product of the Fulton Iron Works of San Francisco. It is at the junction of the E. P. & S. W. Railway and the Southern Pacific. A. J. Pidgeon is manager.

The Martinez G. M. Co. is developing its property, 7 miles north of Benson. To date 300 feet of work in shaft and drifting has been done. In running a tunnel several veins were cut, all dipping toward the main ledge. The ore carries copper, gold and silver.

Fairlee & Castenada are supplying Bisbee, Douglas and Cananea with fireclay from their mine, 8 miles south of Benson. From eight to sixteen carloads a month are shipped. It is used for converter lining.

Benson, April 25.

Bisbee reports say the Golden Fleece G. M. Co. is preparing to build a 10-stamp mill.

Mohave County.

Los Angeles, Cal., men have organized a company for handling a group of mining claims in San Francisco mining district, near Acme, as the Gold Giant M. & M. Co. J. M. Kellerman, W. H. Clune, H. E. Crandall, B. F. Crews, C. E. Slosson, W. L. Moore and C. A. Sergeant are incorporators. The company will take over and work the Mossback group of mines, which have been under bond.

J. Carter, superintendent of the Cedar Valley M. Co., has teams hauling freight from Yucca to the mines. He reports the road from Yucca to Cedar completed. The company will install its smelter and other machinery and will this summer have the mines, mills and smelter in full operation. In that section are several mines carrying values in copper that are expected to produce the necessary ores for reduction of the concentrates from the Cedar Valley mines.

A. I. Richardson, manager of the Black Mountain M. Co., is taking in an outfit for his camp, near Silver creek, in the San Francisco mining district, near Acme.

J. D. Jordan is putting in a Cornish pump at the mines of the Treasure Hill M. Co. at Stockton Hill. Work on the mines is temporarily suspended owing to the large volume of water encountered in the shaft. As soon as the pump is set up and the water pumped out the work of crosscutting to the veins will be resumed.

Pima County.

(Special Correspondence). — Work is progressing in the mining districts contiguous to Tucson. The Silver Bell and Old Boot mines, west of Tucson, are increasing operations in anticipation of connection with the Southern Pacific main line by branch railroad now building from Red Rock. South of Tucson the Azurite mine, on which a smelter stands, will be operating this summer, as a deal is pending. The San Xavier adjoins it on the south. South of these properties, which were copper producers, is a silver producer, the Speculation (also called Banister and Paymaster). It is under control of J. Crane, Jr., A. McArthur and S. F. Squires of Boston, Mass., the last named being resident manager. It is being further opened up and ore taken out.——Recent developments on the Twin Buttes M. & S. Co. property are encouraging. It lies to the east of the Paymaster about 6 miles. Baxter, Ellis & Irish are owners with D. S. Rose and W. H. Earles of Milwaukee, Wis. Development has opened up sulphide ore bodies in two shafts, one on the Glance group, the other on the Senator Morgan group. As yet neither is opened far enough to show full dimensions, but there is said to be enough ore in sight to justify erection of a smelter, which is being negotiated for. H. Blakeley is resident manager, with Superintendent Baxter in charge of mining operations. The Glance shaft is 320 feet deep and the Morgan 100 feet, with drifts leading from them. High-grade copper ore is being piled on the dumps.

The Helvetia mine has been taken over by the Michigan-Arizona Dev. Co. and is doing extensive development work. The shaft, 400 feet deep, is being sunk to 1000 feet, and nine 1000-foot diamond drill holes will reach out from this into adjoining territory to determine the size and lay of the ore body, and this data will also determine the extent of the plant necessary to work it economically. There is a smelter on the mine which, with a 40x96-inch Jacket furnace, handled in a few months' run 36,000 tons of ore, with a recovered value of $16.44 per ton, says Superintendent Close.

Near the Helvetia is the Tiptop C. Co., which is carrying on increased development work. The company is owned by J. H. Currier and G. A. Ryan of Philadelphia, Pa., with W. J. Brooks, resident manager, and H. A. Swift, superintendent. Its holdings include twenty-six claims. There is a 750-foot tunnel with crosscuts. These properties are on the western slope of the Santa Rita range. On the opposite side of the range are the mines and smelter of the Rosemont M. Co., which is at present idle. Eight miles south of this is Greaterville, around which are placer deposits. They were formerly worked by Mexicans. At present the ground is held by the Santa Rita Water & M. Co., and preparations are being made to work the deposits on an extensive scale.

Tucson, April 24.

Yavapai County.

J. M. Sullivan, president of the Great Republic M. Co., which owns claims on lower Turkey creek, in the Bradshaw mountains, southeast of Prescott, says he has put in a hoisting plant and will continue development. The main shaft is down 200 feet and a tunnel is being driven to connect with the shaft. Work will also begin on another shaft on the property. A whim will be used for this work. The new hoisting plant is ready to operate as soon as the lumber arrives for the shaft. The ore carries values principally in copper.

The Rincon M. Co. will put in a small stamp mill on its Welcome group of mines, near Prescott, to prospect the ground and sample the ore during development.

In the Verde mining district, near Jerome, the Pittsburg-Jerome M. Co., 1 mile southwest of the United Verde smelter, has arranged for building a hoisting plant and will begin sinking as soon as it is completed. They will sink to 1000 feet.——The smelters at Jerome and the Equator are both running full blast.

Yuma County.

The Billy Mack mine on the Arizona side of the Colorado river, above Ehrenberg, is reported sold to Randall & Forden, Los Angeles, Cal., men, for $51,000. The mine has been owned by W. H. Mack for twenty years, himself sinking the shaft and exposing a large body of free gold ore.

CALIFORNIA.

Amador County.

At the Kennedy mine, near Jackson, grading for the additional forty stamps to the new mill is progressing.

At the Amador Queen mine, south of Jackson, five stamps of the Amador mill in Hunt's gulch have been put in running order, preparatory to crushing rock from the Amador Queen mine No. 2.

The Amador-Hyrazine M. &. M. Co. has been incorporated, with principal place of business in Sutter Creek, by H. H. Harrah, C. J. Best, E. J. Harrah, G. A. Norton and M. E. Sayre, of Oakland.

Butte County.

C. H. Munro, superintendent of Biggs No. 2 dredger, at Oroville, says his company intends building another dredger.

Articles of incorporation of the Viloro Syndicate, Ltd., of Great Britain were filed last week at Oroville. This company bought the T. McGee dredging land last month.

Calaveras County.

Superintendent G. I. Wright of the Del Monte mine, near Railroad Flat, reports the tunnel last week cut the ledge and that the quartz prospects well in free gold. The intersection is 1048 feet from the mouth of the tunnel. The original survey allowed 1040 feet as the distance to be run to strike the ledge. The tunnel cuts the ledge 300 feet below the bottom of the shaft. This main tunnel has been driven through hard rock at a total cost of $50,000. Preparations will be made to remove the mill to the mouth of the tunnel and take out ore for crushing.

Operations were started last week on the Live Oak No. 2 quartz mine, about 1 mile east of Mountain Ranch. A 10-stamp mill was bought in Amador county and men are placing the same in position. E. L. Holder is manager, with H. C. Higgins as superintendent.

The Summit View quartz mine in Salt Spring valley, near Hodson, is reporting improving. Superintendent B. D. Beckwith is putting in a heavier pump.——The Ranch mine is closed down.

O. H. Bogart, secretary of the Rodesino M. Co., near Mountain Ranch, says he is arranging for working the mine on a larger scale.

M. Rigney of the Ritter mine, near Mountain Ranch, is arranging for a hoist on the mine.

El Dorado County.

A 5-stamp mill will be built by Edwards, Banks & Jones on their mine east of Latrobe. They have developed a gold-bearing ledge on their property, below the Oro Fino mine.

Nevada County.

The 10-drill compressor has been moved from the Centennial mine to the Green Mountain mine, near Nevada City, and is ready for operations. The Green Mountain is putting in a heavier pump and the shaft will be pumped out so that deeper underground operations can be begun.

San Bernardino County.

(Special Correspondence).—A gold lode has been discovered in this vicinity by C. F. Blackburn, 15 miles northeast of Victorville, in a ridge of metamorphic-crystalline rocks intruded by eruptive dikes. The ridge rises 800 feet above the valley and dry lake bed. The gold lode is 100 feet wide. The character of the ore is siliceous, but contains some iron, and is a fine-grained, live-looking white, gray, yellow and brown colored quartz, showing flour gold by pan test. One sample assayed $7.85 per ton gold.

Victorville, April 27.

Sierra County.

(Special Correspondence).—The snow is disappearing and preparations are being made for a resumption and continuance of work in mining in the district.

Jay O. and E. A. Hayes, of San Jose, have purchased the Sierra Buttes mine, that for several years has been worked in a desultory way, and are arranging to operate this property on an extensive scale. Ten stamps will be added to the 20-stamp mill. The Butte Saddle is another mine to be reopened under management of the Hayes brothers, they having a bond on same.

As soon as weather permits and supplies can be secured, a 10-stamp mill will be put up at the Keystone mine at Sierra City. Power to operate the mill will be secured from an electric plant that will be installed at the river above the Marguerite mine. The water from the tunnel at the mine will be piped down the mountain to produce power for the electric plant. It will be conveyed through a 6-inch pipe and will have 1100-foot head.

The Hilda placer will also be operated this season, a bond having been taken out on it by W. J. Anderson, of San Francisco, who is arranging to equip same for hydraulicking.——It is also reported that the Bigelow mine is about to pass into the hands of Eastern parties.

Another quartz property is the Mountain mine, 6 miles east of Sierra City, which has been idle for several years owing to litigation. This mine was partially reopened last fall by L. H. Carver, a mining engineer of San Francisco, who is now in charge of the work, which was discontinued in December last, owing to the impossibility of securing the requisite supplies for mining operations so late in the season. It is stated by those who were employed in the mine that a large amount of ore is ready for extraction, that can be milled profitably. Some work yet remains to be done to completely open the mine for continuous operation and to reach the ore bodies known to exist in the upper levels. This mine is opened entirely by tunnels and adits, and a contract will be let to extend No. 4 adit, which will reach the ore bodies at a depth of 750 feet below No. 3 tunnel, and give a large reserve tonnage. The equipment, including the 40-stamp mill, is being overhauled and put in condition and the addition of concentrators to be installed this summer will increase its efficiency.

There is a rumor that the Young America mine, a bonanza property of the early days, lying north of the Mountain mine, will be put in operation, if negotiations now pending are consummated, in which event the mill which was recently destroyed by fire will be rebuilt. It is asserted that there is ore left in the mine that will pay to mill and the old tailings dump can be successfully treated by the cyanide process.

Sierra City, April 26.

A contract has been let to run a raise from the Miami tunnel, for tapping the old workings and securing better air.

Siskiyou County.

At the Mount Vernon mine, on the head of Cherry creek, near Yreka, a vein of ore averaging 2 feet in width, has been struck in the lower tunnel, which is in over 1000 feet. The winze in the same tunnel is down 90 feet. On the foot wall a streak of telluride 2 inches wide is reported showing.

The Headwater G. M. & M. Co., J. Johnston manager, is said to be preparing to build a smelter near Yreka.

Tehama County.

Red Bluff reports say a strike has been made at the Basler mine, in the foothills west of there. Manager Basler says the ledge in places is 18 feet wide and that it will average $20 per ton. A tunnel has been run in 900 feet and 5 miles of road have been built to the mine.

Tuolumne County.

The Cosmopolite mine, near Groveland, has been unwatered and operations resumed.——Last week operations began at the Republican mill, near Jacksonville.——The Confidence mine, at Confidence, is expected to start in full blast June 1st, when there will be fuel enough on hand, says Superintendent Carmichael.——Three men are sinking a shaft on the Eureka mine, at Jacksonville. A depth of 30 feet has been attained.

W. S. Wilhelm, superintendent of the Republic G. M. Co. mine on the Stanislaus river, near Columbia, known as the Kanig mine, reports bins and tunnel full of ore ready for the mill.

The Old Crœsus mine, near Carters, has been sold to the West Side F. & L. Co.

Men are at work at the Crystalline mine, near Jamestown, drifting east into the Juanita ground to pick up the Gem shoot.

The Lady Washington mine, near Carters, has suspended operations.——Ore is being crushed at the Prudhomme mill from the Cordova mine, near Arrastraville.

COLORADO.

Boulder County.

At sheriff's sale last week C. B. Jentry bought the ten acres of the Republic Oil & Dev. Co. for $1475. Jentry says he will drill another well on that tract. The two wells of the company have produced oil, but were not regarded as paying wells. However, they are so near the oil refinery that but a small volume is required to make a well pay there.

Chaffee County.

Near Buena Vista the St. Elmo Con. M. Co., composed of New York men, C. K. Kankhauser local manager, at St. Elmo, owning the Pat Murphy mine, proposes to increase development and improvements as soon as the snow is gone sufficiently to allow work to be done. This mine is on Murphy mountain and joins the Mary Murphy. This spring they will build a bucket tram connecting the mine with the Colorado & Southern railroad, thus reducing the expense of hauling the ore to the railroad. They also propose building a mill to handle the low-grade ore that averages $8 per ton.——The Mary Murphy mine has resumed shipments to outside smelters, having not yet started their smelter at Buena Vista, which was damaged by fire two months ago and which has now been rebuilt. The smelter proper was not seriously damaged, but the power house and its engines and dynamos were nearly a total loss.

The Buena Vista M. Co., near Buena Vista, headed by C. A. Smith, of Denver, has begun excavations for building a power plant and is working on the tunnel to be run 2500 feet. This tunnel is expected to cut a body of high-grade silver and lead ore.

The Camilla G. M. Co., near Buena Vista, under management of W. G. Smith with A. A. McKnight superintendent, has the plant of machinery set and ready to start. The men have worked through the winter, driving the tunnel by hand and have a depth of 100 feet. This tunnel proposition will tap Pomeroy mountain at depth.

An electro-chemical amalgamating and concentrating mill has been started in operation in the Turret district, 12 miles north of Salida. T. J. Snedekar of Chicago, Ill., superintendent, says the ores are heated to a proper degree of temperature, varying with different classes, then treated in the electro-chemical solutions, which dissolve the cement that holds the particles of mineral and rock together, so that it is readily reduced to a pulp suitable for concentrating or treatment by any of the approved methods of extraction, such as cyanide amalgamation and chlorination. The Vivandiere mine, which will furnish ore for the mill, has three levels opened at depth of 600 feet, with ore on each level. There is low-grade ore on the dump which will be concentrated. The ore is first dropped into the bins at the top. From these bins it passes to the crushers immediately beneath them, where it is crushed to a maximum of 1½ inch. The crushed ore then drops into bins below the crusher and is drawn out into the drier, where it is heated to expel all moisture. Then it passes into the chemical solution tanks, where it is softened and disintegrated. Then it goes into the Huntington mill on the lower floor, where the free gold is amalgamated and the residue passes over tables to be concentrated. The concentrates are shipped to the smelter. Manager J. J. New expects later to cyanide the tailings, and also take wet ore as it comes from the Huntington mill and to save the values of the ore by cyanide process at the mill instead of shipping the concentrates.

Custer County.

The tunnel of the Swallow Tail mine, near Querida, will be extended 200 feet farther. It is in 150 feet. The extension of the tunnel will be in connection with such other exploratory work as may be suggested as development progresses. Machinery, including a duplex, compound air compressor and drills, will be put in.

The Toledo mine at Querida is working full-handed. Sinking at the 200-foot station is in progress. It is expected the shaft will be sunk to the 500-foot point. ——Work has been resumed on the Bismuth mine and the principal operations will be on the main shaft.——Work has been resumed on the Aburdix group at Querida by the Little Jim M. Co., composed of Pueblo and Custer county men. Operations for the present will be centered on the Elemental shaft, which is 400 feet deep and which is being unwatered. The ore carries lead, copper, silver and gold. It is said the Elemental shaft will be continued to the 700-foot point.

Fremont County.

(Special Correspondence).—The Union and Dorcas mills are unable to procure all the ore necessary to keep running full force. The Dorcas is handling 2700 tons per month, while the Union plant is operating four of its six furnaces.

Coal mining, which is a feature of Fremont county's resources, is practically at a standstill, due to the strike, although it is thought some of the mines will open up during May.

The oil prospects are better than ever before. Several additional companies have been organized to prospect and operate oil properties. New wells are being struck frequently and the old wells are holding their own.

Florence, April 24.

(Special Correspondence).—The Empire Zinc Co. is treating eighty tons of ore per day. They are only operating a portion of the mill. They find the magnetic separators will do the work without the aid of the concentrators; therefore, the wet method has been discontinued for the present. They may start up that portion of the mill containing the Wilfley tables later on. They also propose doubling the capacity of the mill. They have a large supply of ore on hand. A. R. Livingston is superintendent.

Canon City, April 24.

Fremont County.

The Sobach Oil Co. opened a body of oil at 1500 feet depth last week that is expected to produce twenty-five barrels a day. The company will put the well to pumping and then drill another. The striking of oil on this land proves the field productive north as well as south of Florence, says the Post.——The Majestic Oil & Gas Co. has been incorporated with G. Wilson, C. Cowan, R. A. Ramsey and I. M. Menzel as officers. The company owns eighty acres of land and intends drilling several oil wells. —— The Empire Oil Co. has also been organized by local men. It has leases on two separate pieces of land and proposes drilling eight wells. —— There are twenty-seven companies operating in the oil belt, with three more ready to begin development work. Figures show that the first well drilled, including the derrick and drilling machinery, costs the operators about $3500 to $3700.

Gunnison County.

The Taylor Park Railway Co. is preparing to complete its 115 miles of line into the Taylor Park region, thereby furnishing the mines of that part of Gunnison county with an outlet to the markets. President A. A. Stewart, of the company, says the tunnel through the divide between St. Elmo and Tin Cup will be completed by fall and that trains will be running into Tin Cup before Jan. 1, 1905.

The Blistered Horn tunnel, near Tin Cup, being driven by the Brunswick M. Co., is in 1000 feet and has cut two fissure veins. The first vein is 8 feet wide and shows values. The second is 17 feet. It was cut at 550 feet from the tunnel entrance and is said to be of concentrating value the entire width. This ore has been left for the present, as the company desires to reach the Jimmy Mack vein, farther ahead, before it does any stoping, says Manager A. Lejune. The Brunswick Co. has proven by its explorations that three distinct fissure veins exist in that part of the district. The 100-ton mill, owned by the company in West Willow gulch, below the mine, will be remodeled this spring and operated. It will treat the low-grade ores.

At White Pine the Spar group of mines, embracing thirty-eight acres of mineral territory, has been sold to the Spar C. M. & T. Co., of which A. F. Downs of Davenport, Ia., is president. This property was formerly known as the Morning Glim. Development consists of a 750-foot tunnel driven on the vein, with 325 feet of stoping. The average grade of the shipping ore is said to contain 60 ounces silver, 7% copper, 0.4 ounce gold and 10% lead. A company has been formed by J. Goodwin et al. on the Copper Queen mine, above Gothic, to build a road to the property from the Sylvanite road. The tunnel will be driven ahead until the main vein is reached. The surface workings produced high-grade silver-copper ore. The ore is a sulphide.

W. F. McQuarrie of Cripple Creek has bought the Sheep Mountain tunnel at Crystal and has begun operations there with a view to continuing the bore until all the main veins and mineral contacts of that mountain are reached. This will include the Black Queen, Lead King, Milwaukee and Silver Temple. Bodies of low-grade concentrating ore have already been exposed in the tunnel and a concentrator is proposed. Water power is available in the river, which flows by the tunnel's dump.

The Woods G. M. Co., composed of Carrollton, Mo., men, has twelve men at work in Pieplant gulch, near Tin Cup, developing the 5-foot vein of free milling gold ore uncovered by them last fall. They have their 100-ton mill ready to start. —— In Bertha gulch, 2 miles below Tin Cup, lumber is on the ground to build settling dams for placer operations by the Bertha Gulch M. Co. The gold is coarse and nuggets of $5 and $10 in value have been found in prospecting. In washing to bedrock at the mouth of the gulch a vein carrying gold and copper was uncovered, and Manager A. W. Hall has a shaft down 70 feet on the lead. He is preparing to ship ore.

Lake County.

The Diamond mine, on Upper Evans gulch, near Leadville, is reported outputting 100 tons of ore daily, besides doing much development work.

For three months past the United M. D. Co. has been putting down a drill hole with an oil well drill on the Mike claim, on the western slope of Rock hill, 2½ miles south of Leadville, about half way between California and Iowa gulches. This drill hole has shown that there is only 48 feet of wash and gravel at the surface overlying the lake bed. After passing through 400 feet of lake bed the white porphyry was encountered and the blue lime found at a depth of 680 feet. The drill was sunk into limestone for 70 feet. The contact between the lime and porphyry was heavily iron stained, full of talc, and gave assays in gold, silver and copper. It is the intention to sink to blue lime, or 1000 feet, ten drill holes along an east and west line drawn through the present drill hole. It is the company's intention to continue these drill holes to the Cambrian quartzite with diamond drills as soon as solid formation is reached in any given drill hole.

Preparations are being made for extensive placer operations at Twin Lakes by N. A. Loggin, who has men clearing away the ice preparatory to the installation of a large hydraulic plant to work 1750 acres of placer ground which he controls in that district. About 100 men will be employed during the summer. The plan includes drifting on the bedrock.

Mineral County.

At Creede, the United M. Co. has bought the properties of the Winchester M. Co. and the Sewell M. Co., consisting of nine claims lying west of the United Mines property. This consolidation named in the deed is that the United M. Co. agrees to pay one-fifth of all royalty from all ores mined on the premises, or that may hereafter be acquired, lying between and bounded by the end lines of the new properties, in case the mines should be worked and operated by the United M. Co. and not by its lessees, to pay a dividend to the parties owning the Winchester and Sewell companies one-fifth of all net profits realized from the working of the mines lying between the end lines. The Creede United M. Co. is a consolidation of five mining companies, whose owners were formerly in litigation over apex rights.——Another transaction in the Creede district is the proposed consolidation of all the mines south of the United Mines, to operate below the Nelson tunnel level. There are said to be bodies of ore below the tunnel level and, because of the water, a joint pumping proposition seems to be the necessary plan.

Ouray County.

The first section of the Poughkeepsie Mineral Point State road is complete from the Uncompahgre bridge on the Red Mountain toll road to the Fermaugh group, near the Micky Breen mill, and they will finish the remainder this spring. The Khedive mine, near Ouray, is reported in pay ore. The owner is G. Hulbert. The Khedive and Bachelor will again be shippers. Ore is being hauled to the Ouray smelter.

The Ouray & Silverton M., I. & R. Co. is being organized by D. Wood, manager of the Portland mine, and others, to undertake a tunnel proposition near Ouray. The tunnel will be about 7 miles in length. The initial point will be on the Ouray side of Mount Ahram. It will pass through Mount Abram and Brown mountains and its outlet will be at or near Gladstone, on the Silverton side of the range, says the News. It will tap a large number of claims, some of them former producers of iron and copper ores. A revenue of $2 per ton for the transportation of this ore, to be paid by the owner of the claims to the tunnel company, would in itself be a paying proposition, but the company proposes to buy and to own a number of the claims through which the tunnel will pass, and adjoining claims that can be opened from it. It is thought that after the first 1000 feet of tunnel is driven and the first veins cut, the output will pay for the work of further driving the tunnel. On the Ouray side an electric railroad will be built from Ouray to and through the tunnel, and when completed will connect on the Silverton side at Gladstone with the Gladstone & Northern Railway.

San Miguel County

In Telluride district the payroll for labor alone for the month of March at the three largest mines of the district amounted to $75,000, these properties employing 1000 men. The expenditures for that period were $250,000 for supplies of all kinds. The greater part of this sum goes into local channels.

Summit County.

The American G. Dredging Co. will start its dredger, near Breckenridge, on its season's run this week. To facilitate thawing of the ice in the artificial pond, on which the boat with its endless chain of steel buckets floats, blasting was resorted to, to shatter the ice. It will probably be May 15th before the high bar placer, owned by the American company in Galena and Gold Run gulches, will be in full operation with hydraulic giants and lines of riffled sluices washing the auriferous gravel. —— The Germania lessees, West & Klinefelter, are at work in the former bonanza drift of that property. It is reported they have opened a vertical vein that extends downwards from the flat blanket vein. The ore carries copper, gold and silver.

The Lincoln G. M. Co. has been organized to operate the former holdings of Clark & Rithman, consisting of 645 acres of placers and several groups of lode mines on Nigger hill, Mineral hill and on Mount Baldy, near Breckenridge, by W. Lennox, T. W. Giddings of Colorado Springs, N. B. Scott of West Virginia and M. G. Evans of Denver. The company will have several shafts sunk to bedrock of French gulch on Emile placer to locate the pay streak of the old channel. The placer will also be worked with giants and ground sluices during the season. The Helen and Helen's Babies group of lode mines at the mouth of Australia gulch will be developed by the Lincoln G. M. Co. by driving the lower tunnel, now in 300 feet, ahead to cut the veins of the group. The ore will be cyanided.

Teller County.

(Special Correspondence).—The Sioux Falls G. M. & D. Co. is operating the Fort Wilcox and Fluorine claims on Copper mountain, on which it has a lease for five years. They are handling seventy-five tons of ore per day through the cyanide mill. The ore averages $5 per ton and they mine and mill the ore for $1.25 per ton. All the work is done in open cuts. Ore is carried down by a gravity tram to the mill. The largest cut is 30 feet deep. Superintendent R. Blanchard is having a tunnel driven underneath the open cut, which will give them 65 feet additional depth. This tunnel is in 70 feet. It is the intention of the management to increase the mill capacity.

The Metallic G. M. Co. is sinking a shaft on the Bill Nye claim, which adjoins the Fluorine, on Copper mountain.

Cripple Creek, April 25.

(Special Correspondence).—The mining conditions in the Cripple Creek district are improving each week, as will be noticed by a trip through the district. The mines are operating with about the same number of men as before the strike. The latest move on the part of the operators is to not permit a lease to be given to any one unless he is recommended by the operators' association, and the party securing the lease must agree to not employ any one without he is recommended by the association. This, it is believed, will compel the men to leave the Federation of Miners or the district as they choose, as they will be unable to secure work in the district as long as they are affiliated with the federation.

Cripple Creek, April 25.

The tenth level of the Moon-Anchor mine at Cripple Creek has been reached in lowering the shaft, but it has a depth of only 920 feet from the surface. This last sinking has been accomplished during the past five months and shows that the drainage tunnel has relieved that portion of Gold hill of its supply of water. So far no lease has been granted on the Moon-Anchor property save in the upper levels.

Banks & Co. have a lease on the Rose Nicol mine, near Cripple Creek, and it is intended to push development work. On the north end of the property, near Bull hill, they are making occasional shipments of ore which they are taking out at depth of 65 feet. They are driving the Gurley tunnel, and when this reaches the vein it will cut it at depth of 200 feet.

D. N. Heizer of Colorado Springs says it is intended by the owners of the St. Thomas mine, on Beacon hill, Cripple Creek, to work that property this season.

Max Boehmer, manager of Stratton's Independence, is said to be besieged by applications for leases on the property. Many miners who have worked in the mine believe that they know where they can make a fortune, and as a result on certain levels in the mine as many as fifty miners have asked for leases.

It is stated that the United States geological survey of Cripple Creek district is about completed. The citizens of Cripple Creek and Colorado Springs raised half of the sum necessary for this work, which was estimated by the geological depart-

ment at $7000. It is said that the report would have been made public some time ago, only the government geologists desired to more fully investigate the lower workings of some of the different mines, which several months ago was impossible on account of water. The drainage tunnel has now made this possible. There are several other matters of lesser moment, but still of considerable importance, which they desired to thoroughly investigate. The report will embrace maps of the lower workings of the properties, together with all details which will be of benefit to the mining man. The boundaries covered by the survey have extended from Barnard creek on the north to the Midland Terminal track on the east. The southern boundary is the original Cross-Ponrose survey line, which takes in the greater portion of Big Bull mountain. Long Hungry gulch is the western limit. Cow mountain, Trachyte mountain and other hills outside these boundaries showing promise of mineralization are to be included in the report. Galena mine on Red mountain is shown on the new map. This producer has been omitted from previous maps of the Cripple Creek district.

The Mary McKinney Co. has now got the property unwatered sufficiently to get into the 600 foot level, and work is in progress there. The management has been driving for several days in the north drift, which has been extended for a distance of about 115 feet from the shaft, says the Cripple Creek Times. During the last few days the miners have cut the vein, which it is believed contains the values found above. In the sixth level there is a little water on the floor, but none drops from above. During March the Mary McKinney produced 630 tons of ore, which gave values of two ounces in gold to the ton. As soon as the miners can get into the new shoot in the bottom the force will be increased.

IDAHO.

Blaine County.

The shaft on the Lipman mines, near Hailey, is going down at the rate of 1½ foot per day, the work being done by hand. The shaft is to be 5x7 feet in the clear, to have a working compartment and a manway. The gasoline hoist is in operation ——A vein carrying 18 inches of solid galena was cut into in the Relief mine last week.——A blind vein carrying galena was cut on the 700-foot level of the Crœsus mine last week.

Custer County.

P. L. Fearn, manager of the White Knob C. Co., at Mackay, says the smelter of the company is again in full operation. Both stacks are in blast and are reducing 600 tons of ore daily. In the mine the developments have been important. The electric railway up the mountain to the mine is running satisfactorily, transporting ore and supplies.

The consolidation of the mines owned by the Ramshorn Co. at Bayborse and the mines owned by the Clayton M. & S. Co. at Clayton and Bayhorse is reported made. This means the extending of the Mackay Railroad to Salmon river and the starting up of the camps of Bayhorse and Clayton, says the Challis Messenger.

Idaho County.

The American Eagle mine, at Elk City, is shut down and likely to remain so for some time, says the Spokesman-Review. ——The Diamond Joe gold mine is reported improving and a mill will be built on it. It is 4 miles from town. J. Olson is superintendent and part owner. W. Struve of Almont, Iowa, is president of the company. The group consists of ten full claims in Diamond Joe gulch, a branch from Red Horse creek, and has a good wagon road to Elk City. On the east side of the gulch the main tunnel is driven 225 feet on the vein, with crosscuts from wall to wall, showing the ore bodies. At the mouth of this tunnel is a shaft 35 feet deep, crosscut also at bottom. In the cuts the ore bodies are shown 8 feet wide. Oxidized ore throughout the ledge shows free gold. About 300 feet below the main tunnel and shaft is the millsite, with sufficient water for use on Red Horse creek, and from this point a new working tunnel will be driven.

D. McKenzie of Boise has bought the Golden Gate group of claims on Johnson creek, in Yellow Pine basin, for the East Dewey M. Co., near Roosevelt.

The dam and bridge at the Dewey mine, on the South Fork of the Clearwater, near Grangeville, has been taken out by high water, causing a loss to the company of $15,000. The Dewey Co. has been putting in an electric power plant with which to run the mine. The dam was nearly completed. The Dewey mine is owned by M. Jacobs et al. of Spokane, Wash., and O. Abeling is manager. He has been planning erection of a 100-ton cyanide mill.

Shoshone County.

S. A. Easton, manager of the Bunker Hill and Sullivan mine at Wardner, says they are working 400 men and are paying dividends of $45,000 a month. They will continue to use mostly water power for the mine, but will take some power from the Spokane electric line.

Washington County.

Mining operations are said to be increasing in the Seven Devils district, near Weiser. The Weiser Signal says extensive operations are proposed by several companies interested in that section.——The Idaho M. Co., Ltd., has been organized in Buffalo, N. Y., to develop the California group of six claims on Camp creek, 2 miles above Landore. The officers are: C. F. Macey, president and manager: A. H. Beckham, F. Macey and J. C. Sutherland, with F. Powell superintendent. The company will begin building boarding and bunk house, blacksmith shop, etc., next week, and when operations begin the work will be confined to sinking the shaft, which is down 100 feet.

The Golden Rule Placer M. Co. (the Hatbaway Co.) will increase operations this season on its Grouse creek properties, near Council, says Manager S. S. Curry, of Milwaukee, Wis.

MISSOURI.

Madison County.

Secretary M. J. Duryea of Mine La Motte Dev. Co., at Fredericktown, says he is preparing to build a concentrating plant at the company's mines.

MONTANA.

Fergus County.

C. A. Case, manager of the Case-Wilson Cyanide and Dev. Co. operating in Cone Butte district, near Lewistown, reports work progressing on the property, which his company has bonded of Losinger and Morrison. Two 50-foot shafts and a tunnel have tapped the ore body in three places, the assays averaging $5. Work will be continued this summer and as soon as sufficient ore is blocked out a mill will be built.

Missoula County.

C. Wing, of the Oro-Monarch quartz gold mine, south of DeBorgia, says he has secured title to the Oro-Monarch ground and will resume work. It is a short distance east of the Deer Creek M. Co.'s mine, owned by an Eastern company.

Silver Bow County.

C. A. Wisner of New York is reported making an investigation of ores of Butte district, carrying zinc, lead and gold, with a view to establishing a plant for treating the ores. He is a member of the company which controls the Emma mine.

NEVADA.

Esmeralda County.

A vein of coal 14 feet in width at depth of 150 feet has been found in Esmeralda county along the line of the new railroad, about 30 miles southeast of Sodaville and 35 miles northwest of Tonopah. The coal is said to be bituminous. A new town called Coaldale has sprung up on the railroad at a point nearest the mines.

A. H. Mayne is preparing to increase developments on the Goldsmith group of mines near Sodaville.

Lander County.

T. K. Code of San Francisco, Cal., will this summer at Pittsburg canyon, 16 miles from Battle mountain, work the tailings from the Pittsburg mine by the cyanide process. The engine and other machinery are being overhauled.

Lincoln County.

Twenty-eight thousand dollars' worth of gold bullion from the Bamberger De Lamar mines at DeLamar were shipped last week to the sub-treasury in New York, being the result of a two weeks' run at the mill.

At the Quartette mine at Searchlight the repairing of the shaft has been completed and 25-pound rails laid to the 700-foot level. The shaft has three inclines, 40°, 45° and 50°, the latter being the dip of the lead. Sinking will be resumed, when the shaft will be sunk to the 900-foot level. The steel tailings tanks at the mill are nearing completion. These tanks are expected to make a saving of water sufficient to run twenty stamps.

At a depth of 60 feet a body of high-grade ore is reported struck in the Golden Terra mine of the Empire Con. M. Co., near Searchlight. The ore shows free gold, says Superintendent E. K. Woods. The shaft is down 80 feet. The shaft will be sunk to the 100-foot level, when a crosscut will be run to show width of vein.

Nye County.

Coaldale has been added to the mining towns of Nevada. Tents and frames of houses are going up. The town is the present terminal of the Tonopah-Rhodes Railroad, and is brought into prominence on account of a recent coal strike. The Los Angeles & Salt Railroad people, it is understood, have secured control of the property and Coaldale will be the base of supply. In addition, a number of gold prospects are being opened up.

White Pine County.

C. Minoletti, owner of the Ne Plus Ultra mines near Hamilton, says he is shipping ore which affords an average of 55% lead, with from ten to twenty-five ounces silver.

The New Gold Bug M. & M. Co. of Salt Lake City, Utah, has been incorporated by A. M. Christensen, O. Grover and J. M. Christensen. The company owns five mining claims in White Pine county.

NORTH CAROLINA.

Davidson County.

(Special Correspondence).—The Southern Homestake M. Co. of Munhall, Pa., with O. P. McCrutcheon, president, and E. W. Lynn of Greensboro, N. C., general manager, is having plans prepared for a 100-ton cyanide plant to treat the ores from the Southern Homestake mine in Lytton mining district, near Thomasville. The ore will be taken out by open cut work, and it is the purpose of the company to increase the milling capacity immediately their first plant has gotten into steady commission.

The Empire gold mining property in the same district has been bought by Pittsburg, Pa., men, who intend to incorporate and equip the mine with a cyanide plant. The vein has been traced for 5000 feet and is from 150 to 200 feet wide, with an average gold value of from $3 to $4 per ton.

Thomasville, April 22.

NEW MEXICO.

Grant County.

Work is progressing on the concentrator for the International M. & M. Co. at Malone, 27 miles from Silver City. The company has forty men working the mines and setting up the machinery in the concentrator.

W. H. Reynolds, at Rodeo, says a copper camp is being opened up 12 miles from Rodeo station on the El Paso & Southwestern Railway. He says there is plenty of wood and water and 90,000,000 feet of saw timber in the Chincanboras mountains. The mineral belt is 10 by 20 miles.

Rio Arriba County.

In Bromide camp, near Tres Piedras, the Bromide tunnel is in 300 feet. The new electric drill is working satisfactorily and a blower to drive the smoke out of the tunnel is being put in.——It is expected a mill will be built in Bromide camp this summer by one or more of the larger mines. This will serve as an impetus to the other mines.——O. Rosenfeld of Manistee, Mich., president of the Tusas Peak G. & C. M. Co., which owns the Tampa mine in Bromide district, says orders have been given to sink 200 feet deeper from the 300-foot level. An air compressor will be set up to supplant the steam drill. It is thought the company will build a mill this summer to treat the ore before shipment.

Sierra County.

The Sierra County Advocate says a gold discovery has been made on Animas creek, 25 miles from Hillsboro, by G. S. & L. Du Bois. The find is 8 miles above the Morrison ranch on the Animas.

Socorro County.

W. H. Cottingham of Las Vegas is reported to have a group of claims in Socorro county, which he will equip with a concentrating plant.

Taos County.

A strike is reported made in a crosscut from the main tunnel on the Gold Mint mine, near Twining. The property is on west side of Gold Hill in Rio Hondo mining district. The vein has been cut at a tunnel depth of about 250 feet and vertical depth of 200 feet. It is 20 feet wide between walls and shows 4 feet of high-grade ore carrying free gold and is accompanied by 4 feet of talcose matter. More men will be put on.

OKLAHOMA.

Comanche County.

Gold is reported near Apache, and many have staked off mining claims in the foothills of the Wichita mountains west of Apache. While digging a well on his place, near Apache, H. Gilbreath found gold ore said to assay $15. The mill run of the ore was $7 per ton.

OREGON.

Baker County.

Development is being increased on the Queen of the West group in Cornucopia district, near Sumpter, after the disastrous slide experienced there last month in which two men lost their lives, says Manager D. H. Soderling of Baker City. Superintendent Smith has men in the crosscut which is being driven to open the vein at depth of about 600 feet. The property is proven above, where a crosscut has been driven to the vein, drifts extended, and a winze sunk to depth of 90 feet below the adit level. Since the snow packed because of spring thaws, slides have ceased to menace the property.

E. C. Allen, superintendent of the Black Butte mine, near Sumpter, says work has been resumed. The hoist will be taken in as soon as the roads permit.

Columbia County.

Work has begun for the year in developing the mines of St. Helens, says G. W. Simpson, of Portland. His company has let a contract for 200 feet of tunnel work on the Last Chance mine. It is purposed to carry on the work until they have the complete plant up. They have worked on the properties all winter.——One of the plants to be installed in the district this summer is on the Mount St. Helens Con., in which H. W. Coe is interested. The plant will be of 150 tons a day capacity. Bodies of ore are blocked out.

Grant County.

G. J. Barrett will resume work at the Grand Union mine, near Granite. He will drive the crosscut to the continuation of the Concord vein. This tunnel has already cut four veins, but little drifting has been done as it is desired to complete the crosscut before starting to open up the ledges.

About May 1, or as soon as the roads will permit getting of supplies to the mine, men will be put to work at the Big Four mine, about 4 miles northwest of Granite. This property is managed by W. C. Rutter of Seattle, Wash. The work will be centered in driving the 600-foot crosscut that was started before shutting down last fall. This crosscut taps the vein at a depth of 400 feet and is being driven for a working tunnel.

In the Copperopolis mine, near Prairie City, a body of high-grade copper sulphide ore has been opened up, says W. W. Gibbs, superintendent. In driving the tunnel on the ledge they found the vein faulted, and they started in another direction and struck the vein, which shows a width of 30 feet. They propose to put in a leaching plant which will have a capacity of 100 tons per day.

Jackson County.

M. P. Ward, manager of the Millionaire mine, near Gold Hill, has begun preparations for putting in pumps, hoists and other machinery for development of the property.

Josephine County.

A. B. Cousin, of Portland, manager of the Galice Con. mines, at Galice creek, near Grant's Pass, has started the ditch to Rogue river to work the property recently bought by the company from P. B. Wickham.

C. J. Allen, F. B. Roberts, et al., owners of the Allen mine, near Grant's Pass, propose to dam the Rogue river, near the mine, to develop 12,000 H. P. Power drills and other equipment will also go in.

Lane County.

G. E. Waggoner, of the Badger mine, at Blue river, is preparing to put up a 10-stamp mill.

The Black Butte cinnabar mines are 36 miles from Eugene and 16 miles from Cottage Grove and are producing a large output of mercury, the ore being reduced by a 40-ton furnace. This property is said to have 5000 feet of tunnels.

SOUTH DAKOTA.

Lawrence County.

P. Wibaux, president of the Clover Leaf M. Co., operating the Uncle Sam mine at Roubaix, is planning for further work. These plans contemplate operating the twenty remaining stamps at the mill, giving the plant sixty stamps in commission. It is also intended to sink the main shaft from 700 to 1200 feet.

The Oro Hondo M. Co., near Lead, is working three shifts in the main shaft, which has reached a depth of 900 feet. It will be continued to 1000 feet and crosscutting will then begin both east and west. It is of three compartments. G. M. Nix is manager of the company.

The Gilt Edge-Maid M. Co. is preparing to build a reduction plant in Strawberry gulch for treatment of ores from the Gilt Edge and Dakota Maid mines. The plant will involve wet crushing and cyanide treatment for the ore. O. P. Ankeny and G. A. Duncan of Deadwood have charge of the property.——The mill of the Ruby G. M. & M. Co. in Ruby gulch has been started. The principal owners are J. Conzett of Deadwood and residents of Newcastle, Pa.

Another shoot of ore is reported by the Penobscot M. Co. in Garden City. It is opened east from the main shaft. The shoot shows a thickness of 12 feet, all of which carries values in gold. The company is putting in an air compressor capable of running twelve drills. The old

air compressor has capacity of six drills, hut has heen required to run ten drills as well as pumps and hoists. —— The Goldstake M. Co. is continuing its crosscut tunnel. This company owns 200 acres adjoining the Penohscot, on which there are hoth the vertical and horizontal formations.——The Dizzy G. M. Co., owning several hundred acres north of the Penobscot, is preparing for the season's work. Considerable money was expended last season in sinking and drilling with a diamond drill. A shaft will he put down this year following the diamond drill, the work to he under the supervision of H. H. Francis of Custer, one of the principal owners.

The McGovern group of mining claims in Bald Mountain and Annie Creek districts, near Greenmont, has heen sold to the Imperial M. Co. Included in the property are five distinct groups of claims —the Burlington and Apex, Reindeer, Rudolph, Costello and Baltimore. All of these groups have heen producers in the past, but for several years have been in litigation.

Work at the Big Four M. Co. property near Deadwood will be resumed and development work carried on. The machinery has been repaired and added to. The machinery was damaged to some extent hy the fire which hurned the company's plant last winter.

The Gordon M. Co. has heen incorporated to develop a mineral tract near Maitland by F. E. Little et al. of Deadwood. They will build a mill.

A rearrangement of the No. 2 cyanide plant of the Homestake mine, on the north end of the property, is being made in order that the plant may treat more satisfactorily the different characters of ore ohtained on that portion of the company's territory. Some of the ore carries a greater percentage of slimes than others, and different modes of treatment are necessary, particularly at the cyanide plant. In order to keep the ores separated part of the hatteries in the stamp mills will be set apart for the treatment of one character and the remainder will be run on a different character; to continue the distinction a new pipe line is being laid from the old Caledonia stamp mill to the cyanide plant. It is claimed that by this arrangement a greater saving will he made possihle not only in the cyanide plant, but on the plates in the stamp mill as well. The cyanide vats in this plant are being enlarged and the tankage will be increased by 1250 tons. There are various improvements under way on this end of the Homestake property. The Washington tunnel project is being pushed under the direction of N. Treweek. The company has been concentrating its energies more and more in this locality, and the indications are that it will become one of its most active fields.

The Tinton Tin Co. is operating its tin concentrating plant at Tinton, in western Lawrence county, and has apparently entered upon a successful career, says the Review. The first product of the mill has been hauled to Iron creek and is awaiting shipment to the East for refining. The plant has a daily capacity of 100 tons. In this plant the waste material is eliminated and the cassiterite, or black oxide of tin, is the result. The Tinton company has plans in contemplation already for the enlargement of the present plant. C. Waite of Tinton is manager.

The Gold Eagle M. Co. is developing eleven claims adjoining the Penobscot mine, in Garden City district, says the Black Hills Mining Review. The company's territory lies 3½ miles northwest of Deadwood. The company has ore in both the horizontal and vertical formations. J. N. Hawgood of Deadwood is general manager.

UTAH.

Beaver County.

President S. Newhouse says his company has decided to construct a railway over which to forward the ores of the Newhouse mines near Frisco to the concentrator at Newhouse, grading for this equipment to be contemporaneous with grading for the San Pedro branch between Frisco and its terminus at the bins of the plant. An electric railway had been originally projected, but the plans have been changed and steam will be used. The route between the mill and the receiving bins at the mine will cover a distance of 2 miles with a 5% grade.

Grand County.

It is reported P. T. Stevens has closed a deal whereby he gains control of the Paradox-La Sal mines on the east side of the range, near Basin, and has also completed arrangements for building a branch line of railroad from Placerville, Colo., down the San Miguel river to Naturita and up the Dolores to La Sal creek at Cashin, where the mines are. Boston, Mass., men are associated with him.

Iron County.

S. B. Milner of Salt Lake City says the Colorado Fuel & Iron Co. has established a camp at Desert Mound and is preparing to start the systematic development of the ground hy means of diamond drills. Milner has men doing the necessary work to secure patents. He has thirty-three claims still unpatented.

Juab County.

The new machinery for the Eagle & Blue Bell mine, near Eureka, is being set up. It includes a compressor. ——The roads throughout Tintic are dry and no more trouble will be experienced in hauling to and from the mines, unless the weather changes materially.——Six leases have heen let at the Victor, from the 300-foot down to the 600-foot levels. The leasers will work under direction of former Superintendent J. Trelear, who will undertake to develop the territory below the 600-foot level. The company is to receive a royalty of one-third on all ores, and pays one-half of the transportation and smelter charges.

The Joe Bowers, at Robinson, has increased the working force.——Arrangements have been made to reopen the Eureka Hill mill, says the Robinson Record. Work is under way at the plant to get it in condition.——It is reported that the $100,000 litigation between the Eureka Hill and the Bullion Beck companies for unlawful extraction of ores and in which the latter company won, has been compromised on payment of $90,000, which will be distributed to the Beck stockholders in the form of a dividend.

The management of the Utah mine at Fish Springs in the Deep Creek section has under consideration a plan for its equipment with a traction engine for ore hauling. To deliver a ton of ore at Oasis, the loading station on the San Pedro, under present methods, says J. Oberdorfer of the company, now incurs an expense of $12.50 with the tariff between that station and the furnaces of the American S. & R. Co. to be added, the total cost of loading and transportation, approximates $15 per ton.

Manager Chipman of the Uncle Sam Con. of Tintic says the ore body in that property is 12 feet wide, one-half of which is shipping ore, assaying 45% lead, $2 in gold and twenty-five ounces in silver to the ton, says the Salt Lake Reporter. The mill is concentrating sixty tons of low-grade rock per day, the concentrates averaging 40% lead, twenty ounces in silver and $2 in gold.

Millard County.

The Oasis G. & C. M. & M. Co. has been orgauized in Salt Lake City. The properties of the company are in the Detroit mining district, in Millard and Juab counties. Its officers are: M. S. Browning, J. T. White, J. A. Jennings and J. B. Toronto.

Salt Lake County.

(Special Correspondence). — The Utah Copper Co. is handling 400 tons per day at its mill which has recently been started. The mill has a capacity of 500 to 600 tons and the crushing capacity is 800 tons, but before this tonnage is reached it will be necessary to put in more concentrators. They started shipping concentrates April 1st. The concentrates run about 30% copper. D. C. Jackling is manager and F. G. Janney superintendent.

Bingham, April 24.

The Fortuna mine of Bingham is shipping fifty tons of ore per day, and this output will be doubled nexth month.

J. B. Stepbens is preparing to start work on the Julia S. mine at Bingham.

S. Newhouse has bought the Evans land near Bingham Junction, near Bingham, for $23,400. The tract comprises 117 acres and is expected to be used as the site for reduction works for the Boston C. Co.

Summit County.

The force at the California mine of Park City is to be doubled, says Manager W. I. Snyder.——The forwarding of concentrates to market from the Kearns-Keith mill at Park City has been temporarily suspended on account of the bad condition of the roads. The plant continues in operation, however, the product being piled up in the bins until it can be moved.

The Wahash, at Park City, has closed down for lack of water. New tanks are heing built.——The strike in the Nelson of galena ore has widened out considerably.——W. I. Snyder reports that in the California a new body of pay ore has been uncovered.

MacDonald Bros., O. T. Johnson, G. Wilson, F. Auhrey and F. Hansen have organized a mining company to develop ground lying near the Majestic and Nelson group near Park City. The company will he known as the Eagle.

Tooele County.

The Honerine West M. Co. of Stockton has made final payment on the Monroe group of claims. Another payment has also been made on the Copper Queen group, but a halance remains due on that property. Development work will he started at the Honerine West next week. Its territory is being unwatered hy the Honerine drain tunnel and operations can be carried on at less expense than formerly.

The Midas mill, Clifton district, near Ibapah, is again in commission after its partial destruction hy a windstorm last season. The structure has heen changed throughout, and has heen so designed on the interior as to make the engine and boiler rooms proof against the clouds of pulp dust as it is conveyed to the tanks from the rollers and crusher. An assay office has heen built. The capacity of the eight cyanide tanks is intended for twenty-five tons each, making a total of 200 tons, says Superintendent W. F. Oden.

The flow of water from the drain tunnel at the Honerine mine of Stockton has increased to 8000 gallons per minute, with waters in the various workings on the zone being correspondingly reduced, says Manager Snyder. The mill has been producing ahout forty-two tons of concentrates per sixteen hours; hut as the third shift has been put on, the management expects to increase the output to seventy-five tons of concentrates, or from thirty-seven to forty tons of lead daily. Meanwhile provision is heing made for five more tables and two additional slimers.

Uinta County.

State Coal Mine Inspector G. Thomas reports the mine of the Gilsonite Asphaltum Co., near Duchesne (known as the St. Louis mine), closed down. The electric lights and ladders have heen taken out and the twenty-five men laid off. The tools and machinery are heing taken to White river in Colorado, where other gilsonite mines are to be opened. The reason given for the move is that they will have railroad connection with the Rio Grande by August 1st and will then he ahle to get cheapor transportation and furnish a larger output. —— The Pariette mines are 30 miles south of Duchesne, employing twenty-five men in three shifts. One double cylinder 50 H. P. hoist, one 40 H. P. air compressor, a complete electric light plant and a 70 H. P. return tubular boiler constitute the machinery equipment. The company will increase the number of men to fifty and the output to forty tons per day of gilsonite. The vein has widened to 3 feet and 10,000 tons have been blocked out. The mine is owned by the American Asphaltum & Rubber Co. of Chicago, Ill.

S. P. Barron, vice-president and manager of the American Asphaltum Association's gilsonite mines on the Uncompaghre reservation, uear Duchesne, says the development of the Cowboy ledge, over which there was rivalry prior to concessions from the Indians which gave the association possession of it, has heen with satisfactory results. A crosscut shows 18 feet of gilsonite, of which 2600 tons has been marketed during the past six months. At present, however, there is no desire to levy on its resources, as the line of railway from Rifle into the region will reduce the cost of transportation and do away with the train of wagons now employed. The company's headquarters are in St. Louis, Mo.

WASHINGTON.

Ferry County.

During March the mines in Republic camp made heavy ore shipments to British Columbia smelters. The Mountain Lion shipped 2250 tons of ore, the Nob Hill mine 150 tons and the Zala M. shipped 750 tons. The average daily shipments amounted to 101 tons.

Stevens County.

Manager E. J. Wilson of Le Roi C. Co. smelter, at Northport, says the smelter will hlow in this week. The new sampling works, which have a capacity of from 800 to 1000 tons of ore per day, is ready for operation.

J. M. Davey, manager of the Iron-Hill mines west of Valley, says they have completed 1500 feet of development work on the property, besides 600 feet of boring with a diamond drill. It is expected work will be suspended next month.

WYOMING.

Bighorn County.

Prospectors report uncovering a ledge of gold-bearing rock on south side of the Rattlesnake mountains, 4 miles west of Cody. The rock is said to carry tellurides.

Carbon County.

The output of copper from the ores of the Ferris-Haggerty mine at Rudefeha has hegun. The concentrator is in operation, and as soon as the ore bins at the reduction works are emptied the tramway will start carrying ore, says the Douhlejack of Dillon. The management of the North American C. Co. has adopted new systems of conducting affairs and will run at less expense. The concentrator has been remodeled and additional machinery installed, increasing its capacity. Changes have heen made to the smelter and roaster to improve the efficiency of the plant.

H. O. Granherg, secretary-treasurer of the Pluto M. Co., says his company is preparing to put in a 65 H. P. steam engine, with hoilers, air compressors and six air drills, at their No. 1 group, ahove Dillon ½ mile, as soon as the roads get in shape to haul them.

The State Line M. Co., operating in the southern part of the Grand Encampment district and 3 miles north of Pearl, Colo., has opened a 4-foot vein of copper ore. This ore hody has heen opened on its No. 4 claim, and it is a separate vein from others on which work is heing done. A shaft is heing sunk.

Work is progressing on the Copper Age mine (the Copper Blossom) on Cow creek, near Dillon. The plant of machinery was put in last fall and ten men have been working all winter. The shaft is down 200 feet and following the vein with satisfactory showings. At 87 feet good ore was struck. The tunnel from Cow Creek canyon is not heing driven farther at present, though it is in 450 feet, ahout half way to the point where it is expected to cut the vein. The policy now adopted is to follow the ore and demonstrate its extent and value. This tunnel will give a depth on the vein of 1050 feet.

Sheridan County.

The East Sheridan Coal Co. has been formed to operate coal deposits which have heen discovered on the Moncrieff ranch, near Sheridan, by W. Moncrieff, J. N. Drake, E. Frost, F. J. Marhle and I. W. Wettford of Omaha, Neh.

Uinta County.

G. W. Short states that the Globe Oil Co. at Fossil has resumed drilling operations and expects to place two more rigs in the field this summer, and that the Fossil Oil Co., of which he is manager, has hegun drilling. The Idaho-Wyoming will have a drill in operation by May 1, and the Cinderella Oil Co. of St. Louis, Mo., proposes building a rig by July.

FOREIGN.

AFRICA.

Transvaal.

The collapse of a cage in the Robinson mine on the 26th inst. is reported to have dropped forty-three natives 1000 feet to the bottom of the shaft. All were killed.

AUSTRALIA.

New South Wales.

U. S. Consul F. W. Goding, at Newcastle, writes from an advance report of the Under Secretary for Mines the following are taken respecting the mining interests of New South Wales during 1903: The aggregate value of the mineral wealth to the end of 1903 produced in the State is estimated at $770,560,627. The value of the production for 1903 is $29,488,488.61—a net increase of $2,086,455.97 over that of the previous year.——The total number of persons employed in and about the mines of the State during the year was 37,739—an increase of 4044 over 1902. The total value of the machinery erected at the mines (other than coal and shale mines), inclusive of dredging plants, is $10,208,505.71. This does not include the value of the various smelting plants.

ESTIMATED PRODUCTION OF MINERALS IN 1903.

Description.	Value.
Gold	$5,255,961 12
Silver, silver lead and concentrates	7,306,577 70
Lead	187,778 76
Zinc	421,375 63
Copper	2,098,366 66
Tin	607,791 78
Alumnite	30,230 69
Antimony	656 97
Bismuth	46,411 80
Chrome	35,729 84
Diamonds	48,601 73
Cobalt	7,640 40
Ironstone flux	77,056 16
Iron oxide	5,747 33
Limestone flux	69,206 46
Lime	83,767 06
Hydraulic cement	271,258 71
Opal	486,650 00
Platinum	8,163 35
Molybdenite	21,594 85
Other minerals	46,129 54

The chief inspector of coal mines has issued a report in which he shows that the total amount of coal produced in New South Wales during the year 1903 amounted to 6,354,846 tons—an increase of 412,835 tons over 1902. The figures for 1903 as compared with those of 1902 are as follows:

District.	1903. Tons.	1902. Tons.
Northern	4,410,565	3,900,297
Southern	1,476,005	1,588,473
Western	468,276	453,241

Work at all the collieries was slack during the last quarter of the year, materially reducing the output. The output of bituminous shale for 1903 was 34,776 tons, as against 62,880 tons in 1902, the reduction being due to the less number of producing centers, one only now being in operation. The quantity of coke made dur-

ing the year was 160,592 tons—an increase of 33,720 tons over the 1902 output. Several of the plants were not fully operated. With the revival of metalliferous mining, it is expected this industry will show improvement during the current year, as its use has proven satisfactory at various mines, supersoding the imported article. ——The total number of persons employed in the coal mines in 1903 was 14,117, as against 13,114 in 1902.

Coal-cutting machines are being introduced in the mines of Newcastle district, writes U. S. Consul Goding. At one colliery, where 250 miners were formerly employed, the number has decreased to those only who are engaged in working the machines and those following up by blasting, drilling and timbering. There is not now a miner in the working faces of this colliery who is getting coal with the handpick. The miner's pay was 11s ($2.67) per day, the helper receiving 7s ($1.70) per day; most of those employed now are placed in the latter class. About 150 miners from this mine must look elsewhere for work or do this unskilled labor at 7s per day.

BRITISH COLUMBIA.

Boundary District.

It is reported in Phœnix that the British Columbia C. Co., Ltd., owning the Mother Lode mine in Deadwood camp, will resume development in the deep levels of that mine. For two or three years the company has been shipping only ore extracted from the surface quarries of the mine. About 300,000 tons of ore have been shipped, and work will still be continued there while development is still going on from the workings in the main shaft. The Mother Lode main shaft is 325 feet deep and long drifts were run at the 200-foot and 300-foot levels, showing up bodies of ore. Improvements are also being made by Manager Keffer at that mine. Another ore crusher for use at the mine will be set up. The mine is shipping from 600 to 700 tons of ore daily, the smelter handling besides some outside ore.

East Kootenay District.

J. Cronin of Spokane, Wash., manager of the St. Eugene mine at Moyie, says the St. Eugene mine will start shipping ore May 1st and will add 200 men to present number at work. J. A. Finch of Spokane, associated with Cronin in the ownership of the St. Eugene, says the mine will ship in part to Kootenay smelters and in part to Germany. It has been working fifty men. The ore carries silver-lead values.

Work will be resumed this week at the Poerman-Tiger group of mines on Wild Horse creek divide, near Fort Steele. The mine is owned by J. P. Larsen.

Rossland District.

J. J. Warren, managing director of the White Bear Con. M. Co. at Rossland, says the grade of the ore is improving. They are opening up one stope, that on the 850 level, at present, and there have an ore body 20 feet in width and 130 feet long. The company will proceed with the construction of its milling plant as soon as the snow is off the ground. By August 15th they expect to be crushing ore. It is planned to hoist 150 tons of ore per day, of which fifty tons will be shipped to the smelters and the balance put through the concentrator. Recent shipments from the White Bear mine have been satisfactory, running $14 per ton. The company has 7000 tons of milling ore on the dumps.

J. H. Mackenzie, temporary manager of Le Roi mine at Rossland, says they are making a thorough sampling of every stope in the mine, with a view to determining, not only the values, but the exact character of the ore. The smelter requires more iron than is produced in some of the stopes. When they have finished the sampling under way they expect to find that the mine will be able to take care of its own fluxing to a large extent. The temporary shut down of the smelter has allowed the company to do some overhauling and make necessary repairs. The sampling in progress in the stopes of Le Roi mine will be a guide in the making up of shipments. The ores that contain sufficient iron for self-fluxing purposes can then be segregated from the more siliceous product and shipped and smelted without loss or delay. The rest can be treated in connection with baser ores from outside mines. In this way the mine will be worked to a better advantage.

The O K mine's stamp mill near Rossland was started last week by the lessees of the I X L mine, Loff & Co. M. Purcell represents the mine and mill owners on the ground. The mine lessees have a quantity of ore broken down for treatment.

The buildings and plant at the Velvet-Portland amalgamated properties near Rossland will be completed next month. The building of a small smelter, designed to reduce the output of the mine, will then be taken up.

The White Bear Con. M. Co. has broken ground for its 100-ton concentrator near Rossland. The machinery for the works has been under orders in the East since the first of the year. It is estimated that six weeks will suffice to complete the buildings. The plant will be located southeast of the shaft house, where the topography of the ground lends itself to construction on the terrace principle. Stops are now under way to secure water for the plant. The company has secured several water rights and is taking up further water to guard against emergencies or enlargements of the plant in future. The mine itself will contribute to the water supply for the concentrator.

West Kootenay District.

A snowslide 1200 feet wide is said to have killed one man and carried away ore sheds, mine buildings and 1600 feet of the tramway of the Silver Cup mine in the Lardeau, near Camborne. The slide also carried down the mountain a large quantity of sacked ore and badly smashed the compressor. The damage is estimated at $75,000.

In the Lardeau, work will be resumed on the Mohican group at the head of Gainer creek, near Trout Lake, next week. This property was taken up by the Caribou Creek Syndicate, formed by Oliver & J. C. Murray, since which time the company has opened up a body of ore at depth of 125 feet, a test shipment of which netted $45 per ton. The new work mapped out is to drive a tunnel to tap the ore shoot at depth of 350 feet. The tunnel will be a crosscut for a distance of 100 feet before tapping the ledge, when it will be continued along the vein.——There are several properties to be worked this season on Gainer creek, among which is the Bad Shot, owned by F. C. Campbell et al., and the Black Prince, under option to T. Becker. These properties are contiguous to the Mohican, and it is thought the Government will build a wagon road during the summer.

CANADA.

Alberta.

The International Coal & Coke Co., developing its coal mines at Coleman, is preparing the foundations for 104 coke ovens.

Yukon Territory.

W. M. Ogilvie of Ottawa says his company will operate a dredger on the Stewart river, which will be one of three to be taken into the gold fields this summer.——The Forty Mile Co., which owns the concession on the Forty Mile river from the mouth of the stream to the boundary, will take in another dredgor, while a third will be operated in the Atlin country. The dredger on the Forty Mile is one that has been used in California, the company not having time to get a new one made for use this summer.

ENGLAND.

The United Kingdom's output of coal in 1903 showed an increase over 1902 exceeding 3,000,000 tons, or about 1½%. The gross output reached 230,323,391 tons. The greatest increase was in the Yorkshire district. The number of mine employes was 842,066, an increase of 2% over 1902, writes F. W. Mahin, U. S. Consul at Nottingham.

HONDURAS.

U. S. Consul W. E. Alger, of Puerto Cortes, says a coal deposit in Las Mogotes is being exploited.

MEXICO.

Chihuahua.

Manager P. Ginther at Santa Rosalia, says the capacity of the smelter of the Encinillas mines, Ltd., east of Santa Rosalia will be increased from 100 tons to 300 tons daily.

D. R. Jackson, general manager of the Santa Eulalia Exploration Co., has bought boilers, hoisting machinery, compressors and drills for the company's mines at Santa Eulalia. The machinery will be on the ground within the next month. The new working shaft on the Buena Tierra mine is down over 300 feet and will be sunk to 1100 feet, with drifts and winzes at stated distances.

D. W. Shanks, general manager of the Almoloya M. Co., operating at Sierra Almoloya, between Jiminez and Parral, says he will put in an electric power plant at Dorado station, on the Mexican Central, about 5 miles from the mines. This power is to be transmitted from the central station to the mines, where it will be used in their operation. On the Cerro Colorado mine Mr. Shanks has struck a body of low-grade lead-silver ore. The 800-foot tunnel being run on another property is in 175 feet.

It is reported that the deal for the Quebradillas mine, in Parral, by the Pan-American M. & S. Co., G. G. Gillett manager, is for $475,000 in gold. Fifty per cent royalty is to go to the owners to apply on the purchase price. The management is making extensive improvements at the mine.

Guerrero.

The Mitchell M. Co., G. Mitchell president and manager, is opening up a group of copper mines 40 miles from Acapulco, with which port the mines will be connected by a railroad to be built by the company. The ore carries chalcopyrite, said to assay 10% copper. Lime occurs associated with the ore. It is expected the railroad will be completed by November next. Power will be developed from the water rights available on the claims. There is also an extensive acreage of pine and oak timber. The cost of labor is said to be 45 cents per day and fuel $5 per ton. The ore body is reported opened up for 90 feet across, 5000 feet long and to a depth of 500 feet. The company is building reduction works at the mines, which are expected to be ready for operation by Sept. 1. The plant will produce twenty-five tons of metallic copper daily.

Jalisco.

The Altamira M. Co. has been organized, with W. M. Matthews as president and J. M. Ryan, secretary and treasurer, to develop a group of mines near Etzatlan. Machinery and other equipment will be put in.

L. E. Fuller et al. of Chicago, Ill., have bought the Rosa Amarillo and adjoining mines, near Navidad, and will put in machinery.

Nuevo Leon.

The Valley M. Co. is preparing to put in a plant, near Monterey, to unwater its Camel shaft.

The Asuncion mine, near Monterey, having been leased to T. S. Moorhead of Washington, D. C., he will build an aerial rope tramway to transport ore a distance of 2 miles to the Mexican National R. R.

Sonora.

Improvements will be made by the Providencia G. & S. M. Co., operating the Providencia mine, near Nacozari. A 10-stamp mill will also be built, says Superintendent S. Fields.

J. M. Romadka, manager, and others are preparing to operate El Globe gold and silver mines, 8 miles west of Nacozari. Additional machinery will be set up.

Superintendent A. J. King says he will build a 30-stamp mill at the King mine, near Yzabel.

Tamaulipas.

Ebano reports say the Mexican Petroleum Co. has struck at that place a 1000-barrel gusher. The flow of oil when the well was shot was strong. It is stated that the oil is now under control, as the company has a 120,000 barrel tank. The strike was made at a depth of 1700 feet. The oil is a thick, heavy variety. Four other wells are being sunk near the one struck, and these will be shot next week. F. L. Doheny is president of the company. There is almost a prohibitive tariff on fuel oil and, if it can be discovered in Mexico in large quantities, it will prove a valuable resource.

NORWAY.

The Norway Nickel M. Co. has been organized at Salt Lake City, Utah, to develop nickel ore bodies in southeastern Norway. In addition to the payable nickel values in the ore, assays proved it to contain copper values. Treatment facilities can be had at the smelters at Swansea, Wales. A. H. Lund and R. Smoot are interested and F. F. Hintze is president.

Personal.

F. F. Sharpless of New York is in Medellin, Colombia.

A. J. McMillan is in New York, en route to Rossland, B. C.

Jno. Dern of Salt Lake City, Utah, is spending a month in Mexico.

E. K. Smart, of Grass Valley, Cal., is in San Francisco, Cal., on mining business.

F. J. Seibert has resigned as superintendent of the Tonopah M. Co. at Tonopah, Nev.

W. Techow succeeds J. N. Esselstyn in the management of the Mt. View mine, Sumpter, Or.

E. C. Rice has returned to Cripple Creek, Colo., from El Oro and Mexico City, Mexico.

H. E. Gamble, manager Cuatro de Julio mine at Parral, Mexico, is in San Francisco, Cal.

W. H. Kilpatrick of Denver, Colo., interested in Colorado mines, is in San Francisco, Cal.

Emerson Gee is in Mexico on mining business and will return to Los Angeles, Cal., June 10th.

H. Monroe of Salt Lake City, Utah, is in Wyoming, conducting examination of mining properties.

J. Heney, who has mining interests in the Northwest, is in San Francisco, Cal., from Seattle, Wash.

C. W. Crusoe of Randsburg, Cal., and connected with the Yellow Aster M. Co., is in San Francisco, Cal.

R. L. Pritchard of the United Alkali Co. of Great Britain has opened offices in Salt Lake City, Utah.

J. F. Josephs of San Francisco, Cal., has gone to Tonopah, Nev., where he has mining and other interests.

C. Wing, owner of the Oro-Monarch, south of De Borgia, Mont., has returned from an extended trip East.

S. P. Mahan of Valley Spring, Cal., formerly superintendent of the Yellow Aster mine, is in San Francisco, Cal.

R. L. Burcham, largely interested in the Yellow Aster mine and secretary of the company, is in San Francisco, Cal.

W. B. Buckmeister, of Boston, Mass., interested in quicksilver properties, is in San Francisco, Cal., on mining business.

G. M. Nix, manager of the Oro Hondo M. Co., operating near Lead, S. D., is in Philadelphia, Pa., on company business.

W. H. Leffingwell of Lake City, Colo., is now manager Butters-Salvador mining property, Salvador, Central America.

S. L. Bean is appointed mechanical superintendent of the Santa Fe coast lines, with headquarters at San Bernardino, Cal.

A. S. Hickey, superintendent of the Detroit Dev. Co., operating near Placerita, Ariz., is in the East on company business.

W. Kemp, formerly with the Rosamont M. Co., is superintendent of the Copper Belle M. Co. at Gleeson, Cochise county, Ariz.

J. J. Morrow has resigned as general manager of the Greene Con. C. Co. at Cananea, Sonora, Mexico, and is in New York.

S. S. Curry, of Milwaukee, Wis., is manager of the Golden Rule Placer M. Co., operating in Idaho, vice Hathaway, resigned.

J. Knight of Salt Lake City, Utah, half owner in the Nevada-Park mine in Lincoln county, Nev., is visiting that property.

J. Singleton, one of the discoverers and present owners of the Yellow Aster mine of Randsburg, Cal., is in San Francisco, Cal.

R. Blanchard is manager of the Sioux Falls & Cripple Creek M. Co., operating on Fortune hill, near Cripple Creek, Colo.

D. Evans returned to Salt Lake City, Utah, last week, after a trip around the world, and will resume charge of his mining interests.

P. Wibaux, president of the Clover Leaf M. Co., returned to Deadwood, S. D., last week from spending the winter in Paris, France.

W. J. Astley, manager of the Snowshoe mines, near Phœnix, B. C., is in London, but expects to return to British Columbia by June 1.

T. P. Rigney returned last week to Salt Lake City, Utah, from New Mexico, where he has been examining mines in the interest of Eastern men.

H. W. Throckmorton, president of the Mohave Con. M. Co., has returned to Denver, Colo., from the company's mines in Mohave county, Ariz.

R. Angove of Grass Valley, Cal., has gone to South Africa as underground superintendent for the Con. Main Reef Co., near Johannesburg.

Manager T. Jacobson of the Columbus Con. M. Co. of Salt Lake City, Utah, is visiting mines in the Lake Superior copper region of Michigan.

Dr. V. T. McGillicuddy of New York, and at one time a topographical engineer of the United States Geological Survey, is in San Francisco, Cal.

J. J. Warren, managing director of the White Bear Con. M. Co., operating at Rossland, B. C., has returned to Toronto, Canada, after a visit to the mines.

Consulting Engineer Dwight of the Greene Con. C. Co. at Cananea, Sonora, Mexico, has been appointed man-

ager of the company, vice J. J. Morrow, resigned.

A. V. THORNES, former superintendent of the Densmore mine, near Columbia, Cal., is at El Dorado, Cal., and A. W. Crowell has succeeded him at the Densmore mine.

S. S. CURRY of Milwaukee, Wis., president of the Golden Rule Placer M. Co., will have charge of the company's mines in Marsball Lake district, near Grangeville, Idaho, this season.

M. DERBY, superintending dredging operations at Oroville, Cal., for W. P. Hammon, has been given charge of dredge lands in other sections of that State and in Wasbington.

J. F. WATSON of Portland, Or., succeeds J. T. Grayson, deceased, as third vice-president of the American Mining Congress. The selection is temporary, until the congress convenes in Portland, Or., next fall.

H. G. OGDEN, assistant chief of the United States Geological Survey, who had charge of the party which located the boundary line between British Columbia and the United States, is in San Francisco, Cal., from Washington, D. C.

J. W. A. OFF, W. W. HITCHCOCK, H. J. CORNISH, R. H. LACY, C. A. MILLER, D. A. HART AND G. B. EARNSHAW, of Los Angeles, Cal., members in the Zubiate M. Co., operating in Sonora, Mexico, are in San Francisco, Cal., attending the annual meeting of the company.

R. V. NORRIS has resigned as chief engineer of coal and water companies of the Pennsylvania Railroad Co., with which he has been connected for the past eighteen years, and by which companies he has been retained as consulting engineer, and has opened offices in New York City and Wilkesbarre, Pa.

Commercial Paragraphs.

ROBT. SCHORR, consulting engineer Chas. C. Moore & Co., bas moved his office to 519 Mission Street, San Francisco, Cal.

THE Sullivan Machinery Co.'s general offices in Chicago are now in the new Railway Exchange building, corner of Jackson boulevard and Michigan avenue, at rooms 1502-1514, instead of 135 Adams street, as heretofore.

E. DRYER has resigned his position in connection with the Westinghouse Electric & Manufacturing Co., and has accepted an appointment with the Allis-Chalmers Co. at their offices in the New York Life Building, Chicago. He will give his attention to their engine work, as well as to the sale of Bullock electrical apparatus, which the Allis-Chalmers Co. now control through their acquisition of the Bullock Electrical Manufacturing Co. of Cincinnati.

A NEW COMPANY has been incorporated in New York City to determine for clients in the financial field the condition, financial and otherwise, of mines, railroads, manufacturing and other properties whose stocks or bonds are presented to the public as an investment. To this end they desire to register the best and most reliable men in all branches, and to keep on file a record of each man's specialty, bis prices for work and the locations with which he is familiar. Richard Eames, Jr., managing director of the company, is consulting engineer of the La Fortuna G. & S. M. Co. of Jalisco, Mexico. The firm's headquarters are at 10 Wall street, New York City.

THE Rand Drill Co. of New York has just installed two compressed air plants for the United States Government, one at Fort Stevens, Or., and one at Tuscaloosa, Ala. At Fort Stevens the equipment consists of one Rand Imperial type 10 air compressor, having duplex steam cylinders, 7 inches in diameter, and compound air cylinders, 10 inches and 6½ inches in diameter with 8 inches stroke; several Imperial pneumatic riveting and calking hammers and piston air drills. The plant will be used in the work of improvement of the mouth of the Columbia river. The Tuscaloosa equipment consists of one Rand 8x8x12, class C, straight-line, steam-driven air compressor, a number of Imperial pneumatic long-stroke riveting bammers and Imperial piston air drills.

THE annual meeting of the stockholders of the Joseph Dixon Crucible Co. was held at the company's main office, Jersey City, N. J., Monday, April 18, and out of a possible vote of 7345 shares, there were 7126 shares voted for the re-election of the old board, consisting of Edward F. C. Young, John A. Walker, William Murray, George T. Smith, Edward L. Young, George E. Long and Joseph D. Bedle. President, E. F. C. Young: vice-president and treasurer, John A. Walker; secretary, George E. Long, were re-elected by the directors. Judge Joseph D. Bedle was also re-elected as counsel. H. A. Neally has been appointed manager of the new paint office of the Joseph Dixon Crucible Co., Paddock building, 101 Tremont street, Boston, Mass.

THE Colorado Iron Works Co. of Denver, Colo., was established in 1860 and incorporated for $25,000 in 1876, and after twenty years of successful business they reincorporated for $240,000. The business of the company has expanded to such an extent that another reincorporation has become necessary, and the capitalization has been increased to $500,000. This time the reincorporation took place in the State of Maine, which gives them the advantage of bringing all litigation into the Federal courts. Under the new incorporation the company has dropped the word "the" and in future will be known as "Colorado Iron Works Co." The officers of the concern will remain the same, viz.: John W. Nesmith, president; Mrs. Isabel Nesmith Evans, treasurer and secretary, and John H. Morcom, superintendent. The main office and works of the company will remain in Denver, but they will maintain offices in New York City.

AFTER five years of experiment the Zwoyer Fuel Co. of 25 Broad street, New York City, has produced a system of briquetting waste coal dust, and is about to install two plants for the production of these briquettes in the West. Several large consumers of coal in New York and Jersey City, N. J., have used the firm's products with good results. The Burlington and several of the leading railroads west of the Mississippi are now experimenting with the Zwoyer briquettes with a view to their introduction throughout their systems if the tests come up to requirements. The company's 100-ton plant, now operating in Jersey City, is run at labor cost of 20 cents per ton of briquettes, and the cost per ton for the binder is 80 cents. The system of production is fully covered by patents. J. Forbes Potter, the treasurer and general manager of the company, is confident that the problem has been solved.

Obituary.

CLEMENT LE NEVE FOSTER, a prominent English metallurgist, died in London, England, on the 20th inst.

F. CARNE of Victoria, B. C., a pioneer mining man of British Columbia, died on the 12th inst., at the age of 75 years. His first mining was in the copper mines near his native town in Cornwall, Eng., and afterwards in the lead mines of Devonshire. In 1853 be operated copper mines at Eagle Harbor, Mich., going in 1856 to California. In 1858 be went to the Fraser river, British Columbia, later operating in the Carihoo country.

Trade Treatises.

"Flowing Oil Wells by Compressed Air" is the subject of Catalogue No. 81 from the Ingersoll-Sergeant Drill Co., 26 Cortlandt street, New York, and gives an interesting description of the Moran-Moser flowing system, a notable application of the air lift.

Their price list of power steel and crucible steel switch ropes is being sent out by the Broderick & Bascom Rope Co., St. Louis, Mo., to the master mechanics and purchasing agents of the different railroads.

Books Received.

"The Sampling and Estimation of Ore in a Mine" is the title of a volume on this interesting and important subject by T. A. Rickard. The work includes, in addition to the personal experience of the author, contributions by other engineers and discussion of some of the more important phases of the responsible task of sampling the ore in a mine and subsequently determining the value of the mine, employing the assays of samples taken as a basis of computation. The book is of value to mining engineers, as it describes a wide range of conditions and various methods of ore sampling and measurement. 222 pages; well illustrated; price $2. The Engineering and Mining Journal, New York.

Latest Market Reports.

SAN FRANCISCO, April 29, 1904.

METALS.

SILVER.—Per oz., Troy: London, 25⅜d (standard ounce, 925 fine); New York, bar silver, 55c, refined (1000 fine); San Francisco, 55c; Mexican dollars, 44c San Francisco, 44c New York.

COPPER.—New York: Standard, $13.25; Lake, 1 to 3 casks, $13.37½@13.67½; Electrolytic, 1 to 3 casks, $13.25; Casting, 1 to 3 casks, $13.00; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £58 7s 6d spot per ton.

LEAD.—New York, $4.65; Salt Lake City, $3.50; St. Louis, $4.25 San Francisco, $4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, $4.85. London: £12 2s 6d ℔ long ton.

SPELTER.—New York, $5.25; St. Louis, $5.00; London, £22 7s 6d ℔ ton; San Francisco, ton lots, 6¾c; 100-lb. lots, 7c.

TIN.—New York, pig, $27.75@28.12½; San Francisco, ton lots, 29½c; 500 lbs., 30c; 200 lbs., 30½c; less, 31c; bar tin, ℔ lb., 32½@35c. London, £127 12s 6d spot.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $19.00 ℔ Troy oz. Platinum ware, 75 @ 82c ℔ gram.

QUICKSILVER.—New York, $45.50@46.50, large lots; London, £8 5s 0d; San Francisco, local, $43@44 ℔ flask of 76½ lbs.; Denver, $46.00. Export, $43.00@43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 19.50c; San Francisco, Plumbers', 100-lb. lots, 16.50c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb., .04c.

NICKEL.—New York, 50@60c ℔ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $14.10 @14.35; gray forge, $13.00; San Francisco, bar, 3c ℔ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $23.00@23.00; open hearth billets, $23.00 @23.00; San Francisco, bar, 7c to 12c ℔ lb.

BONE ASH.—Extra No. 1, 5@6c ℔ lb. No. 1, 4@5c.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.00; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Antbracite, $13.00; Rock Springs, $11.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $11.50, long ton.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6¼c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ¼c ℔ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb., 7c; less than 500 lbs., 7¼c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ℔ lb.

BORAX.—Concentrated, 6@7c ℔ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ℔ lb., 60c.

SODIUM.—Metal, ℔ lb., 50c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.00 ℔ lb.

CHROMIUM.—90% and over, ℔ lb., $1.00.

PHOSPHORUS.—American, ℔ lb., 70c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ℔ lb., $3.50.

(These prices are wholesale, f. o. h. San Francisco, unless otherwise noted.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING APRIL 19, 1904.

757,644.—WRENCH—G. S. Andrus, Globe, Ariz.
757,873.—WRENCH—G. Brauer, Sacramento, Cal.
757,437.—TREE PROTECTOR—G. E. Brown, Selma, Cal.
757,882.—HITCHING POST—T. C. Butterworth, S. F.
757,860.—ORE CAR—C. Canclini, Stockton, Cal.
757,599.—POWER TRANSMITTER—J. Coates, Hemet. Cal.
757,887.—GAS HOLDER—J. H. Coke, Black Diamond, Wash.
757,888.—PIPE COUPLING—C. O. Cole, Whatcom, Wash.
757,652.—SAFETY GAS COCK—B. F. Edwards, S. F.
757,444.—AXLE—P. Englund, Chico, Cal.
757,912.—POWDER DREDGER—C. E. Grapewine, Los Angeles, Cal.
757,809.—BINDING POST—S. C. Houghton, S. F.
757,660.—LOOSE LEAF BINDER—J. W. Husing, S. F.
757,857.—SLUICE BOX—W. J. & J. H. Jory, S. F.
757,558.—BERRY BOX—J. E. Lyman, San Jose, Cal.
757,938.—DENTAL APPLIANCE—W. T. Lyon, Portland, Or.
757,823.—BAND CUTTER—J. Manderson, Seattle, Wash.
757,668.—WINDLASS—G. W. Menefee, Berkeley, Cal.
757,764.—WRENCH—J. N. Noyer, Gould City, Wash.
757,639.—STEAM GENERATOR—Geo. L. Rose, Pasadena, Cal.
757,975.—PIPE CUTTER—W. T. Snell, Octave, Ariz.
757,574.—ENVELOPE SEALER—J. N. Stacy, Portland, Or.
757,583.—LAND ROLLER—R. V. Wallace, Alki, Wash.
757,698.—LETTER BOX—H. H. Warner, Tacoma, Wash.
757,699.—CONCENTRATOR—E. R. Week, Spokane, Wash.
757,706.—THEATING FRUITS—C. R. Wilson, S. F.
757,857.—ROCKING CHAIRS—J. F. Yoho, Seattle, Wash.

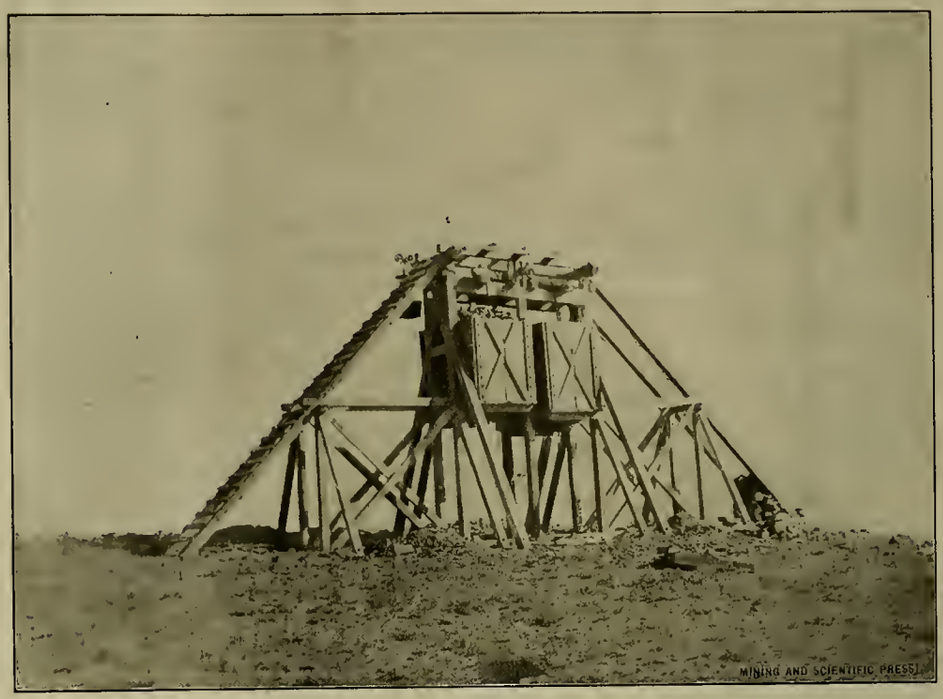
MINING AND SCIENTIFIC PRESS.

Whole No. 2285.—VOLUME LXXXVIII. Number 19. SAN FRANCISCO, CAL., SATURDAY, MAY 7, 1904. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Mountain Transportation.

One of the greatest difficulties which besets the development and operation of mines located in rugged mountain regions is the lack of cheap transportation. Mountain roads are commonly carelessly constructed, that is without due regard to grade and the heavy loads that are to be hauled over them. The roads are usually made from the material found along the line of the highway. Often a fine stretch of hard road is made in passing arouud a jutting spur or a point on the mountain side where the roadway is cut in solid rock, but along the straight hillside portions and at the crossing of intersecting side hill gulches the road is likely to be poor at all times and practically impossible part of the time during the rainy mouths. The result is great expense and sometimes a complete tying up of mining operations. A mountain road sbould never exceed a 5% grade, where heavy loads such as mining machinery is to be hauled. It is economy to build good roads, for if there is to be much hauling over them the additional expense, representing the difference between a good and a poor road, will be saved in a short time.

On each 10-mile haul the machinery for a large mill weighing 1,000,000 pounds should not cost for freight to exceed $1250 on a good road, but on a poor one it may cost as much as $3000, beside delay and possible damage to valuable machinery by overturning of a wagon—an occurrence that happens not infrequently.



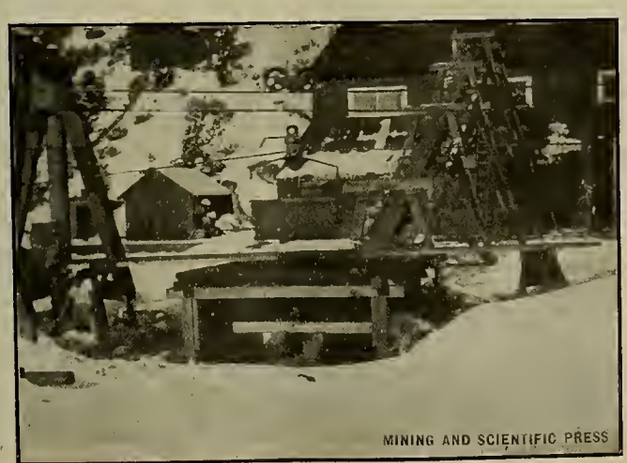
Double Tension on Encampment, Wyo., Tram.

Support at Lower End of a Long Span.

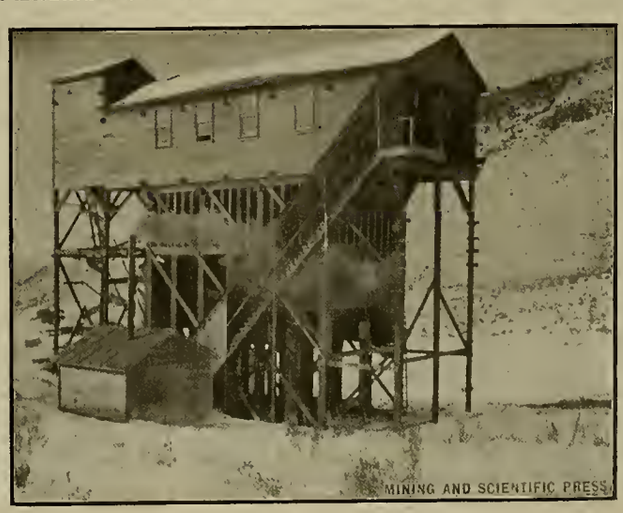
Happily, a solution of the problem of transportation between mine and mill has been solved by the wire rope tramways now found successfully operating in almost all parts of the world. These aerial trams are of various design. Some have tbe buckets secured to a running rope, which makes the circuit at suitable speed, the bucket loaded with ore going down one side and returning empty or carrying mine supplies. Another variety has fixed main cables, the buckets running on grooved wheels, being drawn along by a smaller pulling rope. There are many methods of securing buckets to the cable, and various devices for automatically filling and dumping the buckets at the lower terminal of the tramway, and there are various methods of taking up the tension, controlling the speed on steep grade, or of applying power where the grade is insufficient.

That the aerial tram is a money-saving device in the transportation problem at mountain mines has long since been demonstrated. An instance may be cited where a company built a good road about 3 miles long at a cost of $20,000. The intention was to use wagons aud horses or mules to convey ore from the mine to the mill in the canyon below. Owing to the difficulty in getting suitable wagons to the mine (there being no road connecting the mines with the outside world) and the cost of repairs on the few wagons they did have, the wagons were abandoned for packing on mules, at a cost of $4.50 per ton, wages of drivers, wear and tear of sacks and saddles, keeping of animals and mortality among them—the latter no inconsiderable item. An aerial tram was built at a cost approximating $25,000, connecting mill and mine, and the cost of ore transportation was at once reduced to less tban $1 per ton, the mill handling at that time fifty tons daily. The tramway was direct in alignment, 6500 feet long, and reached an altitude of 1500 feet above the mill at the upper terminal. Since that installation the company has sent more than 200,000 tons of ore over the ropeway. Comment seems needless in a case of this kind.

The accompanying engravings are those taken from two important aerial installations, showing the appearance of upper and lower terminal stations, the supports along the line, and one of them what is termed a double-tension station.



Loading Terminal Aerial Tramway.



Lower Terminal, Grand Central Tram, Robinson, Utah.

AN industrial exposition for South Africa has been planned to be held at Cape Town in November, December, 1904, aud January, 1905. The object is to collect a representative exhibit of the material resources of South Africa and display the same under the usual conditions. Manufacturers of machinery of every description are likely to avail themselves of this opportunity to display their wares.

A HOISTING ENGINEER occupies a position of great responsibility. It requires a man of nerve, presence of mind, and knowledge of his business. He should always be familiar with every foot of the shaft. It is also desirable to have as few meu below in the mine ringing the signals as possible. The engineer becomes accustomed to the manner of ringing of one or two men, and their signals are more intelligible to him. No two men riug bells exactly alike, either as to spacing time between strokes or in the force of a stroke. Aside from a knowledge of his engine, the most necessary qualification in a hoisting engiueer is that of presence of mind and courage to act promptly in the event of anything going wrong. This was exemplified in a striking manner a short time since at the Lightner mine at Angels, Cal., where, when something went wroug, and the man at the hoist lost control of the engine, in the belief that the lives of men were in great danger, he promptly seized a large wrench lying near at hand and jammed it into the gearing of the hoist. He wrecked one side of the machine, destroying the gearing, but he brought the skip to a standstill. Subsequently it was learned that men who had been at work in the shaft had gone up to a level above, but he acted promptly on impulse, believing the situation demanded strenuous measures and applied them accordingly. A man like this certainly deserves credit, and his example might be followed by others who may be placed in a similarly unfortunate position

Relative Size of Mill Screens.

All mill men are aware that the tonnage of ore crushed per stamp is directly affected by the size or kind of screen used. A coarse screen will afford greater capacity than a finer one, but with chauge in tonnage per stamp is usually noticed a change in percentage of values saved. Elsewhere herein is published some statistical data on this practical and interesting subject, in an article by J. Roskelley, in the Journal of the Chemical, Metallurgical and Mining Society of South Africa. In his experiments various screens were employed, from 600 to 1200 meshes per square inch. Unfortunately, the height of drop, number of drops per minute and volume of water in the battery were not maintained at a constant ratio, and although the results are variable, as might have been expected, there would probably have been shown some further variations had the conditions, aside from the mesh of screen, remained constant. He states that the difference between a 600 screen and one of 1200 meshes resulted in a difference of one-half ton capacity per stamp in twenty-four hours, or 1500 tons per month in a mill of 100 stamps. But the writer further says that the use of the finer screen resulted in saving of 3% more in the mill, and 3% further saving in the concentrates. As the assay value of the ore is not stated, and as the percentage of values previously saved is unknown, it is impossible to estimate the actual saving per month iu dollars as a means of comparison with loss of capacity. The reduced capacity per stamp means the saving of that amount of ore daily per stamp—in this instance one-half ton. It becomes a question as to which is the more economical—the extraction of a higher percentage of values, together with interest on the amount saved, or interest on the lesser amount recovered by coarser crushing. The mill labor will uot differ materially, or at all, in the mill, whether crushing coarse or fine, which makes fine crushing somewhat more expensive, but the relative cost per ton of the two systems—fine and coarse crushiug—can be readily arrived at, and a comparison made with the percentage saved by each method. The tests made by Mr. Roskelley are along practical lines, and are suggestive to mill men everywhere, who may make similar experiments with a view to making a further saving in the mill, if the limit of economy has not already been reached.

A New Mining Law.

As an outcome of the recent difficulties in Colorado with the United States land office, in establishing the position of mining claims patented or sought to be patented, a bill has been introduced in Congress, the object of which is to simplify this matter and to enable claim owners to establish the position of their claims as defined by the monuments on the ground. The bill was introduced by Representative Brooks of Colorado. It is as follows:

The description of vein or lode claims upon surveyed lands shall designate the location of the claims with reference to the lines of public survey, but need not conform therewith; but where patents have been issued for claims upon unsurveyed lands, the surveyors general, in extending the public survey, shall adjust the same to the boundaries of said patented claims so as in no case to interfere with or change the true location of such claims as they are officially established upon the ground. Where patents have issued for mineral lands, those lands only shall be segregated and shall be deemed to be patented which are bounded by the lines actually marked, defined and established upon the ground by the monuments of the official survey upon which the patent grant is based, and the surveyors general in executing subsequent patent surveys, whether upon surveyed or unsurveyed lands shall be governed accordingly. The said monuments shall at all times constitute the highest authority as to what land is patented, and in case of any conflict between the said monuments of such patented claims and the descriptions of said claims in the patents issued therefor the monuments on the ground shall govern, and erroneous or inconsistent descriptions or calls in the patent descriptions shall give way thereto.

While it does not actually change the law in respect to patented claims, it is intended to establish the miner in his rights, regardless of the arbitrary rulings of the general land office, which in some instances have compelled claim owners to establish their rights in the courts. By it the land office will be compelled to accept the position of a claim as marked by monuments on the ground, regardless of erroneous calls of deputy mineral surveyors.

Crediting the Miner.

The manufacturers and dealers in mining and metallurgical machinery have many peculiar propositions made them by those desiring to buy machinery, and these propositions often contemplate credit on the account sought to be opened. Necessarily the dealer iu this class of machinery must be discriminating enough to recognize in his prospective customer the man of honest purpose from the unscrupulous schemer. While machinery manufacturers and their agents, who are usually dealers only, prefer to sell for cash, they cannot always afford to risk offending men who have good standing, and in consideration of the belief that his creditor may secure the business if he himself refuses the desired credit, time contracts are common. In extending the credit of courtesy of credit to this class of buyers, the seller has several matters before him for consideration.

First, the man—his record, reputation, etc.; secoud, the property upon which it is desired to place the machinery, whether its value be real and sufficiently covering the credit desired, or whether it be prospective with a good chance for making a mine, or whether it be purely of a speculative kind with nothing in particular to recommend it other than a prospector, or the enthusiastic talk of the credit seeker. If the amount of machinery required or desired involves a large expense, the risk is correspondingly greater than in the case where only a few hundred dollars' worth is wanted. In the former case it would probably justify an expert examination of the mine on the part of the machiuery sellers. It is a well-known fact that haste to equip a mine with a metallurgical plant before the property is sufficiently developed to require or to determine the character of such a plant has frequently led to disaster. The miner is naturally, and almost necessarily, optimistic, but the machinery maker cannot, for business reasons, be expected to share in the sanguine expectations of the miner to so great an extent as the latter.

Mine Patent Surveys.

The Supreme Court of California has again decided—Galbraith vs. Shasta Iron Co.—that the monuments of mining claims, if they can be ascertained upou the ground, must establish lines which shall mark the boundaries of the claims, whether they conform to the distances and directious of lines connecting the claim survey with the corners of the United States land survey or not. This is a matter over which there has been much discussion within the past eighteen months, particularly in Colorado. It was stated herein sometime since that any doctrine contrary to this principle could never hope to be sustained by the Supreme Court of the United States. The most recent decision in this line is that above referred to, the decisiou being rendered on April 27 last, on an appeal from a former similar decision. It was an instance in which a claim had been plainly marked on the ground, and all the "calls," or descriptive language of the United States deputy mineral surveyor who surveyed the claim for the patent conformed exactly with the monuments on the ground, with the single exception of one line which was erroneous, and, if allowed to control, would place the claim a quarter of a mile distant from its actual location, and it was not even claimed that this line was one which had actually been surveyed, but one which was calculated, and extended 5 miles over rugged mountains, and still the Land Department insisted that this line was important, and caused the patentee to relinquish the title to the Government and make application for a new patent, in which the description was void of any known errors.

THE recent case of poisoning by cyanide at the Exposed Treasure mine, near Mojave, San Bernardino county, Cal., reference to which was made herein in the issue of March 23, seems to have been somewhat magnified. That there is no game on the desert all familiar with the situation are aware, and the company seems to have done all that can be reasonably expected of it to lessen the difficulty, and, in fact, much more than miniug companies usually do in similar cases, as shown in a communication from the superiutendent, appearing elsewhere.

CONCENTRATES.

THERE is no California market for tungsten ore.

✤✤✤✤

NICKEL ORES in Sudbury district, Ontario, Canada, contain a little platinum, but not in commercial quantity.

✤✤✤✤

THE next annual meeting of the American Institute of Mining Engineers—the LXXXVIIth—will be held next September in the Lake Superior region.

✤✤✤✤

ON some bearings, such as the surfaces of cams, grapbite is a good lubricant. This does not refer to stamp-mill cams, but those on lighter machinery.

✤✤✤✤

ONE objection to housing head frames is the increase of the danger from fire starting on the surface. Also in the event of a fire in the shaft it intensifies the draft.

✤✤✤✤

REGARDING the pump having a 3-inch discharge pipe being bushed down to 2½ inches, the pressure on the valves remains the same, so long as the diameter of the valves remains unchanged.

✤✤✤✤

THE principal producer of iron pyrite in California for the manufacture of sulphuric acid is a mine on Leona Heights, near Oakland, in Alameda Co., Cal. There a large vein is stoped and timbered by square-set method.

✤✤✤✤

TRIPOLI is a slaty variety of infusorial earth. It is soft and easily pulverized and is used extensively for polishing. There are two varieties—one soft and friable, not adhering to the tongue, the other more solid (from opalizing) and adherent to the tongue.

✤✤✤✤

TO HOLD the unpatented mining claim $100 worth of work or improvements must be annually done until patent is procured; the $300 of work in 1903 has no bearing on the subject; $100 should be similarly expended before Dec. 31, 1904, to legally hold the claim.

✤✤✤✤

THERE is much difference of opinion among smelters as to the efficiency of hot blast. Some insist that a high temperature—600° and over—is desirable; others say it is unnecessary. The general belief, however, is that the air should be heated to produce the most economic results.

✤✤✤✤

A KIBBLE is a bucket used in hoisting. It is larger at the center than at either end. It is the least desirable form of bucket except for small rock, for large pieces of rock frequently jam and cause much delay in dumping the bucket. Its only recommendation is that owing to its form it seldom catches under timbers.

✤✤✤✤

THE windmill, as a dependable device for handling mine water, is limited in its usefulness to a small field. The quantity of water must be small and the workings shallow. Windmills are used to good advantage in pumping water from settling ponds below quartz mills and in pumping salt water at salt marshes.

✤✤✤✤

THE discoverer, owner or operator of a mining claim to which he has United States patent, has a right to follow the dip of the vein under agricultural or timber land if his is the senior title; that is, if his patent antedates the patent or possessory right of the adjoining agricultural or timber land; otherwise, otherwise.

✤✤✤✤

MAN ENGINES, a device by which miners can reach the surface, being a sort of movable ladder set in pairs, one of which is stationary while the other moves up and down, were invented by D'Orrell of Clausthal, and soon became popular. They were later introduced into Cornish mines by a Mr. Lorn, for which he was rewarded by the Royal Polytechnic Society.

✤✤✤✤

ONE of the most essential features of a mine pump is the easy accessibility of the valves and the ease and quickness with which it may be repaired when necessary. When the sinker, after several weeks of continuous satisfactory work suddenly fails, and cannot hold the water and no leak in the suction hose appears, it is probable that the lower valve needs replacing.

✤✤✤✤

HANGING BOLTS for shaft work may be made of ¾-inch iron rods, though ⅞-inch is better for timbers of large dimensions. The hooks must be so forged that they will not open out when the weight comes upon them. Large sized washers are more economical than small ones, which sink into the timbers. Washers 5 inches diameter and 1 inch thick are good size.

✤✤✤✤

CORUNDUM is found in veins in North Carolina, and in irregular deposits in Chaffee Co., Colo., the former averaging 15%, the latter 30% corundum. At Sapphire, N. C., the rock corundum is crushed and ground to No. 12; the sand corundum sluiced from the mines, fed to coarse punched iron screens; then reground, washed and dried. The average price at the mill is 4 cents per pound.

✤✤✤✤

THE lime may at first discolor the plates as it comes in contact with the water in the mortar boxes, and being mixed with ore precipitates certain iron salts from the water and acid ore, thus causing discoloration. Clarifying the water will neutralize such action and keep the plates clean. It is not uncommon on the first introduction of water to have the plates appear dirty and of a greenish-black color.

✤✤✤✤

A STEAM operated air drill may be used underground, but the use of the steam driven drill is mostly confined to quarry work, and is rarely seen there now. Air is superior in every way, and the loss in efficiency in driving the compressor by a steam engine is more than offset by the facility with which the drill can be handled, to say nothing of the comfort and health of the men.

✤✤✤✤

DOUBTLESS some of the paragraphs in this column do sound somewhat "abrupt," but it is to be borne in mind that they are mainly answers to questions received, the questions themselves being necessarily omitted for want of space, and the effort to equalize brevity and accuracy precludes possibility of mellifluous phrase. The main effort of "Concentrates" is to answer the questions sent in briefly and accurately.

✤✤✤✤

THE rock specimen from Tombstone, Arizona, is apparently a peculiar variety of basalt. The microscope shows it to consist of andesine and labradorite (lime-soda feldspars), olivine and augite. These are essential constituents of basalts. While the identification of these minerals indicates the character of the rock, its physical appearance does not suggest basalt, when examined with the unaided eye.

✤✤✤✤

IT were better and safer if the grantee insisted upon having Government patent for base of title. Of course many mines are securely held and satisfactorily operated under the ordinary location title, but there is a constant possibility of litigation in case of sufficient value being developed to incite such annoyance. The United States patent is the only sure guarantee against blackmail, legal or otherwise.

✤✤✤✤

"ELBOW GREASE" is the only kind of grease permissible around amalgamating plates, and the more of it the better. It is not enough merely to have the pulp flow over the quicksilver plates—the plates must be thoroughly and systematically rubbed and dressed. Hard rubbing with a rag or a small broom softens the amalgamating surface. Gold amalgam is still the best gold catcher known; hence, in the daily clean-up the plates should not be "robbed."

✤✤✤✤

IN smelting ores containing arsenic, this undesirable metal and its compounds can be largely gotten rid of by mixing the charges to produce a very siliceous slag. This results in decomposition of arseno-pyrite—the most common form in which the arsenic occurs, and the volatilization of the arsenic, thus avoiding the formation of speiss, which would otherwise occur. This was done by H. Lang near Prescott, Ariz., in treating the complex ores of the Blue Dick mine, 12 miles south of Prescott.

✤✤✤✤

POWDER should not be kept near the shaft or the buildings about it, at a mine, even in small quantities, for in the event of an explosion great damage is likely to result to the head frame, and the miners below may be imprisoned for some time, if their lives are not placed in jeopardy. In such cases as that from the Burke, Idaho, inquirer, where there are 400 or more cases to be stored, it were well to construct a magazine about 14x16 feet—10 feet in the clear; the bottom row on slats, then slats on top of the first row of cases, and so on.

✤✤✤✤

MINERAL WOOL is made by forcing a jet of steam or air against a stream of molten slag or molten rock. In nature the same thing often occurs at the time of a volcanic eruption, when a mass of plastic molten slag is sent into shreds by a violent explosion. The hair-like mass is so light as to float away on the wind for a considerable distance. It is known as Pele's hair. It is a fibrous variety of pumice. Blast furnace slag is generally used in the manufacture of mineral wool. It is used in construction for fire-proofing pipe covering, etc., and is a non-conductor of heat and sound.

✤✤✤✤

WHAT is known as the "inflaming of compressors" is caused by the ignition of the gases created by the beating of the lubricating oils used, and the burning of the carbon deposited there. This is not likely to occur if the compressor cylinder be properly water-jacketed, and where a sufficient supply of cold water is sent through the jacket, to prevent overheating. In compressing air by stages a much lower temperature results than where the operation is performed in a single cylinder. Air compressors require as great care as a steam engine, and some of them even more care.

✤✤✤✤

WHEN mining work is being done on contract it is not uncommon to have the miners furnish the powder, candles, fuse, caps, etc. The owner or company furnishes timbers, and sometimes puts them in place. These are matters of detail. It would be impossible to venture an idea of the probable cost of breaking any ground without investigation. It is not always the hardest rock that gives the most trouble and expense. Some rock which is comparatively soft is often so tough as to be more expensive than harder ground. "Big ground" is cheaper to break than that which breaks "short."

✤✤✤✤

DOLOMITE is technically unsuited for use as a flux in the smelting of ores, but dolomite was the only kind of limestone used at the D & D smelter at Deadwood for some years by F. R. Carpenter. By some they were called "Carpenter's impossible slags," but the magnesian limestone worked all right. This is only a single instance where, in the practice of smelting, time-honored theories were destroyed and a newer, broader field opened up. The history of metallurgy at Leadville, Colo., is full of radical changes in methods, in which so-called impossibilities were frequently performed to the advantage of the district and to the lasting knowledge of the business.

✤✤✤✤

IF too large an area be removed from a wide vein, both walls of which are soft and wet, the probable result will be a cave—a great mass of the overhanging ore dropping in a solid block. This danger is increased should the walls converge upward, leaving a wedge-shaped mass of ore unsupported beneath. Should the walls converge downwardly the danger is greatly lessened. The stope should be timbered as rapidly as consistent with the removal of the ore from the working faces, and filling commenced at once and kept up in such a manner as to support the greater part of the ore or wall above. In a vein of high inclination it is practically impossible to fill right up to the back of the ore, consequently the stope must be worked in sections of relatively small size.

✤✤✤✤

POSSIBLY it might prove profitable to dredge Rapid and Castle creeks in the Black Hills of South Dakota, but in many places the depth to bedrock would be 50 to 60 feet, and in many places the bedrock would be found to be hard, which is detrimental to the best dredging, much gold being lost in crevices and behind projections of rock which the buckets could not reach. Either drifting or bedrock flume methods seem better suited to the conditions. A number of attempts were made twenty-five years or more ago to work the creek bed through shafts by pumping the water from bedrock, but all of these efforts proved abortive. Notable instances were at Sitting Bull, Castleton and near Wheeler Hill. In the latter instance the shaft was put down to a depth of 30 feet and $110 were said to have been recovered from about 10 feet of drift, but the pumps were unable to handle the water.

✤✤✤✤

FOR passing ore down an incline of low angle, where the ore will not run, the shaking steel troughs hung from the roof of the raise or stope, as introduced in some of the mines of the Rand, South Africa, seems an economical means of solving the problem of cheap handling of ore in stopes under these conditions. The ore is shoveled into a steel semi-cylindrical trough, suspended by chains from the roof. A laborer shakes or jerks this trough in the direction of its length and the ore moves forward toward the lower end of the trough. The maximum length of the trough must be determined by experiment. Where more than one is required to reach the car on the level below, a second trough must be placed so that the upper one delivers the ore into the head of the next one below, which is cared for by another laborer. It is much cheaper than shoveling the ore over and over.

✤✤✤✤

A JACKHEAD pump is a type of Cornish pump having the pump rod on the outside of the pump, which works in direct line with the barrel of the pump, being connected with the valve mechanism within, the discharge being connected with the working barrel by a "goose neck." This kind of pump is suited to work in inclined as well as vertical shafts. Those Cornish pumps having the pump rod within the column pipe cannot be economically used in inclined shafts because the weight of the constantly moving rod would soon wear a hole through the casing. Jackhead pumps can only be operated entirely submerged so long as the valves remain in good condition. With the other type mentioned where the rod is placed within the column pipe, the valves may be raised to the surface through the pipe, and necessary repairs made. A plunger pump of Cornish design has only clack valves, and will work more satisfactorily in gritty water than the other types referred to.

✤✤✤✤

THE greater portion of the borax ore (calcium borate) mined in the Calico district of San Bernardino county, Cal., comes from a vein bedded in the shales and sandstones of a Tertiary formation which have been lifted on the flanks of the Calico range. This vein evidently was once a deposit on the floor of a Tertiary dry lake, and being in time covered with an accumulation of mud and sandy sediment, derived either from the erosion of neighboring hills or from volcanic vents in the region, became intercalated in the formation and with it was lifted by subsequent geologic disturbances. The mineral is crystallized, forming a translucent to transparent rock mass of the mineral known as colemanite. It is mined in the same manner as the veins of metal mines, shafts being sunk on the vein and levels run, from which stopes are carried up. At and near the surface the principal vein dips steeply to the south, but in depth it flattens out considerably and is cut off by a fault. Calcium borate also occurs in "mud" rock—an indurated lake silt or mud in the Calico district—the mineral occurring in the form of finely disseminated crystals throughout the mass, in which it acts as a cementing material. Other sources of borax in San Bernardino county are the dry lake beds in the northeast part of the county. The mineral is collected from the surface and in time it recollects as an efflorescence, coming up from below.

Concentration of Ores.

Written for the MINING AND SCIENTIFIC PRESS.

In most instances the concentration of ores is a process preliminary to some subsequent operation or treatment, as, with few exceptions, the native metal is not produced by concentration. A notable exception is the concentration of native copper from its ores at the Lake Superior copper mines. The sluicing of gold from sand and gravel is a rude concentration, effected by the use of water and the simplest mechanical devices. Diamonds are recovered from their crushed matrix by concentration, and some other gem stones are obtained, like gold, by sluicing. These, with a few others, are the most important exceptions. The metal-bearing ores are concentrated for the purpose of enriching the material to be subsequently treated, by eliminating the less valuable and generally worthless and lighter gangue.

There are two divisions in the concentration of ores—coarse concentration and fine conceutration. That system is employed which seems the best suited to the character of the ore, and with many ores both coarse and fine concentration is practiced at various stages of the process. The selectiou of the method, as above stated, depends upon the character of the ore—not altogether upon its value or the kind of mineral contained, but upon the physical condition in which the mineral sought to be concentrated exists in the ore. An ore in which the mineral it is desired to concentrate occurs in coarse crystals or masses is adapted to coarse concentration, while one in which the mineral appears in finely disseminated grains must be crushed fine in order to free the valuable mineral particles from the matrix. Generally speaking, for coarse concentration at least, rolls are superior to stamps, as the former may be adjusted to crush to any desired fineness. They are often used in series, from coarser to finer.

The process through which an ore must pass is usually about as follows: The ore is delivered to a rock breaker, either jaw crusher or one of the gyratory type. From the breaker it passes through rolls (one or more sets), being crushed either dry or wet. The rolls are of several different types: Those which are run at high speed; those which run at a moderate speed; those having fixed bearings, and those adjusted by means of springs; belt-driven rolls and geared rolls, and other differences iu construction. They all will crush ore and each type has its friends—a condition noticeable in every kind of mining and milling machinery.

From the rolls the ore passes to trommels (inclined, cylindrical or cone shaped revolving screens), which are divided into sections, each provided with a screen of differing mesh, through which both ore and gangue minerals pass, the whole being "sized." That is, the ore is mechanically and automatically divided into a series of sizes, both particles of mineral and gangue in each lot being of approximately the same diameter. The purpose of this sizing is to render the subsequent separation of mineral and gangue more complete and easy of accomplishment.

From the trommel the ore passes to jigs, each size going to a separate jig. It is with jigs as with every other class of mill machinery—there are many types, and all of them are capable of good work in competent hands. The jig is an effective concentrator, and continuously separates the heavy mineral from the gangue, in a rapid and satisfactory manner. The finest material being treated—that passing the finest jig screeus, and the overflow—are known as slimes, and this class of material is treated in the same manner as ores that are crushed fine. The tailings from jigs are usually returned by belt conveyors or elevators to rolls or stamps for finer crushing, and recoucentration, either on jigs or on other concentratiug machines.

The matrix, or gangue, must be crushed fiue enough to free the sulphide or other mineral particles or concentration cannot be effected. In the earlier stages of the process the coarser particles, constituting ofteu over 60% of the entire mineral contents of the ore, are separated, and the remainder is recovered later by recrushing and reconcentration. The degree of concentration is determined as in almost every other phase of milling operations by commercial limitations. Concentration of ores may often be successfully carried to a mechanical point beyond that justified by the economic result.

The cost of concentration per ton of ore is influenced to a great extent by the capacity of the plant, character of ore, cost of water and rate of. wages. It will usually vary between $1 and $3 per ton of ore as it is delivered at the mill. In very large plants, where there are no unusual difficulties to overcome, the cost per ton may be reduced to less than $1, as at the Lake Superior copper mills, where the ore is crushed under steam stamps—over 500 tons per stamp daily—and concentration is effected by jigs with intermediate hydraulic classifiers, to grade the ore to the various sizes, before jigging.

The ores best adapted to coarse concentration are those in which the sulphides of lead, copper, iron and zinc occur in coarse masses, like some of the copper ores of Butte, Mont., the sulphide ores of Leadville, and most of those of the Missouri lead-zinc region, and similar ores elsewhere.

Where the valuable mineral occurs in finely disseminated crystals or grains, constituting a relatively small percentage of the entire ore, coarse crushing is impracticable, as the rock must be crushed fine to free the mineral from the matrix. For fine crushing, either rolls or stamps are employed. Where the former are in use the rock passes through several sets of rolls, the last set being known as the finishing rolls.

In fine concentration, after the ore has been crushed sufficiently fine—generally not finer than through a 30-mesh screen—it is passed over one or more of the various types of belt concentrators, or tables, or buddles, or other rotary, flat, cone-shaped devices for effecting a separation of the lighter from the heavier mineral. To facilitate this, various forms of hydraulic classifiers are employed. There is usually little difficulty in saving the larger particles of this finely crushed ore, but the slimes must be handled with care. Experience has long since demonstrated that both coarse and fine sulphides cannot be satisfactorily separated from the gangue by a single concentrating operation—that is, by concentrating on a single machine, or other device, without first classifying the material to be treated. The classifiers all employ water in their operation, and all are based ou the same principle, that larger and smaller particles of mineral do not settle with equal facility in a current of water. This enables the coarser particles to be taken out or collected at the bottom of a classifier, while the finer slimes flow out at the top. These classifiers are made in great variety of form and size, but, as previously stated, all operate on the same principle. An extensive classifying plant, in successful operation, was described in the MINING AND SCIENTIFIC PRESS in the issue of March 26, 1904, by F. W. Sherman. In this plant seven separate classifications are made and this number could be increased if desirable. This process admits of sending a perfectly classified product to each machine, wheu further classification is uecessary. In considering the above mentioned processes it should be remembered that there is a material difference between sizing by means of graded screens and classifying by water currents. In the former a separation of particles of approximately like size is effected, and in the latter, the particles having been sized by screen, have a tendency to settle in water controlled to a great extent by the relative specific gravity of particles of similar size, the heavier being able to sink down through a gently rising current, while the lighter material held in suspension floats over into the next box or flows away to the waste launder.

Cyanide Poisoning.

TO THE EDITOR:—Your editorial on "Cyanide Poisoning" in your issue of April 23d was evidently based upon a recent article in a southern California paper containing many errors, and which did a great injustice to the Exposed Treasure M. Co. I will explain the situation in some detail. The Exposed Treasure mill is situated on the side of a small butte rising out of the desert. The waters for the mill are delivered through a pipe line under reduced pressure from a source 16 miles distant in the Tehachapi mountains. The water supply is abundant, so that rigid economy is not uecessary, admitting, fortunately. of the use of fresh water for hydraulic classification, and for concentration. The region is destitute of timber and clays, so that no better material than sand is available for dam building. Hence impounding of waste waters would entail an immense original outlay. Extensive settling tanks, however, are used for settling the slimes and a portion of the clarified water is pumped back for reuse, the remainder going to waste. The cyanide plant consists of leaching tanks for the sands and a decantation plant for the slimes. Twice each day about eighteen tons of slimes are discharged, this pulp containing about 60% of cyanide solution titrating from 0.005% to 0.008% KCy. This pulp flows through a ditch to extensive ponds in the desert below the butte. These pouds are securely fenced. The retaining dams for the ponds are made of sand, but no difficulty exists in retaining the small amount of cyanide solution discharged into them. Unfortunately it has been necessary to discharge the waste waters into the same ditch, thus increasing the bulk of water in the ponds. This company has for some time been endeavoring to secure permission to build a separate ditch for the waste water across lands belonging to other parties, in order to discharge it into the desert, but up to the present time permission has not been obtained. The volume of water in the ponds at times causes the breaking of the dams, when for a few days, pending repairs, the waters flow across the desert for a distance of about a half mile. By evaporation in the ponds the cyanide solution becomes slightly concentrated, so that when a break occurs the waters are dangerous for such creatures as cattle, which driuk copiously. Within the past year one cow has thus happened to meet death. The story of destruction of game is absolutely without foundation, and we have yet to learn of any investigation having ever been made by any game warden. In fact there is no such official as county game warden in Kern county. As soon as permission shall have been given to duplicate our present ditch, so as to keep our waste waters apart from the discharge of slime tailings, even the present occasional risk to stray stock will be averted.

I should add that the lands now occasionally overflowed are not owned or leased by cattle men and that there is no stream polluted; so that you will perceive how utterly absurd is this tempest over our mythical "river of death." I must also inform you that at least one of the other mines in this district has experienced a similar difficulty, occasionally causing the death of some cow which has strayed from her range.

Mojave, Cal.

Mines of the Cœur d'Alene, Idaho.

Written for the MINING AND SCIENTIFIC PRESS.

One of the most important lead-silver producing regions in the world is fouud in Shoshone county, Idaho, in what is known as the Cœur d'Alene district, in the northeru portion of that State. The country is mountainous, though the slopes are generally not abrupt. Timber is abundant and the country is well supplied with water. This section has long been noted for its mines.

Gold was first discovered at Pierce in this county in 1860, when placers were opened and worked successfully. They are still being worked in a small way.

Wallace is the most important town in the Cœur d'Alene mining district. It is situated in the canyon of the South Fork of the Cœur d'Alene river, where it is joined by Canyou creek and Nine Mile creek. The altitude is nearly 2800 feet above sea level. The rock formations of this region are principally granite and gneiss, but there also occur quartzites and slates, and it is with these latter that the ore deposits are chiefly associated. Most lead-silver ore deposits of magnitude are associated with limestone, but there is no limestone iu the Cœur d'Alene region. The ore deposits occur for most part along zones of fracture in the quartzites. The deposits are mostly large, and usually have a clearly defined foot wall, the mineralization extending out into the hanging wall country without definite limit, but the ore is followed and mined as long as it affords a profit, making the hanging wall limit a commercial consideration and not a geological or scientific one.

The rocks in which these deposits occur are strongly folded in an east-west direction, and this controls the strike of the ore bodies. The strike, however, is not absolutely straight, and this fact, together with the changing direction of outcrops on the surface, due to dip of the inclosing strata and the erosion of the canyons, have led to complicated legal contentions which have furnished some of the most interesting phases of the extralateral right litigation.

The ore bodies range and are worked from 5 feet to over 60 feet in width and from 100 to 2000 feet in length. The gangue is largely siderite (iron carbonate), which being heavier than a siliceous or calciferous gangue, makes concentration somewhat difficult. The dip of the ore bodies is variable, though seldom less than 45° as near Wardner, up to nearly vertical at Mullan and on Cauyon creek.

The greater number of the large producing mines are operated through tunnels, which renders mining much cheaper than where all the ore and water must be hoisted. The tunnel through which the Bunker Hill and Sullivan mines are operated, known as the Kellog tunnel, is 12,000 feet in length, and the Reed tunnel of the same company is 5500 feet long. The Mullan tunnel will be nearly 2 miles long when completed. There are several other tunnels nearly a mile in length, developing various mines.

The only mines in the district operated through shafts sunk from the surface are the Hecla and Tiger, near Burke.

The method of mining is by overhand stopiug, machine drills being extensively used. The stopes are timbered according to their dimensions, and filliug is commonly practiced.

The vertical extent of developed ore bodies is about 4000 feet. That is, the bottom of the Tiger shaft at Burke is 4000 feet below the Hercules outcrop, which is only a few thousand feet distant.

The ore occurs as solid galena in vein-like or irregular masses, and as disseminated crystals through the matrix. In the zone of oxidation are found the usual secondary products of oxidation—lead carbonate and lead sulphate. Zinc and iron sulphides also occur with these ores.

In the several mines are found some interesting geological conditions. The Hercules vein, where cut by its drain tunnel, 1390 feet from the surface, is solid galena 5 or 6 feet thick with a wide zone of low-grade concentrating ore. The croppings of this ore body are described by Robt. Bell, inspector of mines for Idaho, as "an insignificant streak of quartz 6 inches wide, with some spots of iron oxide and lead carbonate, very low grade in lead and silver." The mass of galena above referred to runs 60% lead and

eighty ounces silver per ton, as determined by 10,000 tons shipped in 1903.

Referring to the alteration of the galena in the Hercules mine, Mr. Bell says: "The ore body above No. 2 level exhibits interesting examples of secondary enrichment. Great 'kidneys' of steel galena occur with thick crusts of hard gray carbonate (of lead) and an outer crust of snow-white crystallized lead (cerrusite), often matted with native wire silver."

The greater part of the ores mined in the district are low grade. They are crushed and concentrated and the concentrates shipped. The coucentrating plants handle from 50 to over 1000 tons each per day. The mills are mostly run by water power. The concentratiug equipment consists of rock breakers, rolls, trommels, jigs, conveyiug belts, tables, buddles, vanners and, until recently, canvas tables. There is quite a diversity in the arrangements and operatiou of the several mills, no one mill being supplied with all the devices above mentioned.

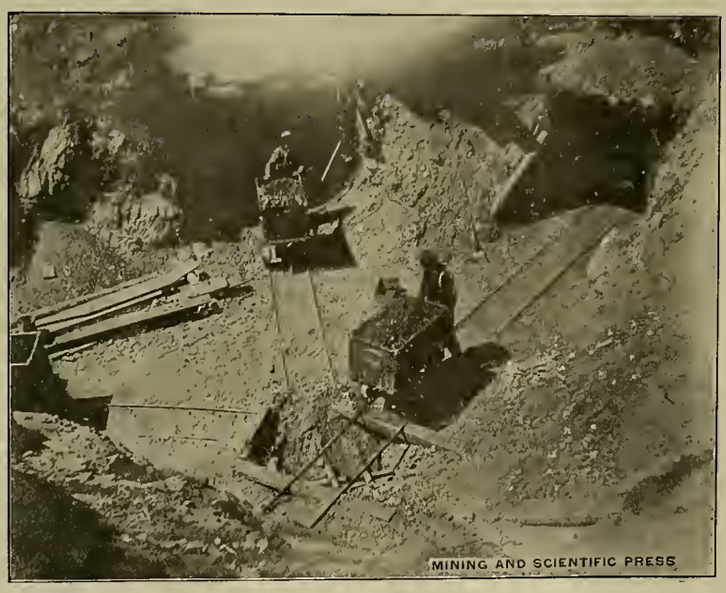
The Cheapest Mining.

Written for the MINING AND SCIENTIFIC PRESS.

In these days when large, but low grade, ore bodies have become popular with investors, it is found necessary to mine these ore bodies at the lowest possible cost, in order that as great a profit as possible may be made from the property. The greatest portion of ore mined is by underground operations, and the science of deep miuing has been so carefully studied and the several methods of mining adapted to suit the various eonditions, that even underground mining is now carried on under experienced management at a cost far below what it was a few years ago; but, undoubtedly, the cheapest mining is that done in open euts, where the ore broken runs by gravity to mill holes. Where the rock is broken in benches and the ore is shoveled into cars and trammed to mill holes, the cost is increased by the expense of shoveling and tramming. If the ore can be broken to run by gravity to chutes, from which it can be delivered to cars, this decreases the expense to the extent of 10 to 18 cents per tòn, according to the wages paid for that class of labor (mucking). Where ore is delivered to a mill hole, as in the accompanying illustration, it is very necessary that large rocks be prevented from going down the ore pass, as they may clog the chute at the bottom, being unable to pass the door. To obviate this, a grizzly should be placed near the top of the mill hole under the tracks, as shown in the engraving. In this instance four old stamp stems were so placed as to form nine rectangular openings, and any rock which would pass the grizzly would also pass the chute door. When the ore is not wet, it is advisable, if the mill hole be vertical or steeply inclined, to allow the ore to accumulate to an extent, at least, which will cover and protect the chute door and timbers at the bottom, and, if the shaft be lined, it is a good idea to allow it to fill to the top, as the ore falling through an empty shaft will quickly cut out the lining and timbers.

In the case of a vertical shaft, it is advisable to have the chute door offset at least 18 inches. It is sometimes desirable to have a quantity of broken ore on hand, that the mill may not be obliged to hang up if there is any cessation in stoping operations from any cause. At such a time a mill hole filled with broken ore is found a convenient thing to have on hand. Such a shaft, 4x5 feet, 100 feet high, will hold 100 tons of broken quartz ore. This amount could be increased largely by first blasting down the upper rim of the mill hole into a hopper-shaped opening. If this "hopper" be made 60 feet square at the top, with a slope angle at the sides of 45°, it will be about 25 feet deep to the rectaugular portion of the shaft. This will reduce the capacity above calculated (100 tons) to 75 tons; but in the hopper-shaped opening at the top will be storage room for nearly 600 tons of ore, if the cars dump at the edge of the pit; but this amount can be largely increased if provision be made to carry the tracks over the pit, so that cars may be dumped at or near the middle of the excavation. If the hopper were level full it would hold about 1500 tons of ore; but this is impossible without, as suggested, bridging over the hopper of the mill hole. Rock running from a car finds a state of rest when the slope angle reaches about 35°. It is evident that unless some provisiou be made for the track to project over the rim of the hole, or extend across it, its capacity will be greatly diminished. In the case here illustrated, the ore is obtained from other cuts situated at a higher level, where the ore runs to chutes, is delivered to cars, trammed to the shaft shown in the cut (an incline), which is temporarily used as a mill hole. From the bottom of this shaft the ore is drawn into cars, again trammed 600 feet to a second (vertical) shaft, down which it falls, to be drawn a third time into 3-tou cars, aud is then hauled by electric motor to the crushers.

Everywhere that it is possible ore should be handled by gravity and as few times then as possible. The writer knew of an instance where ore hoisted from a shaft was trammed 300 feet on the surface, dumped into an inclined wooden chute; loaded into 1800-pound cars, trammed 400 feet, dumped into a vertical shaft 60 feet deep, drawn into 2200-pound cars and trammed 700 feet to the mill. This required on each shift three trammers at $2.25 per day, and often an extra man at the inclined chute to keep the chute clear, as the rock would clog up the chute and refuse to run if the chute became full. The ore contained a large amount of fines, and, being damp, packed hard in the chute. The upper track was extended by a new superintendent around the hillside to a point near the vertical chute, so that ore could be delivered to that chute by one trammer from the shaft. This arrangement dispensed with a trammer and part of the time of a helper on the middle section on each shift, and also the expense of maintaining the inclined chute. The total cost of making the change was $600, the rails on the middle section being used on the new extension of the upper track. The saving effected was for the trammer on the two shifts and the time of a helper part of the time, costing about $6 per day. In less than four months the cost of the change had been saved in wages, beside the annoyance of clogged chutes and consequent delay all along the line. These are small economies, but of a practical kind which a little thought can remedy.



Open Cut, Melones Mine, Showing Mill Hole.

Radium-Bearing Mineral in Quebec.

A radium-bearing mineral has been discovered in an abandoned white mica mine back of Murray bay, Quebec, by J. Obalski, inspector of mines, says the Electrical Review. At the recent meeting of the Canadian Mining Institute Mr. Obalski exhibited specimens of the mineral and gave an account of its discovery. Uranium ores are the only ones in which radium has been found. In the Canadian Laurentian formation uranite composed of oxide of uranium and other rare metals has been met with in the pegmatite dikes, which have been operated as producers of white mica. In certain of the mines monazite, uranite and samarskite have been noticed. About ten years ago Mr. Obalski discovered a remarkable specimen of clovite in a white mica mine. This specimen, which weighs about seven ounces, has been found to contain about 70.71% of uranium. It is well crystallized and has been found strongly active upon photographic plates. It also has a marked action on the electroscope. This specimen was submitted to Prof. E. Rutherford of McGill University, who found that it contained one-tenth of a milligram of radium, making it comparable with the best grade of pitchblende so far operated for radium. Mr. Obalski also found a carbonaceous material, buruing quite easily and leaving a large proportion of ash, which contained 2½% of uranium, based on the original weight of the coal. The color of the ash was an olive green, due to the presence of uranium oxide.

The Use of Cyanide of Sodium.*

Written by ROBERT B. LAWRIE.

Until recently the cyanide generally employed for gold extraction was the standard 98% cyanide of potassium. The cyanide, although sold as "cyanide of potassium," was in reality a double salt, consistiug of a mixture of the cyanides of potassium and sodium, as it was found to be impossible (without an impracticable amount of chemical refining) to obtain commercially even 98% with the use of potassium alone. It is, of eourse, well known that it is the cyanogen contained in the cyanide which is the active gold extracting constituent, and that with a given cyanogen strength it is immaterial whether this cyanogen is in combination with potassium or sodium, so long as the product does not contain any impurities which will act detrimentally on the extraction of the gold. As the chemists at the mines had become accustomed to the use of this double salt, and in some cases objected to any alteration from what they had been in the habit of using, most of the manufacturers were content to continue supplying the usual strength, although they were aware that it contaiued from 15% to 30% of useless though innocuous foreign matter.

The recent development of the electrical industry, especially in its application to chemical manufactures, has, however, almost entirely revolutionized the cyanide trade. The sodium cyanide made at Leven, England, is produced in the form of snow-white flakes which are subjected to a pressure of about three tons per square inch, and are thus compressed into hard bricks of equal weight and reudered free from any objectionable dust. The advantages may be summed up as follows: Higher cyanogen strength, greater extractive power, decreased freight charges, greater solubility, freedom from alkaline sulphides, and saving of labor at the mines.

It is still customary to state the strengths of all cyanides in terms of potassium cyanide, and the sodium cyanide now in use is therefore sold as equal to a given strength of cyanide of potassium, say, 120% or 125% cyanide of potassium, as against the old standard 98%. One hundred pounds pure potassium cyanide (KCN) contain 60.0 pounds potassium and 40.0 pounds cyauogen, while 100 pounds pure sodium cyanide (NaCN) contain 46.9 pounds sodium and 53.1 pounds cyanogen. The sodium cyanide is thus relatively richer in cyanogen than the potassium cyanide, since 100 pounds of it contain 53.1 pounds of cyanogen, as against 40 pounds cyanogen in an equal weight of potassium cyanide. In other words, 100 pounds of pure sodium cyanide will dissolve as much gold as $\frac{53.1 \times 100}{40} = 132.7$ pounds of pure potassium cyanide. Or for trade purposes, where, as already stated, it has always been customary to refer the strength of cyanide to potassium cyanide, the above pure sodium cyanide would contaiu cyanogen equivalent to 132.7% KCN, and therefore 100 pounds weight of pure sodium cyanide would dissolve as much gold as 132.7 pounds of pure potassium cyanide. But, in addition to carrying this greatly increased proportion of cyanogen in a giveu weight, it is also claimed for the new cyanide that, strength for strength, it has a higher extractive power, no doubt owing to its freedom from objectionable impurities.

J. Matthey & Co., of London, recently made some comparative tests between cyanide of potassium (double salt) and the cyanide of sodium. The results showed that, "with solutions of exactly similar strengths, the gold extraction with the sodium cyanide was 5.93% to 7.99% better than with the double salt potassium cyanide." Consequently 100 pounds of cyanide of sodium testing equal to 125% KCN would extract as much gold as 132 to 135 pounds of the usual 98% double salt.

It is evident from the above that purchasers of the ordinary 98% double salt are paying extra freight and inland carriage on impurities instead of obtaining a comparatively pure article of at least 20% or 25% higher strength. Metallurgical chemists report that the average strength of cyanide of sodium is 20% greater than that of cyanide of potassium, so that, even allowing for a difference in price, there is considerable saving of freight on the decreased bulk

* Abstract from London Mining Journal.

of material carried. The first cost, however, strength for strength, is usually in favor of the sodium cyanide, and it will be seen that, with sodium cyanide equal to 125%, the total costs for freight and handling are reduced by one-fifth. This reduction on the heavy freights and inland carriage, along with its slightly lesser initial price, considerably reduces the cost of the cyanide delivered at the mines.

Owing to the double salt being in every case supplied in a fused state, mechanical means must be used for mixing the cyanide in the dissolving tanks at the mines. The cyanide of sodium, being in the form of firmly compressed flakes, dissolves almost immediately upon being brought into contact with the water in the tank. Experiments showed that the time required for dissolving the fused double salt was (1) with agitation 40%, and (2) without agitation 80% greater than the time required for dissolving a similar weight of compressed cyanide of sodium.

It has been found that it is almost impossible to obtain the fused double salt absolutely free from alkaline sulphides. J. Grossmann, in a paper read before the Society of Chemical Industry, in London, on December 7, 1903, stated: "I have never come across cyanide produced in that way which does not contain at least traces of sulphide, whereas cyanide made by the wet process is absolutely free from it." Although it has long been recognized that the presence of even a small quantity of alkaline sulphides has a most prejudicial effect in retarding the action of the cyanide on the gold in the ore under treatment, it is strange that sufficient importance has not hitherto been attached to the selection of a cyanide free from sulphur in this objectionable form. This was no doubt due to the belief that absolute purity in that respect could not be attained. W. Skey, analyst to the New Zealand Government, said: "Experiments showed that while pure 1% cyanide solution dissolved a given weight of gold in ten minutes, a solution of the salt of the same strength, but containing 1-100,000th part of sulphur as a sulphide, required two hours to dissolve the same weight of gold. The speeds were as 12 to 1 in favor of the pure cyauide." As a result it has usually been found necessary to add a certain amount of acetate of lead to the ore in the cyanide vats to counteract the effects of the sulphides in the cyauide used. By the use of the wet process a cyanide is produced which is said to be free from any trace of alkaline sulphides, and the treatment with lead acetate, which is a costly chemical at the mines, can, therefore, be dispensed with, unless such treatment is required for the purpose of neutralizing sulphides in the ore itself. It is, of course, clear that anything that will hasten the action of the cyanide on the gold must tend not only to increase the capacity of the plant by enabling a greater number of charges to be put through in a given time, but also to lessen very materially the loss of cyanide in the course of treatment of the ore.

From the foregoing it will be seen that with high-strength cyanide of sodium the labor at the mines is considerably reduced: 1. The bulk of cyanide to be handled is reduced by at least one-fifth. 2. The cyanide being compressed into bricks of equal weight, any required quantity can be added to the dissolving vats without the trouble of weighing. 3. Owing to greater solubility of the cyanide, the solution can be prepared in a much shorter time and without agitation. 4. Owing to its freedom from alkaline sulphides, the time during which the cyanide solution must remain in contact with the ore is reduced. 5. The time required for washing the gold-bearing cyanide solutions from the residual sands or slimes is also greatly reduced. On this point Johnson, Matthey & Co., referring to their tests, state: "The resultant tailings after treatment with sodium cyanide were much more readily washed than those from the potassium cyanide."

Uranium in Germany.

The Neue Weiner Tageblatt of Vienna reports that at a meeting of the Mineralogical Society F. J. Becke, professor of mineralogy, spoke of uranium pitchblende. Prof Becke, jointly with Prof. Suess, has made investigations at Joachimsthal, the place where uranium is mined. The places where it is found are the deep workings of the silver mines of Joachimsthal. He mentioned the experiments which were made with uranium pitchblende ores at the Imperial Museum of Natural History. The ores have been in possession of the museum since 1806. The experiments demonstrated that, in spite of their age, they have lost absolutely nothing of their intensity of radio-activity and the energy of their electric properties. They do not differ in any way from the ores now taken at Joachimsthal.

THE cost of freighting should not average more than 25 cents per ton per mile, yet owing to badly constructed roads it is often double this figure. This in time represents a very large amount of money if a great deal of freighting is done over the road.

Genesis of Ore Deposits at the Royal Mine, Hodson, Cal.

Written for the MINING AND SCIENTIFIC PRESS by WM. FORSTNER, E. M.

The Royal mine, Calaveras county, Cal., is about 2 miles west of the large diabase extrusion of the Bear mountains, and several miles west of the mother lode or auriferous slate belt of California. As it lies within rocks of the Calaveras formation, its history is more or less related to that of the latter belt, and the following description by Ross E. Browne can be applied to the vicinity of the Royal mine:

"The belt is composed of more or less conformable series of highly tilted slates and metamorphic schists, with intervening layers and occasional intrusions of igneous rocks. The general strike of the strata is northwest, and the dip to the northeast. The cleavage of the slates corresponds partially with the tilted bedding planes."

The Royal mine (see Fig. 1) lies in an intervening layer of diorite, altered into chlorite schist. Owing to the extremely complicated structural geology of the region, positive assertions as to the relative age of the eruptive rocks are unsafe. There is, however, a great probability that the Bear mountain diabase, which has a general northwest strike, is related to the metamorphism and the resulting fissility of the formations west of it, and is, hence, of a later date than the diorite, which was probably, at the time of this diabase extrusion, altered into the schist wherein the Royal mine deposits were later formed.

This diorite was probably intruded during the first recorded period of dynamic activity on the west flank of the Sierra Nevadas, which occurred at the close of the Paleozoic period, and which caused the schistosity of the older rocks. (See also H. W. Turner, Journal of Geology, volume 3.)

Between the Royal mine and Bear mountain there is a belt of Mariposa slates, unconformable with the enclosing Calaveras. These have probably been folded at the time of the post-Mariposa upheaval, which was

accompanied by the outburst of an enormous quantity of igneous material, and to which belong the diabases and porphyrites of the region, as also, probably, the Bear mountains, which are formed by an intruded diabase dike. (See also H. W. Turner, 14th Annual Report, United States Geological Survey, Part II, p. p. 457 and 471, and 17th ibid., Part I, p. 671, and W. Lindgren, 17th ibid., Part II, p. 31.)

The Calaveras slates on both walls of this belt of altered diorite are similar in texture. They have been explored to a great extent in the underground workings of the Wilbur Wamble mine, a southeastern extension of the Royal mine, but only slightly at a few places in the Royal mine, and their course and extension in the northwestern part of this mine is as yet undetermined. There the slates on the hanging wall form only a narrow belt, to the northeast of which lies another body of schistose rocks intersected by numerous quartz veins. The slates are traversed by quartz seams, sometimes so minute as to be hardly discernible with a strong glass, and always impregnated with sulphides, generally very minute.

The diorite has been thoroughly altered into chlorite schist. Several samples of this material were submitted to the California State Mining Bureau, which gave the following determination: "Chlorite schist altered from diorite, schistose, badly altered, contains abundance of chlorite, altered from hornblende, the feldspar partly changed to calcite and kaolin; belongs to the older (Calaveras) formation."

This belt of chlorite schist is from 400 to 1000 feet wide. The foot wall is much more clearly defined than the hanging wall.

Throughout the belt several quartz veins can be traced at the surface, having varying strikes and dips. The principal strike is, however, to the northwest, with a subordinate north and south system.

The Royal vein proper (see Fig. 2) has a much flatter dip than the other veins, and, being the youngest, it cuts through the others at all intersections. This vein is formed by a band of coarse, white quartz, which has all the characteristics of being the result of the replacement of the schistose country rock by quartz, the texture of the former being often clearly discernible in the latter. There is practically no gouge on either wall.

As a general rule, this coarse, white quartz is only slightly impregnated with sulphides. In many places a ribbon structure can be observed, over a width seldom exceeding a few inches, either on the hanging or foot wall (see Fig. 3). This ribbon structure is due to alternating narrow bands of quartz and country rock, the latter always very highly impregnated with sulphides, which in places nearly entirely replace the rock. These bands of ribbon ore are much richer in gold values than the adjoining quartz layer, but are generally only found near the intersection of the Royal with the older veins. The direction of the bands is generally parallel to that of the Royal vein. Only in one place was this structure observed making an angle with that direction (see Fig. 4).

In the ground at present developed above the 400 level, east, the relation between the Royal and veins 3 and 4 can be pretty well traced (see Fig. 2). On the 200 level, east, veins underlying the Royal have been worked to a small extent. From the 400 to the 600 level, east, the main excavation follows the line of intersection of the Royal with vein 4, and also, probably, partly with vein 3, which, as might be expected, formed a wide zone of strong mineralization. This excavation is so extensive that the relation between the cross veins found above the Royal at the 400 level, east, and below the Royal at the 600 level, east, cannot be fully determined, but the two veins found between the 600 and 700 levels, east, just under the Royal, agree in strike and dip with 3 and 4, and are probably identical with the latter. The line of intersection crosses the main shaft near the 800 level, where a very wide body of ore was found. In the 900 and 1000 levels, west, the Royal vein is narrow until a distance of a couple of hundred feet west of the shaft is reached. The same intersection probably causes this enrichment.

Underground the contact of the Royal vein with the Calaveras slates of the hanging wall is found at three different places, in the 300 level, east, 400 level, east, and 600 level, east, the strike of both making a pronounced angle. The little work done at those points indicates that the Royal vein does not persist past the belt of chlorite schist, but bends along the contact underground, as it does in its southeastern extension at the surface (see Fig. 1). We may, then, assume that the Royal vein fissure is due to earth movements posterior to those which formed the Calaveras slates, and that the latter acted as an impervious stratum.

The system of cross veins to which 3 and 4 belong make a sharp angle with the strike of the Royal vein, and their dip is much steeper. The character of their structure is different from that of the latter. They consist of narrow seams of the same coarse, white quartz as that forming the main body of the Royal vein, having still the texture of the schistose country rock, and occasionally forming bunches of quartz, with intervening bands of country rock, generally wider than the quartz seams. The latter are nearly barren, while the intervening bands of country rock always carry some sulphides, and are very often heavily impregnated with sulphides. The latter, however, are rarely found in bands nearly entirely composed of sulphides, as in the Royal vein.

The sulphides are generally rather fine, and experience teaches that the finer the sulphides the better the values they carry in this mine.

All the rock in this belt of chlorite schist is to some extent impregnated with sulphides and carries some slight values in gold. The zones of higher mineralization are allied, as above described, to quartz bands, and the question naturally arises, What is the genetic relation of the two phenomena?

The sulphides in the schistose rock are independent of the quartz seams, nor are they coated or surrounded by quartz films. Often pieces of rock can be found, apparently barren, which when broken show considerable sulphides without any surrounding quartz.

The above described rich bands of ribbon ore sometimes found in the Royal mine lay in the orientation of this vein, and hence are not the result of the fracturing which caused the cross veins, notwithstanding they occur at or near the intersection of the Royal with those cross veins.

The entire mineralization of the belt must be related to its metamorphism, and probably the iron contained as an oxide in the diorite was changed during the process of metamorphism partly into chlorite, partly combined with sulphur into sulphides. The formation of these iron sulphides may be analogous to the metasomatic alteration classified as propylitization (see Prof. Vogt and W. Lindgren, "Genesis of Ore Deposits," Am. Inst. Min. Engs., p.p. 660 and 565), a solfataric and thermal alteration of metasomatic action, affected by attacks of hydrogen sulphide, or alkaline sulphides, and often also of carbonic acid. The pyrite is derived from the iron-magnesian silicates and the iron oxides of the original rocks.

As to the relation of this alteration with the formation of the quartz veins, the genesis of these sulphides may be related to that of the older type of impregnations in the mother lode, described by W. Lindgren (Bulletin Geological Society of America, volume 6, p. 226) as a zone of iron pyrites disseminated in dynamo-metamorphic schists; older than the principal quartz veins and contemporaneous with the dynamo-metamorphism which produced the schists.

The concentration of these sulphides in certain zones, which clearly are also zones of more intense shearing, may be due either to secondary concentration or to the fact that the hydrogen sulphide, which caused the transformation of the iron from an oxide into a sulphide found easier circulation through the rock mass at those points.

While propylitization takes place at relatively small depths, the transformation of iron oxide into sulphide, being an endothermic reaction, must take place under the influence of great heat, due to the mass-dynamical action which was the cause of the metamorphism. Hence this sulphurization took place under conditions wherein silicic acid is, at least partly, ionized, and less subject to deposition. At a later period, under conditions of less pressure and temperature, silicic acid entering into the colloidal state would be more readily deposited. (See C. R. van Hise, Bulletin Geological Society of America, volume IX, p. 273 and following.) The great uniformity of the chlorite schist would tend to suggest that its deformation took place under great pressure.

In the zone of cementation quartz is the prominent substance of deposition, here carried on by replacement. That the quartz carries so little sulphides may be due to the fact that those parts of the rock mass heavily impregnated with sulphides resisted the metasomatic action of the solutions during the deposition of the silicic acid much more than those less impregnated.

The fact that the habitat of the sulphides is largely restricted to the country rock, and that the quartz is relatively barren of sulphides, precludes the hypothesis that the sulphides have been formed by the ascending solutions which formed the quartz veins. Neither does it seem probable that the quartz veins were formed prior to the sulphides, as the latter demand for their birth greater pressure and temperature than the quartz.

Pyrite is soluble in cold solutions of alkaline sulphide and in hot and cold solutions of alkaline carbonates, partially saturated with hydrogen sulphide, and is deposited from such solutions. At Sulphur Bank, California, this process has been observed (see Prof. J. Le Conte, American Journal of Science, third series, volume 24), but there this deposition is accompanied by that of gelatinous silica.

The nature of the deposits, especially whether they be metalliferous or not, will depend upon the relative proportion of the alkaline carbonates and sulphides in the solutions, the former being the main solvents of gangue minerals, the latter of metallic sulphides. As the maximum capacity of solution for various substances have different temperatures, selective solution and precipitation will very often take place C. R. van Hise, "Genesis of Ore Deposits," Am. Inst. Min. Engs., p. 317 and following), and while admittedly the hot ascending waters will (due to loss of heat and pressure and because of chemical changes) deposit in their course quartz, earthy carbonates, metallic sulphates and sulphides, the character of the ore deposits in the Royal mine, with marked preponderant habitat of the sulphides in the country rock, must lead to the hypothesis that the fissure filling which formed the quartz veins was caused by solutions principally charged with alkaline carbonates, not having the composition required for dissolving the already formed sulphides. The relative absence of alkaline sulphides and hydrogen sulphide, and the preponderance of carbon dioxide in these later solutions, is in accord with the admitted fact that in the upper zone of the underground water circulation carbon dioxide forms an important element, but does not explain why, especially in the cross veins, so very few inclusions of sulphides are found in the quartz seams. The hypothesis that the latter were formed prior to the concentration of the sulphides can hardly be accepted, as the latter would demand a greater heat than required for the formation of quartz deposition, and as this heat could not have been caused by static pressure, there being no evidence of considerable denudation, its presence would demand great dynamic pressure. The continuity and regularity of the veins tend, however, to disprove the occurrence of any important earth movement posterior to their formation.

Concentration of Low-Grade Copper Ores.

Written for the MINING AND SCIENTIFIC PRESS by W. J. ADAMS, E. M.

The writer was selected to make a series of exhaustive tests on the concentration of copper ores from the typical varieties existing in a mine in California by the Elmore oil process, and the following embody the results which were obtained:

Copper mines show clearer characteristics of secondary enrichment than those of other metals, and after the richer surface ores are bottomed the unaltered ores are generally found not only very much poorer in metal, but this metal is combined with iron and sulphur to form a compound much more refractory and expensive to treat. The surface ores are generally oxides and carbonates, which are never susceptible to any form of mechanical concentration, but where they consist of chalcopyrite, bornite and chalcocite can be profitably reduced in weight and enriched in value by several methods, dependent on the distribution of the mineral in the matrix and the character of the gangue, as well as that of any associated minerals. The mineral itself also has an important bearing on the adaptability of any particular process.

Among the very brittle minerals chalcopyrite stands as one of the most brittle and easily slimed of all, equal to the comminution and sliming of the tellurides and molybdenite, and its concentration to a high efficiency has always been a very difficult problem.

The character of this particular ore presented exceptional difficulties to any of the well-known methods of water concentration, and it was so refractory to direct smelting that only the higher grades were capable of standing the high reduction charges incurred. The matrix was slate and amphibole schist, which, though soft, is very tough, and in crushing resists grinding and the enclosed mineral gave a very large quantity of slimes, mainly of the chalcopyrite. The associated mineral is iron pyrites, and though containing very little copper is generally present in great abundance. These minerals occur disseminated through the gangue in specks, seams and bunches of greater and smaller width and size.

In order to acquire a thorough knowledge of the ore, the first step taken was that of concentration by gravity alone, such as is employed to demonstrate very closely the actual results that have been obtained on vanners, tables, etc., namely, hand panning of a weighed quantity, and repanning the tailings till no more concentrates are obtained. Knowing that the concentrates were clean mineral the only assays made were of the ore and tailings, to determine the percentage that could be saved. Many and varied samples from all parts of the mine assaying from a trace to 7½% copper were tested. Over thirty experiments were made; the ore being first crushed to pass a screen of twenty meshes to the linear inch (which was determined to be too coarse). All the concentrates were weighed and the percentage of bulk saved was calculated, but the tailings of only ten typical samples were assayed. These tailings were divided by water separation into slimes and sands and separately assayed so as to determine the proportionate loss in each. The following table gives the results:

No.	Assay Copper in Ore.	Per Cent Weight, Concentrates Sand.	Assay Copper in Slimes.	Assay Copper in Sand.
1	0.10%	12%	0.10%	Trace
2	2.62	49.6	3.55	0.50%
3	7.65	33 1	....	1.90
4	5.04	32.8	5.75	2.65
5	0.90	22 9	2.70	0.65
6	0.60	35.6	2.60	Traces
7	4.10	38.5	5.65	2.05
8	Trace	4.2	0.65	0.55
9	2.70	29.3	4.75	0.95
10	5.90	42.4	6.25	Traces
11	0.65	23.7	0.80	Traces

In the operation of panning it was noticed that there was not only an excessive quantity of slimes, but that these slimes carried the majority of the chalcopyrite, only the coarse particles being saved

with the concentrates and a very small proportion of the slimed mineral. In fact, though only passed through a screen of twenty mesh, nearly every particle of chalcopyrite was slimed.

Judged hy their appearance as well as tabulated results the concentrates are only the iron pyrites carrying a trace of copper, some coarse chalcopyrite and a little slimed chalco. The result of these tests showed that gravity concentration only eliminated the harren minerals and left the copper in the tailings.

The last sample tried showed a content of .65% copper, was screened through a screen of thirty meshes to the linear inch, and though the panning showed a cleaner separation from the coarse hornhlende in the concentrates the results were practically the same. To determine the proportions in the sizing of this material, a screening test of this sample was made and the result added another link in the chain of investigation.

Residue Left on		
40 mesh	26½%	
50 "	15	
60 "	7	
70 "	10	Minerals show it to be all iron pyrites.
80 "	5	
90 "	5	
100 "	2½	
Slimes	32½	Minerals are chalcopyrite and pyrites.

This showed that hy dry screening alone, after crushing to thirty mesh, the copper contents passed off with the slimes; and to definitely determine this another experiment was tried on a number of samples typical of different classes of ore in the mine.

In these tests the ores were crushed to pass a screen of thirty meshes to the linear inch and then were directly sifted through a screen of 100 meshes and the resultant products of sands and slimes weighed and assayed for copper.

It should he explained that the several samples were divided, and the column of original assays of ore represents one portion and the columus of assays of slimes and sands represent those of that half of the sample taken for experimental purposes, and this fact prohahly accounts for the small apparent discrepancy of original assays and those of the treated sands and slimes.

No.	Assay Copper in Ore.	Per Cent of Slimes.	Per Cent of Sands.	Assay Copper in Slimes.	Assay Copper in Sands.
1	3.85%	42.9%	57.1%	5.00%	4.00%
2	10.70	40	60	12.50	10.50
3	1.80	40	60	5.70	4.90
4	6.10	40	60	7.00	5.85
5	2.00	40	60	2.80	2.00
6	1.30	40	60	2.00	1.40
7	7.10	40	60	8.80	8.20
8	3.40	40	60	5.00	4.40
9	3.15	40	60	4.15	3.00
10	2.65	40	60	5.10	3.40
11	4.10	40	60	6.25	4.20
12	6.50	35	65	3.00	1.90
13	1.35	35	65	2.90	1.55

We see here that the slimes constitute 40% of the total, and the sands 60%; hut the former carry an average valuation of 5.40% copper and the latter only that of 4.25%, or the slimes, where the losses occur are over 29% richer, hulk for hulk, over the sands. Had these samples heen screened under water the proportion of chalcopyrite in the slimes would have been more than douhled.

A curious test was made which clearly showed the buoyancy of dry chalcopyrite and the mutual attraction between it and iron pyrites. Ahout a pound of crushed ore carrying 20% to 30% of mineral was steadily, hut rapidly, poured into a tank of water, which was filled 2 feet deep. Innumerahle glohules of dry iron pyrites, coarse and fine, rose to the surface, in size from a pinhead to ⅜-inch diameter. In touching these with the point of a pen knife the iron pyrites dropped off and at once sank in the water, hut the inside lining of the air buhhle was ahsolutely pure-slimed chalcopyrite which entirely floated, spreading out like a patch of gold leaf. Here the chalcopyrite, in falling through the water, enclosed the air mechanically carried down hy the flow of the ore, attracted even moderately coarse iron pyrites and rose to the surface like a halloon, hut even ou reaching the top of the water the air was contained through the adhesiveness of dry-slimed chalcopyrite, and itself would not sink even after the air buhhle was hurst and the slimed mineral wetted.

Following out these investigations that proved the high percentage of copper values held in the slimes it became a matter of economic interest to save the values in these iudependent of the sands, but while still combined in the total pulp the process of segregation by oil, and known as the Elmore oil process, had already heen proved a practical success in Wales.

The Mining Department of the State University of California had already acquired a complete set of the Elmore apparatus, the mixing cylinder, full sized in diameter, but reduced in length for hand power, as well as a full-sized centrifugal separator.

Through the courtesy of President Wheeler and Professor Christy, the writer enrolled as a graduate student and was given every facility possible to carry on the investigations, as it was seen to he of great value to the general copper industry of the entire State.

As the oil concentration is essentially a process ou slimed mineral (though it takes up coarse mineral), it was advisahle to eliminate as much of the coarser sulphurets as possihle. and particularly as these consisted principally of iron pyrites, and in this way reduce the burden on the oil as well as the quantity of pulp to he treated hy it.

The closest-saving mechanical device ohtainahle, which is far inferior to the work of vanners or tahles, was a small model power jig with a hed 2½x4 inches long on a hed screen of forty mesh. With its employment, however, a clean concentrate was obtained in hoth the hutch and the bed and definite facts were estahlished.

Before going into details, an explanation is due in regard to the discrepancy in the assays of these results. The ore was very irregular in its distrihution of the copper minerals and yet could not be crushed fine enough to allow of an intimate mixture and carry on the various steps, so that all the calculations were based on the assays of the final products where accurate sampling could be obtained. Also, the small percentage of copper contained in the sample makes ahsolutely accurate determinations very uncertain, unless several days are employed in the analysis of each sample.

In the same manner as in the previous tests a very large number of samples were taken directly from the mine and dumps, typical of its different characteristic ores, of surface, different depths, and from the dumps as exposed to oxidations and chemical changes from weathering. These were separately assayed and then divided into lots of different grades according to the results obtained. Each grade was carefully mixed together, hut without grinding to a finer state than the two and a half meshes to the linear inch originally employed, was resampled and assayed.

Several experiments were made with the ores of lowest grade before the regular tests were entered on, and the most feasihle size of screen and the general method determined that would he advisahle to employ in actual practice. Ore crushed to pass a No. 8 screen was shown to be the coarsest size possihle to use in jig work, and was adopted in all the tests, except the final one, in which the different products were not dried and reground. In order to determine the quantitative results in each stage of the process, all the products had to he dried aud weighed and then ground and sampled, and this drying oxidized materially hoth the fine and coarse sulphurets, and to such an extent as to reduce the efficiency to a large degree of the subsequent oil treatment.

(TO BE CONTINUED.)

Obtaining Mean Velocity of a Cross-Section in Gaging Streams.

In measuring the discharge of streams of any character, whether rivers, canals or flumes, when using a current meter, I helieve it is the common practice to first make the measurements of depth at regular intervals across the stream, then dividing the width of the stream into sections of greater or less width, according to its size and character, taking the velocity, hy means of one of the recognized methods, either the point, the six-tenths or the integrating method, and taking the velocity for each section as heing the mean of the velocities entertained with the meter at each side of this section. In the case of the two end or shore sections the velocity at the edge is taken to he zero, and the mean velocity is therefore taken to he the mean of the ohserved velocity at the first station and zero, says H. F. Rohinson in Engineering News.

This practice I helieve to he wrong, though as most of my work is to he compared with measurements taken hy others who use that method I, perforce, must also do so. If this end section is a triangle with hank slopes of 45° and smooth sides, this method would he proper. When, however, the slopes are either very flat or nearing the perpendicular, and particularly where the sides are actually perpendicular, as in the case of a rectangular flume, this will certainly not give correct results.

Some time since, the late Benj. F. La Rue, C. E., then professor of civil engineering of the International Correspondence Schools, in connection with this suhject, wrote a private letter to one of his students, which the writer has lately had the pleasure of seeing, as follows:

It is somewhat erroneous to consider the mean velocity for the first section and for the last section to be one-half the velocity at the first and last stations. This is virtually assuming the velocity at the edge of the stream to be zero, which is far from being the case. While no absolute rule can be given for this, I would be inclined to take the difference between the velocity of the water at the edge and its velocity at the first station to be, say, from about 1½ to 1¾ times the difference between the velocities at the first and second stations. I think this would represent the actual conditions with reasonable accuracy. It might be well to make the ratio 1½ in a stream having a reasonably irregular edge, and 1¾ or less in a channel having straight or nearly perpendicular sides.

This rule followed out would make a material difference in the results obtained from that commonly used.

Concrete in Mining and Metallurgical Engineering.*

NUMBER III.

Written by H. W. EDWARDS.

CONCRETE CONSTRUCTION. — Unquestionably, the mixing of the ingredients hy machine is much hetter than hy hand, and in my experience if more than 80 cuhic yards of work be required, it will pay to install a mixing apparatus. My experience has been confined to home-made mixing machines. The apparatus I have used is a cuhical woodeu hox lined with No. 10 sheet steel and having an iron manhole at one corner. The box is mounted on two corners or trunnions, one a piece of 3-inch pipe through which the water is introduced, and the other connected hy means of a gear wheel and pinion to a hand crank. The manhole is turned up to receive the charge from the hopper and is then fastened down. The hox is then revolved a few times to give the ingredients a dry mix. The necessary quantity of water is then introduced hy hose and nozzle through the hollow trunnion and the revolving continued as long as required. The manhole is removed and the hox partly rotated, so that the contents are discharged into a wheelharrow for transportation to the work. Too far a trip for a wheelbarrow is to he avoided, unless precautions are taken, because the liquid separates from the mass, and, if in a leaky wheelharrow, is lost, or if in a tight iron wheelharrow, the workman often empties the "slush," which is mostly cement, elsewhere than where it ought to go. In order to avoid this action it is hest to dump the material onto a small platform of sheet iron, remix it by turning over, and then shovel it to its proper place.

Machines on the pug-mill type, which deliver the concrete after a definite and invariable number of revolutions, are not so satisfactory as those of the hox type, which permit the mixing to he continued as long as desired.

Mixing hy hand consists merely in turning a shallow hed of the ingredients over and over with shovels on a platform. The shovels should go fully down to the platform and the material turned completely over. A sheet iron platform lightens the lahor.

It is also essential to have all parts of the hatch equally wet, otherwise hy having some parts wet and some parts dry, the drier part will set before the wetter and thus cause stresses within the mass, which may sooner or later lead to ugly cracks.

With referencc to the quautity of water required, this depends largely upon the climate and the season. In a hot, dry climate, Arizona for instance, much more water is necessary than in a moist, cool climate; also in summer more water is required than in winter. I have experimentally made the mixture so wet that on stepping on the fresh concrete one would sink in over the shoe tops, yet, on drying, the wet concrete had a smoother appearance than similar concrete containing less water which required to he heavily tamped; furthermore, I have never seen any evidence which led me to douht the strength of the wet concrete. On the other hand in cool, moist weather, I have used the concrete so that it appeared only slightly moist, aud persistent heating was required to force the water to the surface.

In general and within reasonahle limits, the wetter the mixture the easier is the work of thorough mixing. It is best, perhaps, to follow a medium line, hut no fixed rule can he laid down, for the reason that different kinds of rock and cement require different quantities of water. It is easier to make the mistake of having it too dry than too wet. A good rule to follow is to have the concrete so wet that it will shake like a jelly when being rammed into place with a heavy heater, and will only just support the beating tool. In dry weather only should it be fully up to this limit, keeping it somewhat stiffer in wet, cool weather. If spread in shallow layers (floors, for example), the mixture should he much wetter than when laid in a mass, otherwise it will dry up before chemical action begins.

In retaining walls I prefer to use the mixture as dry as I reasonably can, because an excess of water, on evaporatiou, leaves the concrete somewhat porous, and thus allows seepage water to pass through it.

If concrete impervious to water be required (tanks, reservoirs, etc.), it is necessary to use a somewhat richer mixture, i. e., one containing more cement, and to have it thoroughly mixed and tamped. The ideal condition for this class of material is to proportion the coarse and fine ingredients so as to eliminate all the voids.

LAYING AND BEATING THE CONCRETE.—For foundations and walls the material should he laid in layers not exceeding 6 inches in depth; if thicker than this, it is apt to lose a part of the benefit of the labor of beating—the effect of the blows not penetrating to the hottom of the layer. A convenient heater is made of an iron casting, 6 inches square, having a handle of 1-inch round iron, or 1.5-inch pipe about 5 feet in length, which should weigh in all from twenty to twenty-five pounds.

In order to avoid horizontal joints, it is very necessary that each layer should he put in hefore the previous one has set, and that not more than half an

*Abstract Trans. Am. Inst. Min. Engs.

hour should elapse between completing, mixing and depositing. If for any reason, however, the work has to be interrupted, a number of large rocks or old rail ends set vertically should be partly imbedded in the last layer so that the projecting parts will provide a grip for the succeeding layers. Even this, however, should not be permitted near the top of the work. On continuing the work, the layer that has set should be thoroughly swept and wetted, first with water and then with thin cement grout. It is of great advantage to have the work continue day and night until completed—the men working in squads.

In a long and heavy retaining wall, it is best to divide the length into sections, because vertical joints do not affect the strength to the same extent as do horizontal ones. In any event, it is best to divide a large wall into panels, otherwise, owing to the expansion and contraction of concrete under changes of temperature (the co-efficient of expansion of concrete is but little less than that of iron), cracks are apt to develop, and thus spoil the appearance of the work. This division of the work into panels causes the cracking to take place along the vertical joints where their appearance is not so evident nor disfiguring. A panel should be of a size that can be completed in a day's work.

During the progress of the work it is a good plan to embed in the concrete old wire rope, chains or rails, which help to bind the concrete together and strengthen it. Concrete adheres very tenaciously to iron and seems also to preserve it from rust.

The Crib, or Form.—Unless the concrete is being filled into an excavation below the ground level, it is necessary to construct a crib of timber, the interior of which has the shape of the exterior of the completed work. There is scope for much ingenuity in the arrangement of these cribs, not only to produce the necessary shape and size, but to have them so stiff that no amount of beating of the concrete will cause the boards to bulge or to shift. Also, for economy's sake, the work should be so designed that the same lumber may be used repeatedly. I have found that tongue-and-grooved boards are not as satisfactory as plain boards, or planks, with straight, planed edges. Cement works into the tongue and groove and then, when swelling occurs from the contact with the wet concrete, the lumber appears to warp irregularly, and to leave unsightly marks of each plank on the face of the finished work. Unless braces are put in frequently, I have not found any advantage in using 1-inch boards, and I much prefer 2-inch ones.

Rounded corners are formed by inserting strips of "cove" molding in the crib, and for corners of walls around which there is much traffic, it is well to place inside the crib a bent strip of stout, sheet iron, provided with bolts. The concrete is beaten around and behind these bolts embedding them and the sheet iron snugly in place.

Concrete should never be dropped from a height for the reason that, invariably, the mortar and stone separate, and weakness results, an effect which I have noticed to be more pronounced with broken slag. For example, if it be necessary to get to the bottom of a deep excavation, it pays to lower the concrete in a tub or bucket, or if the excavation be large, to lower the wheelbarrow itself. In a case of this kind, I find it pays best to discard the wheelbarrow entirely, mount the mixing gear close at hand, erect a temporary derrick, which will command not only the mixing gear, but the area of the whole excavation, and then carry on the work with a tub.

Strength.—Concrete that has been made with care is superior in strength to the best masonry, but any slovenliness or neglect in the mixing or wetting, or in permitting a separation of the ingredients after thorough mixing will bring its penalty. Poorly proportioned ingredients also lead to weakness, particularly an excess of fine material.

I have tried the following experiment: A square slab of concrete 10 feet by 10 feet and 4 inches thick, having embedded within it old 0.5-inch mesh wire screen, after seven months' seasoning was supported by placing a block under each of the four corners. The slab withstood without apparent bending a distributed load of ten tons, and afterward a load of 3000 pounds concentrated in the center.

The following quotation on the subject of strength is of interest:

* * * A ring of 6 by 6.5 inches angle iron 15 feet in diameter was used as a horizontal circular tie, within which a flat dome of concrete was built. The concrete was 6 inches thick throughout, and was formed of four parts of stone, two of sand and one of Portland cement. The dome rose 6.44 inches at the center, and it stood covered with 2 inches of damp sand for fifty-eight days after it had been completed. A bed of sand was then laid over it to support a circular platform 5 feet in diameter. About 60,000 pounds of bricks were laid on the platform before any deflection could be detected, and 80,000 pounds were supported for six days without any signs of failure. It was intended to test the dome to destruction, but more than 80,000 pounds could not be be applied without danger to the men conducting the experiment.

It is to be noted that the writer of this statement says nothing about having iron or woven wire embedded in the concrete of this dome.

(To be continued.)

Mill Construction, Milling and Amalgamation.*

NUMBER III.

Written by I. Roskelley.

Crushing.—The aim of mill operators should be to crush the maximum quantity of ore to such a degree of fineness that the most profitable extraction can be made. Though many factors go to determine the rate of crushing, the screen is undoubtedly the controlling one; 600 or 700 standard screening has, in the past, been in general use, but although it gives a high rate of crushing, other conditions being favorable, the extraction from the crushed product, more particularly the concentrates, has not been satisfactory, and, in consequence, there is a tendency to adopt a finer screen; 600, 700, 900, 1000 and 1200 standard screening have all been tried on the Robinson Deep. With 600 standard our duty was 5.45 tons; with 1200 staudard it is only 4.95—that is, there is a loss of .5 ton per stamp per day, or 1500 tons per month on a hundred stamp basis. As a set-off against this comes a better extraction all round—3% better in the mill and about 3% in the concentrates. Now, it seems to me that of these the concentrates extraction is the most important. The question then arises—and to which I am not prepared to do more than express an opinion—whether it is more profitable to contiuue the fine screening at a loss of 1500 tons in crushing, or whether it would not be better to return to, say, 700 standard screening, and recrush the concentrates?

Personally, I believe the latter would be the better course, though I am by no means sure about it. Mr. Chester, in his paper on "Crushing by Stages," was decided on the point; H. H. Webb seems to lean towards it when he said: "In the future it is also probable that the scheme of regrinding the coarser pyritic portion of the pulp leaving the mill before cyanide treatment will be adopted in order to obtain better extraction from this rich material by more perfect exposure of the gold." The final settling of this point of crushing is beyond my scope, involving, as it does, the balancing up of many adverse points and much calculation, but it is a question which I should like to see taken up.

Perhaps the results obtained by me with the different screens may interest others who have not yet tried them, but who are contemplatiug doing so.

Fall of Plate. Per Foot.	Screen. Standard.	Slimes. Per Cent.	Height of Drop. Inches.	Speed.	Discharge. Inches.	Water—Tons.	Tons Crushed.
1 1/8 inch	600	25.4	8½	96	2¾	6	5.45
1 1/16 inch	700	29	8½	96	2¾	6	5.28
1 1/16 inch	900	31.8	8½	96	2¾	6½	5.07
1 1/16 inch	1,000	35.3	7½	100	2¾	7	5.06
1 1/16 inch	1,200	35	7½	100	2¾	7½	4.95

Tonnage and percentage of slimes in the above were obtained from the cyanide works by me during respective periods of individual months. It will be observed in the above table that the decrease of tous milled per stamp with decreased mesh aperture is not regular; for instance, the difference between 900 mesh and 1000 mesh is only .01 ton. This is accounted for by the fact the speed has been increased four drops per minute.

The factors determining the rate of crushing are screening, length of drop, order of drop, speed, weight of stamp, feed, discharge, water supply, and last, but by no means least, size of ore fed into the bins.

(a) Screening.—This I have already referred to. Experience teaches me that it is the most important factor, though I believe some other members of this society have come to a different conclusion.

(b) Length of Drop.—The smaller the ore fed into the mortar the shorter this can be made. If 2-inch cubes are fed in and the drop is set at 8 inches, the actual drop will be anything from 6 inches to 8 inches. As long as the drop is sufficient for the stamp to crush the material beneath, all that is required is obtained, and to make the drop greater than this is to do unnecessary work. Great care must be exercised to keep the drop of constant length, otherwise an irregular splash and slow crushing will result. The tappets have to be adjusted about every third day, owing to the wear of the shoe and die, otherwise the drop will become too long. Of course, the wear is far from even, and the adjusting which may be right for one stamp may be too little for the next. It is a great mistake to think that half an inch from the staudard length makes no difference to the crushing power of the stamp, and as soon as any variation is discovered it should be immediately set right without waiting for the time when the other stamps in the battery need adjustiug.

Order of Drop.—The drop of a stamp does two things: (a) It crushes the material beneath it, and (b) it splashes the crushed product against the screen. Were the stamps dropped one after the other, the fall of one stamp, by its splash, would remove much of the material from beneath the adjoining one, and very slow and defective crushing would be the result. To obviate this, millmen arrange so that no two adjacent stamps shall fall consecutively. 1, 3, 5, 2, 4 and 1, 4, 2, 5, 3 are the usual orders in use.

Speed.—Assuming that the drop is not made too short to crush effectively, then a mill running at 100 drops per minute will do one twenty-fourth more work than one going at 96. Coaling cost in running the engines and the greater wear and tear occasioned by high speed are factors which tend to keep the speed within reasonable limits.

Discharge.—One of the greatest objections to crushing with stamps is that particles crushed sufficiently fine for extraction do not immediately escape from the mortar box, but are recrushed and slimed. A high discharge retards the escape of the pulp from the box, since, instead of being splashed against the screen at the fall of the stamp, it splashes against the chuckblock and is driven back under the stamp and slimed. When the discharge is high the mortar box is liable to be filled with several inches of pulp, so that instead of the stamp falling on rock lying on the die, it pounds its way through this pulp.

(To be continued.)

*Abstract Trans. Jour. Chem. Met. and Min. Soc., S. A.

The Elspass Quartz Mill.

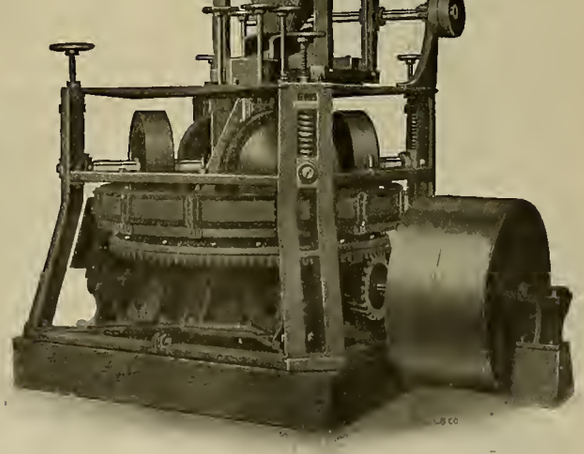
Fairbauks, Morse & Co. now control the exclusive manufacture aud sale of the improved Elspass quartz mill, which has been on the market for two years and is operating in Mexico, Arizona, New Mexico, Colorado and other mining sections. They state that contracts have been made in the last sixty days for twelve mills, to be distributed in the Black Hills, Oregon, Idaho, Colorado, Nevada and Arizona mining districts.

The mill is designed to issue freely, the flow of pulp being directed against the screens by the use of plows between the mullers or rollers; it has 21 lineal feet of screen surface. The die revolves and the rollers or mullers are stationary, with intent to furnish a satisfactory panning motion.

In the treatment of gold ores, the gold settles on the shelf or gold receptacle and is retained there by the action of the wash water, while the gangue and lighter minerals issue through the screen.

The manufacturers say: "The gold saving in the mill, without the use of mercury, freedom from slimes, small cost of renewing tires and dies and uniform product are a few of the features which are commanding the attention of mining men who are interested in up-to-date crushing."

Fairbanks, Morse & Co.'s main office is in Chicago,



The Elspass Quartz Mill.

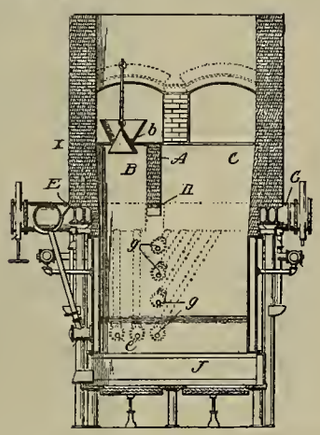
Ill., with branch offices in Denver, Colo., Salt Lake City, Utah, San Francisco, Cal., Portland, Or., and Los Angeles, Cal. They are preparing to furnish complete plans covering all classes of machinery necessary for successful treatment of ores, and would be pleased to furnish information in detail upon receipt of requests therefor.

Mining and Metallurgical Patents.

PATENTS ISSUED APRIL 26, 1904.

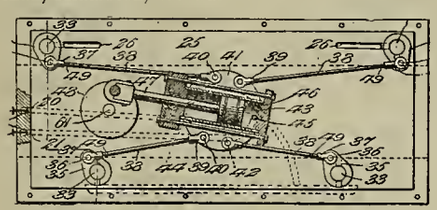
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

PROCESS OF TREATING ORES.—No. 758,532; W. F. Hannes, Deming, N. M.



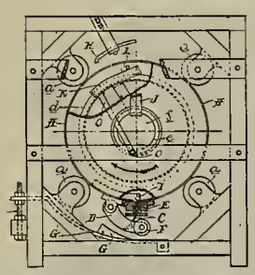
Method of treating metalliferous ores by supplying solid fuel and ore to furnace in separate, vertical strata, supplying oxygen to fuel and ore mixture, leading resultaut gases through ore separated from fuel and there supplying to ore additional oxygen in excess of that required to oxidize ore, and bringing ore thus treated into contact with incandescent fuel.

ENGINE FOR MINING MACHINES.—No. 758,533; J. Heenan, Middleton, W. Va.



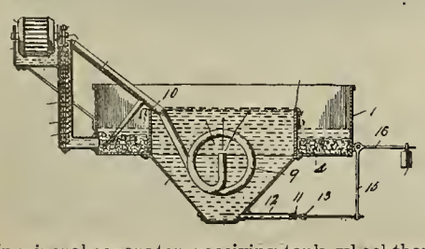
In mining machine of class set forth, combination with main piston chamber, piston therein having stem projecting forwardly therefrom to receive implement, ports in opposite sides of chamber controlling inlet and exhaust in relation to chamber, valves in ports, chest on chamber, and oscillating controller having means adjustably connected to valve aud provided with cylinder and piston operative by motive agent to alternately open and close opposite sets of inlet aud exhaust valves.

ORE CONCENTRATOR.—No. 758,565; J. Shier, Detroit, Mich.



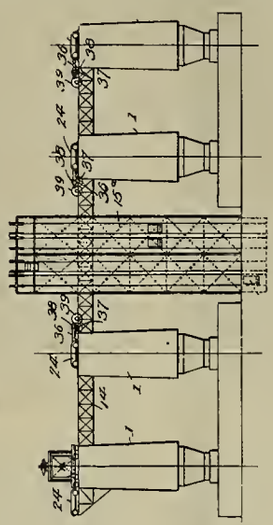
Iu ore concentrator, combination with supporting frame, of revolving drum having cylindrical chamber on the bottom of which material is carried in passage through drum, variable cut off mounted in longitudinal slit iu cylindrical wall of chamber, collecting pan stationarily suspended above bottom of chamber and meaus for actuating cut off and retarding or advancing its action.

MINERAL SEPARATOR.—No. 758,464; H. L. Orr, Greeley, Colo.



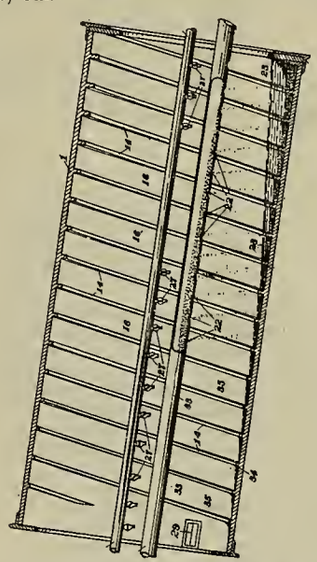
In mineral separator, receiving tank, wheel therein operated by inflowiug water, separating tank and filtering tank communicatiug as described, pipe having pump located therein operated by wheel for returning filtered oil to receiving tank from filtering tank, and counterbalanced valve located in separating tank operated by excess pressure in separating tank to dispose of unfiltered residue.

CHARGING APPARATUS FOR BLAST FURNACES.—No. 758,498; K. Backlund and B. F. Burman, Baltimore, Md.



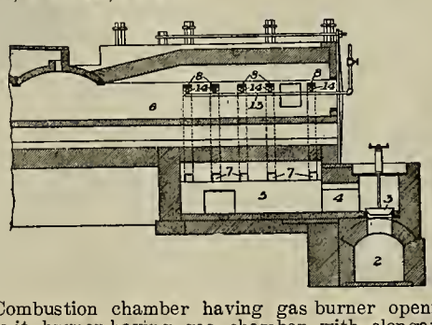
In charging machine for furnaces, combination with movable truck; stock chamber thereon having outlet in bottom thereof and inlet, distributing bell within outlet and adapted to support stock chamber, automatically operated closure for inlet, and means for imparting vertical movement to bell and chamber.

CONCENTRATOR.—No. 758,458; L. C. Graupner, San Francisco, Cal.



In mineral concentrating apparatus, hollow revoluble cylinder set in sloping position, shallow helical riffles on interior surface of cylirder, gradually diminishing in height throughout entire length from lower end to upper end thereof, inclined pipe in cylinder for distributiug ore thereiu, perforated in lower half, and inclined pipe passing through cylinder from upper to lower end, for distributing water supply therein, having series of adjustable cocks by which water supply can be distributively regulated.

GAS BURNER FOR FURNACES.—No. 758,420; N. Cote, Montreal, Canada.

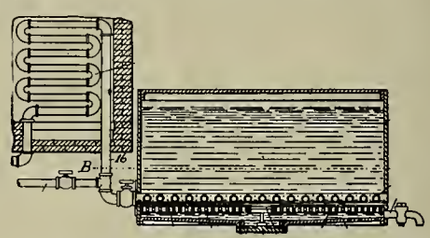


Combustion chamber having gas burner opening into it, burner having gas chamber with elongated opening, separate air chamber having slotted outlet opening into combustion chamber parallel with gas outlet and pipe leading from source of air under pressure to air chamber.

ORE CONCENTRATOR.—No. 758,412; W. L. Card, Denver, Colo., and F. S. Card, Canon City, Colo.

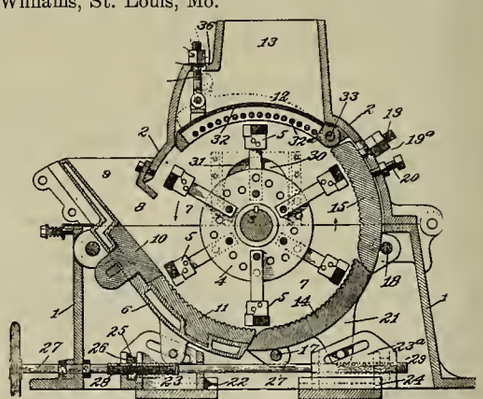
In ore concentrator, combination of concentrating table having longitudinally disposed channels adapted to discharge concentrates at one end, channels having transverse sectiou formed by gentle and abrupt incline which meet at obtuse angle, and means for imparting longitudinal concentrate-discharging vibration to table.

APPARATUS FOR EXTRACTING METALS BY CHEMICAL PROCESS.—No. 758,367; T. B. Joseph, San Francisco, Cal.



Apparatus for extracting metals by chemical process comprising tank provided with filter bottom, and perforated pipe placed within tank above and near filter bottom and connected with air compressor, perforations being directed upward with slight inclination, only to drive slimes upwardly.

CRUSHER AND PULVERIZER.—No. 758,288; M. F. Williams, St. Louis, Mo.



In machine of character indicated, combination with rotatable beaters, of breaker plate, imperforate grinding surface, and perforated grinding surface, breaker plate and grinding surfaces being arranged in order named in direction of travel of beaters, whereby beater commencing its travel in co-operative relation to breaker plate first passes breaker plate, then imperforate grinding surface and then perforated grinding surface, and screen upon outer side of perforated grinding surface and spaced therefrom, there being exit opening for tailings from space between perforated grinding surface and screen.

PREPARING IRON PYRITES FOR DESULPHURIZATION.—No. 757,531; U. Wedge, Ardmore, Pa.

Mode of preparing small particles of iron pyrites for desulphurization by combining particles with sulphate of iron and forming them into blocks or briquettes.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ALASKA.

The Great American Marble Co. has been incorporated in Seattle, Wash. The company owns marble quarries on Prince of Wales Island, Alaska. G. W. Dickinson, J. W. Clise, H. R. Clise, F. W. Relf, O. D. Humphrey, F. C. Harper, J. A. Moore, G. M. Stewart, E. E. Kaine, J. Schram and I. A. Nadeau are incorporators.

A preliminary survey for the railroad between Valdez and the interior of the Copper river country will be made this summer by New York engineers headed by A. B. Iles of Washington, D. C. It is said the present survey is backed by the Havemeyers of New York, who last year bought the Bonanza group and other copper properties on Copper river.

T. D. Drew of Juneau says he is prepared to work 100 men on his Pearl harbor property this season.

Another hydraulic proposition has been located near Valdez. The discovery was made on a stream which flows into Lowe river below Keystone canyon, on the east side, by E. H. Craig. Seventy-two claims in all were staked by Craig and three other men. The stream is said to fall abruptly from the bench to the Lowe river flats, but above the cataract there opens a broad valley or basin. Surface prospects in this basin indicate that it carries gold. They are preparing to open up the group.

Extensive development work will be done this year on the hydraulic properties at the head of Lowe river, near Valdez. The property has been leased by W. Hawkins, who is making arrangements to open them up. The terms of the lease are that 25% of the gross output shall go to the owners and the lessee has an option to buy within two years for $100,000 the amount paid in royalty to apply. The water must be flumed for quite a distance above, over rugged ground. Hawkins expects to have two giants operating on the ground by late in the summer. If conditions warrant, however, the hydraulic machinery will be put on the ground next year.

ARIZONA.

Cochise County.

(Special Correspondence).—The Tombstone Con. M. Co. is shipping about thirty cars of ore per week to the smelters. Some of the waste dumps are being sorted and the low-grade ore obtained is also being shipped to the smelters.

Tombstone, May 1.

Manager Harrington of the Michigan company that has taken over the World's Fair group of claims near Bisbee, is preparing to put down several diamond drill holes on the property. G. Groten et al. of Detroit, Mich., are interested.

Gila County.

The Glasson & Whelan property has been sold to J. Pfister, who for the past year has been developing a gold mine on Tonto. The property is 9 miles northeast of Globe, near Richmond basin. Pfister has also a year's bond on the Weatherwax mine adjoining, which, together with other ground located, gives him a group of twelve claims. The formation is lime and quartzite cut by dyke running 47% in hematite iron and manganese, carrying 3% copper. This is desirable for flux and much of it has been used by the United Globe and by the Black Warrior C. Co.

Santa Cruz County.

R. Ferguson, of Nogales, says three-fourths interest in the World's Fair silver mines in the Harshaw district, in Patagonia mountains, has been sold to J. W. Booth, D. A. Stewart et al. of Winona, Minn., for $450,000. F. Powers retains one-fourth interest in the World's Fair mines. An increased number of men have been at work at the World's Fair for three weeks past and additional machinery will be set up.

Yavapai County.

(Special Correspondence).—Characteristic veins of the Bradshaw mountain district trend north and south, the one exception to this being the east and west ledges on the Oro mine, 8 miles west of Crown King. In past years the property has been worked by leasers and stopes opened from the 150-foot level to the surface, in the 1800-foot tunnel on the vein. The present company, headed by B. Heller of Chicago, Ill., has taken up development of this property. A 20-stamp mill and concentrating plant have been built, with eight cyanide leaching tanks to extract values not plated. From the 150-foot level of the tunnel a double-compartment working shaft has been raised to the surface, a head frame built and self-dumping skip put in. With this the shaft is being sunk on the vein, which dips north at an angle of 45°. It is also expected that the shaft will make sufficient water to operate the plant. The ledge crops with a width of 4 to 10 feet, the vein matter being white quartz, carrying oxides and iron sulphurets and occasionally galena. Superintendent O. Stein recently took up the tunnel work at the point where it was abandoned by the lessees and in a short crosscut north again came into the pay shoot, showing a width of 7 feet. At three different points on the Beatrice claim (the location of mill and principal workings) the vein is faulted and thrown to the north from 30 to 60 feet, and at these points wherever opened the ore body is said to be larger and values concentrated. A wagon road connects the camp with outside points. An assay office has been equipped. A 120 H. P. compound steam-driven air compressor has been put in and development is being increased. Bins will be placed below the hoist and the ore crushed and conveyed by gravity to the mill below. An electrical plant supplies light for the camp. Two other ledges parallel this main one on the property, but as yet little has been done to develop them. The group contains a total of twenty-two claims.

Crown King, May 2.

Near Mayer the Treadwell M. Co. has begun relaying tracks of the narrow gauge railway to the Hackberry mine, the Boggs smelter and the Boggs mine. Work is progressing on the Hackberry and the Boggs mine, in each of which the shaft is being sunk. There are seven bridges to be constructed along the Big Bug and elsewhere and a timber crew is at work.

J. S. Johnson, of the Copper Queen M. Co., near Mayer, says the work they have been doing has opened up ore and the showing justifies them in putting in heavier machinery.

C. W. Platt says the hoisting plant on the Illizona M. Co. at Kirkland is in operation and he will start two shifts of men to work in the mine sinking the shaft, and expects by May 15 to increase the working force to three shifts.

Prescott reports say E. Foltz and F. Giroux, who have a lease on 100 feet of the north tunnel of the Great Peck mine, have made a strike. They opened a body of ore, 14 inches in width, which goes 1600 ounces in silver. They are sinking on the ore body.

J. Carrol has put men to work on the Iron King Extension property, belonging to Douglas, Lacey & Co., near Prescott.

The sale of the Cactus group of gold mines on Cherry creek, near Prescott, includes thirteen claims, and the work done on this property amounts to over 3000 feet. C. A. Chambers has bought the group for the Keystone Investment Co. of Indianapolis, Ind. They will put in machinery for mining and handling the ore and also put in a mill. The ore is free milling.

H. L. Hall, superintendent of the United Mines G. & C. Co., whose properties are 2 miles from McCabe, says arrangements are completed for resuming operations next week.——B. F. Switzer, superintendent of the El Dorado group, near Prescott, is awaiting the arrival of a hoist. He has completed sinking a 50-foot working shaft and as soon as the hoist is in place drifting and other development work will be done.

Groom Creek reports say work will be started on the Pacific G. Co.'s Nevada mine, which adjoins the Home Run mine. It is also stated that the company proposes putting up a mill.——C. B. Genung says a gasoline hoist is being set up on properties of the Rincon M. Co., near Prescott, and that another strike of ore has been made in that company's Welcome claim.

The pipe for the Oro Grande mine pipe line, north of Wickenburg, is being laid, and the site for the extra five stamps is being graded.

T. C. Archer of Prescott, who owns a group of prospects in Agua Fria section, which show outcroppings of ore, has arranged to explore these ore bodies by diamond drill work.

It is reported C. T. Kennan of the Sun Cloud M. Co., on the Colorado river, near Signal, has an option on the Jorsey Lily mine, south of Prescott, and that operations will start this week.

ARKANSAS.

Boone County.

J. H. Bartles of Dewey, I. T., manager of the North Star mine, east of Harrison, is arranging for the summer's work on that property.——The Susquehanna mill is again running. The ore bins were so full that work underground has been temporarily suspended until the bins are empty.

CALIFORNIA.

Amador County.

Ehlers and Williams are sinking a shaft at Clinton on a 3-foot vein which assays $4.90.——The Amador Climax mill, near Jackson, is running steadily on $7 rock, and as soon as the roads are good a larger hoist will be installed and sinking resumed.

The Lagomarsino M. Co. shipped seventy-five ounces of gold from their Volcano claim, near Volcano, last week. They have taken out pieces from the sluice boxes of $30, $25 and $20, but have not made a general clean up.

The Liverpool Tunnel Co. has lines surveyed and stakes set and the tunnel is in 40 feet. They expect to reach the main ledge of the East Belt within 200 feet. This tunnel will tap the Clinton, Paugh, Union, Gouge, Spagnoli and Edinburgh ledges, 6 miles east of Jackson.

Calaveras County.

D. Ross, superintendent of the Union copper mine at Copperopolis, says he is preparing to put in power for mining machinery. Electricity can be furnished from the same line which supplies the Royal mine at Hodson, while if water is furnished it will necessitate building a pipe line from Angels to Copperopolis.

Near Murphys, at the Red Gold mine, a small 4-stamp mill, with water power, is kept running daily on high-grade ore. The mine is 2 miles west of Murphys.——The May Day mine is being opened at the top of the mountain at the shaft. Work in the tunnel on the grade has been discontinued for the present. —— It is said work will be started next week on the Mayflower and the Beatrice mines.——The Hercules-Horseshoe mine has a 2-stamp mill at work and ten tons of high-grade ore is crushed daily.

The Utica M. Co. at Angels will start the installation of forty additional stamps at its Stickle mill this month. The stamps will be taken from the company's Utica mill, which is idle.

Del Norte County.

T. W. M. Draper and associates are preparing to put in a 100-ton matting plant at the Monumental mines.

Kern County.

H. H. Blodd, at Amalie, operating the Zada mining property, says he is preparing to increase development work. It is intended to run a tunnel to cut the ore body at 1000 feet. The tunnel is in 475 feet. The Gold Peak M. Co., which owns the Zada mine, intends to put up a 20-stamp mill. R. Lang is superintendent.

Mono County.

I. N. McKean and M. J. Cody have bonded the Carter group of seven claims at Antelope, near Bodie. They have started development work. The property adjoins the Golden Gate mine.

Nevada County.

A strike was made last week at the Murchie mine, near Nevada City, in the west drift, at a depth of 600 feet, in a part of the mine hitherto unexplored. It shows 2 feet wide, carrying free gold, says Superintendent Maltman.

At the Central shaft of the North Star M. Co., near Grass Valley, work on the 40-stamp mill is progressing. The batteries, stamps and their accessories are in position. Work on the rock breaker is under way. The grading has been completed. The building is of steel.

The Slide mine, near French Corral, is being reopened, and U. B. Bishop and C. D. French are driving ahead the tunnel along the ledge. They report getting out ore.

The mineral claim of Walling & Muller on the Newtown road, 1½ miles from Grass Valley, has been bonded to a San Francisco company, headed by A. P. Redington. The mine adjoins the Nevada City mine on the north and the Spanish on the south. The Redington company will begin sinking a shaft.——The Gold Tunnel mine will be reopened. B. F. Hall of the Pioneer Reduction Works has men to work cleaning out the drain tunnel, preparatory to opening up the property.

T. F. McAvoy, part owner in the Standard mine, near Grass Valley, is arranging to reopen that property. McAvoy has bought the interests of the late H. J. Thomas and is negotiating for the other interests held in the Standard. He will use water power, with an auxiliary steam plant. A road is now being built from the Standard mine to the Jenny Lind, as it is intended to haul ore from the former mine to be crushed at the Jenny Lind mill.

The Gold Blossom mine, near Grass Valley, is being reopened by the owner, R. Jeffrey. The wet spell this spring resulted in both tunnels being caved in places. Men have placed the upper one in repair again and are at work in the lower one. It is Jeffrey's intention to run the lower tunnel 150 feet farther to tap the shoot cut above. A raise will then be driven.

Placer County.

The Turkey Hill Con. G. M. Co. has been incorporated, with principal place of business in Sacramento, to operate in Placer county. The directors are W. C. and W. W. Chapin of Sacramento, W. C. and W. Muir of Michigan Bluff, and J. D. Meredith of Auburn.

Plumas County.

At Johnsville the Jamison mine has usual number of men at work running regularly.——Manager McLaiu, of the Continental mine, has fifteen men operating the mine. The deep banks of snow on the surrounding mountains will insure a long water season to the owners.——The Bluenose M. Co., W. Passetta, manager, reports having made progress with development work, and is preparing to make a raise from the tunnel.

Shasta County.

The Gambriuus group of claims near Redding have been sold to a Montana company represented by A. J. Glass for $40,000. The company has taken possession and will build a 20-stamp mill this season. The Gambrinus group consists of five claims—the Gambrinus, Temperance, Gilt Edge, Steam Beer and Bohemian.

The Bowery Belle mine, 3 miles west of Keswick, has been bonded to E. A. Braddock of Boston, Mass. The quartz vein shows in places 25 feet wide and carries free gold.

Sierra County.

The Sierra Buttes mine, near Sierra City, is under management of Superintendent Pinkstone, who is making a number of improvements in the workings. Ten stamps will be added to the present plant as soon as the roads are in condition to haul in the machinery. More men are being put on.

Trinity County.

One mile of the channel of Trinity river near Douglas City will be laid bare by turning the stream through a tunnel excavated across Horseshoe bend. Work on the tunnel will be begun next week. The surveys are completed. The tunnel will be 800 feet long, and will lead from an open cut 300 feet in length. It will be 11 feet wide and 7 feet high.

Tuolumne County.

At the Street mine, at Tuttletown, the pump placed in the shaft is in steady operation. Two shifts are at work on the 300-foot level stoping ore for the mill, which began dropping the stamps last week.

The Waif, a patented mine on the Mono road, 5 miles from Sonora, will be reopened. It is owned by F. A. Hanko, and has lain idle for several years. Two shafts were formerly sunk to a depth of 50 feet showing a vein 4 feet thick, assaying $10.

It is reported that a 14-foot ledge of $14 ore has been struck in the App mine, at Quartz.

Sinking has been discontinued at the Black Hawk mine, near Soulsbyville, and a station and sump are being cut. Drifting has started.——Superintendent A. Bryant of the Prudhomme put men to work last week unwatering the Prudhomme mine at Arrastraville. Sinking and crosscutting will be done. The mill is running on Cordova rock. The number of men will be doublod at the Cordova mine this week. The drift from the lower level is said to be showing up high-grade ore, that averages 7 feet in width.

Work will be resumed at the Contention mine on Knight's Creek, near Columbia. The vein on the Contention has been tapped by tunnel and drifting has been done to extent of 250 feet. The vien is a foot in width, carrying values in gold. Some molybdenite is found in the claim. The surface improvements consist of a light 5-stamp mill. The Summer Bros. own the mine.

Work is progressing on the Mountain Lily mine, near junction of Five-Mile creek and the South Fork of the Stanislaus river, near Columbia. The 5-stamp mill is now crushing ore. This mine has been almost continuously worked for several years past. The vein is a foot in width botween slate walls. The tunnel has been run 1200 feet.

The engine at the Republic mine, near Columbia, was started up last week, and the 4-stamp mill is in operation.

COLORADO.

(Special Correspondence).—A preliminary meeting was held April 29th in the Chamber of Commerce building for the purpose of discussing the advisability of organizing a society composed of Western chemists, assayers and metallurgists. At this meeting a committee of three was appointed to correspond with various assayers and metallurgists for the purpose of obtaining their views as to the best method of procedure. The committee is composed of H. C. Parmelee, 1755 Arapahoe street, Denver; Guy M. Vail, Denver,

and Chas. D. Test, Golden. It is believed that such an organization would be of material benefit to all members.

Reports from the different mining camps throughout the State would indicate that mining conditions are improving over the past few months. The Leadville and Cripple Creek districts are both up to standard in production and the outlook for the future is much brighter than for some time past.

The north end of Gilpin county will soon be enjoying renewed activity. The Moffat Railroad has reached Rollinsville, which will give the mines in this locality an outlet for their ores. Heretofore the ore has been hauled to Black Hawk or Central City, which made it rather expensive mining.

A large number of mining men from different sections of the State attended the third annual meeting of the Colorado Mine Operators' Association held in Denver to-day. Resolutions were passed commending the action of Governor Peabody on the labor situation in different parts of the State. Also adopted resolutions thanking Senator Teller and Congressman Brooks for their work in getting through House Bill No. 13,298, to amend section 2327 of the Revised Statutes of the United States. A number of matters of importance were brought before the meeting and discussed by the members of the Association. The following officers were elected for the ensuing year: F. J. Campbell, president; L. P. Martin, T. W. Beam, E. A. Colburn, vice-presidents; W. E. Passmore, secretary and treasurer. The office of the Association will be retained in the Boston Building. The Association includes members from all over the State. Nearly all the mining camps have a local organization of their own which works in conjunction with the head office.

Denver, May 2.

Boulder County.

In the Grand Island district, near Eldora, the Gold Coin mine on Spencer mountain has been bought by W. M. Williams, who has a bond and lease on the Terror.

Clear Creek County.

(Special Correspondence). — The set of lessees on the Sunhurst mine of the Red Oak G. M. & M. Co. property are shipping 100 tons of ore per month. Thirty lessees are at work on the properties and Manager A. B. Montgomery expects to have fifty working in the next few months. He also expects to rebuild the mill which was destroyed by fire some two years ago. All of the mill ore is being thrown on the dump.

Georgetown, April 30.

Work is under way retimbering the Torpedo shaft in Spring gulch, near Idaho Springs. The shaft is vertical, being 100 feet deep, and when the timbering is completed, a crosscut will be run south to cut the vein. The work is under J. C. Hull, manager. Work was being done in the tunnel last fall, when the property was shut down, due to lack of water for boiler and compressor. The machinery will be started up again as soon as there is sufficient water in the gulch, but in the meantime work will be done by hand. There is said to be an ore shoot showing in the bottom of the tunnel level.

The Yankee Con. M. Co. is arranging for starting up the Lombard mill at Yankee next week, says H. I. Seeman, manager. The mill was closed down during the winter months on account of lack of water.

Silver Plume has 200 men working day's pay and also employs fifty more men who live at Georgetown, aside from the many leasers at work from both camps, says the Silver Standard. The coming summer promises to be the best in the camp's history. The new railroad to be built, the Pelican Dives Co. to extensively operate their many properties and erect a mill, the Stevens mine will be worked on a larger scale, the Terrible mine will be working 250 men before June 1, the Silver Plume M. & T. Co. expects to install machinery and increase work, the Indiana M. & M. Co. intends to fully develop its group this season, the Southern M., M. & D. Co. will thoroughly develop its claims, a company has been formed to work the Bertha mine in Grizzly gulch, and every property in the gold belt will do a larger amount of development work during the summer months.

The Pelican-Dives M. Co. are said to be preparing to build a concentrating mill near Silver Plume this summer. About 600 tons of concentrating material, taken from old stopes and the dumps of the Seven-Thirty, Zero, Pelican and Diamond tunnel levels, has been shipped to Idaho Springs for treatment as a trial lot, and the entire tonnage has brought favorable returns.

Chaffee County.

(Special Correspondence).—Preparations are being made for a season of activity here. Good finds are reported from the Bowerman and Sherod camps, west of here. At the Monarch there is great activity and ore shipments are increasing. At Turret the Vivandiere mill has just been started and is producing a good quality of concentrates, which is being shipped to the smelter here. Five hundred tons of ore are being reduced to bullion every twenty-four hours at the Ohio & Colorado smelting plant. An average of three carloads of bullion is daily shipped. During the year 1903 Chaffee county produced in gold and silver $550,000.

Salida, April 30.

The Baalbec M. & M. Co. at St. Elmo will build a concentrating mill of thirty tons daily capacity.

Fremont County.

The Page mill at Florence has been bought by the Florence M. Co. and will be used to treat the low-grade ore of the Dexter mine, on Bull hill. The mill will have a capacity of 100 tons a day and the cyanide process will be used. Development work has been in progress in the Dexter for several months and the body of low-grade ore has been opened down to a depth of 520 feet. The ore is said to average $10 per ton in gold. In the junctions the ore shoot is 15 feet wide.

Gilpin County.

(Special Correspondence).—The Michigan Hill Tunnel & Mining Co. has recently opened up a 2½-foot body of copper and iron ore which carries some gold and silver. They have a crosscut in over 600 feet, which has cut 3 feet of free milling ore. The property is located at the junction of Clear creek and Silver creek. H. Deitz is president and manager.

Apex, May 1.

At Rollinsville last week, the Happy Hollow group, in Gamble gulch, was sold to L. E. Grimm and J. R. Keefe of Chicago, Ill., for $12,000. The Happy Hollow group consists of seven unpatented claims, 1 mile south of Rollinsville, which will be reached by the new Moffat road. The group has been developed by a number of shafts ranging from 10 to 65 feet in depth and by a tunnel which has been driven 100 feet. Some surface work has recently been done by the owners. O. J. Duffield of Rollinsville is manager with G. Churchill as superintendent.

The Penohscot M. Co. operating near Rollinsville, in which Valley Falls, Kan., parties are interested, are figuring on building a stamp mill to treat their ores, says the Register-Call.

It is reported operations will be started at the Benton mine on War Eagle hill this month. The property is equipped with plant of machinery, has a shaft down 150 feet, showing surface ores carrying values. It is claimed operations were suspended until the arrival of the railroad at Rollinsville.

The Colorado Tellurium G. M. Co., operating the Freedom mine on Winnehago hill, near Central City, has men at work repairing the main shaft. The work of repairing the shaft has been done to a depth of 500 feet and when 570 feet is reached, which is at the pump station, the company will proceed to unwater to the bottom of the shaft, a total depth of 822 feet, after which it is intended to start sinking operations. Green & Co., who are working the Freedom No. 2 shaft under sublease, are sinking and have reached a depth of 115 feet. In sinking they took out mill dirt which brought returns of three ounces of gold to the cord, besides a ton of concentrates. Manager Borcherdt has just completed arrangements for purchase of the Oliver mill in Chase gulch, near Central City, which will be known hereafter as the Freedom mill. This mill was built three years ago. It is the intention of the company to drive the tunnel in on the Freedom extension from Chase gulch towards the Freedom shaft, and when connections are made they will handle the milling ores by taking them through the tunnel direct to the Freedom mill. The company has increased its capital stock and its holdings in this and Boulder counties are to be operated on a larger scale and the company will buy some of the properties which it is now operating under lease and bond, says Manager Borcherdt.

Gunnison County.

The production of the Crested Butte mine, near Crested Butte, for the month of March was, coal 13,000 tons and coke 5500, says the Elk Mountain Pilot.

Hinsdale County.

Work at the T. C. M. tunnel of the Hinsdale M. & M. Co., near Lake City, is said to show that the tunnel is on the edge of the No. 2 vein. The tunnel cuts this vein at depth of 500 feet.

Lake County.

Preparations are being made for the development of the northern section of Leadville, says the Carbonate Chronicle. The first work will be done in the Poverty Flats district. S. M. and J. K. Carleton have taken up the work on the Casco Co.'s properties, and have put men to work overhauling the machinery at the shafts on Poverty Flats. The shafts will not only be sunk lower than was possible before the Coronado pumps drained that territory, but much drifting will be done.

Work has resumed on the Belvedere Nos. 1 and 2 claims in the St. Kelvin section, near Leadville. Some work was done there last fall, showing a streak of silver ore. This was caught in a shallow tunnel. The lessees intend to start the tunnel farther down the mountain.

With the payment of the judgment held by H. Head against the Sedalia G. M. Co. comes the report that preparations are being made to resume operations. The Sedalia mine is on Little Ellen hill, near Leadville. It is reported that the other claims will be satisfied, and the property will resume full operations. Owing to its prolonged idleness, considerable work will be necessary to get the plant into working order again.

Shipments are again regular from Ibex No. 4 shaft at Leadville, in addition to considerable exploration work going on below the 1200-foot level in virgin ground. Manager J. F. Campion says the matter of leasing the remaining territory will be taken up this week, and within thirty days it is expected quite a number of lessees who are waiting to get hold of this ground will be at work.

Ouray County.

The Bullion King M. Co., operating in Porphyry basin, near Red Mountain, 1½ miles west from the Silver Ledge property, is increasing work. The holdings of the company consist of two groups of claims, eighteen in all, six of which are patented, and a tunnel site. A tunnel driven on the Oliver Twist claim is 500 feet long, and at 600 feet farther it will cut the Bullion King, running at right angles with the Twist, and of a good shipping record from upper workings. This tunnel, which is to be the main working tunnel, will cut consecutively the entire group at depth. The product of the King and the Twist consists of lead and copper sulphides, carrying gold and silver values. Next week the gasoline engine, of 2-drill capacity, also for furnishing electric motor for lighting the mines, will be set up. Electric drills will be used. New buildings are to go up, and a gravity tram line will be put in place, connecting mines with the railroad, a distance of 1½ miles. The president is H. N. Timolat of Brooklyn, N. Y., and the manager is A. J. Aurand of Silverton, Colo.

Rio Grande County

(Special Correspondence).—The Golden Income Co. at Embargo has a 196-foot incline shaft dipping at 80°. A 50-foot drift on the 50-foot level is showing sulphide ore, and a 40-foot drift on the 100-foot level is also showing ore. Most of ore shoot has been stoped between the 50-foot and 100-foot levels. A drift from the bottom of the shaft shows ore and in one place about ¾ inch of petzite (silver-gold telluride) shows. The value of this streak is about $350 per ton. Massive sulphides are said to carry from $30 to $50 per ton and the vein material $7 per ton.

The Tornado M. Co. property is owned by Terra Haute, Ind., men. The incline shaft is down 130 feet, with some drifting. Galena ore carrying both gold and silver has been opened up, and so far as shown is a milling proposition. The Tornado Co. has put in a gasoline hoist of 15 H. P.

——The Comet Co. is owned by Smiley & Freeman of Del Norte, Colo. Development consists of a 100-foot incline shaft with a 10-foot drift. The average value across vein is said to run $19 per ton. A small streak of quartz on hanging wall carries horn silver. There are a number of promising prospects in this camp, with 10-foot holes on them—a few are deeper. Development work is showing improvement. The camp is 19 miles from Del Norte and 9 miles from Granger siding, on the Creede branch of the Denver & Rio Grande Railway. Summer Coon camp, 6 miles north of Del Norte, shows values in small streaks. Hubbard & McFadzean have a 60-foot shaft on the Quien Sabe that shows values in gold, silver and lead. Cochran on the Iron Hat has a showing of hematite.——Jones et al. have a good showing in some small streaks at 25-foot depth in a short crosscut. There is water in this claim. Water is handled by a windmill, which makes a cheap power. In that part of Colorado winds are prevalent during the spring months. The old camp at Summitville is quiet since the failure of the Schuch cyanide plant.——There is high-grade copper ore showing in the lower workings of the Golconda.——Little work is being done in Jasper, since the failure of the Moody mill and the Herr mill. Lack of values is said to be the cause.

The camp of Carnero, 22 miles north of Del Norte, is quiet. There is ore in this camp, but it is a camp that will require treatment on the ground to make a pay camp.

Del Norte, May 1.

San Juan County.

The Royal M. Co., operating on Sultan mountain, near Silverton, has started operations with an increased force of seventeen men. The work for the greater part will be done on the King and the Mazeppa veins, consisting of a raise on the King to connect with the upper workings, a vertical distance of 600 feet, and the running of a drift on the Mazeppa. Power drills are being used in drifting. One of the workings is in 7 feet of mill ore. The property represents 3000 feet of development. Manager W. Pyke says a concentrating plant is proposed.

The Kendrick smelter of the San Juan M. & S. Co., near Silverton, blew in last week, and the first two hours' run resulted in three tons of matte. The ore bins are stocked and there are ample reserves at its Henrietta mine. The smelter started up with forty-one men, which has been increased to about sixty. The plant will treat 150 tons of Henrietta ores per day, exclusive of custom ores, which it is buying.

The North Star mine, on Sultan mountain, near Silverton, is shipping 1259 tons of ore a month.——The Sunnyside is shipping two cars of concentrates every three days. The capacity of the cars is twenty tons.——Work was resumed on the Big Colorado mine last week with two shifts of miners. Electric drills are employed in continuing the main tunnel on to certain ore zones on Boulder mountain.

Summit County.

The Ten Mile Co., at Robinson, under management of M. Shepherd, reports having opened up a body of ore rich in lead and silver. The ore body is 25 feet wide and 15 feet high. It assays $35.

It is reported that the Washington property, on Nigger hill, near Breckenridge, has been sold to Lennox & Co.——The Puzzle Leasing Co. is working mine and mill steadily.——About forty men are employed at the Gold Pan mine and everything is in shape for an early start at placering. The ditch is open from end to end, the pipe line filled with water, and they are unwatering the pit.

At the Oro Grande mine at Dillon, pending the arrival of Manager Griffin, W. H. Foster has twenty-five men putting equipment in condition for resuming gravel washing. The 11-mile ditch from the Snake is free from ice and attention is now directed to freeing the Straight creek ditch from its winter's accumulation of snow. The entire plant will be working and washing gravel next week.

The Monte Cristo mine, near Breckenridge, will be added to the shipping list by the Quandary Mountain M. & M. Co., which owns it. The principal values in the ore are gold and silver, besides lead and copper. These are associated with iron and zinc. The copper and zinc are not saved by the present machinery, which produces a grade of iron-lead sulphide running up to 50% lead and containing the bulk of the gold and silver values. On the first 500 tons to be run through the mill the value of the concentrates made by putting about six tons into one is estimated at $35 per ton. The second lot of 900 tons is expected to run up to $50 per ton of concentrates, as it carries more lead and has not been leached so much by exposure to the elements. The ore is broken, quarry style, by contract, and costs about $1 a ton to mine and stack ready for hauling. From the ore quarry to the mill is a down grade and short haul. Later a hucket tramway will be built to transport the ore to the bins at the mill. The mill is 100 feet long by 33 feet wide, having five floors. The boiler room is an annex 25x25 feet.

Teller County.

The total production from the mines of Cripple Creek district for the month of April was 41,900 tons, that had a gross value of $1,268,300, says the News. Of this quantity of ore, 35,900 tons, that had a coinage value of $908,300, was treated at the reduction plants. The following is the record of each plant:

Plant.	Tons.	Value.
U. S. R. & R. Co.	15,000	$375,000
Portland	7,500	210,000
Telluride	2 500	62,500
Dorcas	2,200	154,000
Economic	3,000	84,000
Cripple Creek Homestake	3,600	14,400
Sioux Falls	2,100	8,400
Smelters	6,000	350,000
Totals	41,900	$1,268,300

Superintendent Waldron of the Last Dollar mine at Cripple Creek has started crosscutting to the ore body from a depth of 1320 feet. Only a few buckets of water have to be brought to the surface each shift. About two years ago work had to be stopped at the 1200-foot level on account of water. The flow disappeared with the advent of the drain tunnel.

J. Hostetter, F. Hangs, F. Pitney, T.

Terlau, owning ten acres 2½ miles southwest of Cripple Creek, claim to have uncovered a deposit of mica 2½ feet in thickness. The sheets up to 6x12 inches in size have been taken out. It is reported a grindling mill will be built on the ground.

Gradually the reduction plants are getting more ore than formerly, both of high and low grade, from the smelters. The average grade of the ore treated in April at the Dorcas mill was $70 a ton. Heretofore it has been supposed that no ore running better than $40 a ton could be handled at a profit by the cyanide and chlorination plants.

On account of a lawsuit between the Golden Cycle and Theresa mines, at Cripple Creek, 125 men were laid off last week on both properties. Work will not be resumed until the case is settled in court. ——The new cyanide plant at Gillett will be started about May 15. They expect to be able to handle ore running as low as $3 a ton. The mill has a capacity of 200 tons a day.

The Cripple Creek & Colorado G. M. Co. has been incorporated by R. Campbell, A. P. Kennedy, D. J. Duncan, R. G. Mullen and E. H. Teats. Operations will be carried on in Teller and El Paso counties.

Secretary Lloyd, of the Stratton & Cripple Creek M. & Dev. Co., says, relative to the holdings of the company on Bull hill, that until the Globe and Gold Hill leasing blocks have been disposed of no applications for leases in Bull Hill section will be considered or granted.

IDAHO.

Blaine County.

J. Peterson, superintendent and part owner of the Argosy M. Co., is preparing for increased operations at his company's Muldoon property, near Hailey. He expects to haul ten tons of ore a day from the mines to the railroad. There is said to be 2 feet of solid lead carbonates in the Argosy, and a good-sized dump is ready for hauling to the railroad, thence to Salt Lake City, Utah.

Boise County.

It is reported work will be resumed in the Gold Hill mine at Quartzburg by G. W. Grayson and W. C. Ralston of San Francisco, Cal.

Custer County.

Work is progressing on Alder creek, 8 miles southwest of Mackay, 3 miles from the White Knob group and ¾ of a mile from White Knob Peak. It consists of four full claims.

Manager J. A. Czizek of Salt Lake City, Utah, of the Lost Packer M. Co., operating on Loon creek, says he has arranged for the construction of 25 miles of wagon road over Mt. Estes. Czizek reports physical conditions at the mine satisfactory.

Idaho County.

H. O. Nevin and J. A. McKay of Pittsburg, Pa., have bought the Yellow Boy mine, known as the Wundram strike, in the Cave Gulch district, and the property will be developed and a mill built. The shaft will be sunk 100 feet with drifting. The plan is to open up the ground and block out the ore, when a mill will be built. One and one-half miles of wagon road have been built, which, with little additional work, will connect with the boat landing on Snake river. The mine is 3½ miles from the river. Manager Nevin will make his headquarters at Lewiston.

Shoshone County.

H. F. Samuels, manager of the Stewart mine near Government gulch, near Wardner, states they are completing a tramway to carry the ore to the O. R. & N. spur.

Washington County.

E. D. Ford, manager of the Gold Coin M. Co., whose plant at Black Lakes, near Council, was destroyed by fire last month, says he is putting in a 100-ton cyanide plant. The Gold Coin Co. had miners employed all winter developing the mine and arranging for putting in the plant.

KANSAS.

Cherokee County.

Work at the Sunny Side mill at Baxter Springs is progressing satisfactorily. The plant was put in operation this week. A new shaft is being sunk south of the Sunny Side mill. When the ore level is reached a drift will be cut to connect with the drifts from the other shaft. —— J. E. Putman & Co. of Joplin, Mo., are still prospecting the Charters ground and are making good drill strikes.

On the Gaines-Brewster lease, near Baxter Springs, where Ford, Goodwin & Co. are mining, work is progressing. Two new shafts are sinking on some of the ground they have sub-leased. The mill of Ford, Goodwin & Co. will be ready to run by May 17th. The boilers are set, foundations for the mill and adjacent buildings are in, and machinery is being set up. The mill will have a capacity of 150 tons daily. The Gaines-Brewster people have 160 acres under lease.

KENTUCKY.

Christian County.

Near Gracey, a few miles north of Clarksville, Tenn., samples of fluorspar and evidences of zinc and lead have been found. The Gracey M. Co. has been incorporated to carry on mining operations on several tracts of land. It will begin operations as soon as the machinery can be set up.

MICHIGAN.

A Calumet report says Lake Superior copper production for the current year may fall considerably short of the earlier estimates, says the New York Commercial. For the first quarter of 1904 the output of the Lake mines was 47,230,900 pounds of refined copper, or at the rate of a little less than 190,000,000 pounds for the entire year. The strikes at the Quincy, Baltic, Tri-Mountain and Champion properties had an adverse influence on the production of those mines, and cut the yield for the entire district considerably below the amount expected. Production, however, will show an increase over the figures for 1903, although the growth will not be so large in proportion as last year's.

Houghton County.

The Calumet & Hecla C. Co., at Calumet, has begun crosscutting from No. 20 shaft. This is one of the two shafts on the Kearsarge lode, and the crosscut is being driven westward to cut the lode. When the bed is located an upraise to surface, at the proper angle of dip, will make a permanent No. 20 shaft. No. 19, the north shaft of the Kearsarge bed, is drifting and shows payable ground.

For several years the residents of the Quincy location and the city of Hancock have been disturbed from time to time by air blasts. These, says H. J. Stevens of Houghton in the Daily Mining Record, are caused by the settling or caving of old workings in the Quincy mine, and are similar in general effects to light shocks of earthquake. Calumet seems slated for a similar series of shocks, the first happening last week. With more than 100 miles of worked out and abandoned mine openings, it is not strange that such a subsidence should occur in the Calumet & Hecla. While unpleasant, they are not considered dangerous to the mine or to the city.

The fourth level of the Champion mine, at Painesdale, is 5000 feet in length. The third and fifth levels, when rendered continuous by completing the driving of short connecting sections, will be about same length. These are opened on the Baltic amygdaloid bed.

The Elm River mine, near Winona, is reported drifting in encouraging ground on the Winona lode. As settled weather is at hand, it is expected work will be resumed on the sinking of the new shaft of the Winona, which passed through good ground in the four levels already sunk.

The diamond drill borings of St. Mary's Mineral Land Co. near the Winona mine, near Winona, are reported progressing, and as the Winona lode has been located and identified by these borings, it is thought a shaft will be started by summor. Nothing has been heard recently of the proposed shafts on the Globe tract, south of the Champion mine.

The Old Colony mine, near Calumet, reports cutting another of the cupriferous amygdaloids located by drill borings in the crosscut driven westward from No. 1 shaft.

July 1 the Centennial mine, near Calumet, expects to begin production, with one head, at the Arcadian mill at Grosse Pointe. The Arcadian mill has three heads. It is thought the Centennial will begin stamping with a single head only. Two heads might be started, but it is doubtful if enough stopes are opened ahead to allow a proper selection of rock to the extent of 1000 tons daily. The principal shaft of the Centennial is 2850 feet in depth, and good stopes have been opened, especially in the lower levels.

Keweenaw County.

This month the Ahmeek mine, west of the Mohawk mine, near Allouez, will be added to the present list of producing Lake Superior copper properties. The Ahmeek will supply one head at the Tamarack mill with rock.

The new shaft of the Allouez mine, at Allouez, is 650 feet in depth and should cut the Kearsarge bed by fall. This shaft is sunk at an angle of 80°, but will take the angle of the lode's dip when the copper-bearing amygdaloid is reached.

The management of the Phœnix mine, at Phœnix, is considering the plan of extending its railway to Eagle river and building a pier and coal wharf at that point.

Ontonagon County.

The Mass mine, at Mass City, is sinking two shafts—"A," which is 1300 feet deep, and "B," which is 1250 feet in depth.

MISSOURI.

Jasper County.

The Jubilee mine, ¾ mile southwest of Carl Junction, is making progress. It is joined on the east by the Des Plaines and on the west by the Lehigh mines. The company has sixteen lots, with the main shaft down 127 feet in pay dirt, and to reach the bottom of the ore the shaft will have to be sunk to a depth of 142 feet. Their drill holes, eleven in number, show ore from 106 to 142 feet, giving them a face of 36 feet. The present pumps are not large enough and they are preparing to put in two walking-beam pumps, an air compressor and a large boiler. Arrangements are being made for building a mill. The property is under management of H. Smith, president, and E. S. Keskeys, superintendent.

Near Diamond, 14 miles southeast of Joplin, is reported development of a zinc prospect. The ore has been found on the Lovo land, leased by M. Byers and Kelley Bros. of Diamond. A drill was put down on the land and zinc struck at a depth of 35 feet, and the drill continued in ore to a depth of 130 feet. A shaft was then sunk 12 feet from the drill hole and the body of mineral opened.

The Gih Wommack lead mine has been sold to Ross & Alexander of Kansas City. The mine is ½ mile east of Duenweg, on the Gage & Carrick mine, and the sale carries with it the mine and a 40-acre fee for $100,000.

MONTANA.

Beaverhead County.

At the Ajax mine, near Dillon, the ore is free milling and is said to average $10 per ton, and the concentrates run $35 in gold and 33% in lead. The 10-stamp mill has been shut down because of the great amount of snow which interferes with transporting the ore from mine to mill. The company expects not to start the mill again until the aerial tramway, which the company will begin building next week, is completed. It is expected this tramway will be finished by July. When the improvements now being made are all completed three shifts of forty men each will be kept at work. While the mill has been stopped for improvements, development work in the mine continues. The principal work being done is the driving of tunnel No. 4, which will tap the vein at the lowest point.

Broadwater County.

Rossberg & Sutton, who have bought the supposedly worked out Stray Horse mine, near Winston, report having struck gold ore below the old workings, and have begun shipments to East Helena.

Cascade County.

E. W. King of Bozeman, of the Barnes-King M. Co. of Fergus county, has bought mining properties on the Dearborn river. The claims are accessible either from Craig or from Great Falls, via the Montana & Great Northern.

Jefferson County.

The Basin-Comstock M. Co., composed of H. Layne, A. S. Ray, C. Sturtevant, W. Bauden and W. Kidney, is preparing to continue equipment and development of the Comstock mine, near Basin. Last fall, as the roads were not in condition to allow the hauling of the necessary material, operations were suspended until spring. Up to the time of the closing of this mine considerable development work had been done, there being a shaft 315 feet in depth and 1200 feet of crosscuts, drifts and raises. This work was done with a 60 H. P. boiler and a 45 H. P. engine. The company intends to sink the shaft 200 feet deeper and will put in more boilers and two heavy pumps. The Comstock mine is 4 miles from Basin.

The Pennsylvania-Montana M. Co., operating the Hattie Ferguson mine, near Basin, has started shipping ore again. The company has been working the mine all winter, but stopped shipping the product a month ago, as the teams could not get over the roads.

Powell County.

The Gold Creek-Montana Co., Ltd., has been organized for working the bars of Gold creek, 60 miles northwest of Butte. The company has bought from C. Bergstrand et al. 1500 acres of ground along the creek. It has also ordered machinery for a dredge boat and lumber for building the boat. T. Clearage and T. Sletter are interested. The point at which the boat is to be built is 6 miles from Gold Creek station, or 2 miles west of Pioneer.

NEVADA.

Nye County.

In the Montana Tonopah, at Tonopah, the main shaft has reached the 750-foot level and the crosscut north to the ore bodies has been started. The 50 H. P. hoist is in full operation and progress is being made in raising to the surface the ore and dirt which had accumulated in the drifts and crosscuts which the former gasoline hoist was unable to handle.

Superintendent Tripp of the Tonopah railroad says the line will be completed and in operation by June 20th if the C. & C. road can deliver material in time.

NEW MEXICO.

Colfax County.

The Ponil Placer Co. has been incorporated and owns a 4-mile strip of placer ground along the South Ponil in Colfax county. South Ponil creek has its source in the Copper Park basin. The Aztec gold mine is above the ground of the company and the placers receive the drainage from Aztec hill. H. Brainard of Raton and E. S. Douglas of Chicago, Ill., are interested. The property is supplied with an abundance of water and the fall of the stream makes the location favorable for hydraulic mining. There is also plenty of timber on the ground. Douglas says the Grand Duchess tunnel is in 290 foot. Ore has been struck in tunneling. J. Bidwell has the contract for running the tunnel. It is the intention of the company to drive in 800 feet, cutting the main vein of the Grand Duchess at a depth of 800 feet.

Grant County.

The business men of Silver City have subscribed $2200 as a bonus to secure a smeltor, says the New Mexican. Johnson & Atkinson have been offered a bonus of $2500 to move their Burro Mountain smelter to Silver City.

The Scotch Lassie mine at Central City will again be operated now that the litigation which involved title to it has been settled in favor of Mrs. J. Hutchinson.

I. H. Rapp, owner of the Roosevelt group at Silver City, is doing development work. The claims are said to be on same vein as the Paymaster. There are five shafts on the group from 20 to 40 feet in depth and the ore averages $10 per ton.

The owners of the Boston Bucket mine at Central City are preparing for work. The pay streak runs in gold.

Sixty-five men are at work on the mines of the Southwestern C. Co., under management of T. W. Carter. Twenty-five men additional are removing the machinery from the properties of the Pinos Altos G. M. Co. at Pinos Altos, which has been bought by the Burro Mountain C. Co. The grading for the mill is completed and the work of building is under way. A road has been built from Sheridan Camp around St. Louis hill. The double-compartment shaft, which is to be sunk to a depth of 130 feet to make connection with the workings in the St. Louis and Sampson mines, has reached a depth of 50 feet. When completed the shaft will be equipped with cages and other machinery. As soon as the surface improvements are completed, men will be put on to take out ore, and the mill will be started.

Sierra County.

The station on the 200-foot level of the Empire mine at Hillsboro has been completed and sinking resumed. Considerable water has been encountered.——The mill on the El Oro mine at Andrews has been cleaned and is ready to resume operations.

It is expected the Richmond M. Co. will build a 50-ton mill near Hillsboro on its millsite on Percha creek. The company has during the past year shipped $250,000 worth of high-grade ore to El Paso, but the lower grade was kept on the dump and in the workings. This ore runs $4 per ton, and on one dump there are 60,000 tons. The development work on the Richmond continues, the entire development aggregating 7000 feet, with a depth attained of 450 feet.

Taos County.

The Rio Colorado M. & M. Co. has been incornorated to operate at Red River.

Valencia County.

The shaft of the Fourth of July of the Montezuma group at Copperton is down 100 feet on a 6-foot vein of high-grade copper ore, says the New Mexican. A Los Angeles company is 40 feet down on the Compromise and is in ore. F. R. Rogers as well as Eldridge & Richards and others are doing assessment work. A drill hole 400 feet deep on the property of J. L. Leavitt & Co., passed through several feet of copper ore that runs 10%, besides one ounce of gold. An iron ledge in the camp shows gold values.

OREGON.

Baker County.

D. L. Choate says that on the Banzette group of claims, near Greenhorn, of which he is owner, development will be taken up again this week. The Banzette group consists of six claims. About 1500 feet of development work has been done, besides sinking several shafts, and from this development $50,000 is reported to have been cleaned up. The ores from the different veins on the group range from $40 to $60 per ton in gold.

Manager F. T. Kelly's second battery

of steam stamps for the I X L mine at Greenborn is in operation. The additional steam power required is furnished by the Don Juan boiler, placed alongside of the old one. The two batteries do not tax the leaching plant, as it is capable of handling thirty tons. The two batteries handle sixteen tons daily.

Surface improvements are to be increased at the Gold Bug mine, near Sumpter, as soon as snow permits the work, says Manager O. C. Wright. When the other buildings are finished the number of men will be increased and the crosscut hastened to completion, that the vein might be opened on the lower level early in the season. At the same time this work is being done, arraugements will be made for a milling plant.

Development will be resumed on the Grand Union mine, near Sumpter, says G. Barrett, manager. The crosscut will be completed to the Concord vein.

Jackson County.

F. Jordan, of Cottage Grove, operating on Thompson creek, is associated with W. Jordan, of Merlin, and R. Thompson, of Grants Pass. The mine is 1½ mile from Applegate and shows a vein of ore from 8 to 18 inches across, which has been traced for 400 feet and carries values. There are 200 feet of tunnel besides other improvements, and it is the intention of the owners to equip the mine with machinery and develop it during the summer.

SOUTH DAKOTA.

Lawrence County.

The Imperial M. Co., near Deadwood, is arranging for entrance into the McGovern claims through the abandoned workings of the Horseshoe M. Co. on adjoining property. The Horsesboe and other companies owning claims next to the McGovern claims have worked the ore shoots to the boundary line. —— The Oro Hondo Co., near Lead, has been getting ore in the bottom of its shaft at a depth of 900 feet. The property adjoins the Homestake on the south. The shaft is intended for a depth of 1100 feet before any lateral work is attempted.

UTAH.

Beaver County.

C. Rae et al. of Chicago, Ill., who had an option on the Talisman mine, the Roosevelt Hot Springs and other properties near Milford, have bought them. The same men own the Gilt Edge mine in Montana. It is intended, says Manager Rae, to put men at work in the Talisman next week. A hoisting plant will be put in and railroad siding built 3 miles from Solus, and ore shipments started. There are bodies of shipping ore exposed.

Juab County.

The Eagle & Blue Bell shaft, near Eureka, has been finished to a depth of 500 feet below the tunnel, and when the 600-foot level is reached the new boist will be put in position and stoping on the fourth, fifth and sixth levels will start. The management expects to be ready to break ore by July 1st. The compressor, which will furnish air for the hoist and drills, is being set up. It will be driven by electric power.

The Eureka Hill mill, near Eureka, has been cleaned out and will be started up next week. About one-half of the one hundred stamps will be startod on the low-grade ore.

Salt Lake County.

Work on the Flagstaff mine at Alta, which produced ore in the early days, will be resumed this month.

A strike is reported from the Alta-Quincy mine at Alta. A body of ore averaging 11% copper, 30 ounces in silver and $180 in gold per ton is said to have been cut at the contact of the limestone and porphyry formations.

The management of the Yampa mines at Bingham will forward to the furnaces of the Bingham Con. smelter in the valley 200 tons of ore daily while the equipment of its own plant in Bingbam is being completed. Meanwhile the smelter, which has been reducing 175 tons of ore a day, will have its capacity increased and at the resumption at loast 300 tons of ore will be daily reduced. To do this the plant will bo blowu out for about sixty days, says Manager Robinson.

Work was resumed in the Mascot (Dalton & Lark) tunnel at Bingham last week, and it will be extended under the D. & L. incline and into Brooklyn ground. —— A consignment of Utab C. Co. concentrates marketed last week contained 40% copper, $10 gold and 5 ounces silver per ton, according to mill assays, says Superintendent Janney.

Summit County.

J. Allen, T. Bell and A. E. Raleigh have a three-year lease and bond on the Sunrise claim, adjoining the Woodside mine, near Park City and have men at work sinking a shaft.

Tooele County.

Last week the Sacramento mine at Mercur made a sbipment of 350 flasks of quicksilver, worth $16,000. The Sacramento Co. is now a regular producer of this metal. It is also producing its usual output of gold.

WASHINGTON.

Columbia County.

J. R. Tbronson et al. are arranging to operate the Mayflower mine, near Dayton, and will build a mill and cyanide plant.

Ferry County.

(Special Correspondence).—The Republic mill may start up again this summer. The Golden Eagle is sinking. The bottom of the shaft is 80 feet from the ledge. A station has been cut and a cross drift started for the ledge at the 400 level. It is believed that the crosscut will encounter another ledge lying between the shaft and the main or Quilp ledge. It will probably be July 1 before either of the ledges is cut.

The Quilp mine is still closed. The Knob Hill is stoping and driving on the 230-level. A winze is also being sunk at that level. The ore is of good shipping grade and maintains its width of from 7 to 8 feet. It will resume shipping next week.

Republic, May 1.

The House of Representatives at Washington last week passed a bill to permit the Keller & Indiana Con. S. Co. to construct a smelter near the San Poil river, near Keller, and build a flume, and grants the company six acres of landsite for the smelter and a strip of land of sufficient width for the flume. This company must pay the Colville Indians for the privileges thus granted.

Kittitas County.

A smelter and other equipment will be installed by the Gallagher M. & M. Co. in Cle Elum district, near Roslyn.

Stevens County.

The Paragon M. & Dev. Co. of Spokane has bought the Lucky Boy mining claim for $10,000. The Lucky Boy lode is 5 miles south of Boundary City, and was formerly the Bald Eagle claim. The Paragon company has taken charge and will put men at work taking out ore for shipment.

Whatcom County.

J. Siegfried of Bellingham, president of the North American M. Co., says the company's stamp mill will be increased from ten to fifty stamps.

WYOMING.

Bighorn County.

Prospectors are going to the canyon of the Shoshone river, 5 miles west of Cody, where it is reported telluride ore assaying in gold and silver has been found. All available ground for several miles up and down the river from the scene of the reported discovery has been located.

FOREIGN.

AFRICA.

Rhodesia.

The Rhodesian Chamber of Mines reports the following analysis of gold production for month of February: Matabeleland, 19 mines (336 stamps); Mashonaland, 6 mines (78 stamps); total, 25 mines (414 stamps).

	From Mill. Ozs.	Dwts.	Tailings. Ozs.	Dwts.
Matabeleland	14,079	2.03	1,261	6.00
Mashonaland	2,396	11.29	250	0.00
Totals	16,466	13.32	1,511	6.00

	Concentrates. Ozs.	Dwts.	Other Sources. Ozs.	Dwts.	Total. Ozs.	Dwts.
Matabeleland	....	....	149	11.16	15,480	19 19
Mashonaland	545	18.00	....	....	3,192	9.29
Totals	545	18.00	149	11.16	18,673	8.48

SUMMARY OF PRODUCTION.

Gold—	Value.
From mill	£59,846
From concentrates	2,111
From tailings	4,754
From other sources	517
Total	£67,228
Other Metals—	
Silver	3,461 ozs.
Lead	29 tons

Transvaal.

Tho Transvaal Chamber of Mines at Johannesburg reports tbe figures for tbe gold output of 1904 to April 1st:

	Witwatersrand. Ozs.	Outside Districts. Ozs.	Total. Ozs.
January	278,867	9,957	288,824
February	282,436	7,066	289,502
March	299,625	8,617	308,242
Totals	860,928	25,640	886,568

AUSTRALIA.

Queensland.

The Lancelot Freehold Tin & Copper Co., at Newellton, reports during March eighteen tons of 65% tin-bismutb ore were produced and twenty-five tons shipped. Tbe 5-stamp mill is becoming defective. The mine is looking well. There is a supply of ore to provide for the 20-stamp mill in course of construction. Tbe main sbaft has been sunk to a depth of 250 feet. The lode improves with sinking. The lode in the end is 5 feet wide, and carries 15% tin oxide. G. Waller is manager.

The Mount Morgan G. M. Co., at Mount Morgan, reports March results: Tons chlorinated, 20,636; gold returned, 9618 ozs.

Western Australia.

The following tablo of working costs has been compiled by W. Sutberland of tbe Golden Horseshoe M. Co. at Kalgoorlie, based on tbe latest annual reports of tbe leading mines, and sbows tbe last year's total costs:

Company.	Cost Per Ton.	Cost Per Ounce Extracted.
Associated Northern	$32 44	$ 8 11
Oroya-Brownhill	24 43	11 52
Lake View Consols	18 15	14 87
Golden Horseshoe	16 81	9 74
Kalgurli	16 47	14 65
Boulder Main Reef	15 93	17 23
Great Boulder	13 14	8 21
Great Fingall	11 94	7 19
Westralian Mount Morgan	11 90	11 92
Cosmopolitan	11 60	13 20
Boulder Perseverance	10 96	7 13
Ivanhoe Gold Corporation	10 82	10 02

Under bead of working expenditure are included development, diamond drilling, ore reduction, depreciation, maintenance and management expenses (in fact all expenditure incurred in Western Australia).

The Ivanboe G. Co., at Kalgoorlie, reports output for month of March: 14,400 tons of ore crushed, yielded 3238 ozs. (100-stamp mill running 30 days 1 hour); 7430 tons of sand treated, yielded 2337 ozs.; 6100 tons of slimes treated, yielded 2552 ozs.; 880 tons of concentrates troated, 2347 ozs.; 320 tons of telluride ore treated, yielded 436 ozs. Total, 14,720 tous (2000 lbs.) yielded 10,910 ozs. fine gold. Expenditure: Working expenses (= 23s 2d per ton), £17,100; mine development, £4300; machinery and plant, £500. Estimated profit for month, £22,995. Total estimated profits from January 1 to March 31, 1904, £64,955. Expenditure on new plant, etc., from January 1, 1903, to February 29, 1904, £51,190: ditto, during Marcb, 1904, £3800. Total, £54,990.

Tbe Chamber of Mines at Kalgoorlie reports that the scale of wages fixed for the Kalgoorlie field by the Court of Arbitration in September, 1902, will, by agreement, be continued for eigbteen months from April 1st, with the following exceptions: The hours of labor underground will be forty-seven per week; mechanics and laborers will receive 11s per day; oilers will receive 10s 6d per day; riggers will receive 11s 8d per day.

BRAZIL.

Tbe State Government of Minas Geraes has abolished the direct tax on diamonds, which are now free of duties, whetber cut or uncut, says the Brazilian Mining Review. A system of claim taxes, more easily applied and causing less annoyance, as well as being impossible to evade, bas been substituted.

Tbe President of the State of Rio de Janeiro has issued a decree fixing tbe duties payable on monazite mined on State lands at 20%. The deposits are at Saquarema and Safrucaia.

The statistical returns of tbe Bureau of Statistics of Brazil for 1903 give the export of gold in bars at $3,846,324 or £192,316. and that of manganese at $1,966,792, or taking the Minas Geraes official value of $20 per ton as a basis, 98,340 tons. The average output of tbe S. Joao d'El-Rey Co. is said to be £250,000 per annum.

BRITISH COLUMBIA.

A number of American companies have acquired deposits of free-milling ore on Siwash creek, 6 miles from Yale, and since coming into possession a year ago they bave made important improvements in the district. They placed a cable across the canyon of the Fraser river, built a 4-mile trail at a cost of $5000 and have landed fifty tons of macbinery via the Canadian Pacific Railroad at tbat point, ferried it across the river and are transporting this machinery to the mines on Siwash creek. I. L. Cole will start erection of this 10-stamp mill this week.—— There are tbree American companies on this creek, including the Mount Baker & Yale M. Co., composed of Bellingbam, Wash., men. The ore body at tbis point consists of three parallel dykes, and in each is exposed a body of free-milling ore. They will put in forty stamps.——The International M. Co. is putting in a 5-stamp mill on its claim adjoining the Mt. Baker & Yale and is also putting up two hydraulic giant plants. H. Sayers of Seattle, Wash., will put in two hydraulic pumps in Hill's Bar, and Mr. Stanazloski will put in 2 miles of flume to work Boston Bar. Other smaller workings will be taken up.

Rossland District.

The Le Roi mine at Rossland, says Manager J. Mackenzie, shipped to the company's Northport, Wash., smelter during the month of March 21,545 tons of ore, containing, according to smelter assay (which is below mine assay), 7425 ounces of gold, 11,200 ounces of silver and 548,700 pounds of copper.

Slocan District.

G. D. Potter et al. of Spokane, Wasb., and W. E. Zwickey of Kaslo bave bought tbe property of the Queen Bess Proprietary Co. comprising tbe Queen Bess, American Girl, Mentor, First Extension, Young Dominion, Concord and six fractional claims above tbe Alamo concentrator, near Three Forks, near Kaslo. Tbey bave organized the Queen Dominion M. Co., Ltd. Tbere are known to be tbree leads on the Queen Bess ground. Tbe lead ou tbe Idaho is said to strike into tbe property and outcrops at two or three places. The bulk of the values bave been taken out of lead A, on which 3000 feet of work bas been done in tunnels, crosscuts, etc. A small amount of work has been done on load C. Potter & Zwickey are driving a tunnel to tap lead B, on whicb there has been no work done. Ore shipped from the Queen Bess has averaged 100 ounces in silver with 50% lead. The owners bave granted a loase of a block of ground embracing part of tbe old workings to McDonald Bros., who have started to open up some of their drifts. There is a warebouse at the Alamo siding, on the Canadian Pacific Railway, to whicb point ore can be brought by wagon or over the Alamo gravity tram by arrangement with that company.

Vancouver Island.

The new owners of the Britannia C. Co. mine at Howe sound have organized tbe Howe Sound Co. with the following directors: E. Dewdney, G. H. Robinson, F. M. Leonard, C. H. McMeekin, D. G. Marsball, H. C. Bellinger and J. W. Lee. Tbe second vice-president and manager at Vancouver is F. M. Leonard, and managing director, G. H. Robinson. Tbey are preparing to equip the mine on a shipping basis. Plans for the contemplated works are completed. It is estimated that wben the plans are carried out there will be a daily output of at least 500 tons. Tbe capacity of the tram will be 2500 tons of ore per day of twenty-four bours, but at the start it is not expected more than from 500 to 1000 tons of ore will be handled over it. As the line is located the tram will be about 3½ miles in length. A wbarf will be built at tbe water front. The output will be in the meantime shipped to Crofton smelter. Later a concentrating works may be established on Howe sound for preliminary treatment of tbe ore.

Tbe Tyee C. Co. at Ladysmith during month of March reports following smelter returns: Smelter ran twenty-one days; 4701 tons of Tyee ore smelted, giving a return, after deduction of freight and refining charges, of $55,565.35.

West Kootenay District.

With completion of the Great Western silver mill at Five Mile, which will be put in operation next week, the silver and gold ores of the Silver Cup and Nettie L mines, near Ferguson, will be reduced to bullion. The mill is of twenty stamps.

CANADA.

Ontario.

Manager E. Hall of the Gold Standard mine, near Wabigoon, reports satisfactory progress in tbe lower workings of company's property on Nelson bay. From the crosscut at the 80-foot level 116 feet have been drifted, tbe ore maintaining high grade throughout. Until navigation opens this portion of development will be continued, when sinking below the 140-foot level will be resumed.

A. B. Hermann, manager of the Redeemer M. & M. Co., near Dryden, is arranging for building a 10-stamp mill on the lake front this spring.——At the Gold Coin M. & M. Co.'s property, near Dryden, Hutchinson Bros. have done considerable surface work in the way of clearing the ground and erecting camp buildings preparatory to starting mining operations.

The 60 H. P. boiler, 3-drill air compressor and other machinery for the Little Master mine, near Wabigoon, are on the ground. says Manager Halsted.—— Samples of ore containing visible gold bave been obtained at the Baden Powell property, near Eagle lake, of which J. Higbee is manager. These samples were obtained from the north and south drifts and the vein is said to be 3 feet wide.

Yukon Territory.

Miners working in the paystreak of an ancient river channel, 38 feet below tbe surface of the ground, where the frost is practically permanent, found last week tbe complete form of a mastodon at Hillside, opposite No. 5 below A. Mack's dis-

covery on Quartz creek, near Dawson. The flesh of the animal was partially decomposed, but the hair and skin remained intact. Owing to the frozen ground the work of excavating was difficult, and it was only by the use of steam thawing plants that it was completed. The tusks of the animal are intact.

MEXICO.

It is reported that for the eight months ending March 1, 1904, Mexico bought from the United States electrical machinery of $333,027 value.

Aguas Calientes.

G. A. Marquez is preparing to open up an iron mine near Aguas Calientes.

A group of copper properties near Topezala have been taken over by A. Cruz, and he will start development this month.

The American S. & R. Co. is making additions to its plant at Aguas Calientes. New furnaces are being built. The company employs 1564 men at that point and has an annual payroll there of $700,000.

Chihuahua.

There are fourteen diamond drills in the Santa Eulalia camp in operation on nine different properties.

The Terronates Con. M. Co., operating in Parral, has been reorganized as the United States M. Co., and J. P. Elkin of Pennsylvania is president, with J. W. Marshall as manager. The 600 H. P. electric plant is up and in operation. The power is used for lighting and hoisting and later will be applied to the pumps. The stationary pumps are on the ground and the others are to arrive.

D. R. Jackson, manager of the Santa Eulalia Exploration Co., has boilers and heavy hoisting machinery and air compressors and drills on the ground for the company's mines at Santa Eulalia.

In the district of Hidalgo, which includes Parral, Minas Nuevas and Santa Barbara, and the district of Jimenez, there are 1200 different mining properties or denouncements paying taxes to the Federal government, says the Chihuahua Enterprise. The last named district includes the new district of Sierra Almaloya.

An electric plant of 100 H. P., with a 150 H. P. gasolene engine to generate electricity, is being installed for the Alferencia mine of the company that owns the San Francisco del Oro mine at Santa Barbara. The plant is to furnish power for hoists, pumps, drills and lights.

The Tecolotes M. Co. at Santa Barbara has resumed development work while waiting arrival of electric machinery which is to be used for generating power for the 450-ton concentrating plant. The mine and mill have been closed down for several weeks to substitute electric power for the gas engines which have been in use heretofore.

G. C. Beckman of Parral, A. Longere and A. G. Galan have bought 55,000 acres of land near Sabinas and have started prospecting for coal under encouraging circumstances. The lands are 10 kilometers from the Mexican International railroad. The coal is said to be of coking qualities. The owners are sinking three prospecting shafts. One shaft is 20 meters deep and shows a vein 3 feet thick. They also have three diamond drills at work.

Durango.

The Velardena M. & S. Co.'s property, near Velardena, has been bought by the Guggenheim Exploration Co. on a valuation basis of $10,000,000 gold, the Guggenheim Exploration Co. acquiring a 60% interest in all the company's holdings, paying $5,000,000 in cash and guaranteeing to expend $1,000,000 more in improvements and developments. The other 40% is held by the Velardena Co., in which F. W. Nash, M. Dahlgren, C. Wilhelm and the estate of J. N. Matthews are stockholders. The mining claims comprise 6000 acres.

The Torreon smelter will build roasters at its plant in Torreon for treatment of the ores of the San Francisco del Oro mine in Santa Barbara district of Chihuahua. The smokestack of the smelter at Torreon, which is 235 feet high, has been finished and another 100-ton furnace is in process of construction.

Guanajuato.

W. H. McCord of Guanajuato and L. M. Fairbanks of Chicago, Ill., have bought the Peregrino and the Tajo de Dolores mines, near Guanajuato. They propose to build a mill and cyanide plant at the Peregrino mine to be run by electricity.

The Guanajuato Power & Electric Co., owned by Bonbright & Co. of Colorado Springs, Colo., has been merged into a new corporation, known as the Guanajuato R. & M. Co. The officers are C. L. Kurtz, H. Hine, L. E. Curtis and I. Bonbright. The power company last November completed the erection of a plant and transmission line in Guanajuato district at a cost of $1,500,000.

Jalisco.

N. Z. Seitz of Philadelphia, Pa., vice-president and manager of the Central M. Co., says he will put in machinery at their mines, near Ixtlan del Rio, and begin development.

A lead mine on Cuyutlan hacienda, near Mascota, will be developed by F. Mendez.——F. Hernandez has a gold and silver group, near Navidad, which he will develop.——A. Quesada has bought the Santa Isabel silver mine, near Ojuelos, and will start development this month.

Near Lagos, E. A. Durst and M. A. Algelt, of Irapuato, are preparing to develop cinnabar deposits.

Lower California.

It is reported the Evangelina Copper Co. has struck a 5-foot vein of copper glance on its property near San Julio. Manager Wilder of Los Angeles, Cal., has men doing development work on the mine.

Mexico.

A 100-stamp mill will be built at El Oro by El Oro M. Co. In same camp the Dos Estrellas M. Co. also proposes building a mill.

Nuevo Leon.

The Compania Minera de Naica, owning the San Pedro mine at Naica, has its 16-mile narrow gauge railroad in operation and a train of eight cars making three trips with ore every day. The cars are of two tons capacity, but the carbonate ore being shipped runs a little over a ton and a half to the car. Smelter No. 2 of Monterey is still shipping from the district and is hauling ore by wagon to Conchos station on the Mexican Central. Four or five companies are operating in the district.

Oaxaca.

The Escuadra M. Co. is working a property on Escuadra mountain in Taviche camp of Ocotlan district. The mine is well equipped with machinery and compressed air plant for drills. W. J. Cartin of New York is president of the company and E. G. Hart is manager.

La Providencia mine, C. A. Hamilton, Jr., manager, is preparing to build a 50-ton mill.

Sinaloa.

Deposits of gold are reported found at Choix and prospectors are going to the district.

Sonora.

The Gold Coin M. Co. at San Javier has completed and blown in its smelting furnace at the Santa Rosa mine.

The reduction plant of the Yaqui S. Co. at Toledo is running and shipments of lead and silver bullion are being made.

The Hayes Con. M. Co., near Casita, is preparing to add a cyanide plant to its 20-stamp mill, which is under construction.

J. R. De Lamar of New York has an option on the Anita copper mines near Alamos, in southern Senora. T. Douglas is in charge of the mines and has started development.

NEW ZEALAND.

The mine development and dead work carried out at the Waihi mine, at Waihi, during the past year, says the Mines Record, was equal to about 3½ miles, as follows:

	Feet.
Crosscuts through country	3,733½
On course of lode	8,563½
Crosscuts in lode	530
Winzes sunk	5,921
Shafts sunk	289
Total	19,017

The total product from the mine was 214,508 tons, nearly one-half of the ore having been obtained from the Martha reef and a quarter from the Empire reef. The ore, the whole of which was wet-crushed, yielded 677,873 ounces of bullion, valued at £519,445. This was exclusive of concentrates and slag tailings, about 1785 tons of which were shipped for treatment, and gave assay value of £82,402 for concentrates and £1320 for slag tailings. Total value of ore treated, £603,167. Average value of bullion was somewhat lower than in year 1902, but a better extraction of silver was obtained. Twenty-eight vanners are in use and five filter presses.

W. T. Glasgow, secretary of the New Zealand Department of Trade and Customs, reports the following comparative return for the years ended December 31, 1903 and 1902:

	1903		1902	
Districts.	Quantity. Ozs.	Value. £	Quantity. Ozs.	Value. £
Auckland	232,681	832,334	201,583	721,977
Marlborough	972	3,845	601	2,404
Nelson	7,962	31,710	5,947	23,649
West Coast	125,241	501,090	118,796	475,272
Canterbury			2	7
Otago	166,458	668,852	181,116	728,124
Totals	533,314	2,037,831	508,045	1,951,433

TASMANIA.

The Briseis Tin Co.'s Melbourne office reports for period ending March 31: Black tin cleaned up, 35 tons (February 35 tons 13 cwts.). Average total sluiceheads of water available from all sources, 149 (February 145). Rainfall during period, 126 points (February 947). Overburden removed, 45,800 cubic yards, in addition to 15,501 from No. 1 Co. (February, Briseis 44,930, No. 1 Co. 13,000). Drift sluiced, 13,400 cubic yards.

The Mount Zeehan Co., at Zeehan, output for month of March amounted to 375 tons of silver-lead ore, containing 206 tons of lead and 30,000 ozs. of silver.——The Zeehan-Montana Co.'s output for March amounted to 245 tons of silver-lead ore, containing 147 tons of lead and 20,000 ozs. of silver.

Personal.

G. A. PACKARD is examining mines at Baker City, Or.

W. A. DOBLE of San Francisco, Cal., is in St. Louis, Mo.

J. C. HULL is manager of the Torpedo mine near Idaho Springs, Colo.

THOS. J. BARBOUR returns next week from London to San Francisco, Cal.

W. C. RALSTON has returned to San Francisco, Cal., from an Idaho visit.

JAMES LAWLER, a mill builder of Deadwood, S. D., is in San Francisco, Cal.

GEO. S. RAYMER is now assistant mining professor at Harvard University.

R. GUENTHER is manager of the Martha Washington mine, near Eureka, Utah.

O. J. DUFFIELD of Rollinsville, Colo., is manager of the Happy Hollow group of mines.

B. E. SHEAR of Denver, Colo., is in Tonopah, Nev., where he has mining interests.

K. E. KELLER is now superintendent of the Pan-American M. Co. at Guadalajara, Mexico.

C. P. CRAWFORD of Santa Rita, N. M., is in San Francisco, Cal., on mining business.

CHAS. W. PAULY has resigned the receivership of the Free Gold Mining Co., Hedges, Cal.

W. E. THORN has returned to Denver, Colo., from mine examinations in southwest Colorado.

G. W. MILLER, Denver, Colo., is examining mining property in the Silverton, Colo., district.

R. HERRON of Los Angeles, Cal., interested in oil properties, is in San Francisco, Cal., on business.

THOS. B. COE has resigned the superintendency of the Magnolia mine, Miller Mountain, Idaho.

O. J. MCSORLEY of San Andreas, Cal., interested in Calaveras county mines, is in San Francisco, Cal.

W. J. BARNEY succeeds Percy Williams as superintendent of the Imperial mine, Tucson, Arizona.

F. OLIVER is general superintendent of the mines of the Waldorf M. Co., near Georgetown, Colo.

GEO. JOHNSTON, proprietor Johnston Concentrator, has returned from Arizona to San Francisco, Cal.

F. C. FINKLE, chief engineer of the Edison Electric Co. of Los Angeles, Cal., is in San Francisco, Cal.

ARTHUR WEST has resigned as assistant to the chief engineer of Allis-Chalmers Co., and goes to Europe.

A. P. SMITH of Sumpter, Or., has resigned as superintendent of the Victor mine, Baker county, Or.

G. CHURCHILL is superintendent of the Happy Hollow group of mines, near Rollinsville, Gilpin county, Colo.

O. H. FAIRCHILD AND C. E. BRAINARD have removed their offices to 202 Mining Exchange building, Denver, Colo.

H. W. TURNER of San Francisco, Cal., has gone to Seven Devils district, western Idaho, to make mine examinations.

T. CLARK of Placerville, Cal., superintendent of the River Hill mine, is in San Francisco, Cal., on mining business.

J. NEWELL, manager of the Fryer Hill M. Co., Leadville, Colo., is also manager of the Fortune mine for J. McNeece.

V. H. ROOD, vice-president and general manager of the Jeanesville Iron Works, Jeanesville, Pa., is visiting California.

T. DOUGLAS is superintendent of the Anita copper mines, near Alamos, Sonora, Mex., for J. R. de Lamar of New York.

F. L. SIZER has returned to Montana from New York and has assumed the management of the new Whitlatch Mining Co., which will operate in the vicinity of Helena.

J. W. CULBERTSON, interested in oil properties at Coalinga, Fresno county, Cal., is in San Francisco, Cal., on business.

S. B. WELD of the firm of Parmlee & Weld, chemists and assayers, Denver, Colo., has returned from Albuquerque, N. M.

C. F. GODDARD of Prescott, Ariz., has taken charge of the properties of the Goddard M. Co., near Wickenburg, Ariz.

G. SNYDER of the Western Exploration Co., operating the Balaklala copper mine at Kennett, Shasta county, Cal., is in San Francisco, Cal.

JESSE J. MACDONALD of Los Angeles, Cal., is examining the Mendoza mines, La Paz, Baja California, with a view to the use of cyauiding.

ROBT. L. WARNER has been appointed New England manager Westinghouse Electric Manufacturing Co., with headquarters at Boston, Mass.

W. B. DEVEREUX of Colorado Springs, Colo., consulting engineer for the Melones M. Co., operating in Calaveras county, Cal., is in San Francisco, Cal.

P. E. MURRAY, manager of the Humboldt M. Co., operating in Santa Cruz county, Ariz., returned to Nogales, Ariz., last week from San Francisco.

W. GLEASON has resigned as mill foreman at the Gold Reef mine near Gilt Edge, Mont., and has gone to Seattle, Wash. P. Burchie succeeds him.

J. L. PARKER goes as superintendent of the Brown Alaska Copper Co., Ketchikan, Alaska, where Paul Johnson is building a smelter for that company.

C. DE KALB, superintendent of the Exposed Treasure M. Co., has returned to the company's mines near Mojave, Kern county, Cal., from San Francisco, Cal.

G. WALLER, Tasmanian government geologist, is manager for the Lancelot Freehold Tin & Copper Co., operating near Newellton, Queensland, Australia.

J. DERN of Salt Lake City, Utah, president of the Mercur G. M. Co., returned there last week from an examination of mines in Mexico in which he is interested.

J. H. FENNESSEY, president, and A. H. Seep, vice-president, of the Mine & Smelter Supply Co., Denver, Colo., have returned there from the City of Mexico.

MANAGER BORCHERDT of the Colorado Tellurium G. M. Co., operating the Freedom and other mines, near Central City, Colo., is in the East on company business.

GEO. S. BINCKLEY, engineer in charge of the Puyallup River Power & Development Co., has returned from San Francisco, Cal., to his headquarters at Electron, Wash.

L. CUMMINS will resign the superintendency, metallurgy and milling, American Copper Co., Blanchard, Ariz., May 10th, and will open engineering offices in San Francisco, Cal.

H. I. SEEMAN, president of the Yankee Con. M. Co., at Yankee, Clear Creek county, Colo., returned there last week from an Eastern trip and has taken charge of the company's mines.

CHAS. H. FARROW, mill superintendent for the San Rafael M. Co., Ameca, Jalisco, has resigned and taken a similar position with the Keystone Copper Smelter Co., Tapalpa, Jalisco, Mexico.

R. E. DOUGLASS, late manager of the Choix Con. M. Co. at Choix, Sinaloa, Mexico, has taken the position of assistant consulting engineer of the Rhodesia Goldfields at Bulawayo, South Africa.

E. L. DUFFOUR has resigned as manager of the Montezuma Lead Co., at Santa Barbara, Chihuahua, Mex., and has gone to New York City, where he will open an office as consulting mining engineer.

J. A. DIGGLES has resigned as metallurgist for the Melones M. Co. at Melones, Cal., and has gone to Leonora, Western Australia, to take charge of a 60-stamp mill and reduction works for Bewick, Moreing & Co.

GEO. D. JAMES, mining engineer, Denver, Colo., has returned there from Boulder and Gilpin counties and will leave shortly for Sonora and Chihuahua, Mexico, to investigate some properties for Kansas City men.

H. S. WATERMAN of Berkeley, Cal., has received the appointment of resident engineer of the Northeastern Siberian Co., which has mining interests in Siberia. He will leave for the trading post of the company at St. Nicholas in June.

J. M. GARRISON, for several years fore-

man at the works of the North American Dredging Co., at Breckenridge, Colo., and later at the property of the Nevada C. Co., at Lovelock, Nev., has taken charge at the Athens gold mine in Rhodesia, South Africa, one of the properties being developed by T. F. Van Wagenen, consulting engineer of the Rhodesia Goldfields.

LAFAYETTE HANCHETT of Idaho Springs, Colo., manager of the Newhouse tunnel, has been appointed general manager of all the mining properties, mills and reduction works owned by S. Newhouse in Colorado, Utah and Montana. He will remove to Salt Lake City, Utah, July 1st, where he will establish permanent headquarters. He is credited with having an annual salary of $25,000.

THE following officers have been elected by the Canadian Mining Institute for the ensuing term: President, Eugene Coste, Toronto; vice-president, E. B. Kirby, Rossland; treasurer, J. S. Brown, Montreal; members of the council, J. M. McEvoy, Fernie; W. F. Robertson, Victoria; A. W. B. Hodges, Granby; W. G. Miller, Toronto; R. G. Leckie, Sudbury; J. Blue, Eustis; F. D. Adams, G. Fraser, North Sidney. The death of B. A. T. Bell was so recent that under the constitution it was impossible to elect another secretary, but the council will appoint one.

Commercial Paragraphs.

F. A. EARLS, Boston Block, Denver, Colo., is manager Dearborn Drug & Chemical Works of Chicago, Ill.

THE Gardner Electric Drill & Machinery Co., Denver, Colo., branch has recently shipped a complete plant, comprising generator, drill, engine, blower, etc., to the Stony Pass Mining Co., Silverton, Colo., and a drill equipment to the Golden Link Mining Co., Hillside, Ariz.

ABBOT A. HANKS AND FRANCIS L. BOSQUI have established in San Francisco, Cal., metallurgical and engineering offices, in conjunction with ore testing works, at 531 California street, and will make working tests on ores, devise methods of treatment, and design and install milling plants.

THE Broderick & Bascom Rope Co., 805 N. Main street, St. Louis, Mo., have issued a complete and authentic vest pocket map of the World's Fair as an aid to visitors to the fair, showing the methods of reaching the fair from any point in the city, location of all buildings and other points of interest on the ground, etc., a copy of which will be mailed free upon receipt of a 2-cent stamp for postage.

CROCKER-WHEELER CO., manufacturers of electric generators and motors, will on May 10th open a branch office in the Hibernia Bank Building in New Orleans, La. Mr. W. P. Field of the St. Louis office of the company, will be the representative in charge. There are fifteen Crocker-Wheeler branches from Boston to San Francisco, including St. Louis and Atlanta, but the company states the establishment of this new office has become necessary to accommodate the steadily increasing market for electric machinery in the South and Southwest.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAPPED BOTTLE OPENER AND TEMPORARY CLOSURE.—No. 758,235. April 26, 1904. Charles Cady, Berkeley, Cal. This invention relates to a combined opener and stopple for soda bottles, beer bottles and the like. Its object is to provide a simple device for removing the metal sealing caps from bottles, at the same time affording means for interengagement with the external annular flange on the bottle neck to close the bottle and render it air tight, in order to preserve the unused contents of the bottle.

HERMETICALLY SEALED METAL BOXES.—No. 758,255. April 26, 1904. S. Jacoby, San Francisco, Cal. This invention consists in the employment of a plurality of overlapping hermetically sealing covers soldered to the top of the can and normally covered and protected by what is known as a "slip cover," these slip covers being so disposed as to be successively removed for the purpose of obtaining access to the contents of the box.

GARMENT SUPPORTER.—No. 758,201. April 26, 1904. F. S. Boedefeld, San Francisco, Cal. One-half assigned to Wm. L. Spencer of same place. This invention relates to a device for supporting hose and other garments. It is also applicable to corsets and may be used for all purposes where a garment-supporting device is required. It consists essentially of a loop or link having a coating of yielding material, the upper ends of said loop being made divergent and slidable in a corresponding guide, so that when tension is brought upon the article supported by the loop it will also act to contract the loop and cause it to bind upon the button or part with which it is connected. There is also means for locking the loop in its extended position.

Latest Market Reports.

SAN FRANCISCO, May 6, 1904.

METALS.

SILVER.—Per oz., Troy: London, 25½d (standard ounce, 925 fine); New York, bar silver, 54⅝c, refined (1000 fine); San Francisco, 54⅝c; Mexican dollars, 44½c San Francisco, 43½c New York.

COPPER.—New York: Standard, $13.50; Lake, 1 to 3 casks, $13.50@13.67½; Electrolytic, 1 to 3 casks, $13.25; Casting, 1 to 3 casks, $12.87½; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £58 6s 3d spot per ton.

LEAD.—New York, $4.65; Salt Lake City, $3.50; St. Louis, $4.25 San Francisco, $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5¾c; pig, $4.85. London: £11 12s ℔ long ton.

SPELTER.—New York, $5.25; St. Louis, $5.00; London, £22 7s 6d ℔ ton; San Francisco, ton lots, 6¾c; 100-lb. lots, 7c.

TIN.—New York, pig, $27.95@28.12½; San Francisco, ton lots, 29½c; 500 lbs., 30c; 200 lbs., 30½c; less, 31c; bar tin, ℔ lb., 32½@35c. London, £127 5s spot.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $19.00 ℔ Troy oz. Platinum ware, 75@82c ℔ gram.

QUICKSILVER.—New York, $45.50@46.50, large lots; London, £8 5s 0d; San Francisco, local, $43@44 ℔ flask of 76½ lbs.; Denver, $46.00. Export, $43.00@43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 19.00c; San Francisco, Plumbers', 100-lb. lots, 16.50c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb., .04c.

NICKEL.—New York, 50@60c ℔ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $14.00@14.35; gray forge, $13.00; San Francisco, bar, 3c ℔ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $23.00@23.00; open hearth billets, $23.00@23.00; San Francisco, bar, 7c to 12c ℔ lb.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4 and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $1.25 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $2.15@2.65 ℔ bbl.; California carload lots, $2.10 f. o. b. at works; small lots, $2.45 ℔ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7¾c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11¼c ℔ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.20@1.40 ℔ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3½c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

BONE ASH.—Extra No. 1, 5@6c ℔ lb. No. 1, 4@5c.

OILS.—Linseed, boiled, bbl., 49c; cs., 54c; raw, bbl., 47c; cs., 52c; Lucol oil boiled, bbl., 44c; cs., 49c; raw, bbl., 42c; cs., 47c. Kerosene—Pearl, per gal., 20½c; Astral, 20½c; Star, 20½c; Extra Star, 24½c; Eocene, 25½c; Elaine, 26½c; Water White, in bulk, 14c; Mineral Seal, iron bbls., 19c; wooden bbls., 21½c; cs., 25c; Mineral Sperm, cs., 26½c.; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E W. S., bbl., 85c; cs., 90c; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crude, 60@65c; Natural White, 70c; Bleached, do., 80c; Whale Oil, cs., 50@55c.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.00; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $11.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $11.50, long ton.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb., 7c; less than 500 lbs., 7¼c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ℔ lb.

BORAX.—Concentrated, 6@7c ℔ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANCANESE.—Pure, ℔ lb., 60c.

SODIUM.—Metal, ℔ lb., 50c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.00 ℔ lb.

CHROMIUM.—90% and over, ℔ lb., $1.00.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ℔ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Trade Treatises.

Circular No. 52—B, from the Sullivan Machinery Co., Chicago, Ill., is the avant courier of Catalogue 53, illustrating and describing the Sullivan air compressors and rock drills, going into the subject in detail. A copy of No. 52 or No. 53 will be sent anywhere on request.

"Electric Mine Locomotives," from the power and mining department of the General Electric Co., Schenectady, N. Y., is a fine illustration of the present state of the art in that line and gives in its 70 pages much of value and interest in connection therewith.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING APRIL 26, 1904.

758,291.—SPINNING TOP—F. Ansley, Spokane, Wash.
758,292.—LOOSE LEAF LEDGER—H. W. Ayers, Los Angeles, Cal.
758,042.—WOOD CUTTING MACHINE—A. A. Bartlett, S. F.
758,500.—BUILDING CONSTRUCTION—G. A. Behrud, S. F.
758,201.—GARMENT SUPPORTER—F. S. Boedefeld, S. F.
758,046.—FENCE—G. Bronson, Seattle, Wash.
758,235.—BOTTLE OPENER—C. Cady, Berkeley, Cal.
758,298.—BOTTLE—D. S. Cooke, Los Angeles, Cal.
758,203.—BEEHIVE—H. Davenes, Sierra Madre, Cal.
758,241.—HARVESTER REEL—Friend & Bolton, Kingsley, Or.
758,356.—DRIVING BELT—A. Fritz, Portland, Or.
758,438.—CONCENTRATOR—L. C. Graupner, S. F.
758,530.—BOX COUCH HINGE—C. W. Gross, S. F.
758,206.—OIL BURNER—Grundell & Tucker, S. F.
758,209.—TIRE—A. Hendey, Jerome, Ariz.
758,255.—METAL BOX—S. Jacoby, S. F.
758,367.—EXTRACTING METALS—T. B. Joseph, S. F.
758,200.—GRIPPING DEVICE—F. H. Lamb, Hoquiam, Wash.
758,583.—BOTTLE—G. W. Lovejoy, Tehachapi, Cal.
758,263.—RIVETING MACHINE—M. C. Macbado, Morro, Cal.
758,375.—UNDERGARMENT—G. A. Mattern, Berkeley, Cal.
758,271.—BUCKET DUMPER—J. McKinnon, Prescott, Ariz.
758,461.—TRACK GAGE—A. P. Nichols, Tacoma, Wash.
758,462.—TRACK CLAW—A. P. Nichols, Tacoma, Wash.
758,215.—MATCH SAFE—Sarah Quee, Pasadena, Cal.
758,600.—TOWEL RACK—S. A. A. Stenberg, S. F.
758,224.—OIL BURNER—Tucker & Grundell, S. F.
758,578.—MECHANICAL MOVEMENT—F. A. Yokoum, Seattle, Wash.

Dividends.

The Bunker Hill & Sullivan M. & C. Co. paid dividend No. 79 ($60,000) on the 4th inst., a total paid since Jan. 1, 1904, of $213,000 and a total to date of $1,739,000.

SITUATIONS WANTED.

ANALYTICAL CHEMIST AND ASSAYER DESIRES position with a reliable company. Address "Analyt. Chemist," this office.

ASSAYER AND CHEMIST DESIRES POSITION at mine, mill or smelter. Is competent. State salary when writing. Address C. A., this office.

ASSAYER, WITH KNOWLEDGE OF BOOKkeeping, wants position with mine or mill. Address J. L., this office.

ASSAYER AND CYANIDE MILL MAN DESIRES position with established company. Address "Assayer," care Mining and Scientific Press.

EXPERIENCED ASSAYER AND CHEMIST DESIRES change of position by May 1st, preferably with smelting company. At present employed in Mexico. Best of references. Address E.T.A., care this office.

EXPERIENCED SUPERINTENDENT, ENGINEER, Metallurgist; technically and liberally educated; 15 years handling men and machinery of smelters, mills and mines. See testimonials. Address Prof. Stickney, Mountain View, Cal.

YOUNG MAN, A LICENSED SURVEYOR, wants position—field or office. Address J. P. Ryan, St. John Cal.

WANTED.

WANTED—TO CONTRACT HAULING OF 15 tons daily of matte from Takilma to Crescent City; 10 tons coke daily Crescent City to Takilma. Distance about 50 miles. To commence about July 1st. Will guarantee tonnage sufficient to warrant reliable parties to bring in outfit. Also require guarantee of fulfillment of contract. TAKILMA SMELTING CO., Albert I. Goodell, Mgr., Takilma, Josephine County, Oregon.

HELP WANTED.

The Business Men's Clearing House, Century Building, Denver, Colorado, furnishes mining companies in United States and foreign countries with managers, superintendents, engineers, mill men, assayers, electricians, bookkeepers, stenographers, etc.; good positions for competent men.

WANTED—COMPETENT ASSAYER WHO also understands bookkeeping. Address R., care of Mining and Scientific Press.

FOR SALE.

For Sale---Elevator Gold Dredger,
Electrically operated. Bucyrus make. Five-foot ouckets. Practically good as new. For full particulars, write
Bedrock Dredging Co., Placerville, Idaho.

200 SECOND-HAND TRANSITS AND LEVELS, CHEAP.
ARCHITECTS' & ENGINEERS' SUPPLY CO.
1010 Grand Ave., Kansas City, Mo.

PLACER PROPERTY.
One of the largest and best placers in California. Superb water rights; good flumes, ditches and dams. Entire acreage patented. Splendid timber; all facilities; complete saw mills. Good buildings and animals; abundant supplies. Whole plant self-contained. Never freezes; rainfall five years averaged 58.52 inches. Everything in perfect running order.
Grand promotion project; tremendous possibilities. Distant affairs requiring attention, will sell at fair price on reasonable terms. Address GOING PROPERTY, care of this publication.

Quicksilver
BY THE FLASK OR CARLOAD.
WEIGHT AND QUALITY GUARANTEED.
THE EUREKA COMPANY,
OF SAN FRANCISCO.
320 SANSOME STREET, - SAN FRANCISCO.

THE CALIFORNIA DEBRIS COMMISSION having received application to mine by hydraulic process from Vacinda Mining Company in Vacinda Mine, near Indian Diggings, El Dorado County, Cal., draining into Cedar Creek which reaches Cosumnes River, gives notice that a meeting will be held at Room 96 Flood Building, San Francisco, Cal., May 23, 1904, at 1:30 P. M.

MINING AND SCIENTIFIC PRESS.

Whole No. 2286.—VOLUME LXXXVIII. Number 20. SAN FRANCISCO, CAL., SATURDAY, MAY 14, 1904. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

High Duty Pumping Engine.

Herewith is illustrated what the manufacturers say is the largest and most powerful high duty pumping engine built on the Pacific coast. The halftone engraving represents one of the two engines furnished by the Geo. E. Dow Pumping Engine Co. of San Francisco, Cal., for the Honolulu Plantation Co. of Honolulu, H. T. The entire plant was contracted for, including boilers, piping and all auxiliaries, by this firm of pump builders. The combined capacity of the two engines is 14,000,000 gallons of water each twenty-four hours, raised to an elevation of 450 feet, when running at normal speed. This water is taken from wells and is intended to irrigate about 1200 acres of sugar cane which is now being staked out by the plantation company. This increased acreage will add about 50% to the present output of the company, which will then be one of the largest plantations on the Hawaiian Islands.

The pumps are to be set side by side in the same pit and will be supplied with steam from a battery of 1000 H. P. Babcock-Wilcox water tube boilers at 180 pounds pressure at the pump through a 10-inch steam pipe. The pumping engines are of the horizontal, duplex, four cylinder, triple expansion pattern, with the Dow standard design of Corliss valve gear. The steam cylinders are all steam jacketed, with reheating receivers placed overhead. One of the most important new features of this design is the method of holding the steam and water ends together. Each side has two steel rods running from the crosshead yokes along the side of the steam cylinders, inside the valve gear, to the water end. This will allow for a free expansion and contraction of the steam cylinders without disturbing the alignment of the engine as a whole.

The sizes of the engines are as follows: Diameter of H. P. C., 22 inches; diameter of I. P. C., 38 inches; diameter of L. P. C. (two), 44 inches; diameter of plungers, 14¾ inches; length of stroke, 48 inches.

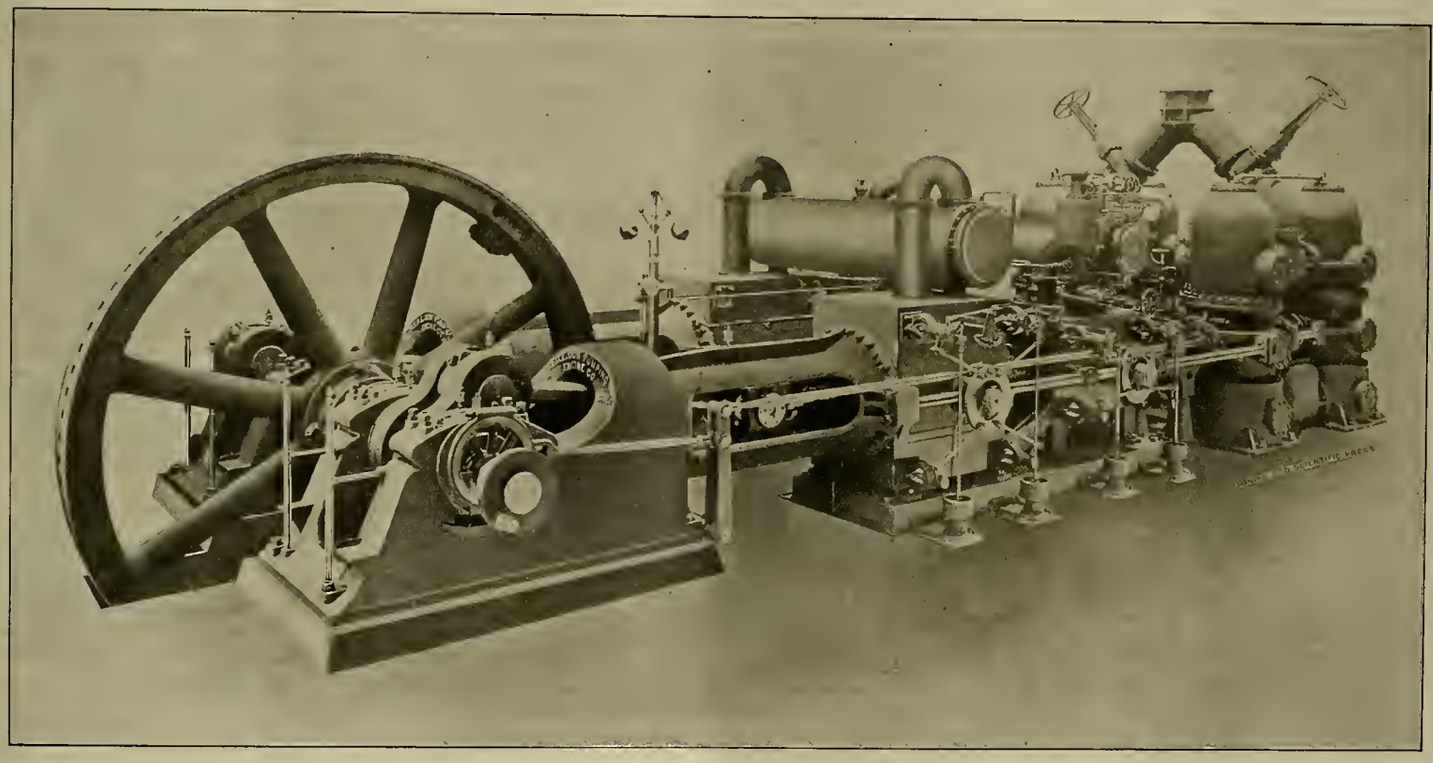
Each engine has one surface condenser of 1400 square feet of cooling surface of the Dow standard pattern. The air, circulating and feed pumps are operated from the crank pin and disc-keyed to the main crank shaft, as seen in the accompanying cut. The crank shafts are of the double-throw, built-up pattern, made of high-grade nickel-steel, and weigh fourteen tons each. The flywheel is 16 feet in diameter and weighs twenty-five tons. The pump end is of the outside center-packed pattern, with removable valve decks. All parts are made extra heavy, well braced, with shrink bolts and ribs to withstand the heavy duty to which it is to be subjected.

The metal used in the construction of the water end aside from the bronze is a special mixture of close-grained cast iron, the same as the Dow Co. put in all their hydraulic pumps, and has tensile strength of 28,000 pounds. The delivery chambers are made in the form of large domes that they may act effectively as air cushion spaces to ease off the flow of water and eliminate the presence of any shock or water hammer. Relief valves are fitted to all the chambers as an element of safety, should the engine be started with the delivery valves closed.

The suction opening of each pump is 30 inches in diameter and the delivery 24 inches. The plungers are cast of close-grained bronze. The valves, seats, guards and all parts subject to wear are of the same material. Piston rods are of solid Tobin bronze.

Mechanics are now working day and night getting this machinery into position, and by June 1 the big engines will be ready for their initial trial for efficiency, capacity and durability. The Geo. E. Dow Pumping Engine Co. will send their mechanical engineer to conduct the test in the interests of the builders. They expect to make a record with this engine that will prove satisfactory to themselves and gratifying to the owners of the Honolulu Plantation Co.

The builders predict that with such a high class engine and skillful handling they will be able to obtain 152,000,000 foot pounds for every 1000 pounds of dry steam used in the cylinders, or about 130,000,000 to 135,000,000 foot pounds for every 1000 pounds of steam used by the engine—that is, the cylinders, jackets, and all the leakages.



High Duty Dow Pumping Engine.

Our National Advertisement.

The Louisiana Purchase Exposition at St. Louis, Mo., has been formally opened by President Roosevelt, who set the machinery in motion by touching an electric key of gold, in Washington—which in itself is an index of the progress of the new century. This Exposition, though following so closely on the Columbian Exposition at Chicago and the large, but lesser, Pan-American Exposition at Buffalo, is said to surpass anything heretofore undertaken in this direction in the world. It is an opportuuity to exhibit to the entire world the tremendous strides being made in industrial progress.

The exhibition buildings themselves, while of magnificent appearance, are with few exceptions similar to exhibition buildings elsewhere—built for show and short duration. They will no doubt answer every requirement, but no one will criticise the construction nor the architecture of the buildings. It is the exhibits themselves that will attract the greatest attention, for it is these which form the feature of real value. Every conceivable phase of industry is represented, affording unsurpassed opportunity to compare the past with the present, and one country or section with another. In no branch is this more noticeable than in machinery. The old locomotive engines in use half a century ago standing beside the magnificent machines used on modern railroads forms an object lesson in material progress which few who see will forget. It is pleasing to note that large space has been devoted to a display of mining and metallurgical machinery and methods, and to an exhibition of the raw and finished products of the mines. Each mining State has awakened to the value of a representative exhibit, and it is safe to say that the mining exhibit at St. Louis is superior to any heretofore made in the world. There is more that is new to display than at any time in the past, and the world is eager for knowledge and that which is new. Electricity forms a most important feature in the exhibition as a means of power, light and heat.

LESS than thirty years ago equatorial Africa was a great terra incognito. From time to time small and unsatisfactory bits of information concerning the great unknown interior has come out from various explorers, among whom were Livingstone, Grant, Du Challeau, Baker, Speke, Gordon and Stauley. To the latter, who died on the 10th inst., is the greatest early knowledge of the "dark continent" due. It is a region of great mountains, great lakes, great forests, great rivers and great animals. Nature seems to have formed everything on a gigantic scale. This vast wilderness is now in a fair way to be opened to the knowledge of the world, and possibly become no small factor commercially. The construction of railroads is progressing spcedily. Civilization is encroaching on "Darkest Africa" very rapidly. From the southward in Rhodesia the miner is extending his explorations northward. On the east coast the tide is slowly setting westward through Uganda, and in the Congo State the recent mineral discoveries promise to do more than any other thing for the development of the country. Thus far these discoveries are chiefly of copper ores. but gold is also reported in paying quantities. Should valuable gold deposits be discovered and developed it will settle the country more quickly than anything else, for the pursuit of gold stops at neither arctic cold nor tropical heat, and neither the barren wastes of western deserts, nor the swamps, jungles and forests of Central Africa offer a material barrier to the occupation of the country by white men once, it is known that gold exists there in paying quantity.

THE recent publication by the United States Geological Survey of Professional Paper No. 12, entitled the "Geology of the Globe Copper District of Arizona," by F. L. Ransome, is one of the most interesting and valuable contributions to mining geology that has been issued by the Survey in some time. The large economic interests of the Globe district, together with the present interest shown in the copper mining industry, makes this publication both timely and welcome.

The Value of Advice.

The professional man, whether lawyer, physician or engineer, necessarily considers his knowledge as his capital. He gains it at the expense of years of study in college, and by practical application and experience later. Every class in the business world expects to pay for professional advice when they appeal to the lawyer or the doctor, but the mining engineer is generally looked upon as a generous-hearted individual whose knowledge is at the disposal of all who may desire it without price, and sometimes without thanks. Advice which costs nothing is valued lightly, but that which "comes high" is treasured as among the good things of this world. There are hundreds of people who do not hesitate a moment to impose upon the mining engineer, taking up his valuable time asking questions, a correct answer to which may save the questioner thousands of dollars, and which it has possibly cost the engineer years of experience to learn, and still the questioner would not only be surprised, but be indignant if a bill were presented for professional advice. Notwithstanding this, these people would not think of visiting a lawyer and asking for professional advice without expecting to pay for it, any more than they would expect a physician to prescribe for them without charge. There is a class who are willing to pay, but their idea of pay is on a basis of time at a wage rate such as miners receive. Five dollars is considered a reasonable fee for half an hour's "conversation," and a hundred dollars is extortionate, while anything more than that is criminal. There is another class who expect to pay and do pay to engineers fees commensurate with the value of the advice received. They have learned that it pays. It is not a rare instance for mining companies to place a successful business man, but one without experience in mining, in charge of their affairs, and are surprised to learn later that had they employed a competent engineer to simply advise at the beginning they might have been saved many thousands of dollars. An instance may be cited where a company bought a mine and built a stamp mill. The mill was located in the middle of a flat, while there were hills about within a short distance, on any one of which the mill might have been placed to advantage. The result was that in a few weeks after starting up the mill the tailings were running in on the mill floor, and soon thereafter an expensive bulkhead was constructed and an elevator installed to lift the tailings high enough to run away from the mill. All ore treated in the mill had to be pulled up an inclined tramway to the breakers, when the ore might have run in on cars from the mine by gravity. These were only a few of the mistakes made by this company.

The employment of a competent engineer at the cost of possibly $5000 would have saved this company over $50,000 in the first two years of its operation. This is only a single instance. Such mistakes are being made constantly by companies who undervalue the services of mining engineers of experience.

THE ingenious handling of difficult mining problems in the lead-silver mines of Santa Eulalia, Chihuahua, Mexico, as described elsewhere herein, is an instance of the versatility of American engineers. Not infrequently it becomes necessary to sink shafts through running ground, quicksands, etc., but to build shafts through the air is somewhat of an innovation, but this is what the peculiar conditions at Santa Eulalia have required. The ore extracted by the Mexicans years ago has left great open stopes like caves. Shafts now being sunk are likely to be in line with one of these old workings, but the unusual difficulties have thus far been overcome by the various applications of engineering skill.

THE outlook for copper is more promising than for some time past. It is stated by authorities that the surplus has been entirely absorbed and that the present output of the mines of the world scarcely keeps up with the demand and actual absorption of the metal by the industries. Whenever copper reaches a low price the result is heavy buying by consumers, and also the introduction of the metal into new uses, and into channels where its use is prohibitory in the time of high prices. In view of the present situation, a firm market for copper is anticipated, with possibly a somewhat higher price.

Economize Time.

In superintending the practical operation of a mine it is necessary to see that men economize time. There are those who claim that hand drilling is more economical than machine drilling. There may be a few instances where this is true, due to the character of the ground through which the work is being done, or to other local conditions, but such instances are rare if the superintendent sees to it that the machine men put in their time drilling and not in attempting to recover a fitchered drill, which it is evident cannot be removed before blasting. In the first place, the chances are such a condition may have been avoided by the exercise of care on the part of the driller. Too much time is often wasted in setting up and taking down machines; delays are caused by waiting for the water can when it should be at hand. There is no economy in having the drillers running about the mine in search of drill bits, oil cans, wrenches and other paraphernalia of the drilling outfit. But men often find these excuses for stopping work. Expenses are going on continually. The power, wages and many other expenses operate continuously while the drills run and while they are idle, consequently it is economy to keep them running during shift as much as possible, striving in every way to facilitate the work by seeing that the men are supplied with all essentials. "Half the battle" lies in the selection of the drill runner. A man who has "tended chuck" for a fortnight, with no further experience, cannot be expected to make an expert drill runner, and yet it is no uncommon thing to find such men thus employed. It is an easy thing for a drill runner to waste from half an hour to an hour on a shift, and this means a like time for his assistant. If a dozen drills are at work in the mine and each one is idle this length of time, it means the idleness of twenty-four men for half an hour to an hour, or the equivalent of over two shifts work for a man—say $6.00 per day. In many mines the loss of time is much greater than this—and it is not always the fault of the miners either. The superintendent should see to it that no such loss of time occurs without a good reason, and then to see that it does not occur again from the same cause.

The Utilization of Waste.

In many directions new economics are sought and are being worked out in the industrial world. In mining and metallurgy there is a promising field for discovery and adaptation. Gold mining is one of the industries that is without a competitor, yet it is as desirable to recover gold from its ores at as little cost as possible, as it is necessary to eliminate extravagance from other branches of the mining industry. The utilization of waste products is one of the forms of modern economy. In mining an effort is being made to reduce expense by utilizing natural forces and such waste materials as may be the result of the operation. Barren rock through which the workings are driven is no longer hoisted to the surface and thrown on the dump, at a well-managed mine, if any place can be found underground to economically dispose of it. At some smelters the sulphurous gas resulting from the reduction of the ore, which has heretofore passed off into the air, is now being conducted to lead-lined chambers and made into sulphuric acid—a valuable and useful by-product. In smelting the pyritic method utilizes the sulphur of the sulphide ore as fuel, thereby reducing the cost of carbonaceous fuel. The slag of smelters is being utilized in a variety of ways—in the manufacture of concrete and of Portland cement; it is being cast into paving and building blocks and for other structural uses; it is employed as railroad ballast and as macadamizing material. The waste heat and gases of blast furnaces are being turned to good and economical use, in running gas engines, etc. The tailings from stamp mills, heretofore considered absolutely worthless, after extraction of the valuable metals, are in some instances being used to fill old stopes—a practice permissible in dry mines, but inadvisable where there is water, as it would be found difficult, if not impossible, to control them. The onward march of progress constantly aims at new achievement, and seeks to convert to usefulness everything that comes before it, making the obstacle of yesterday the useful agent of to-day.

CONCENTRATES.

COKE is brought to San Francisco, Cal., mostly from British Columbia; a little from England, Australia and Antwerp. The British Columbia coke contains about 17% ash.

✤✤✤✤

IN Cripple Creek district, Colo., tellurido ores assaying less than $10 per ton are said not to pay a profit after paying mining, transportation and treatment charges.

✤✤✤✤

THE striking of illuminating gas in boring a well is not a certain evidence of the existence of petroleum. Natural gas is often found in quaternary deposits in which no petroleum exists, so far as known.

✤✤✤✤

A MILL may save enough from ore to make the operation of the mine profitable, and still a large percentage may be lost. Daily assays of tailings are as necessary as the determination of the value of heads.

✤✤✤✤

THE Brooks-Teller bill, amending the mining laws with reference to the proper marking of boundaries of mining claims, became a law in the closing hours of the late session of Congress and is now in effect.

✤✤✤✤

THE selling of stock of a newly organized company would not be considered by the courts as "being in operation." The company must actually engage in the business for which it was incorporated, the selling of stock being merely incidental.

✤✤✤✤

BLOXAM'S CHEMISTRY states that the only single acid which attacks gold is selenic ($H_2 Se O_4$), which it reduces to selenious acid ($H_2 Se O_3$). A gold crucible is useful in the laboratory for effecting the fusion of substances with caustic alkalies, which would corrode a platinum crucible, which they attack more strongly than they do gold.

✤✤✤✤

WHEN mine samples are taken in duplicate from the same places, or when the samples are divided after breaking down to small pieces like hazel nuts and smaller, and the respective duplicates do not agree within reasonable limits, these samples should be rejected for the time until the cause of the discrepancy is investigated.

✤✤✤✤

GOLD SULPHIDE is formed by precipitation, together with sulphur, from solutions of gold salts by means of sulphuretted hydrogen. In color it is brownish black. Chloride of gold is formed by dissolving gold in aqua regia. It is known as auric chloride $Au Cl_3$. Text books generally do not contain the specific gravities of gold sulphide, oxide, bromide, chloride, etc.

✤✤✤✤

NITRO POWDERS are graded as follows; No. 1 = 70% nitro-glycerine; No. 1* = 60%; No. 1** = 50%; No. 2 = 40%. Other grades containing 35%, 30% and 20% are also made, for earth work and loose rock. A 5% powder, known as "low powder," is also made for shaking up large rock masses, where it is desired to break large tonnage without throwing the rock, as in open cut, millhole work.

✤✤✤✤

IF the four claims located by A and B in California are contiguous, a tunnel which will aid in the development of all the claims may be charged to annual assessment work, $400 worth being done each year. This credits each claim of the group with $100 worth of work. A notice to this effect should be posted at the mouth of the tunnel. No assessment work is required in a newly located claim between the date of location and the succeeding first of January.

✤✤✤✤

THE field notes of a survey are not limited to the courses and distances set forth therein, but include also the monuments referred to, and all the objects mentioned by which the lines of survey can be ascertained. If there is any discrepancy between the monuments and the courses and distances, the monuments must prevail; and if these monuments can be ascertained the lines connecting them will be the lines of the tract, irrespective of their variation from the lines given by the courses and distances. Los Angeles vs. T. Thompson, 117 Cal., 594.

✤✤✤✤

A BODY falling in a medium like air is retarded in its fall by the medium, but moves downward with a constantly accelerating velocity. An object offering little resistance to the air, like a sphere, should fall 4650.9 feet in seventeen seconds. At the Red Jacket shaft of the Calumet & Hecla mine, on Lake Superior, nearly 5000 feet deep, this experiment was tried, but the sphere did not reach the bottom, being deflected from a vertical course. Some suppose it to have been due to air currents and others to the rotation of the earth, and that, if the latter, the sphere swerved to the eastward in a curve and struck the timbers and was lost.

✤✤✤✤

MINERS striking double-handed can put in 10 to 12 feet of holes in a shift of ten hours in hard granite. Two men drilling single handed, if expert, can put in about 15 feet of holes in the same time. The reason that in practical mining holes are never drilled at anything like the rate at which holes are put down in exhibition drilling contests is accounted for by the wide difference in conditions. On the exhibition platform all holes are drilled straight down; the cuttings are generally removed from the hole by water under pressure; the drills are each forged and tempered with the greatest care; the men are working under high nervous tension, and under a strain which could not long be endured, and everything is done in the broad light of day. These are conditions which never obtain underground, even under the most favorable circumstances, but miners have occasionally performed astonishing tasks when working to relieve comrades imprisoned by a cave or otherwise cut off from the outside.

✤✤✤✤

A LARGE AMOUNT of salt is made annually in Utah and California by evaporating natural saline waters—in the former from Great Salt lake and the latter from San Francisco bay. The salt is produced by evaporating the waters pumped from the natural lake or bay. This is accomplished in a series of ponds. The water of Great Salt lake contains over 20% sodium chloride; that of San Francisco bay is about that of the ocean. The gypsum is precipitated at the bay works. At Great Salt lake the "mother liquor" is not allowed to evaporate, as it contains nearly all the magnesium and sodium sulphates and practically all the magnesium chlorides. It is returned to the lake. Sodium sulphate when formed floats on the surface and is driven by the wind to the leeward shore, where it is collected. After drying and crushing, the salt is further purified by rotary fans, which blow out a large amount of the remaining magnesium and sodium sulphate, which is lighter than the sodium chloride.

✤✤✤✤

WHEN drifting with machine drills, it is advisable that the machine men do no more mucking than is necessary to place the bar horizontally across the drift at a proper distance from the face and mount the machine, or two of them, if they be in use. This may require the removal of a small amount of rock near the top of the pile lying against and near the face as a result of the last round fired, but it will enable the machine men to more quickly get at work drilling, while the muckers work behind them, loading the ground already broken into cars. By the time the upper holes are drilled the shovelers will probably have removed sufficient rock to enable the machine men to make a new set up. This method saves much time that in some mines is daily lost. If there is a lack of machines to work at every face, or a lack of air to run them, the drill may be moved to another place while muckers are clearing out the rock broken down, and, when clear, bringing the machine back to this face and continue drilling there while the other excavation is cleaned out. In this way, working alternate shifts, little time is lost.

✤✤✤✤

THE heat in some mines is caused by the rapid oxidation of sulphides in the ore. This usually takes place near the surface, as at the Daulton copper mine, in Madera county, Cal., where at a depth of 100 feet the temperature approached 100° F. At this mine and at some others in that vicinity it was not uncommon for the sulphide ore to ignite spontaneously, owing to rapid oxidation. In some of the Butte, Mont., mines the great heat is largely due to oxidation of the ore; but this occurs at a depth of hundreds of feet. The heat in the Comstock mines is apparently due, to a great extent, to the large volume of hot water coming up from below in various parts of the mine workings. Whether the water is being heated by the heat generated by the decomposition taking place in the minerals occurring in the workable zone, or whether it comes up hot from profound depths, is a question on which all who have investigated do not agree. The rotting of a large amount of timber in the stopes of a mine produces appreciable heat and also gives out a large quantity of CO_2, which is detrimental to health and, in excess, is deadly.

✤✤✤✤

THE placer law includes as "placers" all forms of mineral deposit, subject to location, except veins of quartz or other "rock in place." These shall be subject to entry and patent under the Act under like circumstances and conditions, and upon similar proceedings, as are provided for vein or lode claims; provided that where the lands have been previously surveyed by the United States the entry in its exterior limits shall conform to the legal subdivisions of the public lands, no further survey or plat in such case being required, and the lands may be paid for at the rate of $2.50 per acre; provided, further, that legal subdivisions of forty acres may be subdivided into ten-acre tracts; and all placer mining claims hereafter located (May 10, 1872) shall not include more than twenty acres for each individual claimant. The limit for each claim is twenty acres, but the law makes no restriction as to the number of claims an individual may take. On each claim of twenty acres held by an individual $100 worth of assessment work must be performed annually. An association of eight or more individuals may locate a claim not to exceed 160 acres, and this constitutes one claim, on which only $100 worth of assessment work is required annually.

✤✤✤✤

UNDER no circumstances can an electric dynamo be placed between an engine and machinery it is desired to run without loss of power. If the dynamo could be run at a distance by water power, or at some point where fuel were cheaper than where the engine and mine are located, it might be more economical to install the electric plant and transmit the electricity to motors in the mine and mill, but if the power must be originated by the engine apply it direct by means of shafting and belts in the usual way. The mine pumps may be run by steam conducted into the mine by pipe (these should be carefully covered to prevent condensation as far as possible), or a Cornish pump could be put in which is actuated at the surface. A third expedient is the driving of a dynamo by the engine to supply electric power to the pumps in the mine alone, running the surface plant by steam. If this latter suggestion is not found to require too much of the 100 H. P. of the engine it may be found more economical than any other way to handle the water. Bailing by skips may obviate the necessity of pumping if conditions are such that this method can be employed.

✤✤✤✤

THE following gives the steps in the calculation for the quantity of water carried by a flume 28½ inches wide, pitch ¼ inch to 16 feet, water running 6 inches deep, flume made of unplaned lumber: Width of flume, 2.35 feet; depth of water, .5 foot; therefore cross section of water = 2.35 × .5 = 1.175 square foot; the wetted perimeter = 2.35 feet + (2 × .5) = 3.35 feet; the hydraulic radius, or the area divided by the wetted perimeter, will equal 1.175 ÷ 3.35 = .35; the slope of the slope = the drop divided by the length, or ¼ of an inch divided by 192 inches = .0013; the velocity in feet per second of the water will then be C multiplied by the square root of the product of the hydraulic radius, and the sine of the slope — or $V = C \sqrt{(.35 \times .0013)}$. The constant C for a flume made of unplaned lumber varies according to the hydraulic radius from 100 when the hydraulic radius = .3 to 166 when the hydraulic radius = 10, so that our correspondent can figure out any other size flume he may wish from the above calculations. In his case the answer is 2.2 feet per second velocity, which will give him a capacity of 155 cubic feet per minute, equivalent to about 100 miners' inches.

✤✤✤✤

AN automatic tally for checking the number of cars of ore run into a mill can be made by the blacksmith at the mine, it only being necessary to have a flat disc provided with teeth somewhat like those on a circular saw. These teeth must be of uniform depth and spaced exactly the same distance apart. This wheel may be placed beneath the track on which the car runs, the best place being in the trestle, which is found at most mills. It should be so arranged that by shimming up under one of the rails, at two cross ties, the rail may be slightly raised above an intermediate third tie. Beneath the rail and at the side of the tie should be fixed an upright rod which connects with a lever below. On one end of this lever is a pawl which engages the toothed disc, causing it to move forward one notch whenever a loaded car passes by. The notches being numbered consecutively, the number of loaded cars passing over is registered and may be read off by the superintendent. The rail must be sufficiently stiff to support the empty car without bending enough to cause the device to register on the return trip. Where it is considered advisable, the counter may be enclosed in a locked box, with a glass front.

✤✤✤✤

A FRACTIONAL mining location has no greater nor any less rights than those of a full-sized claim, and for that reason there is no law particularly referred to fractions. Where two fractional claims are located by the same person, with an intervening space between them owned by another locator, as in the Tonopah, Nev., case, the locations cannot be amended to constitute a single claim. Each fraction remains a single location. They may be held under separate amended locations, however, so formed as to secure parallelism of end lines, if this can be done without conflicting with others, and, consequently, the exercise of the extralateral right privilege, presuming that the fractions are located on a vein or veins, a prerequisite to location. The only conditions under which fractional claims may be included in a single location, in the manner described, is in the case of fractional placer claims occurring within the same 40-acre tract and separated by a quartz location. In such cases the land department has permitted such consolidation, though there is nothing in the statutes referring to anything of the sort.

✤✤✤✤

THE Federal statutes, Section 2336, says: "Where two or more cross veins intersect, or cross each other, priority of title shall govern, and such prior location shall be entitled to all the ore or mineral contained within the space of intersection; but the subsequent location shall have the right of way through the space of intersection for the purposes of the convenient working of the mine. And where two or more veins unite, the oldest or prior location shall take the vein below the point of union, including all the space of intersection." This statute has been the cause of a great amount of litigation, and many opinions have been rendered by State Superior and Supreme courts, as well as by the Supreme Court of the United States. Lindley on Mines says re. this matter: "All courts now agree upon the following propositions: (1) The grant to the senior locator is of all veins found within his location, regardless of their course, and whether they were previously known to exist or were blind and undiscovered. There is no limitation implied and the grant is exclusive. A junior cross-lode locator has no right to any ore found upon the cross vein within the boundaries of a senior claim. (2) The owner of a junior tunnel site cannot by means of a crosscut tunnel penetrate within the boundaries of a senior claim for any purpose."

Concentration of Low-Grade Copper Ores.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by
W. J. ADAMS, E. M.

The oil used was the residuum oil from Pennsylvania petroleum, having a paraffine base and of the consistency and color of cylinder lubricating oil; but the California residuums are just as efficient, though having an asphalt base, provided they have a specific gravity of 13° to 14° Baume, and are freed from the lighter oils of naphtha, gasolene, etc., the so-called distillates. On this ore no doctoring of the oil is required, as it contained only iron pyrites and chalco; but as in water concentration generally, higher or lower grade concentrates can be made at will if the resultant loss is not considered. The first application of oil, with a slight agitation, absorbs only chalcopyrite; but with greater agitation takes up the iron pyrites and particles of the gangue mechanically forced into the oil. Each succeeding application takes up more of the pyrites and the gangue, so that in these tests on a small scale the concentrates are much poorer in quality than in regular work, in order to find the real loss in the tailings that would occur in actual practice. As in testing in water concentration operations by hand, even though repeated over and over again, do not by any means come up to the efficiency of mechanical handling of the same material, either in cleanness and consequently higher value of the concentrates or small loss in the tailings, so that in some cases here the ore was separately shaken with oil eight to ten times. Special attention must be paid to using a sufficient quantity of oil each time, as there can be no useless excess, while very little is accomplished if only a small amount is taken. As a minimum, there must be mixed with the ore each time at least one-half the weight of the pulp, and if there is an excess of sulphurets present this weight must be doubled and perhaps trebled.

At first sight, it appeared that the sulphurets were ouly attached to the sides and under surface of the oil, but a closer examination showed that not only the sulphurets, but that some of the gangue, were scattered uniformly through the oil. When the ore was high in sulphurets the oil would at once become so heavily charged with mineral, that not only big globules (called "sinkers"), but sometimes a lower layer of the entire oil surface would settle through the water to the bottom; but this would be recovered with succeeding applications. When the oil was heated in boiling water to 90° or 100° F., its selective action was greatly increased and less of the pyrites and gangue were absorbed, owing to its greater fluidity. As the oil and concentrates were always heated before feeding into the centrifugal separator, over 50% of the mineral and all the gangue would settle out of the oil before the feeding began. On the other hand, when the oil was chilled to 60° F., or less, it became so viscous that it would not absorb and hardly hold the mineral to its surface by its purely adhesive properties. Therefore, it is advisable to have the temperature between 70° and 75° F., and if a very strong selective action is desired, to heat the oil, for the first application, to as high as 100° F., the subsequent repetitions to be made with the oil at the ordinary temperature of 70° to 75° F. In this way the first product will be a concentrate of nearly pure chalcopyrite which can be kept entirely separate from the second grade, containing the iron pyrites and some of the gangue. On other ores it is authentically stated by actual practice that silver glance can in this way be separated from sphalerite, and the same selective action should take place between the copper sulphides and zincblende, owing either to the difference in their specific gravities or the primitive conditions of the difference in their surfaces, whether tarnished, or bright and polished.

In doctoring the oil or water to add to its efficiency it is a question whether any direct benefit commensurate with the costs is obtained. Water, slightly acidulated, will, of course, prevent or decrease the tarnishing of the surfaces, thereby increasing adhesion to the oil and enabling the employment of the acid water from the mine. The addition of common salt to the water will render it more dense, so that the holding power of the oil will be increased; but in the opinion of the writer this is unnecessary, as its absorbent powers are naturally ample, if sufficient oil is used; and particularly, as no oil is lost except the modicum remaining with the concentrates, hardly exceeding one gallon per ton of material passed through the cylinders, it is not necessary to restrict oneself to a small quantity of oil.

With these explanations the modus operandi was as follows: A definite weight of each grade of ore was taken and crushed dry to pass a wire screen ⅛-inch mesh. On the grades low in percentage of sulphurets an artificial bed of a mixture of Nos. 4 and 5 birdshot was placed on the bed screen in the jig, when the ore was slowly and steadily fed to it, having been previously thoroughly wetted to prevent as much as possible the mechanical loss of floating dry slimed chalcopyrite. The fine sulphurets passed through the bed and the 40-mesh bed screen into the water tank underneath, called the hutch.

The clean and coarse mineral settled by gravity to the artificial bed of lead shot when employed, and otherwise to the screen, and was designated the bed.

Resting on this and going to the overflow, the mixture of coarse gangue containing mineral and with some free sulphurets, was known as middlings and was reground and treated by oil.

The overflow of tailings was first conducted into a settling tank and the water and slimes from this siphoned into a large tub, preventing entirely the loss of the floating scum of chalcopyrite, and saving practically all the tailings as determined by subsequent weighing. The difference ran between 1½% to 2¼%, and consisted of clayey slimes only, showing a faint trace of copper by assay.

These tailings, after drying, were screened through a wire sieve of 100 mesh, and that passing through was treated as slimes, while the residue after regrinding to pass through 30 mesh was treated as sand, and each class was separately concentrated with oil.

In the higher grades the middlings carried so much mineral that they were reground to 30 mesh, rejigged and then the resultant products treated as with the original ore.

Three series of tests were employed: The first, where the products were dried before the next step was taken, in which case approximately 10 kilos of the ore were used, and primarily only passed through a ¼-inch mesh screen.

The second, where the process was continuously carried on, without drying anything but the concentrates and final tailings, and the sand and slimes unseparated, but treated by oil together. Two kilos of the ore were taken and crushed dry to pass a screen of 30 mesh.

The third, direct application of the oil to the ore, previously crushed dry to pass 30 mesh, and ½ kilo or 500 grams taken in each test.

GRADE NO. 1 (THE POOREST QUALITY) — FIRST SERIES.—Taken 11⅝ kilos of ore, crushed dry to pass a No. 10 screen. Speed of jig, 350 revolutions a minute, with throw of eccentric ½-inch, and an artificial bed of lead shot. This parcel assayed 0.927% copper, or 18.557 pounds copper in each ton.

JIGGING.

CLASS.	Assay Copper Per Ton, %.....	Per Cent Weight Saved.....	Pounds Copper Saved Referred to Ore.....	Per Cent Copper Saved Referred to Ore.....
Hutch	2.50	1.034	0.517	2.786
Bed	6.10	3.620	4 416	23.796
Middlings	2.10	5.517	2.317	12.485
Tailings	0.56	68.108	7.628	41.105
Slimes	1 10	19.482	3 679	19.825

JIGGING AND OIL CONCENTRATION.

CLASS.	Assay Copper Per Ton, %.....	Percentage of Weight Saved.	Per Cent of Copper Saved.....	Per Cent of Copper Lost.....
Jig Concentrates:				
Hutch	2.50	1.034	2 786	.....
Bed	6.10	3.620	23.796	.....
Oil Concentrates:				
Middlings	5.67	8.70% of 5.517% = 0.480	3.874	.....
Tailings	4.30	7.38% of 68.108% = 4.958	19.598	.....
Slimes	6.29	5.11% of 19.482% = 0.995	4.884	.....
Final Tailings:				
Middlings	1.20	.....	.....	8.610
Tailings	0.293	.....	.....	21.506
Slimes	0.829	.....	.....	14.940
Totals	.....	11.087	54 938	45.056

In the individual steps of the oil concentration there were saved from each class as follows:

From one ton of middlings.....31.035%
From one ton of tailings.....47.680%
From one ton of slimes.....21.640%

This was the first complete test and the results were poorer than any obtained from any of the subsequent ones. Too small a charge of oil was used; too much mineral was still locked up in the sands owing to the coarse crushing; while from the drying of the tailings to their subsequent wetting a very large quantity of the sulphurets was so tarnished that they did not adhere to the oil. In addition to these causes of excessive loss, as well as the low percentage of copper in the hutch, is the fact that jigging is not adapted to this low-grade ore under any circumstance; but there must be employed either vanners or tables, with which clean concentrates should be made and the tailing loss disregarded.

SECOND SERIES.—In this the parcel of ore weighed 2 kilos and assayed 1.34% of copper. It was crushed to pass a screen of 30 mesh, was then thoroughly moistened and fed to the jig, in which was an artificial bed of lead shot. The middlings were treated without drying, directly with oil, and the sands and slimes of tailings were mixed together and also treated direct by oil; only the clear water, after standing sixtcen hours, being siphoned off.

JIGGING AND OIL CONCENTRATION.

CLASS.	Assay Copper Per Ton.....	Percentage of Weight Saved.	Percentage of Copper Saved.....	Percentage of Copper Lost.....
Hutch	2.90%	14	30.449	.....
Bed	4.20%	4.50	14.174	.....
Oil concentrates from middlings	1.60%	6.11	7.331	.....
Oil concentrates from tailings	2.95%	14.75	32.624	.....
Tailings of middlings	0.24%	.....	.....	3.739
Final tailings	0 40%	.....	.....	11.159
Totals	.....	39.36	84.578	14.898

In this test the lowest possible value of the tailings was aimed at, and, in consequence, the oil concentrates were very low grade and very dirty. The hutch had necessarily a great amount of barren matrix, owing to the small bed of mineral obtained with only an original weight of 2 kilos of ore; but the final losses of 0.24% Cu in the middlings and 0.40% Cu in the tailings was conclusively proved to be mineral still locked up in the sand, and to require a crushing to a fineness of 60 mesh to free it, and that there was no tarnishing of the sulphurets.

THIRD SERIES.—In this, the parcel of ore taken weighed ½ kilo, or 500 grams, and assayed 1.29% of copper. It was crushed to pass a screen of 30 mesh and was then treated direct with oil.

CLASS.	Assay Copper Per Ton.....	Percentage of Weight Saved	Percentage of Copper Saved	Percentage of Copper Lost.
Concentrates	3 7%	27	77 38	.....
Tailings	0.4%	...	.....	22.62

Here again it is a matter of fact that the loss is principally locked up in the coarse tailings; but, outside of that, the objections to direct oil application on the original ore are the needless large size of the plant, and the impossibility of getting two grades in the resulting products, namely, the water concentrates, high in iron and low in copper, and the oil concentrates rich in chalcopyrite.

(TO BE CONTINUED.)

Dredging Operations in Oregon.

The scene of greatest activity in dredging operations in the State of Oregon has been upon Snake river, the bars of which, for practically the entire length of the stream, carry values in gold. The metal occurs in thin scales, several hundred colors sometimes being required for 1 cent in value. The problem of saving such gold is a vexing one, and numerous devices have been proposed having this purpose in view. Some success has been achieved by the use of burlap in the sluices, in conjuncion with copper plates for amalgamation.

Inquiries into the status of the industry upon Snake river for the year past brought reports from but a single dredger, though others are known to exist, and may have been in operation. The dredger in question has been working near Ontario. It is the property of the Moraine Mining Co., and has a capacity of 2000 yards of gravel per twenty-four hours. The gravels handled are said to carry 17 to 35 cents a yard.

The Pomeroy Dredging Co. of Portland had a plant at work a few years ago in the bed of Burnt river, below Weatherby, Baker county. Difficulties in operation, presumably, brought about a cessation of operations.

A dredger seems to be a possibility in the near future for the Crane Flat placers, near the Cougar mine, Granite district.

On the John Day river, 4 miles below the town of John Day, the Empire Dredging Co. of Portland is operating a large plant with notable success, according to all accounts. The dredger is of the bucket type, each bucket having a capacity of 7 cubic yards. A 250 H. P. steam plant is used to drive the machinery. The gravels are said to contain 30 cents a yard.

In southern Oregon a dredger is nearing completion upon Foots creek, a tributary of the Rogue between Grants Pass and Gold Hill, the Champion Dredging Co. of Chicago being the owners. About 1200 acres of dredging ground has been made available in the Foots creek basin by the building of a dam near its confluence with Rogue river. The hull of the dredger is 112 feet long, 37 feet wide and 8 feet deep. When loaded with its 175,000 pounds of machinery it will draw 4 feet of water. In its construction 225,000 feet of lumber was used. The elevated material first passes into a revolving screen, by which the heavier wash is carried over the side, the finer being raised to sluices above, which are so arranged that they can be directed to any point from a right angle on either side to dead astern. The length of these sluices is 100 feet, giving a large area of dump. The dredging elevator is 81 feet long and has forty-two buckets of 8 cubic feet capacity each. A steam plant develops 150 H. P. The daily capacity is stated to be from 2500 to 3000 cubic yards. Cost of the plant

is $60,000. It is expected that the dredger will begin operations within a short time.

Dredging operations are contemplated for the Sixes river, Coos county, where values in gold, platinum and osmiridium are to be saved; for Evans creek, northern Josephine county, and for Bolan creek, tributary to the Illinois.

The dredging industry in Oregon is doubtless in its infancy, as many locations are yet available which can be made to yield profitable returns by this method of mining.

Method of Working Mines of Santa Eulalia, Chihuahua, Mexico.*

Written by EDWARD G. CAHILL.

The Santa Eulalia silver-lead mines are 16 miles southeast of Chihuahua, Mexico. The ore bodies occur in a hard Cretaceous limestone, lying nearly flat. This formation is capped by rhyolitic tuff that varies from a fine-grained rock to a coarse breccia. Between the deposition of the limestone and of the tuff a long period in geological activity intervened, which is indicated by a marked unconformity between the two formations. The thickness of the limestone is unknown, but is certainly more than half a mile.

The deposition of the ore bodies occurred after the period of volcanic activity which produced the tuff capping, for the fissures, which in the lime widen into ore lenses, extend through the 300 or 400 feet of rhyolite to the surface, and can be easily traced across the country.

Mines of Santa Eulalia, Chihuahua, Mexico.

The ores are lead carbonates and oxides carrying silver chloride with occasional bodies of galena and silver. They appear to have been deposited by ascending thermal waters bearing the metallic sulphides in solution. The process was clearly one of metasomatic replacement between the easily soluble carbonate rock and the sulphide solutions.

The ore bodies occur in three shapes—flat blankets, vertical ledge-like "abras" and vertical pipes. The occasional streaks of galena are very hard, but most of it is friable sand carbonates and is mined by pick and shovel without the use of powder.

One hundred and fifty years ago the Spaniards worked the Santa Eulalia mines by gouging, and packed the ore to the surface on the backs of peons. In this manner all the ore within 400 feet of the surface has been extracted. At that depth mining on the Spanish plan ceased to be profitable, and the mines stood idle until the advent of American enterprise and machinery.

The problem before the modern engineers was to go down 400 feet through hard rock and immense caves before striking any pay ore. It has been successfully solved and Santa Eulalia is now a deep mining camp, most of the working shafts being below the 1500-foot level. Some of the caves through which shafts have been sunk are 100 feet wide. The miners met this difficulty in two ways. In some places hollow pillars of concrete with the shaft passing through the center have been built. In other cases a vertical line of square sets has been built from the bottom of the cave to the roof where the shaft enters. The sides of the sets are then lagged securely and all the waste that is broken in the mine in both development work and ore stoping is brought to the cave and dumped around the shaft. Thus gradually the cave is filled and the shaft secured. In one case—Mina Vieja—of the American S. and R. Co. the problem of getting to the deep ore was met by Superintendent T. H. Mitchell in a manner which did away with all necessity for a surface hoisting plant. The mountain side was entered at the bottom of the arroyo, and a spiral and zigzag roadway 10 feet wide was carried through the solid lime down to the faces of the stopes 400 feet below. Electric lights were then put into the tunnel and burro trains run day and night from the stopes below to the surface chutes. This burro road branches to all parts of the mine, and in several places bridges great caves, sometimes with fills and occasionally with trusses.

In general the ores are low grade, and therefore to work the mines profitably a large tonnage is necessary. Most of the tonnage is now coming from below the 1000-foot level. To hoist a large tonnage from such a depth large engines are necessary, and probably the best surface plants in Mexico are to be found here. The Potosi shaft which taps an ore body in which 3,000,000 tons have been blocked out has the best equipment. A steel gallows frame surmounts the shaft, and the cages are run by a direct-action, conical-drum Corliss engine of 500 H. P. All the other working shafts have heavy steam plants.

Shafts sunk in ore bodies are not safe. The ore is too soft and friable, and no timber is strong enough to secure the ground. Several deep shafts in ore have been lost by caving. Therefore the engineers endeavor to place their shafts in solid limestone and crosscut to the ore bodies. It is impossible to predict where the ore will go, and for this reason the placing of a shaft is largely a matter of guesswork. Of all the working shafts in this camp there is but one which has not tapped ore at some level. The new shaft of the Buena Terra mine is in ore at the 250-foot level. The engineers realize that to go through the ore with heavy timbering will not do. They have decided to take out every pound of the ore that is there before going a foot deeper. If it leaves a cave in front of them they are prepared to go through it by the method of sets and filling described above. If other ore bodies are met, the same mode of procedure will be adopted. In this way only can they hope to keep their shaft safe. If they go through the ore and then attempt to back out they will come to grief. An ideal shaft can be cut through the solid lime. The rock is so hard that no supporting timbers are necessary and nothing is put in except what is needed to hold the guides in place. None of the shafts in the district have pump lines. The bottom of the Santo Domingo mine is 1350 feet below the surface. It is so dry and dusty that water for the drill holes and drinking purposes must be carried down by the miners.

There are two systems of hoisting in use in the district. The majority of the mines use the double cage and car system. The others use the skip and level-chutes plan with automatic dump in the gallows frame. As practiced in Santa Eulalia the latter is by far the cheaper and more efficient method.

There are in use three general ways of working the ore bodies. The first tried was the square set and filling system on the vertical bodies. A shaft is sunk, if possible in the limestone, and crosscuts run to the ore bodies at intervals of 75 to 100 feet. On each of these levels, sill sets are put down and the entire width of the body, which may vary from 50 to 150 feet, is worked out one set high. Then heavy lagging floors are put down underfoot and all the sets that are not necessary for car tracks are filled solidly with waste. The ore above is then attacked and mined by overhand stoping, and another row of sets is thus gradually built over the full width of the body. When this layer of sets is worked out it is filled solidly with waste, and this process is repeated over and over. Chutes are carried up through the sets in convenient places and ore thrown down to the cars in the track level below. Finally the timber from one level connects with the sills of the level above. The heavy floor lagging originally put in prevents the waste from falling down. As the last layer of ore is removed from the level below, waste is packed in tightly and the upper floor supported. The idea is to square set out the ore and fill with waste. That the filling must closely follow the face is the vital condition for success under this method and is fully recognized by all the engineers using it. If the stope gets two or three sets ahead of the filling in these loose friable bodies a cave is almost inevitable. The square set in use is a modification of the Comstock system, the tenons being cut differently. This method of mining is expensive because timber must be brought either from the United States or Southern Mexico at an expense of 6 cents Mexican a board foot. This amounts to thousands of dollars in a month. Another disadvantage is that a great deal of time is needed to lower such a large quantity of timber through the shaft. This is especially bad where a large tonnage is required, as it decreases the hoisting time, and, therefore, the capacity of the plant. A great advantage of the system is that it disposes of all waste from development work, and thus renders prospecting cheap. The best distance between levels is about 70 feet. A 7-foot high set is used, which makes ten sets between levels. That is about as high as it is advantageous to pack up waste filling.

*Abstract Cal. Jour. Technology.

The Force of a Drill Blow.

TO THE EDITOR:—I never really became thoroughly interested in the problem of finding the force of a blow struck by a power drill until we got into the electric drill business, and prospective customers asked the question on an average of half a dozen times a day. I had discussed the question several times with engineers, but the discussion soon ended, as we readily agreed that the time element necessary to solve the problem was unknown, and could not be measured without prolonged experiment with very elaborate and expensive apparatus.

But, when customer after customer asked the question and I was obliged to say that we did not know, and the customer would proudly state that the Blank drill struck a blow of 700 pounds, and the Blankety Blank struck 500 pounds (the agent told him so—and agents never lie), I thought it was time we knew the correct answer.

Curious to know what other drill manufacturers estimated the blow of their drills to be, I asked a few, and the amounts they stated varied from 450 to 900 pounds.

After studying the problem for some time I found a very simple method of calculation and prepared the following dissertation on the subject, which will appear in our new bulletin on the box electric rock drill:

"The force of a blow may be defined as the average pressure which would accomplish the same result as the blow. In general, a blow is the result of a small weight moving at a high velocity.

"The high pressure developed by the blow is the result of the sudden stoppage of the rapidly moving weight. To calculate this pressure it is first necessary to find the amount of energy in foot-pounds stored in the moving weight, and the energy can be found if we can measure the velocity of the weight the instant it strikes.

"To measure the velocity is by no means a simple matter, especially in the case of a power drill.

"On the other hand, if we did know the foot-pounds of energy in the moving weight, we cannot obtain the average pressure on the drill without knowing the time during which the steel is moving forward into the rock under the impelling action of the blow. This space of time is so short as to be imperceptible and cannot be measured except by very elaborate and expensive apparatus.

"Therefore, the measurement of the force of the blow in a power drill is not likely to be accomplished outside of a very richly endowed laboratory.

"However, the advent of the electric drill in which the power and efficiency are so readily measured, enables us to use a very simple method for calculating the force of the blow, as follows:

"The electrical energy delivered to the box electric drill is 1½ H. P., or say 50,000 foot-pounds, and assuming that only half of this is actually delivered

to the cutting end of the drill steel, we have practically 25,000 foot-pounds of work done per minute.

"In hard granite the box drill will penetrate at the rate of 3 inches, or 0.25 foot per minute.

"The work done on the drill side of the cutting edge of the steel must equal the work done on the rock side of this edge; we, therefore, have the equation: 25,000 foot-pounds = 0.25 X P, in which P is the average pressure throughout the distance of 0.25 foot. Solving the equation for P gives the value of P as 100,000 pounds. Therefore, the force of the blow struck by the hammer of the box electric drill is fifty tons." LEWIS SEARING.

Concrete in Mining and Metallurgical Engineering.*

NUMBER IV.

Written by H. W. EDWARDS.

COST.—It is difficult to give any very definite figures in regard to this very important subject because the prices of suitable rock and the facilities for crushing it, as well as the cost of sand or tailings and cement, will vary widely in different localities. I submit, however, a figure which may be useful as a guide. In modifying this figure to suit conditions in any giveu locality, it is important to bear in mind that the magnitude of the work has cousiderable effect on the ultimate cost. For example, a piece of work like the experimental dome described consumes a relatively small quantity of concrete material, while the cost of the wooden form must have been relatively large. Compare this with a heavy retaiuing wall where a crib has to be built to form one face only. It is best, therefore, to limit this discussion to the question of the cost of labor only; the remaining figures of the cost of the material and the crib can then be adjusted to suit the local conditions.

Presuming that the materials are delivered in railroad cars convenient to the work, I find that an average cost—covering many jobs at different periods and locations—of unloading cars, mixing, arranging platforms, gangways, placing and beating concrete in place, is approximately equivalent to a cubic yard of structure per man per day. This figure is sufficiently liberal to cover incidentals, such as wear and tear on tools, lights at night, etc. Beyond this there yet remains the cost of cribs, excavations, scaffolding, lumber, etc.

About the cheapest work recorded in my note book is a retaining wall 16 feet high, 92 feet long, 3 feet thick at the base, tapering to 20 inches at the top. The ingredients of the concrete were jig tailings and picking-belt rock available ou the spot, and cement at $2.15 per barrel. The lumber cost was $14 per 1000 feet and wages were 15 cents per hour. The total cost of the wall was 22 cents per cubic foot. This cost included the straightening up of the work after it bad been roughly finished, and the supervision during the entire construction. About two-thirds of the lumber was credited as fit for other rough work.

Anotber entry in my note book is the following: A large engine foundation of hand broken slag, granulated slag and cement was constructed at a total cost, inclubing crib, of $7.75 per cubic yard iu place. In this instance, I have spccified, not per cubic yard of material, but per cubic yard of finished work. It is necessary to bear tbis distinction in mind because, as before explained, a cubic yard of tamped and finished work requires more than a cubic yard of material.

I find that there is but little difference in the cost of hand mixed concrete and machine mixed concrete. Tbis statement, of course, is restricted to the comparatively small structures built in the ordinary run of mining and smelting operations. For the construction of heavy railroad bridges or other massive structures involving thousands of cubic yards, I believe there is now but little hand mixed concrete used. In this conuection, however, the machine mixed concrete gives the better results.

SEASONING.—The seasoning of concrete is worthy of important consideration. The question is: "How long a period should elapse after laying the concrete before it should be loaded?" The auswer depends on two conditious: First, the season of the year, and, second, the use to which the work is to be put. In summer time, or in a dry, winterless climate, concrete rapidly reaches its full strength, and it is best to retard its too rapid hardening by coveriug it with a layer of sand or dirt, which is frequently moistened. Under these conditions the concrete may receive its load in a week or ten days, or even sooner, if it is entirely below ground, where the mass has no opportunity to spread. In more northerly localities, where the winters are cold, concrete, if built late in the autumu or in the winter, will not be really solid until warm weather has set in. The influence of temperature on tbe hardening and seasoning of concrete is very distinct and must be taken into account.

The second condition which has to be considered before applying the load is the purpose of the structure. If the load be applied gradually, as, for example, in the case of a retaining wall to be gradually filled up from behind, loading may commence after a week or two of warm weather. It would be unwise, however, to set an engine to work on a green concrete foundation, although there would be but little harm in mounting it in its place after a week or two have elapsed.

Thin work, such as floors and flues, naturally solidify much more rapidly than heavy masses. I have used a floor on the third day after its completion, merely taking the precaution to place a few old boards where there would be the most traffic. Unless in winter, the cribs can be removed on the third day.

In heavy masses, hardening and seasoning will go on for many months. Beyond delaying the setting until warmer weather, frost, even if the wet concrete itself be frozen, does not appear to be in the least injurious.

REINFORCING CONCRETE WITH IRON.—The embedding of iron in concrete is almost as old as concrete construction itself. F. Von Emberger, in Trausactions of the American Society of Civil Engineers, cites a case where iron rods were found embedded in concrete below water level for 400 years. For the protection of iron, concrete is better than paiut.

In 1897 there was some discussion on the effect of limestone in concrete, and a general impression is left by the correspondence that limestone was injurious to iron embedded in concrete.

For reinforcing retaining walls nothing can surpass old rails set vertically and horizontally, so that, if the wall goes at all, it has to go bodily—an effect uot to be apprehended. For light work, such as roofs or walls of dust flues aud chambers, discarded coarse mesh woven wire trommel screens are very suitable.

For foundations in bad ground the area of the concrete may be largely extended without fear of deflection by placing on the bottom of the mass a double series of steel beams, placed horizontally at right augles. I once had occasion to erect on very unsatisfactory ground a brick stack estimated to weigh 100 tons. The foundations, therefore, were extended and laid in the manner described above, by two layers of 8-inch steel I-beams 16 feet long. In all, thirty-six I-beams were used, giving a foundation area of 16x16 feet, upon which was rammed about 3 feet of first-class concrete. Including the weight of this bed of concrete, the total stress on the under surface of the foundatiou was about 1000 pounds per square foot—a most moderate pressure. This construction gave as firm a footiug as could be desired.

FOUNDATIONS UNDER WATER.—Concrete may be deposited in still water and will harden there almost as soon as in the air. Evidently, however, it will not do merely to dump the concrete into a deep pool. I have had good satisfaction in the use of a home-made iron funnel with a stem long enough to reach to the bottom, and which for convenience was cut shorter from time to time as the work progressed. The method of operating is to rest the outlet of the funnel on the bottom and to fill the stem and hopper with concrete; then, by lifting it a little and moving it about with some judgment, the concrete can be spread evenly and with slight opportunity for the cement to get washed out from the sand and crushed rock.

In running water quite a different method must bc followed. The cheapest is to make a more or less water-tight box, or coffer dam, consisting of a bottom and sides. The height of the sides must be sligbtly greater than the depth of the water. A double layer of boards, having a layer of tarred roofing paper between them, makes a very suitable construction. The ground upon which the foundation is to rest is roughly leveled and the coffer dam sunk into position by loading it with concrete. I witnessed the construction of foundations for a large stack—a very heavy spring of water having been struck in the excavation—made in this manner, and, so far as known, there have been no subsequent difficulties. The construction must have been much cheaper than pumping out the water while the concrete was laid in the usual manner, and cheaper than sheet piling.

SHRINKAGE.—In places where concrete is intended to finish accurately to a definite level, the shrinkage must be taken into account. The shrinkage varies with the coarseuess or fineness of the ingredients, the quantity of water used in the mixing and with the rapidity of setting. Fine material used very wet and setting rapidly is the combination which gives the greatest amount of shrinkage.

An allowancc of one-eighth or three-sixteenths of an inch per foot in height for vertical sbrinkage is a fair average; but great caution sbould be used not to exceed the desired level, as it is much easier to "shim" up the work to be placed on the concrete than it is to shave off a fraction of an inch. After the first piece of work has set, the operator has a standard of shrinkage which can be used for all of the constructiou, provided the materials remain unchanged, or as long as the season of the year permits an approximately similar period for the concrete to set.

*Abstract Trans. Am. Inst. Min. Engs.

A Nevada Ore Deposit.

Written for the MINING AND SCIENTIFIC PRESS by SAMUEL C. WIEL.

In a recent issue of this paper "Concentrates" said that the occurrence of alabandite as an ore was rare, and mentioned deposits in Tombstone, Arizona, associated with silver as the most notable example. It may be of interest to note a recently opened deposit of similar nature in Nevada.

This manganese deposit is located in the Shelbourne range, in White Pine county, Nevada, in the eastern part of the State, about 15 miles north of Aurum. The Shelbourne range is one of the Paleozoic ridges common to Nevada, running north and south, formed by great outflows of eruptive rock and by tilted Paleozoic strata. It reaches a height of about 9000 feet.

The structure of the ridge at the place where the deposits now in question lie consists of a series about 1000 feet thick, at the base quartzite, above that limestone—in which the ore is found—and at the top shale. The strike of this series is about northwest and southeast, dipping about 50° southwest.

Tbe limestone is much crushed. It was at one time without doubt in stratified beds, as is usual. The breaking resulting from mountain building was largely felt by this limestone, being much softer than the quartzite or shale. There is much evidence of faulting and slipping throughout the limestone, especially slickensided surfaces (seen in the tunnels), the planes running in various directions, without uniformity. The writer had just previously visited the Eureka Consolidated mine at Eureka, Nevada, making the visit to the present locality in company with H. C. McTerney, for many years superintendent of the Consolidated, and noted a strong resemblance betweeu the limestoue in question and the crushed limestone at Ruby Hill.

The outcrops were originally found by tracing heavy, black float rock up the mountain. The ore in place is a heavy, black mineral, usually soft and moist when taken out, but soon hardening. Frequently it is concretionary, looking like small balls of closely packed needles, at the same time often showing small cavities, like gas bubbles, which give it an appearance very much like a wall of slag. It is, in fact, a common explanation given by the miners that the deposit was formed by solidification from a molten state.

An analysis of specimens of tbe ore showed it to be in the main alabandite, the sulphide of manganese, to which its hardness and blackness are due. Silver is carried by the ore to the extent of perhaps 150 ounces to the ton, making it a high-grade ore. The analysis indicated that the silver was carried by the alabandite, mixed with it either as sulphide or as minutely divided particles of the metal. There is present also in considerable quantity rhodochrosite, the carbonate of manganese, and in lesser quantities as incidental constituents there are hydrous iron sulphate, pyrite, free sulphur, argentiferous galena and antimonial silver.

To review the relative importance of these constituents: The fact that the body of the ore consists of alabandite, and the intimate mixture of the rhodochrosite with the alabandite, of the carbonate with the sulphide, is probably conclusive against an igneous origin for the deposit. A carbonate is a demonstrated impossibility as an original constituent of an igneous rock. Iu this connection the writer once heard Alexander Agassiz discussing the origin of certain islands in the South Pacific, attributed by others to volcanic action, but by him to the work of corals. Having found limestone to be one of the important rocks of the place, he asked whether his opponents would call it a volcanic limestone, this evokiug a laugh from an audience composed largely of many learned men of science.

As to the other constituents, the free sulphur, antimonial silver, and some free mercury that is reported in small particles as occasionally met with, would be taken, especially in connection with the concretionary and slag-like appearance of the ore, to represent some degree of fumerolic action, and the presence of gases, but their relatively small quantities would preclude this to any great extent. The absence of oxides of manganese would argue against any great influence on the score of surface enrichment.

Perhaps the following is a fair explanation of the origin of the deposit: During the process of crushing and faulting, approaching brecciation of the limestone, which, like most geological processes, must have gone on imperceptibly over a long period of time, lines of weakness and even open cavities were formed that afforded channels for the deep-seated circulatiou. One open space, especially, in the form of a long, flat, inclined cave, has been opened, entirely similar to the well-known caves at Eureka, the ore being rich in the vicinity of this cave in much the same way. Heated solutions making their way tbrough this crushed limestone while still buried in depth deposited the sulphide, and at the same time replaced with manganese the calcium in the limestone, forming rhodocrosite, by the process known as metasomatic replacement. The earlier formed deposits were themselves crushed in the slow movement

that continued to go on, the general result being that the ore occurs in chambers or pockets of varying sizes and forms, scattered throughout the limestone. The chambers or pockets show a preference at present for the hanging wall contact, which may be attributed to the greater crushing of the limestone at its contact with the harder rocks. But no general continuity throughout the deposit appears at the contact any more than elsewhere.

Probably it would be called a single lode within Justice Field's definition in the Eureka case, which includes all deposits of mineral matter found through a mineralized zone or belt coming from the same source, impressed with the same forms and appearing to have been created by the same processes, but it is certainly not a single vein within the miner's and geologist's definition.

Remembering the close relation in properties between manganese and iron, and changing the manganese of this Shelbourne deposit for the iron of the Ruby Hill deposits, the deposits seem alike. In both cases, moreover, the chief value was in the silver associated with the ore, and in both cases the ore was readily smelted because of the value of the base as a flux. The many discussions relative to Eureka would indicate that the deposits here, as there, are due chiefly to replacement.

Ore Deposits of Rossland, B. C.*

Written by EDMUND B. KIRBY, E. M.

The Rossland mining district began active production in 1894. Its total yield up to Jan. 1, 1904, is 1,620,540 tons of smelting ore, containing about $26,000,000 gross value, or $16 per ton in gold, silver and copper.

This tonnage was derived from the following mines:

	Approximate Tonnage.
Le Roi	974,785
War Eagle	240,455
Center Star	229,648
Le Roi No. 2 (Josie and No. 1 mines)	115,007
Iron Mask	17,655
Rossland Great Western Nickel Plate	12,331
Columbia-Kootenay	7,790
Velvet	5,416
Jumbo	4,305
Giant	4,344
I. X. L.	2,900
Miscellaneous	2,447
Evening Star	1,500
Spitzee	900
Monte Cristo	409
White Bear	302
Homestake	140
Virginia	100
Portland	25
Total	1,620,540
Estimated value	$25,816,342
Average value	$16

The ore is transported to the Columbia river over two competing lines of railway, and supplies extensive smelting works at the town of Trail and at the town of Northport. These towns, together with a population of about 6000 in Rossland, are supported by the mines.

GEOLOGICAL POSITION.—The geological position of these ore deposits is shown on a map by the Geological Survey of Canada. An elongated oval area of gabbro is surrounded by a border of varying width of augite and uralite porphyrites and fine-grained green diabases. The transition from the gabbro to the porphyrites is not well defined, and they are both from the same magma. Beyond the above border come alternating series of porphyrites, tuffs and slates, and beyond these are agglomerates.

The basic coarse crystalline and plutonic gabbro thus surrouuded by borders which become more acidic and finely crystalline, and fiually pass into volcanic breccia and tuffs, indicates an ancient volcano center. The gabbro area is the main plug or neck of lava crystallized at great depths and exposed by deep erosion. Its great age is indicated by this erosion and by the numerous alterations in the rock structure and in the rock minerals.

The active mining has been carried on, not within the gabbro area, but outside of it, and in the porphyrites surrounding its western end. The principal mines are all included in the small group of claims shown near the edge of the gabbro and located on the flank of Red mountaiu, above the town of Rossland. A horizontal section through this group of claims at the approximate elevation of 3530 feet above sea level shows the structure details exposed by the workings of the Le Roi, Center Star, War Eagle, Josie, Number One and Iron Mask mines. These mines aggregate 20 miles of total workings, and the priucipal depths attained are those of the War Eagle, 1615 feet, measured on the vein, Le Roi 1361 feet and Center Star 1289 feet.

Ou the west of these claims there is a belt of fine-grained eruptives, probably porphyrites, which are in a schistose condition, frequently resembling shale.

COUNTRY ROCK OF MINES.—Within the area of the claims the prevailing rock is evidently all from the same magma, but shows innumerable variations in rate of cooling and degree of metamorphism. It is mainly composed of plagioclase feldspars and pyroxene, generally in about equal proportions, but towards the gabbro area bodies of pure pyroxenite are occasionally encountered. There is usually a small proportion of orthoclase feldspar and sometimes hornblende, and some observers have noted the fact that these appear more frequently towards the west. The rock appears to be holocrystalline and more or less porphyritic. The crystals may be either microscopic or as large as, say, five mm., while one or two mm. is a common limit. The feldspars are more or less altered to a turbid or porcelain-like appearance, while the pyroxenes are partially transformed to fibrous minerals of the uralite group. In strongly altered plaees, and especially within the veins, the rock is frequently colored brown from microscopic crystals of secondary biotite.

DIKES.—This country rock is cut by innumerable dikes which require detailed comparison and determination by the microscope. Generally speaking, they appear to be either miea traps (perhaps kersantites) or altered basalts (perhaps melaphyre). The latter are often greatly decomposed.

The general direetion of the parallel fractures has been north 10° W. with dips, which are either vertical or very steep, to the east. They have mauy fluctuations in strike and dip, and they branch, unite and re-branch. They probably beloug to at least two periods—one before and the other after the ore deposition. Occasional belts of special crystallizatiou in the country rock indicate dikes of an earlier date, which have since become cemented with the country rock and jointed to correspond with it.

THE VEINS.—These are shear zoue fissures consisting of a series of parallel platings of the rock produced by shearing under high compression. In the Center Star–Le Roi vein, in which the shear zone is most typically developed, this series of platings is 20 to 40 feet wide and dips about 70° to the northwest. The Josie vein is parallel; but the Center Star north vein, the War Eagle and Iron Mask veins are brauches from the Center Star–Le Roi vein. Their positions and dips are shown upon the maps.

The ore consists of country rock more or less replaced or impregnated by pyrrhotite, accompanied in places by small proportions of chalcopyrite, pyrite, arsenopyrite and quartz. The pyrrhotite when it occurs by itself, even in solid masses, carries but little gold, say, from 50 cents to $3 per ton. The chalcopyrite is the principal carrier of gold, and ore of commercial value occurs ouly in those localities where chalcopyrite, pyrite and arsenopyrite have been deposited with the pyrrhotite. The manner in which these minerals occur within the interstices of the pyrrhotite, and the fact that continuous masses of pyrrhotite ore are impregnated in some places and barren in others, proves the later deposition of these valuable minerals. They have been introduced after most of the pyrrhotite was in place, although occasional occurrences of chalcopyrite aud pyrrhotite in quartz point to the possibility of some contemporaneous deposition. The change from one deposition to another was probably gradual. A small proportion of the gold in the ore is native in the form of small grains and scales. The fact that oxidation extends only a few feet below the surface, while the proportion of metallics seems to average much the same, even in ore shipments from the lower levels, suggests original deposition in this form. No data have been collected, however, to indicate whether it was contemporaneous with the pyrrhotite formation.

The average proportions of gold, silver, copper and total sulphides in a grade of, say, $15 full assay value, are as follows:

	Average Center Star ore.	Average War Eagle ore, Representing also ore of Number One, Josie–Le Roi.
Gold, ounces	0.59	0.505
Silver, ounces	0.43	1.0
Copper, per cent	1.12	1 78
Sulphide minerals, per cent	25.0	22.5

In various places the pyrrhotite seems to be accompanied by a little nickel and cobalt. Specimen analyses ranging from 0.13% to 0.65% nickel, and from a trace to 0.59% cobalt.

FAULTS.—These have an average direction which corresponds to the dike system, with dips ranging from vertical to 50° easterly. Out of the great number of fractures studied and surveyed only the principal faults have been plotted, i. e., those fractures which appear to have affected the veins by well defined displacements or by acting as barriers to min eral solutions.

The faults are frequently not plainly marked, having no clay filling, and at most only a small thickness of comminuted material. They frequently consist of a zone or series of close fractures, some of which are better marked than the others, and these fracture planes often interweave in such a manner that local measurements of their strike and dip are deceptive, and these can be determined only by comparison with other workings. As a general rule, the faults appear to have been too tightly compressed to give access to mineral solutions, and those existing during the deposition period have therefore tended to act as barriers to the flow of tbese solutions.

Since individual faults often cross dikes at sharp angles in strike and in dip, a fault frequently breaks along a dike for considerable distances. Hence, in many cases of vein displacement it is impossible to say how much of the total amount has been due to the dike fracture and how much to the subsequent fault fractures accompanying it. In most cases where dikes are not accompanied by plainly marked fracture planes the displacement is so small as to indicate that the fault system, and not the dike, has probably been responsible for most of the shifting.

The sharp angles at which the faults cut the War Eagle vein have tended to produce overlaps of the vein, which is most clearly disclosed in the case of a fault on upper levels.

The Opportunities for Gold Dredging in the Yukon.

Written for the MINING AND SCIENTIFIC PRESS by E. B. BOLGER, C. E.

In the month of August, 1896, the first discovery of gold was made by a miner called Henderson ou Gold Bottom creek, 35 miles from what is now the town of Dawson. Almost simultaneously with this discovery gold was discovered on Bonanza and Hunker creeks by Carmac and Hunker, respectively, and ever since the news of these discoveries became general, there has been one continual stream of humanity pouring into that land of golden opportunities.

In the early days the only meaus of transporting outfits was to pack them on your back over the Chilcoot pass, later by pack train via the White aud Chilcoot passes from the seaports of Dyea and Skagway, Alaska. Now, however, the trip from the sea to the inland waters of the mighty Yukon can be made with as little inconvenience as is incurred by traveling from San Fraucisco to Los Angeles.

The old time miner, or "Sour Dough," as he is familiarly called, had formerly many difficulties to contend with: Firstly, the extreme cold weather during the winter months, when for weeks at a time he would be obliged to discontinue excavating the pay until the weather moderated. However, he was somewhat compensated for this inclement weather by the five months of fine weather duriug the summer, three months of which were continual daylight; secondly, the scarcity of provisions and cost of transportation; thirdly, the difficulty of working the ground, which was frozen to an unknown depth iu some places, having been in that condition for ages.

During the first years of mining the hardy "Sour Dough" resorted to the primitive method of lighting fires on the ground to be worked, thus loosening a foot or two of the auriferous gravel at a time, which could theu be handled with the pick and shovel—altogether a very tedious process indeed, and one which required the richest kind of ground to pay for immense expenditure of time and labor. From 1896 to 1898 no ground could be handled which contained less than from 50 cents to $1 per pan, i.e. from $135 to $270 per cubic yard, a pan containing on an average 0.10 of a cubic foot, while in many iustances as high as $10 to $15 per pan were found, though this of course was only occasional, still it all goes to show the immense wealth hidden in the gold fields of the North.

To facilitate the thawing of the gravel, some miners then conceived the idea of using a steam boiler fitted with rubber tubes having steel nozzles attached; the steam is sent through these tubes and the nozzles driven into the ground to be worked, so that a cousiderable amount of the pay streak could be thawed by one shift and excavated by the next.

Until 1900 the steam boiler with attachments was considered the acme of modern appliauces for working the mines in the Yukon, but in that year a Detroit firm decided to place a modern dredger of 700 cubic yards capacity per twenty hours ou claim No. 42, below Discovery, Bonauza creek.

This idea was looked upon with a great deal of incredulity by the majority of the miners who thought that it would be impossible to use a dredger on frozen ground with any success; uevertheless, this dredger with a crew of ten men, five on each shift, handled more grouud than 400 men with a boiler could.

The following is a fairly accurate description of the dredger above referred to: The dredger is provided with two endless chains of buckets, twenty-nine buckets for each chain, occupying, respectively, the frout and rear of the structure. The chain of buckets situated at the front performs the functiou of excavator and hoist, the other that of tailings stacker. The lips of the buckets of the former are armed with strong prongs of nickel steel, those of the latter are plain. A 75 H. P. boiler furuishes the power, 65 H. P. being required to operate the plant.

The excavating buckets elevate and empty the gravel into a rotating perforated trommel, the axis of which is inclined about 10°. The gravel is treated in the usual way, the oversize falling iuto buckets of the tailings elevator and the fine gravel, carrying the gold, passing along with the wash water over tables situated on either side of the trommel. The gold which is not caught on these tables falls with the tailings into sluice boxes situated below.

The "cleau up" is made every morning. The mats are shaken over a pan placed in a large box and panned in the usual way. The fine gold which cannot thus be reclaimed is transferred to amalgamators and run over amalgamated plates. The sluice boxes are cleaned in the usual way. It is es-

sential, in order to make the working of the dredger a success, that you should have the following information: First, an accurate knowledge of the nature of the ground to be worked, the distance to bedrock, the size of the gravel, etc. Second, a thorough test of the auriferous gravel. (This is easily obtained, as there are hundreds of prospect holes in every claim of any value so that there is little difficulty in making a thorough test with a minimum expenditure.) Third, the proximity of good roads to facilitate the transportation of the dredger, the hauling of fuel, provisions, etc. Fourth, a sufficiency of water to float the dredger (4 feet is ample). So I have no hesitation in saying that with the immense area of auriferous land to choose from there would be no difficulty for an engineer conversant with the requirements of a dredger in the Yukon, to obtain, perhaps, one of the best dredging propositions in America today.

The only rival the dredger has in the North to-day, and it can hardly be considered a rival, is the steam shovel. Some miners recently have used the steam shovel as an excavator, but there are inconveniences connected with its use.

With the present existing facilities for gold dredging in the Yukon, and which will improve year by year, it is safe to predict that the near future will see numerous dredgers in operation there and that the yearly output of $10,000,000 worth of gold dust may be trebled or quadrupled.

The Balance Rope at Hylton Colliery.*

Written by T. E. PARRINGTON.

It is desirable, where winding bas to be done from great depths, that some means should be employed to counteract the effect on the engine of the weight of the winding ropes. To produce a large output, a high speed of winding is essential; and, to attain this with safety, the load on the engine must

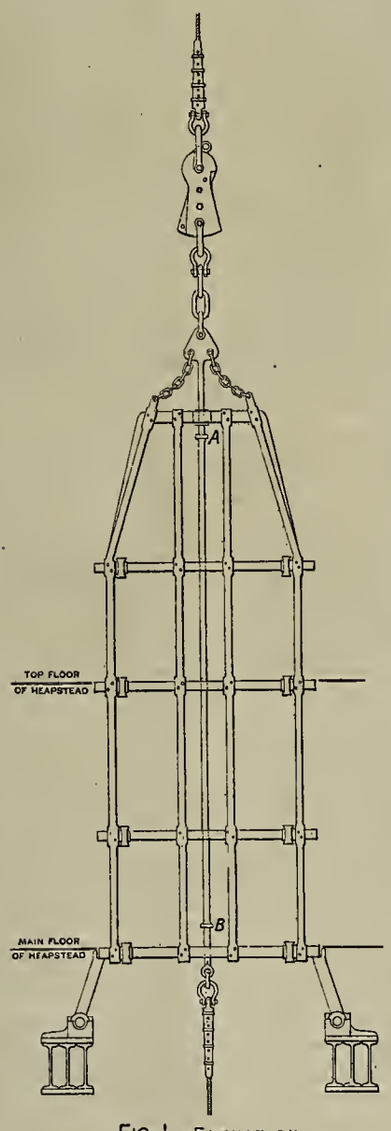

FIG. 1.—ELEVATION.

be as nearly constant as possible, throughout the run.

The method of applying a tail or balance rope, hung beneath the cages, though in theory the most perfect, never appears to have come into great favor, especially in this district, owing no doubt to several admitted objections to its use; notably the increased strain on the sockets of the winding ropes, on the cages, and upon the keps, when the cage is landed; and, in addition, the loop at the pit bottom has frequently been a source of much trouble, probably owing to the want of some suitable means of guiding it.

The east pit, at Hylton colliery, is 20 feet in diameter, and is drawing coals from the Hutton seam at a depth of 1560 feet. Some months ago, a balance rope was introduced into this pit, and it has since

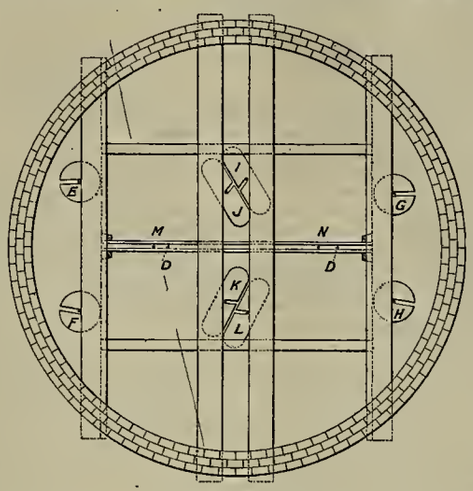

FIG. 2.—PLAN

been running, most successfully, beneath the cages, especially designed and built for its adoption. Each cage carries eight tubs, that is, four tubs on each deck: the intervening space, in which the men ride, adapts the cage to the double beapstead and obviates "decking." A draw bar of forged iron, 2½ inches in diameter, runs through the cage from top

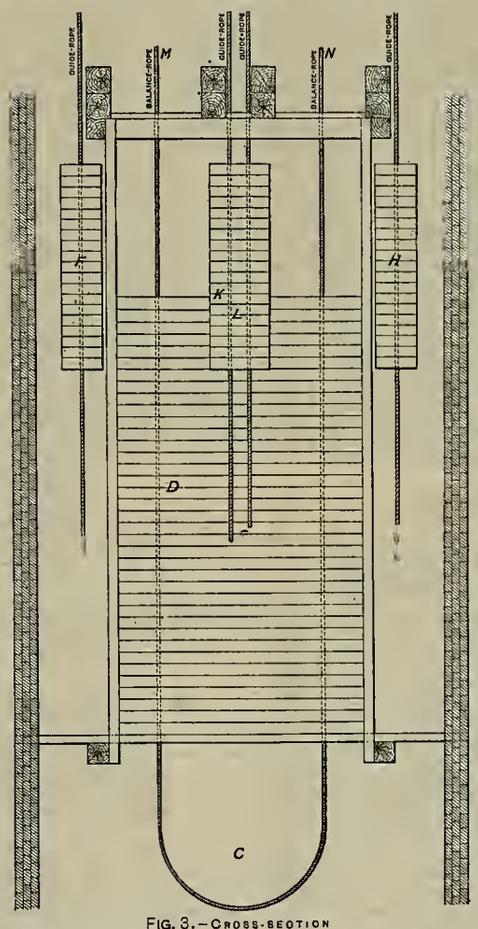

FIG. 3.—CROSS-SECTION

to bottom. The cage is built in halves, and the draw bar is inserted before the two sections are bolted together.

Fig. 1 represents the cage standing on the keps. At the lift, the draw bar moves up until the collar, A, comes against the head of the cage, and the cage is taken off the keps and carried ou the collar during the run, the draw bar dropping again so soon as the cage is landed. By this means, the extra strain occasioned by the weight of the balance rope is never applied to the cage, while the keps are never required to carry more than the weight of the cage and its load, the balance rope being always directly connected to the winding rope by the draw bar. In the event of the draw bar falling until the collar, B, rests upon the cage bottom, the principle would of course fail; but, unless the cage dropped very heavily upon the keps, this could never happen, the movement of the draw bar being, at the extreme, about 2 inches in ordinary coal drawing. The winding ropes and balauce ropes are capped in the ordinary way, the sockets being riveted and hooped (Fig. 1). The winding ropes, of Langs lay, built up of six strands of nineteen wires each, are 5¼ inches in circumference and weigh 13.7 pounds per yard. In order to make the balance rope as flexible as possible, special thin wire is used in making it, the full rope comprising six strauds of thirty-seven wires each, and it weighs twelve pounds per yard.

Figs. 2 and 3 are a plan and a cross sectiou respectively of the pit bottom below the dabbing baulks; and they show how the loop, C, or return of the balance rope is dealt with. The rope is made to run in a deep perpendicular groove, D, whose vertical sides guide the rope parallel to the bend, but in all other respects the course of the rope is entirely free. This method, the writer thinks, has not before been adopted in this district, altbough it has becn in use for some years at collieries in South Wales, where he believes it was first introduced.

At Hyltou colliery, the groove, D, is 22 feet deep and 2½ inches wide, and the sides are formed of redwood deals, 1½ inches thick. It will be noticed (Fig. 3) that the extreme bend, C, of the rope is allowed to project below the groove, the arrangement being found advisable iu order to prevent the possibility of the rope becoming jammed. Owing to the twisting action of the balance rope, the top deals of the groove, at first, wore through very rapidly, but by substituting teak instead of redwood, at the top, the trouble has been overcome. This remedy is preferable to liniug the top with sheet-iron, as is sometimes done, the noise iu that case being very objectionable. In every other respect the arrangement has been found most satisfactory, and the ex treme simplicity is a great recommendation.

Mill Construction, Milling and Amalgamation.*

NUMBER III.

Written by I. ROSKELLEY.

This excess of feed need not, I admit, be present, but it often is because it is hidden away behind the chuckblock and the millman cannot see it. The advocates of high discharge say that banking against the screen of material too coarse to pass through will occur if a low chuckblock is used. A 2-inch discharge has been used in the Robinson Deep mill ever since the mill has been running, and by always keeping the feed low we have not been troubled witb "banking" or excessive breaking of screens.

FEED.—This should be kept even and low. Uneven feeding causes banking at the ends of the box, and both this and high feeding impedes crushing.

WATER SUPPLY.—The mill should have a coustant head of water, and its supply should not be tapped by any other department. If the pipes of the mill are supplied from a large tank outside, as is done on some mines, this is assured. The water pipes of a mill should always be somewhat larger than theory demands, to allow for space taken up by adhesive matter in the water; as, after being in use for some time, unless provision is made for this, tbe supply will be inadequate. In every mill some arrangement should be made so that each shiftman uses the same amount of water. Where each battery is supplied with a single pipe this can be easily done, but whatever system of piping is adopted in the construction of the mill, if cocks are used instead of valves and the cocks marked, the water supply can be always kept near the actual amount required. The water supply must be varied according to the coarseness of the rock coming to the mill, as the rate of crushing varies as it is coarse or fine.

I do not see that it can make much differeuce to the rate of crushing wbether the water is introduced at the top or the bottom of the box, as the action of the stamps prevents it striking directly on the ore. Several different arrangements are in vogue for the distribution of the water throughout the box. A supply near each eud is good, aud so is small jets the wbole length of the box.

Increasing the quantity of water does not greatly affect the rate of crushing, but if the supply is irregular crushing is undoubtedly retarded. The water supply is regulated not by conditions in the mortar box, but by the flow over the plates. If the supply is inadequate, sand will bank on the plate, and if in excess botb black sands and fine gold will be carried away, the latter not getting a chance to amalgamate. If a fine screen is used the amount of water per ton of rock crushed must be increased. If the screen is very fine the particles passing over the plate are fine, and slimes and fine material tend to stick to the plate much more than rougher particles, hence the increased supply of water necessary to keep the plate clear.

Before making any remarks on amalgamating I have a little to say on the use of cyanide in the mill.

* Trans. North England Inst. Min. and Mec. Engrs.

* Abstract Trans. Jour. Chem. Met. and Min. Soc., S. A.

I have never yet met a millman who did not advocate the use of cyanide, nor a cyanide man who did not say that it ought to be discontinued. These widely different attitudes are but natural; the millman finds it assists him in his work, and, consequently, he stands up for it; the cyanide man says it dissolves gold on its way from the mill to the cyanide works, and speaks against it. This antagonism, though I have always found it a friendly one, has done harm, and has prevented the question from being discussed openly, and the result has been that millmen preserve as a dead secret the amounts which they use for different purposes. The harm which cyanide does when used in a mill is patent to every chemist, and the result is that in a few cases millmen have discontinued using it.

Stated briefly, the objections to using cyanide in the mill are: (1) It dissolves gold on the plates; and (2) it interferes with the pulp after leaving the mill.

The advantages accompanying the use of cyanide are perhaps better known to millmen, who have the practical handling of the amalgamating tables, than to any one else. They are:

(1) It greatly assists in the setting and dressing of plates by causing the mercury to spread and mix with the amalgam. Two men who can set a copper plate well in an hour, using cyanide, will require twice that time without it, and even then the result is not as good.

(2) It keeps the plates in good condition. When cyanide is used, plates are seldom seen discolored with streaks of yellow, oily-looking scum as often occurs with certain ore when it is not used. It has been affirmed that this discoloration can be done away with by feeding a little lime into the mortar boxes, but I have not found lime very effective. The use of lime ought to be avoided when cyaniding follows amalgamation, since it interferes with the amount required in settling the slimes, and for this reason, since it is of small use in the mill, I have discontinued it.

Cyanide, when used in dressing plates, removes this yellow scum which forms on the lower part of the plate, and since the dressing is done every four hours it prevents it from appearing in any quantity. The amount of gold caught on the lower part of the plate is small, and the loss in gold, therefore, owing to the presence of this scum, is slight, but the escape of mercury to the cyanide works, which it causes, is another matter. When plates are in good condition the mercury which is applied in dressing oozes through the amalgam down to the plate and never appears on the surface. Immediately the oozing quicksilver reaches one of those discolored patches it rises to the surface and drains down the plate in "tears."

(3) It thoroughly cleans copper plates of grease and foreign matter, which would interfere with "setting."

Some time ago I started taking samples in the mill, to see how far the evils advanced against the use of cyanide were real ones. I may state here that for dressing plates I use one-half ounce of cyanide dissolved in four gallons of water, and that this is sufficient for ten tables. In setting plates I sometimes used a slightly stronger solution, but since this occurs seldom I leave it out of consideration. Cyanide is never used in the Robinson Deep mill, except for dressing and setting plates, but seeing I was face to face with the fact that either I must discontinue the use of cyanide and let the amalgamation suffer, or else I must go on seeing a certain amount of gold dissolved and partly lost, so giving trouble to the cyanide works. Both of these I was unwilling to do, and at last it struck me that both my troubles might disappear if I washed off the dressing solution before letting the stamps fall and collect it at the bottom of the table. I now collect regularly the first wash of the plates after dressing with a trough which is rectangular, about 4 inches deep and 2½ inches wide, and goes the whole length of the table. I store the washings in tanks.

From what I have said it will be seen that I consider the indiscriminate use of cyanide in a mill distinctly harmful, but that if used in small quantities and special precautions taken against its escape to the cyanide works, it is beneficial. Using large quantities and not collecting the washings may contaminate the water supply of the mill on those mines that return the water after only a short interval.

The time lost in collecting the first wash of the plate is infinitesimal, something like five seconds, I should say.

Amalgamation.—Inside amalgamation, pure and simple, is not often seen nowadays, but it is still the custom in many mills to feed mercury into the mortar boxes. The advocates of this method say that the mercury from the box which passes through the screens helps to keep the plates in good condition, and that a small percentage of gold is caught in the boxes. If plates are dressed properly every four hours this continued application is unnecessary, and there are several objections to the practice. These are:

(1) Excessive loss of mercury. Much of the mercury in the box is "floured" by the beating of the stamps and passes through the screen in this finely divided condition. Floured mercury floats readily on water, so that little assistance is given to the plates, but much mercury is carried down the plates and escapes through the mercury traps to the cyanide works and is lost. I find that the loss of mercury with outside amalgamation is .3 ounce per ounce of gold recovered. On more than one occasion in this society, when the loss of mercury in mills has been under discussion, it has been stated as so much per ton of rock crushed. Now, this seems to me to be a most misleading method of making the statement. The loss depends on the amount used, and this is dependent on the number of ounces of gold recovered. Where the grade of rock is low the loss of mercury must be low, since the amount of gold recovered is low, and the reverse is the case where the grade is high. If the loss is stated per ton of rock crushed, then the dwts. of gold recovered in the mill per ton of crushed rock should also be stated.

If the loss is stated as so much per ounce of gold recovered, or as a percentage of the total amount of mercury used, we have figures which can be compared with those of any other mill.

(2) Accurate screen samples cannot be obtained. This is true for two reasons:

(a) Some of the gold is amalgamated in the box, and

(b) Beads of mercury and amalgam passing through the screens get into the sample tin, making the sample go higher than it should.

(3) Loss of amalgam. Small beads of amalgam collect on the blanketing of the screens and on their frames, and when screens are changed these fall on the plates. Often these are not collected in the clean-up pan, but are allowed to remain until the water is turned on, when they are carried away.

Setting Plates.—Before attempting to set a plate the operator should see that it is perfectly clean. If the plate is scoured with fine sand, brushed down with a cyanide solution and then washed, it will be ready for setting.

Sixteen ounces of mercury is sufficient for setting a 16-foot plate. The mercury, which is sprayed on the plate through canvas, is rubbed into it with a soft brush. If the brush is dipped into a cyanide solution from time to time it will be found that the mercury will spread much better than if this is not done. Of course, the top of the plate is the proper place at which to begin.

After the plate has been silvered, if possible, about six ounces of gold amalgam should be rubbed into it. If this is not done for the first twenty-four hours after amalgamating is commenced the plate will not amalgamate more than two-thirds of what it should do. In setting a plate care should be taken not to get it "wet" with mercury. When in the best condition for catching both gold and black sands a plate has a pasty surface.

Dressing Plates.—Plates are dressed every four hours—twice each shift. Ten minutes is allowed for the first dressing and five minutes for the second, hence the total loss is forty-five minutes per day. In some mills the stamps are hung up, and when the water has washed the plate clean dressing is commenced. In others, again, the water is shut off immediately the stamps are hung up and the plates are left covered with black sands and concentrates.

This sand is brushed off and put aside to be amalgamated in a grinding barrel. The latter is the method which I adopt, and this, I believe, accounts for the varying amounts of gold in the first washing after dressing. I usually get about one-half pound of fine sand washed down into the trough in which I collect the washing, but this, of course, varies according as the brushing up has been thorough or otherwise.

In dressing plates mercury is sprayed over the upper part—the 3 feet that is scraped daily—and this mercury oozing downwards supplies the lower part. Then a .08% cyanide solution is sprinkled over the plate and the mercury is rubbed in with a hard brush. Afterwards the amalgam is brushed smooth with a soft brush, and after being washed down is ready for amalgamating.

The upper part of the plate is the part that needs most mercury, for it is here most amalgamating is done; 95% of the gold caught by amalgamation is got within 3 feet of the top of the table. With a low-grade ore it is difficult to keep the lower part of a 16-foot plate from scouring, and consequently I do not see that anything would be gained by putting another plate outside the mill, as has been suggested. Neither mercury nor amalgam should be allowed to leave the mill. After a series of tests running over three weeks nothing more than a trace of mercury was discovered on the Robinson Deep.

(To be continued.)

Cost of Mineral Surveys, Etc.

The U. S. Surveyor General for Montana states:

"Only four plats of mineral survey shall be made; only a single posting is required in proceedings for patent for a mining claim, the survey of which comprises a number of contiguous locations.

"But one plat of a mineral claim will be furnished for posting, except in the case of a lode claim and millsite embraced in the same survey, when one plat will be furnished for posting on the consolidated lode claim and one on the millsite.

"The following schedule of prices for office work on mineral surveys is in effect:

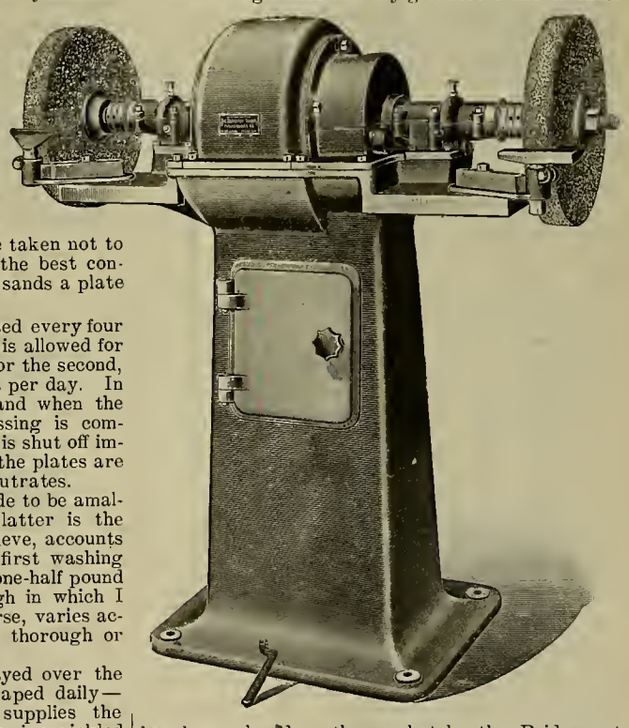
For lode claim, $30.
For placer claim, $35.
For millsite, $30.
For millsite included in one survey with a lode claim, $20.
For each lode claim within and included in one survey of a placer claim, $20.
For several lode locations included in one survey, the first location named, $30.
All other locations included, each, $25.
For several placer locations included in one survey, the first location named, $35.
All other locations included, each, $30.
Supplemental order for survey additional, $5."

The U. S. Surveyor-General's office for California furnishes the following schedule of official charges:

"One lode claim, $35.
One placer claim, $40.
Contiguous lode claims, consolidated, each, $25.
Contiguous placer claims, consolidated, each, $30.
One placer claim, with lode included, $55.
One placer claim, including lodes, $30, and $25 for each lode embraced therein.
One placer claim and lode claim, consolidated, $55.
One millsite, $35.
One lode claim and millsite, $45.
Segregation surveys, $15.
Cancellation of instructions for the survey of a mining claim and re-issuing same, $5.
Official reports, as to expenditures, on either lode or placer claims, $5."

Motor Driven Buffing Lathes and Dry Grinders.

To supply the demand for effective electric motor driven buffing lathes and dry grinders a line of these



has been placed on the market by the Bridgeport Safety Emery Wheel Co. and the Crocker-Wheeler Co. Instead of extending an ordinary motor spindle and making a base to fit the motor, the emery wheel builder supplies shafts upon which the Crocker-Wheeler Co. mount their armatures.

Machines of this class must, of course, be fully inclosed, and the problem of cooling by air is a serious one. This has been solved by having the lower half of the motor open directly into the base casting. The air contained in the inside of the base is thus added to the quantity that circulates around the inside of the motor, and enables it to run much cooler than an ordinary fully inclosed motor of the same size and capacity.

The armature and brush mechanism is covered with an end shield, split horizontally. The lower half contains the brush holders and wire connections; the upper half is attached to the motor frame by cap screws. This upper half of the frame can thus be readily taken off, giving easy access to the armature and brushes.

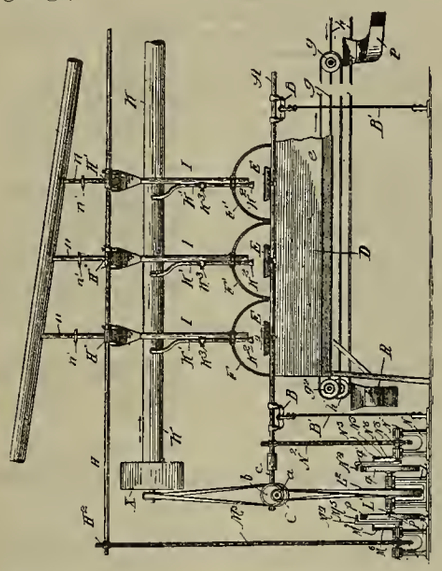
The machines are equipped with ring oiling bearings. On the outer end of each box is a dust-proof collar, held in place by a key with two ring nuts, to compensate for all end wear and thrust of the spindle. The machines are strong, rigid, compact and self-contained. All wires and connections being inside, a short circuit through outside terminals is impossible.

Mining and Metallurgical Patents.

PATENTS ISSUED MAY 3, 1904.

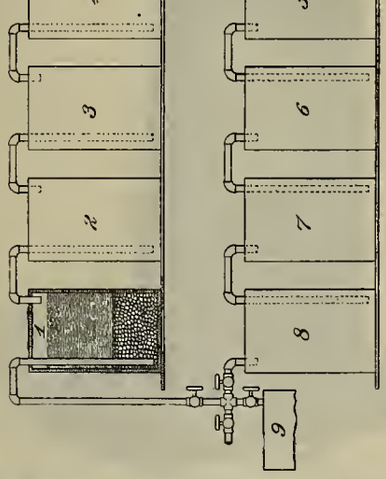
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

DRY ORE SEPARATOR.—No. 758,097; W. H. Noakes, Lagrange, Ill.



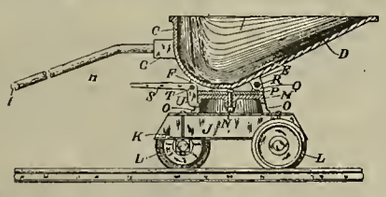
In dry ore separator, combination of pan for holding ore, agitating mechanism for pan, stationary hood extending over pan and means extending through hood for directing overhead air blast into pan.

PROCESS OF TREATING COPPER ORES.—No. 759,191; C. H. Rider, St. Louis, Mo.



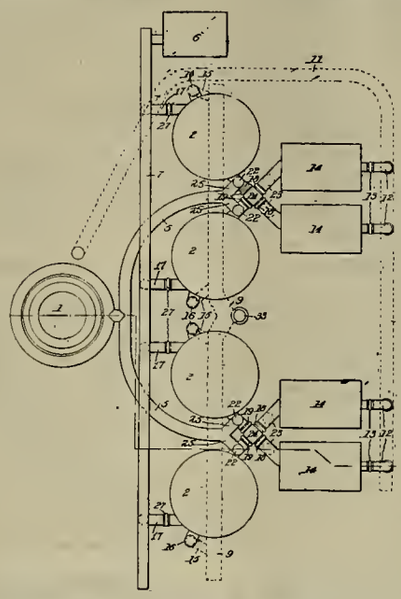
Process of extracting copper from ores by crushing ore, charging a series of connected receptacles therewith, adding solvent comprising sodium chloride, nitric acid and water, closing receptacles and permitting gases generated to circulate through the several receptacles and through a second series of receptacles, connected thereto, containing water, removing water from second series and charging same with metal-impregnated fluid from first series of receptacles and precipitating copper therein.

SLAG CAR.—No. 758,812; B. H. Bennetts and L. W. J. Jones, Tacoma, Wash.



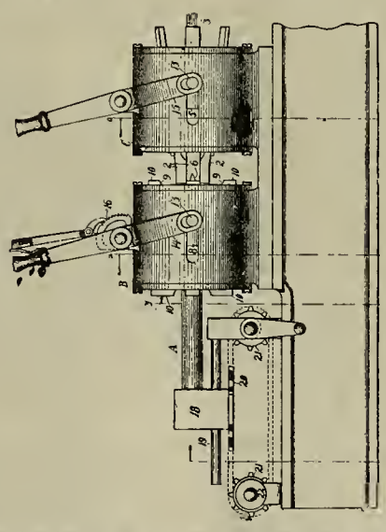
In slag car, combination with truck, of slag pot mounted on truck aud adapted to dump slag in solid mass in any direction from truck, hook pivoted to slag pot and adapted to engage truck whereby pot is prevented from turning on truck and from tripping thereon, and handle engaging rear end of slag pot and bent so that when pot is down car may be pushed by handle, and when it is tipped handle may be within reach, whereby the dumping of slag may be controlled.

HOT BLAST APPARATUS FOR METALLURGICAL FURNACES.—No. 759,171; A. P. Gaines, Bessemer, Ala.



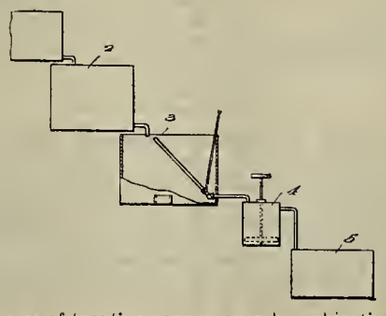
In hot blast apparatus for metallurgical furnaces, combination with furnace, regenerative stove or chamber, means of supplying blast of air thereto, and closable connection between stove and furnace through which hot blast passes to furnace, of plurality of combustion chambers separate from stove, closable connection between each combustion chamber and stove through which hot gases and products of combustion pass from chamber to stove, and means for supplying gases for combustion in combustion chambers.

DRILL SHARPENER.—No. 758,926; D. G. Morgan, Chinese, Cal.



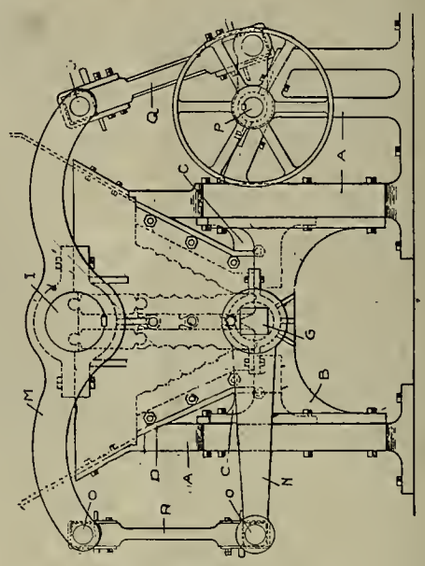
Combination in machine for sharpening hollow drills, of expansible reciprocable dies, jaws for adjustably holding hollow drill with bits in opposition to dies, whereby all bits may be sharpened simultaneously, mandrel in axial alignment with drill, and jaw series and means for actuating dies.

METHOD OF TREATING COPPER BEARING ORES WITH CYANIDE SOLUTIONS.—No. 759,220; L. E. Porter, Los Angeles, Cal.



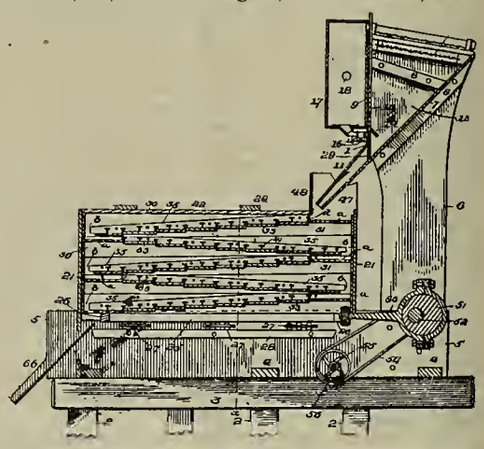
Process of treating copper ores by subjecting ore to action of alkaline cyanide solution, thereby dissolving metals soluble in solution; treating solution with acid and producing copper cyanide precipitate and hydrocyanic acid solution; separating solution containing hydrocyanic acid from copper precipitate; neutralizing hydrocyanic acid solution with alkaline oxide, reproducing alkaline cyanide solution for repetition of before described process; producing metallic copper from copper cyanide precipitate by placing copper precipitate in suitable receptacle together with alkaline solution and treating mixture by electrolysis and producing metallic copper and alkaline cyanide solution.

CRUSHER.—No. 758,735; J. W. Boileau, Detroit, Mich.



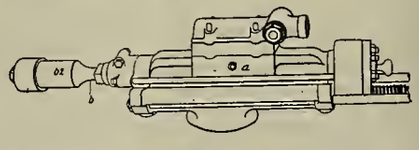
Ore crusher comprising pair of rock shafts connected for synchronous movement, crushing plate, strut, one end of plate and strut pivotally abutting, and opposite ends pivotally engaging bearings upon rock shafts whereby plate may be reciprocated, cooperating stationary plate arranged at angle to movable plate to form wedge-shaped chamber therebetween, and cam in rear and intermediate pivotal bearings of reciprocating plate adapted to cause lateral deflection thereof during longitudinal movement.

CONCENTRATING AND AMALGAMATING MACHINE.—No. 759,153; F. J. Bonnington, San Francisco, Cal.



Tray for concentrators and amalgamators, comprising series of level horizontal steps arranged one after the other in progressively lower planes, combs having depending teeth arranged over the steps and having teeth extending below plane of steps and bent to overlap same.

CLUTCH HEAD FOR ROCK DRILLS.—No. 758,761; J. E. Littleton, North Tarrytown, N. Y.



Drill shaft for drilling machines provided with cylindrical head having central longitudinal recess therein, inuer end of which is conical in form, sleeve inserted in outer end of recess and inner surface of which is conical internally at its inner end, clutch member circular in cross-section and tapered at both ends and composed of plurality of longitudinal parts and held in head by sleeve, and cap adapted to be screwed on head and to force sleeve thereinto.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ALASKA.

J. H. Fox, formerly of the Funtor Bay Co., says he is organizing a company to work the Portago group at Funter bay, near Juneau.

Juneau reports say the Eagle River M. Co. has its 10-stamp mill in full operation. Tho first week there was only sufficient water to run five of the stamps, but Superintendent Thane cleared up off the plates each day $160.

Operations are resuming in the Alaska-Juneau mine, near Juneau. Tho snowfall in tho upper hasin was light last winter and the shoveling out crew is having little difficulty in opening up the surface workings. J. Porella, foreman at the Alaska-Juneau mine, has men laying pipos.

Manager W. Hile says the Jualpa M. Co., near Juneau, will oporate this season. Among the early contracts let will be a flumo 3000 feet long, 1000 foet of wingdam and 325 feet of crib dam.

The Treadwell mines at Douglas are running full blast and 1100 mon are on the payroll. The number will he incroasod to about 1300 men bofore June 1.

J. H. Hutchinson of Boise, Idaho, and Pittsburg, Pa., men have organized the Pittsburg-Alaska Tin Co., to open up tin mines on Seward peninsula, which Hutchinson holds under a bond. Tho National Load Co. is part owner. Hutchinson will sail from Seattle, Wash., about June 7, with sixty men, including a tin expert from Singapore, and will go direct to Port Clarence.

ARIZONA.

Cochise County.

At Duluth, Minn., the Lake Superior & Pittsburg M. Co., has been incorporated as the result of consolidation of the Lake Superior and the Pittsburg Development companies, operating near Bishee. T. F. Colo and C. F. Congdon of Duluth, Minn., and G. R. Campbell, Calumet, Mich., constitute the first board of directors.—— The Yavapai Dev. Co., organized for general mining business, both in Minuesota and Arizona, has been incorporated in Duluth, Minn. Its directors are T. A. and L. H. Merritt and A. E. McManus of Duluth. It is understood that its object will be to develop the Pickaway group of claims.

Graham County.

The new section of the Shannon concentrating plant near Clifton is in operation, there being in all thirty-nine tables, which aro handling 400 tons of ore per day. The entire plant is treating from 625 to 650 tons of ore per day and making 20 tons of copper per day. It is expected that the output will be increased to 700 tons of copper per month.

The directors of the Standard C. Co., with mines near Clifton, report the following figures and statements, which embrace a period of fifteen months, from Jan. 1, 1903, to March 31, 1904. At that time the company was on the edge of some rich ore bodies which required but little development to bring to the surface. This was done, and for soveral months the mines made rapid shipments of high grade ore. For the period of fifteen months mentioned, there was shipped to the Clifton smelters a total of 5030 tons of ore. Favored thus with ore of high-grade and with the double advantage of small production cost and good prices for electrolytic copper, on which settlement for ore deliveries was made, three dividends were paid, aggregating 12½%; since there has been a decline in revenue through a gradual fall in the price of copper, as well as a smaller output of rich ore. As the ore grew leaner and more difficult to extract, the cost of mining advanced, and the directors are at present considering the best and cheapest method of increasing the value of the ore hy reducing its cost. At the same time the erection of an aerial tramway and two sets of ore bins began, which have since been completed at a cost of $16,311. They have also had to contend with a lawsuit over a disputed territory, which, although decided in the company's favor, involved it in a loss of $10,000. These expenses are now finished with. They also bought some smaller mining property. With the exception of the Chavez crosscut of 406 feet, the majority of the period's development work paid for itself, as the bulk of it was driven on ore. The crosscut of 406 feet will have to be driven at least 300 feet more to get at the point where it was originally intended to drive it. With the development that has been laid out, it is intended to keep the reserves continually in advance of output. Within the past few months they have made a satisfactory contract with the Shannon C. Co. for the treatment of all the Standard's ores, whereby they are enabled to ship much of the ore at a profit that formerly had to go on the dump. The balance sheet shows the following figures: Tho ore shipments for the fifteen months amounted to 5030 tons, which gave a net profit of $83,792, out of which dividends were paid to the amount of $52,500; cost of litigation, purchase of new property, patenting claims and other improvements made amounted to $15,000.

Tho Poland-Nelson Mountain group of seventeen claims near Clifton have been sold to the Polaris M. Co. These claims adjoin those of the company and several of them are on the Black Prince lode. They are higher up the mountain than the other claims of the company, and will be developed by the Phonolite tunnel now being driven. The holdings of the company, with these claims, include forty claims in one group.

Santa Cruz County.

Full operations are under way at the Mowry mine, at Mowry Camp, near Nogales, hy the American Industrial & Dev. Co., of which J. N. Curtis is manager. The Mowry is a contact vein, between granite and limestone. The ledge proper is 100 feet in width. The main shaft is 360 feet in depth, developing the ore shoot below tho old workings. Another shaft southwest of the main shaft, along the ledge, has reached vertical depth of 70 feet, from bottom of which a drift and winze are developing the ore shoot. Northeast, another shaft is going down on another ore shoot, and is at a depth of 80 feet, from the bottom of which a drift is running to connect with the old Mowry workings. There are fifty mcn at work and the numher will be increased.

Yavapai County.

(Special Correspondence).—The Bradshaw railroad is finished from Prescott to Crown King, and trains are regularly running.

Crown King, May 7.

Yuma County.

The Bonanza mine (the Harqua Hala) at Harqua Hala, 65 miles rom Aztec, has been sold, says Superintendont A. G. Hubbard, for $40,000 to an Eastern company. The owners of the Oro Cobra, adjoining the Agard properties in the Hacuvars, have let a contract for 250 feet of work.

CALIFORNIA.

A table has been compiled by the United States Geological Survey, showing the production of petroleum of California hy years. The total production previous to 1876 was 175,000 barrels. From 1876–81 (inclusive) the production was under 100,000 barrels per month; in 1882 it was 128,636 barrels, and in 1886 reached 377,145 barrels. The following year it nearly doubled, heing 678,572 barrels, and in 1888 was 690,333 barrels, dropping in 1889 back 303,220 barrels; raising to 705,969 barrels in 1894, and then by years as follows:

Years.	Barrels.
1895	1,208,781
1896	1,252,777
1897	1,903,411
1898	2,257,207
1899	2,642,058
1900	4,324,484
1901	8,786,330
1902	13,984,268
1903	24,337,828

The total production to Jan. 1, 1904, has amounted to 66,172,301 barrels.

Calaveras County.

The Royal mine of Hodson has about completed a 12-inch pipe line from the Salt Spring reservoir to tho mine, a distance of 10 miles, for supplying the 120-stamp mill with water. The line will also furnish the chlorination plant of the company with water. This plant will be built to handle all the sulphurets of the 120-stamp mill, as well as the forty stamps of the old mill. Everything is put through the mill, commencing at the surface and going down, the rock on the top showing $1.50 per ton free gold, says the Angels Record. An incline shaft 1100 feet with crosscuts and drifts has been sunk and in the course of work the entire property will be quarried out. J. C. Kemp Van Ee is superintendent.

The Maltman mine, near Angels, is closed down pending a settlement of claims against it.

The 5-stamp mill formerly at the Empire mine, below Hodson, is being placed on the Benson mine, 1 mile from Angels, near the Gold Hill mine.

Inyo County.

Olancha reports say a new district is being opened up at Cactus Flat, 15 miles southeast of Olancha. On the Boland and Lockett prospect the shaft is down 60 feet. At this point the ledge is 4 feet wide, and assays show gold values. The ore is being sacked for shipment as it is taken from the shaft. On the mine owned hy E. Walker et al. a shaft has been sunk 36 feet on the vein. They have an 18-inch streak in the bottom, which carries high grade free-milling gold.

Nevada County.

I. Haas and G. W. Root of Grass Valley, interested in the Auriferous mine, report machinery in place and working, and the compressor was started up this week. It is believed by July 1 they will reach the gravel channel. They have 350 feet more to run.

On Badger hill, a mile from Cherokee, quartz mining is progressing. Last week at the Siberian mine, A. S. Bigelow, of North Columbia, reports striking a ledge in the lower tunnel showing the pay shoot that existed in the upper levels. The ore carries free gold. The tunnel was run in a distance of 700 feet and tapped the vein 340 feet below the surface. The work of drifting north and south has begun, and as soon as the drifts are run ahead some distance, stoping will be started. The formation is 6 feet wide and there are 20 inches of quartz. The company will build a 5 or 10-stamp mill on the mine as soon as the roads are in a condition to haul the lumber and machinery.

Manager G. W. Root, of the Kenosha M. Co. (Seven-Thirty mine), near Grass Valley, expects to have the machinery in place and ready to start up next week. The duplex air compressor, together with the hoist and pump, have been hauled out to the mine. The electric company has strung the wires. The 90-foot shaft will be continued to depth of 400 feet before drifting is done.

Next week operations will begin on Randolph Flat, near Grass Valley, where C. Hay has a group of claims. Work was suspended with the heginning of winter.

Placer County.

The Buckeye mine, on the Forest Hill divide, has heen sold to J. A. Johnson et al. for $40,000. The Buckeye adjoins the Mayflower mine, near Forest Hill.

Santa Clara County.

R. B. Harper, manager of the Santa Teresa and San Juan quicksilver mines, being operated south of San Jose, is preparing to build a 25-ton furnace for coarse ore, and will also increase the condenser capacity.

Shasta County.

A tramway to haul fluxing ores to the smelter of the Mountain C. Co. at Keswick will he built by M. Muriansky & Co., operating the Quartz Hill mines, 3 miles east of Keswick station. They have asked the supervisors for a franchise to construct a steam tramway along the county highway from Quartz Hill to Keswick station. The tramway will be of 30-inch gauge and will follow the general course of the road now in use, with the exception that the tramway will follow the new road ¾ mile in length from Quartz Hill to the Redding, Keswick and Old Diggings road.

The Gipson place on Cloar Creek, near Shasta, has been bonded to J. White & Co., and will be prospected for gold. The ground lies helow the Heintz dredger 2 miles.

Manager Cohen of the Bully Hill C. Co. at De Lamar says they are preparing to put in a heavier hoist for the main mine, and preparing for construction of a tramway from the Anchor lode to the smelter.

The annual report of the Mountain C. Co., operating mines at Iron mountain and smelter at Keswick, for 1903 shows 118,973 tons of ore mined, 124,678 tons smelted, yielding 6616 tons of copper bullion, or an average of nearly 5% copper. This bullion yielded at the refinery 6226 tons of fine copper. The fire in the mine has been put out, though parts of the mine continue hot. The effects of the strike have been overcome and the works are in full operation. —— Exploratory work has not shown any new deposits of copper ore. The principal ore bodies are those of the Iron mountain deposit and the Hornet deposit. —— Preparations are heing made to utilize the sulphur in the ores for manufacture of sulphuric acid and artificial manure.

Siskiyou County.

J. Johnston, manager of the Headwaters quartz mine on upper Humbug creek, near Yreka, reports opening up a 4½-foot ledge and will start crushing next week at the mill, now ready for operation, a 10 H. P. engine and boiler having been set up. Johnston says he has the money raised to put up a smelter in Yreka as soon as the railroad to Scott Valley is built. It will be a 300-ton smelter, to he used in smelting ore from this mine, and other mines on Humbug, hut needs the output of mines from Scott valley, Cherry creek, Cottonwood creek and other sections to keep it in steady operation.

Tehama County.

(Special Correspondence).—The Basler M. Co. of Sacramento is operating a group of claims on the north side of Elder creek, 9 miles from Lowrey. The main tunnel has heen driven in 800 feet. The formation is granite, near a slate and greenstone contact. At 200 feet beyond the present face of the tunnel it is expected to cut a large vein, which on the surface shows an iron capping. This vein carries copper, gold and silver values. The plant is equipped with a compressor, and machine drills are worked in the tunnel. C. M. Basler of Lowrey is superintendent.

Lowrey, May 12.

Trinity County.

At Dedrick H. Ramdohr, superintendent of the Globe mino, has men at work opening up for the season.——The water supply for the gravel mines is botter and will last for a longer season than usual.

G. W. Payuo of LeLoy, Ill., superintendent of the dredger on the Boyce ranch at Trinity Center, says the dredger will be started up next week, as soon as repairs are made. The company owns 600 acres of dredging ground, said to average from 15 to 17 feet in depth.

Work will be resumed at the Globe mine at Dedrick about June 1. The snow is 14 feet deep at the Globe, which is over the mountain divide beyond the Chloride-Bailey. Each works forty to fifty men during the summer. At the Globe the superintendent has a few men at work shoveling out trails and trying to gain admission to the hoisting works and office buildings.

Tuolumne County.

At the Mt. Jefferson mine at Groveland the mill is running steadily and crushing four and a half tons per stamp. With the reservoir ahovo the mill, sufficient water for hattery and boilor purposes is at hand without uecessity of pumping hack that which has onco been through the mill. Work is heing done on the cyanido plant. The gasoline engine, roller mill and all the tanks are in position. The tramway from the concentrating room to the roller mill will be huilt and the plant put in operation by June 1. In the mine drifting at the 600-foot west levol is going ahead. At the 500 east stoping is going on. Gains in the wood supply are being made with the four teams at work. There are twonty men on the payroll.

Near Groveland operations will he resumed on the Golden Harvest M. Co.'s mine, 6 miles southeast of town on the Tuolumne-Mariposa line. This is a Los Angeles company, and the group consists of nine claims. There are 300 feot of shaft and drifts. N. Bundy and G. A. McElfresh of Los Angeles are part owners. J. C. Hendersou is superiutendent.

W. S. O'Brien is preparing to develop his mining claims on the main Tuolumne river, near Groveland. Work has been started on the Victor mine, one of the group, and as soon as prospects warrant a mill will he huilt. W. H. Scott is foreman and W. S. O'Brien superintendent.

Underground work will be resumed at Confidence next month in the Confidence mine. The mill will start about June 1. The cyanide plant has already been started. About twenty-five men are employed in and around the mine.

COLORADO.

(Special Correspondence). — It is reported tho strike in the southern coal fields has been settled by agreement between operators and miners. In the northern fields a strike is imminent on account of the operators having declared a reduction in wagos, which the miners claim they will not accept.

"Colorado Manufacturers," is the title of a booklet published hy the Colorado promotion and publicity committee of Denver to be distributed throughout the East and at the World's Fair at St. Louis, Mo. The book gives statistics concerning manufacturing plants of Colorado.

Government engineers are at present in the State to pass upon the proposed Gunnison tunnel in Montrose and Delta counties. This tunnel, if carried through, is estimated will cost $2,500,000 and will take four years to build. By its construction, 180,000 acres of land in the Uncompaghre valley will be reclaimed.

Denver, May 9.

Boulder County.

The Victoria mine, in Gold Hill district, was bought last week at sheriff's sale by L. W. Fowle of Boston, Mass., for $48,600.

The Revenge Dev. Co., owning a group on Bryan mountain, near Eldora, expects to resume operation. F. Armstrong of Eldora is consulting engineer.

A strike was made in the tunnel of the Wellington mine, in Gold Hill district, near Boulder, last week, says Superintendent Kirkbride, at 200 feet from the surface. The ore runs in nickel, gold and copper, assaying 30% of copper. Manager Degge says the width of the vein is 25 feet. The company is preparing to build a matte smelter at the property.

The Gold Coin mine, near Eldora, has been sold to W. M. Williams, who will resume operations this week.

Chaffee County.

Manager T. Goodwin of the Ohio & Colorado S. & R. Co., operating the smelter at Salida, says plans are being

made for the establishment of an independent refinery plant hy the company either at Salida or Puehlo.

R. G. Hinkson, manager of the Mary Murphy mine at Romley and the Buena Vista S. & R. Co. smelter at Buena Vista, has returned to Romley. He has started the company's mill. This mill is treating daily seventy-five tons of low-grade ore, the product* heing lead concentrates, which are shipped to the Denver smelters. They are working forty men in the mine, who are doing development work largely. It is expected work will he resumed on the tunnel, which was shut down last fall. This tunnel, in Chalk Creek district, will cut the Murphy vein at a depth of 3000 feet. The length of the tunnel when completed will he 4200 feet, and it has heen driven 2250 feet. The smelter has heen rehuilt and is ready to he hlown in. Hinkson states no date has as yet heen settled on when they will resume.

Clear Creek County.

Arrangements have heen made hy the Waldorf M. Co., near Georgetown, for construction of a mill. F. Oliver, general superintendent of the holdings of the Waldorf Co., says the mill will have a capacity of at least 200 tons per day, and will he hoth a concentrator and stamp mill. A large amount of the ore carries a percentage of copper. In the Tohin tunnel there is said to he 4 feet of mineral which will return a net value of $40 per ton. The mill will be huilt at the mouth of the Wilcox tunnel, hut for the present it will he kept supplied with ore hauled from the Tohin. The distance is 1 mile, and there is a down grade to that place. Work is being crowded on the Wilcox tunnel, and it is the intention of Superintendent Oliver to drive it rapidly to cut under the Independence, Kittie Ousley and other former producers. It is expected that the mill will he completed hy July 15th, and that hy September 15th the Wilcox hore will have reached the ohjective point. Then ores from hoth the Wilcox and Tohin will he treated.——Owing to insufficient supply of water, the Stevens mill, near Georgetown, has been closed down temporarily the past two weeks, hut it is expected next week a sufficient flow of water will he availahle to warrant a steady run for several months. This mill has a capacity of 100 tons daily.

Operations on the Terrihle mine, near Silver Plume, are in full hlast and more men have heen put to work. The company mill, which was closed down last month on account of frozen pipe line, is again turning out concentrates, and freighters are husy hauling the output to the Georgetown sampler. This mill has a capacity of fifty tous per twenty-four hours. The Whiting M. Co., owners of the Terrihle group, are increasing development. Five machine drills are operated in the levels and it is intended to put in two additional drills for stoping ore. Fifty men are on the payroll, hut hy May 1st it is expected 100 men will he employed in mine and mill.

It is expected that work will be started on the Ramsdale group of claims, on Lincoln mountain, near Georgetown, this week. A tunnel site has heen located and will he known as the Market tunnel.

The Standard says the Central Colorado mine, near Silver Plume, is again heing put in condition for production. It is owned hy a Denver company, and is under the management of W. Blanton. Several lodes have been cut hy the tunnel.

The Boneita mill, near Idaho Springs, will have improvements made. The entire plant will he raised one story and more machinery put in, such as sliming tahles, Hartz jigs and a sizer, also apparatus which takes the water out of the pulp and returns the mineral, putting it on a tahle in such a condition as to make it susceptihle to treatment with a minimum loss. The new mill will have capacity of fifty tons per day.

The Pacific group of claims on Repuhlican mountain, near Georgetown, is now owned hy the Pay Rock Extension M., M. & D. Co., and hy June 1 men will he put to work, in addition to a numher of contracts to he awarded. It is also thought a numher of leases will he issued. A tunnel has heen driven on the Pacific lode for 425 feet and 3 inches of lead ore are exposed. The tunnel is heing driven southwesterly, and it is thought the vein is an extension of the Pay Rock. The company owns nine claims, three of which are patented. A storage tank was erected which will hold 12,000 gallons of water. It is near Bridal Veil stream. A pipe line 8 inches in diameter has heen put in and a Pelton water wheel set up. An exhaust pipe line has heen placed in the tunnel and it is estimated that there will he sufficient water to run eight power drills for at least nine months during the year. J. H. Roheson is general manager and D.W. Hartshorn superintendent.

The completion of preparations for treatment of ore at the Clear Creek mill, near Empire, hy addition of an eight-ton crusher and other machinery to enlarge the daily capacity to the thirty-ton mark, will he followed hy concentration of an accumulation of mill stuff from the Gold Dirt and Gold Fissure mines. As shipments of this class of ore from the former alone will more than utilize the capacity at the Clear Creek plant, the idle Knickerhocker mill will prohahly he again used with its equipment of crusher, rolls, jigs, tahles, etc.

Custer County.

Cahles 2500 feet in length will he put in at the Bassick mine, near Silver Cliff. The shaft is 1600 feet deep, and as soon as the new cahle arrives, says President Radel of Denver, the shaft will he sunk deeper.——A lead of telluride hearing quartz that runs $70 a ton is reported uncovered at a depth of 140 feet in the Dakota Bill mine.

A forty-acre plot of ground adjoining the Silver Bar mine has heen sold to the O. W. Murphy M. Co. The ground adjoins the Silver Bar mine, near Rosita, on the south. The company owns the Silver Bar, which is a low-grade milling proposition.

The Big Bonanza M. Co. has heen organized for developing mining interests in Custer county, its properties heing 4 miles east of Silver Cliff. E. P. Ricker, C. W. Haskell and J. R. Smith are incorporators.

Gilpin County.

W. Kelly, owner of the Claudia J. group on Tip Top mountain, near Rollinsville, is preparing to take out ore. He has a large hody of ore in the Millie B., hut for the present he will devote his attention to taking out ore of a smelting grade.

The shaft huilding and plant of machinery on the Kirk mine on Quartz hill, near Central City, is nearly completed and developments will he started next week, as soon as the shaft has heen put in repair. Pitchhlende or uranium ore has heen taken out of this mine. The lessees are California and Colorado men. L. C. Nesmith is superintendent.

The shaft huilding on the East Missouri mine on the "Patch" in Nevada district, near Central City, is up and a 25 H. P. steam plant placed. A local pool is interested and they have heen taking out milling ore, some of it running four ounces gold to the cord and the smelting ore going $80 per ton. The property is owned hy McFarlane & Co., and is heing operated under a lease.

J. R. Anderson of Denver, who has heen operating the Gold Dirt mine at Perigo, under lease and hond, has taken up the hond. The price is reported at $125,000. Pittsburg men are associated with Anderson. During the past year the company has heen increasing development work and it is claimed smelting and milling ores are hlocked out ready for stoping, and that hy June 1st, at which date the Moffat Railroad announces they will he ready to receive freight to and from Rollinsville, the company will he prepared to make regular shipments to the Denver smelters. As yet no stoping for production has heen done, hut hetween 400 and 500 tons of ore are in the hins, saved from development work. It is the intention of the company to huild a 50-ton reduction mill, which later will he increased to 100 tons.

Hinsdale County.

Machinery for the Megunticook M. Co. mill, near Lake City, is on the ground. The shipment was made up of two Huntington mills and a numher of hydraulic sizers, says Manager Kazar.

Lake County.

Leadville reports say Leadville mines shipped 70,000 tons of ore during the month of April. Of this ore the American S. & R. Co. handled 50,000 tons. This tonnage going to the American Co. is exclusive of the zinc ores and includes the sulphide and carhonate silver ores and the lead and gold production. The Ohio & Colorado smelter at Salida, the Empire & U. S. Zinc Co.'s and the Colorado Fuel & Iron Co.'s plant at Puehlo received the greater part of the ore not taken hy the American. During the month a contract was let for erection of an electric plant at the Yak tunnel to supply power and light to the tunnel and mines tapped hy it and to operate an electric railway through the tunnel. Considerahle new work and prospecting and developing in hoth old and new properties was carried on during the month.

Ouray County.

It is reported negotiations are under way for extending the railroad track from Red Mountain to the Barstow mine. The Barstow Co. will huild the grade, and the railroad company the rest.——Work has heen resumed on the Snow Flake in Red Mountain district. The property is owned hy Van Horn & Anderson, and was closed down last fall for lack of water.

Manager J. Warner of the Silver Ledge, near Red Mountain, is preparing to put in an electric process of zinc extraction. He says the railroad has made him rates on zinc ores and he will hegin shipping as soon as the mill is ready to treat it. Bodies of ore are hlocked out. With the exception of one hody of zinc ore, the ore runs 40% lead and forty ounces in silver.——As soon as the water supply is increased hy the melting snow, Manager Rumery will resume operations on the Congress mine at Red Mountain.

The Atlas M. & M. Co., near Ouray, is continuing development on a group of claims on the same vein on which the Governor mine is located, says the Times. The company owns seven claims in the group. The group is headed hy the Atlas and is in Sidney hasin. The main tunnel has heen driven 1200 feet, attaining a depth of 500 feet from the surface. The ore hody is 3 feet in width and averages $20 per ton in gold, hesides values in silver, copper and lead. Preparations for huilding a 10-stamp mill to treat the ore are under way and the mill will be huilt as soon as the snow is gone.

Summit County.

The gold placer mining dredger of the American Gold Dredging Co. is working in the gold-hearing alluvium of the Swan River valley, 5 miles northeast from Breckenridge. The dredge can work gravel to a depth of hetween 38 and 40 feet helow the surface of the artificial pond on which the hoat floats. It is secured to the hank with steel cahles. The average depth to the hedrock is less than 30 feet, and as there are few large howlders in the deposit, says Manager W. W. Dyar, the gold-hearing sands and gravel are readily scraped up and dumped on hoard the hoat into revolving screens, where jets of water wash the adhering mud and fine gold from the stones or gravel. The gold, sand and mud then pass through riffled sluices which have their hottoms covered with cocoa matting. Mercury is also used in saving the gold. The dredger is credited with an output of $2000 gold per week. At the mouth of Galena gulch, in Swan valley, this company excavated a pit to the bedrock with hydraulic elevators; hut, owing to circumstances, the "elevator" method of operation was postponed.

Teller County.

By June 1 the Elkton management at Cripple Creek expects to he ahle to get into the lower levels and hegin mining there. There is only ahout 10 feet of water in the mine at present, the El Paso tunnel having unwatered it to this depth. The water is receding at the rate of 2 feet per week. The Elkton is making weekly shipments of fair grade of ore, hut as soon as the miners can get into the lower workings the output will he increased and the values will also increase. —— The Mary McKinney has men in its lower workings and ore is heing hoisted and shipped from the hottom of the mine. The Mary McKinney, while greatly assisted hy the El Paso tunnel, hurried the unwatering of the property hy pumping.——Many mines in the north end have already heen unwatered, and nearly all that were affected at a depth of 600 feet have heen unwatered hy the tunuel.

The Mary Cashen mine, at Cripple Creek, heing worked hy Inkeep & Co. on lease, is producing regularly and shipping out eighty tons of ore per month. The output is coming from a point 50 feet south of the shaft at a depth of 400 feet. The ore hody varies from 18 inches to 2 feet in width, and the last two shipments gave returns of $32 and $42 per ton, respectively. The lessees expect to increase the output.

The American Eagles mine of Stratton's Co. at Cripple Creek has resumed. Superintendent Robhins says 100 men will he employed and a production of a carload of ore per day he made. The work of developing the ore hody at a depth of 1500 feet will he increased.——It is expected the Lillie mine, on Bull hill, will he put in operation next week. F. Gilpin is reported to have a lease.

The Foley shaft on the Keystone claim of the Mint Con. M. Co. on Gold Hill, Cripple Creek, will he lowered to depth of 1000 feet. The shaft is 742 feet deep and from a few of the levels mineral is heing daily hroken hy lessees.

IDAHO.

Boise County.

Work is temporarily suspended in the Mary Jane mine on Willow creek, near Idaho City. A flow of water was struck that the pump was unahle to handle, says Superintendent Ring of Brooklyn, N. Y. If work is resumed a larger pump will he put in. A ledge was struck in the hottom of the shaft, reported to assay $4 a ton. This ledge has not heen drifted on.

A. C. Gallupe, superintendent of the Mineral Hill mine in Placerville, reports work progressing in the district. He says the placer miners are all at work and securing good results. Hs is putting up a sawmill at the mine, and expects to have it in operation next week. The two Chilian mills, with a capacity of eighty tons, and other machinery are on the ground, and he expects to have them in operation in July. The track for the tram cars in the tunnel has heen relaid with heavier iron.

Custer County.

C. E. Gahle of Pittshurg, Pa., manager of the Golden Sunheam mine, 60 miles from Custer City, says the property has been equipped with a 60-ton mill, the crushing heing done with two roller mills, each of daily capacity of thirty tons. The plant will he ready to start June 1. The ore of the mine occurs in porphyry dykes. The values run principally in free gold.

Idaho County.

W. Q. Brown has started work on the Mother Lode No. 2 mine at Hump. There are 24 feet of ledge matter. Values were ohtained in silver and gold.——Work on the Ajax continues north and south in the drifts.——The 100-foot level has heen reached in the Atlas shaft. Drifting will he started north and south.——Flint & Hawley of the Crackerjack Co. are in camp. A cyanide test will he made of the concentrates and tailings from the mill, which was started May 1.

A. A. Cass of Cartersville, Mo., who has a hond on the Glasgow mine in Big Creek district, is preparing to increase work this summer. He has let a contract for driving a tunnel. This is in 436 feet. In running it eight veins were crossed, the assays all showing values.

(Special Correspondence). — Superintendeut Ahhott of the Sunnyside company says when survey of the wagon road is completed work of huilding the road would he pushed to completion.

The Burr Oak crosscut tunnel on the Sunnyside is in over 1200 feet. Foreman Wagner says the ore hody will he reached in ahout 200 feet. This crosscut is 480 feet vertically helow the upper tunnel. In a crosscut in the west tunnel a hody of ore found assays $33.94 per ton. A contract for 3000 cords of wood has heen let.

M. Curran of Boise has men running a tunnel on the Mysterious Slide group, adjoining the Dewey grounds. The hreast is in 400 feet and ahout 150 feet helow the surface. Assays taken as the work progressed show values from $2.75 to $6 per ton in gold. Davis & Shaw are managing the work.

Work is progressing on the H. Y. group under the charge of Foreman Bushy. A tunnel on the Dakota claim is now in 300 feet. The ore is different from most of the ores of the district, in having more iron sulphides. They carry from $1 to $1.50 per ton in silver. Boulders of diorite are met in the last 50 feet, usually surrounded hy high-grade ore. For the last 100 feet values averaged $6 per ton.

Men are clearing out the cave in the Mollie tunnel preparatory to continuing the hore. The mill plant for the group will he placed on the Cornish creek side of the divide.

On the upper end of the Climax group a double-compartment shaft is down 60 feet. A steam hoist will he installed as soon as transportation will permit. At the lower end of the group a tunnel is in 200 feet and has cut a succession of phonolite strata having the same pitch as the hill. The including ground is ore having values running from $5 to $20 per ton.

Roosevelt, May 1.

The Eureka Fraction mine, in Buffalo Hump camp, was sold last week to W. Parks of Lewiston. The Eureka Fraction is an extension of the Wise Boy and free gold ore is shown in places. Development work has shown a hody of ore. Parks says a small developing mill will he put on.

Record Bros. of Everett, Wash., have hegun work on their property at Grimes Pass. They will develop the group this season hy driving a tunnel.

Kootenai County.

The Panhandle S. & R. Co., Ltd., is going ahead with the plans for its refining plant and other improvements at Sandpoint. The smelter will be on the shore of Lake Pend d'Oreille at Penderay, ¼ mile east of Sandpoint, on the north side of the lake. H. M. Williams of Spokane, Wash., and W. E. Nelson of St. Paul, Minn., are interested. They have water power on Sand creek, 2 miles from the smelter and 3 miles from Sandpoint. From the dam huilt across Sand creek, the point of divergence of the water to the smelting plant gives a fall of 400 feet. This water power is sufficient to furnish water and light for Penderay and Sandpoint and also to furnish the new plant water, light and power. The company owns the townsite of Penderay. The company hought the hoats of the Pend d'Oreille Navigation Co., consisting of two steamers, three harges, a pile driver and some floating docks. The company has hought a group

of mines at the south end of the lake, known as the Venezuela group, said to contain fluxes needed in the Northwest. The mines are the extension of the Keep Cool group, on which extensive development work has been done. The Venezuela shows 400 feet of ore. It is in lime formation and it is stated to carry $15 in gold and silver. A contract has been let for a dock 2200 feet long to extend from the smelter to the deep water of the lake. This dock will have a tramway extending to the smelter. The smelter will be run by electric motor. The sampler will have a 30 H. P. motor, the crusher a 30 H. P. motor and the tramway a 20 H. P. motor. Bids will be called for this month for the erection of the plant.

Shoshone County.

According to the sworn statements of the mine owners made to County Assessor Hooper, the net profits of the silver-lead mines in Shoshone county for 1903 reached the sum of $2,165,416, an increase over the preceding year of $660,000. Of this amount the four companies of the Federal M. Co. netted $998,726. The record of the Hercules shows 10,043 tons of ore extracted from the mine, giving a net profit of $438,746, after expending $100,000 in repairs and construction. For 1902 its net profits amounted to $169,000. The net profit for the Morning was $346,420, a gain over 1902 of $200,000, while the Bunker Hill returns a profit of $287,497, as against a profit of $67,000 for 1902. The net profits of the Standard and Mammoth were $595,038, while in 1902 they reached $618,912. The Last Chance, at Wardner, increased to $382,652 from $279,697, while the gain of the Hecla was approximately $40,000. The producing mines to report a loss were the Cœur d'Alene Dev. Co., the Gold Hunter, the Frisco and the California Con. The Cœur d'Alene Co., operating the Silver King mine, reported deficit of $38,838. For 1902 the company reported a net profit of $143,000. The gross yield of the mines was $10,064,218. The total cost of extraction was $5,811,388; reduction and transportation cost, $3,814,343; repairs and construction cost, $376,394.

The Oreano M. Co. has an air pipe line under construction from the compressor of the Anchor M. Co. to the tunnel which is being driven on the Oreano mine, near Burke. The line will be built of 2-inch pipe and will be 6000 feet long. The drilling so far has been done by hand. The tunnel has been driven 400 feet, and it will be necessary to go 1000 feet farther before the first ledge is cut. There are three parallel ledges on the surface. All of them will be cut by the tunnel. C. Amonson is manager.

During April the Bunker Hill & Sullivan M. & Conc. Co. shipped between 4500 and 5000 tons of concentrates and ore. The Standard and the Mammoth consigned, approximately, 3900 tons of concentrates to the smelters last month, while the shipments from the Tiger-Poorman were 1000 tons. The ore body opened in the Kellogg tunnel is said to show in the breast of the tunnel 6 feet of shipping ore, between 2600 and 3000 feet deep on the dip of the vein. The tunnel cut the ore body at 12,000 feet. No. 8 tunnel, which was 250 feet above on the dip of the vein, uncovered a body of ore 105 feet wide and 450 feet long, all of which will be mined and milled.

Under management of J. Murphy, operations have been resumed on the placer properties of the Cœur d'Alene G. M. Co. near Murray. He has twelve men at work. This number will be increased as the season opens up. About 100 claims are owned by the company. They extend along Prichard creek and its tributaries. The first work is being done on Prichard creek, 1 mile below Murray.

After a forced idleness, development work is again under way on the Sixteen to One mine, near Wallace. The present work will be done in the lower workings.

The Hercules M. Co. proposes building a tramway from the mine near Burke to the railroad track. It is said negotiations are pending between the company and the railroad companies for an extension of their tracks through the upper part of Burke to the proposed site of the terminal of the tramway. It will be necessary to extend the railroad track about 1000 feet. The proposed tramway will be 7000 feet in length. The ore from the mine is now transported to the railway by wagons.

KANSAS.

Cherokee County.

At Galena the Black Jack mill, operated by J. Keys, is running steadily and a weekly turn-in is made of 10 tons of jack and 4000 pounds of lead.

MISSOURI.

Benton County.

C. H. Dahlgren, manager of the Southwest Lead & Zinc Co., at Raymond, says the company is working in ore carrying zincite at a depth of 185 feet. The company is building a mill to crush and clean the ore and it is expected shipments will begin next week.

Jasper County.

G. Hubbard, superintendent of the Forrestal & O'Donald lease on the Connor land, near Webb City, is preparing to put up a head frame and tramway to the mill from the shaft the company has finished. ——The Golden Rod mine on Underwriter's land last week made production of 190 tons of jack and 120,000 pounds of lead, in value approximately $10,000.

Manager Beckwith, of the Premier Lead & Zinc Co., on the Guinn land, north of Webb City, in the sheet ore belt, says he is getting good dirt from a drift being driven west from the shaft. The face of ore is 14 feet in height and carries both lead and jack in paying quantities. Two other drifts will be started. Beckwith is planning for a concentrating plant. The water is easily handled with the pumps.

Work on the mill of T. Coyne, near Webb City, is progressing. The wiring of the mill for the motors and electric hoisters is being done.

J. W. Aylor and R. A. Bowen, who hold the lease on the Williams land 2 miles west of Carthago, are still in mineral. Their company is the Monitor M. Co. The shaft is down 64 feet and a drift has been run 8 feet south. Hand jigs were started last week on the ore already taken out and piled about the shaft. A drill sunk in the bottom of the shaft showed good cuttings. A 20-foot face of ore has been uncovered to present depth of the hole.

H. J. Vancil, who has a 40-acre lease near Prosperity, is prospecting it with a drill. In the first hole a body of ore was penetrated from 160 to 180 feet and the drill is on a second hole.——The Sancho Panza M. Co. of Joplin has been incorporated by G. C. Spencer, A. E. Spencer and R. C. McConnell.——The Prior Creek Oil & M. Co. of Joplin has been incorporated by A. H. Freeman, F. G. Writer, I. Simon, J. Malang and J. M. Entwistle.

The Mutual M. Co. is making eight tons of zinc ore per week, says W. J. H. Kapp, manager. The mill is temporarily closed down, pending addition of three more jigs and also changes in the building so that the company can handle more dirt. They have three working drifts with faces of ore. The sub-lessees are repairing one of the old shafts on the lease.

MONTANA.

Broadwater County.

The Stevenson M. & Dev. Co., which owns thirteen claims near Winston, 1½ mile from the railway, is preparing to increase prospecting and development work on the group, says Manager Stevenson. They include the Free Coinage group and several other claims adjoining the H. & H. In the Free Coinage no work has been done below the water level. The tunnel on the Free Coinage will be continued and sinking will be done on the veins that have been cut. The values are principally in silver with a showing of gold. The 300-foot tunnel on the Manitoba will be continued. Machinery will be put on the older properties for working, and a spur will be run from the railway 1½ mile. There are water and timber at hand. The company is composed of Eastern men, with headquarters at Sharon, Pa.

NEVADA.

Lincoln County.

G. F. Colton of Los Angeles, Cal., of the Duplex M. Co. at Searchlight, says he will resume operations. G. F. Mitchell, superintendent, is fixing up the storage tanks preparatory to unwatering the mine. During the shut down all the lower workings, including the 600-foot crosscut to the New Year's Gift, filled and there are 85 feet of water in the shaft.

Superintendent C. Rives of the Pioche-Nevada Con. mine at Pioche, says he has opened a body of ore in "contact" vein and will begin sacking ore for shipment. He is sacking ore for shipment from the Talisman claim and getting ore that will go 500 ounces in silver per ton.

O. A. Tibbetts of Salt Sake City, Utah, has an option on the Delmue group of claims near Pioche.

Esmeralda County.

A company is being organized to put in a custom cyanide mill at Goldfield, says Manager J. Jones of Goldfield, south of Tonopah. Jones, with L. L. Patrick and Z. Keudall, has a lease on the January mine. They have been shipping $150 ore from the January. There are 4000 sacks of ore on the dump, but can get no teams. The teams are all working on the railroad. They have a 60-mile wagon haul and it costs $40 a ton to ship and treat the ore. They have sixty men working on the January.

J. R. Sears of Yerington has men at work on the Lottie mine in Garfield district.

J. C. Ralston of Spokane, Wash., has a bond for $80,000 on the Sandstorm group at Goldfield, which consists of sixteen claims, on Columbia mountain.

Storey County.

The suit of the Occidental M. Co. vs. the Comstock Tunnel Co. has been settled and a satisfaction of judgment filed in the U. S. Court at Carson. No money is to be paid in settlement of the judgment for $50,000, but the Tunnel Co. will extend the Brunswick south drift to the Occidental mine and that company will work its property through the tunnel.

Lyon County.

The Douglass mill in Dayton, which was built in 1864, will be torn down.

Washoe County.

It is reported a strike has been made at Olinghouse canyon, near Wadsworth, in the Oro mine owned by D. M. Harvey et al. The Oro group of three claims adjoins the mines of the Springfield, Nev., G. M. Co. Harvey reports they have an open cut across the vein 4 feet of ore, 15 inches of which has a value of $100 per ton. The remainder goes $15 per ton. They have started a crosscut to tap the ore shoot at a depth of 150 feet. The length of shoot on surface so far exposed is 300 feet.

NEW MEXICO.

Grant County.

Work on the removal of the Burro Mountain smelter to Silver City started last week. By June 10 it is expected the plant will be in operation at Silver City. The site for the smelter adjoins the Silver City reduction works site on the north and covers ten acres.

OREGON.

Baker County.

Operations at the Adelene group will be resumed as soon as snow will permit surface work in the Rock Creek basin, near Sumpter, says Superintendent C. S. McLaren. He will start work in the tunnel above the buildings, where a crosscut was being driven to open the lode. Other men may be put in the deep tunnel started near the creek level.

L. G. Lilley, manager of the Baby McKee Con. properties, suspended work temporarily at the Last Chance mine, near Sumpter, owing to the deep snow preventing surface work in securing necessary timbers and materials for sinking. He was sinking the main shaft from the 100 to the 200 foot levels.

The Golconda mine, in the Cracker Creek district, near Sumpter, is shut down pending repairs, and forty men are out of work. The pumps will be kept going and a day shift employed.

L. R. Bellman, manager of the California mine, near Sumpter, expects to start operations at the California before June 1st.

The Emma mine, in Virtue district, near Sumpter, has installed electricity as motive power at the hoist. Later it will be used both at the mill and the hoist. The Cyclone, in the same section, has been using this power for some time and reports it cheaper and more reliable than either coal or wood.

Douglas County.

The Oregon Pacific M. Co. has been incorporated by J. E. Hardman, B. T. Underwood, E. F. Gray, G. G. Graham, G. and J. W. Cox, J. F. Miller and W. M. George, with principal place of business Cottage Grove. The company owns several claims in Bohemia district, which will be developed.

Josephine County.

F. L. Morris, H. C. Berry, H. C. Pickett et al. of Oroville, Cal., who have two dredgers in operation there, are preparing to test a body of dredging ground in the Althouse district, near junction of Althouse and Sucker creeks. The seventon prospecting and boring machine formerly used by the Champion Dredger Co. has been bought. They propose to take up 3000 acres of ground, nearly all of which will be available for dredging.

The mill of the Granite Hill mines, near Grants Pass, has begun operations. It is a 10-stamp battery. The mortars have been placed on cement foundations, made by the filling of deep pits, filled and packed with gravel and granite. Superintendent L. Y. Wickersham of the Granite Hill properties has fifty men at work.

SOUTH DAKOTA.

Lawrence County.

Superintendent Rock, of the Golden Empire M. Co., at Tinton, says work is progressing on the company's mines. Besides work which the Golden Empire company is doing on its gold mines, it is also developing tin prospects, one of these being the Homeward Bound. On this a double-compartment shaft has been sunk for 60 feet on a ledge of high-grade tin ore, and will be sunk several hundred feet deeper. The company is building a hoist on the shaft, putting in a compressor plant and making other arrangements for deep working. The company's placer ground on Beaver creek is also being worked.

The Tinton Tin M. Co. mill is saving from 1500 to 2000 pounds of concentrates daily, which assay 75% metallic tin. These concentrates are saved from about sixty tons of ore crushed, the mill not being able to work to its full capacity owing to the present bad condition of the roads, most of the ore having to be hauled in wagons. With good weather and better roads it is expected that the mill will handle 100 tons daily. It is said that the capacity of the plant will be enlarged this summer and a system of transportation from the mines to the mill will be put in. M. H. Lyon is superintendent.

The Golden Empire M. Co. is repairing the Inter Ocean stamp mill at Welcome, in Garden City district, and is preparing to start it this month. The mill has twenty stamps.

The Safe Investment G. M. Co. of Deadwood is building a sawmill on its mine in southern Lawrence county, and will cut lumber to be used in surface improvements. An air compressor and drills will be put in.

Pennington County.

The Black Eagle G. M. Co. is preparing to put in a Huntington mill on its mine near Rochford. This company was formed by H. E. Fisher and others for operation of the Black Eagle group of claims along Castle creek.

UTAH.

The ore and bullion settlements reached $2,000,000 for the month of April and the copper product reached 4,300,524 pounds, bringing the total in value for that time to about $3,000,000. The total copper output of the independent smelters for the month was 3,210,524 pounds. To this should be added to obtain the output of the State, the product from the American S. & R. Co., estimated at 850,000 pounds, but the money value of this copper is included in the regular ore and bullion settlements. To these totals should also be added the output from the Utah & Eastern smelter, near St. George, which is 240,000 pounds, and the value of which is not included in the ore and bullion settlement returns, says the Salt Lake Tribune. A number of mines of the State, the ores from which are sold to independent buyers, are not included in the totals given, so that the ore and bullion sales, including the copper from the American smelter, will aggregate close to $2,000,000, while the copper from the independent concerns, aggregating 3,450,524 pounds, will bring with its gold and silver contents from $750,000 to $1,000,000, making the total output of the State for the month about $3,000,000.

Davis County.

The second rig is in operation in the Farmington oil section, near Salt Lake City. The Union Gas & Pipe Line Co. began drilling last week at a point west of the Oregon Short Line depot at Centerville, in Davis county. The derrick measures 72 feet in height. Superintendent Wallace says it is equipped with machinery that will drill a hole to a depth of 3000 feet. J. H. Bigger & Co. of Salt Lake City are interested.

Iron County.

The Creole G. M. & M. Co. of Stateline has been incorporated by W. J. McBurney, C. W. Cheney and G. H. Tryon.

Juab County.

J. Knight of Salt Lake City says it is his intention to consolidate La Reine and the Bullion-Beck Tunnel Companies, near Eureka, as soon as the present La Reine assessment is paid in and the company's indebtedness discharged. He expects the ledge in which the cave occurs in the tunnel will be productive of ore below, and that it is the same ledge on which La Reine was preparing to sink when he bought the mine.

The hoist for the Tetro mine, near Eureka, has been set at the top of the shaft in the tunnel. The shaft will be sunk and the ore body proven up at depth. Six cars were shipped during April, from which the company realized $5000.

The shipments from the mines of Tintic district for the month of April are reported as follows: Ajax, 14; Centennial Eureka, 242; Tetro, 12; Salvator, 8, Dragon Iron mine, 43; Laclede, 1; Joe Bowers, 1; South Swansea, 4; Star Con., 1; Lower Mammoth, 8; Grand Central, 82; Mammoth, 48; Gemini, 99; Bullion-Beck, 46; Uncle Sam, 8; Yankee Con., 15; May Day, 1; L. E. Riter & Co., 1; Carisa, 22; Martha Washington, 1; Cornucopia, 1; R. A. Brown, 1; Showers Con., 1; Utah Lease, 1; Eureka Hill, 29; Victor Con., 3. Total, 693 cars.——Three cars of concentrates were shipped from the Uncle Sam mill and one from the May Day mill.

The Godiva mine of Tintic, near

Eureka, after an extended shut down is again in operation. The extraction of ore will begin as soon as some of the old workings are cleaned out.

Salt Lake County.

The Maxfield M. Co., in Big Cottonwood canyon, near Alta, says Manager Thomas will start driving a new tunnel by which the ledge may be tapped at a point 700 feet below the present workings and at the same time unwater it and do away with pumps. To accomplish this it will be necessary to drive 1 mile.

Summit County.

A strike is reported made last week in the California mine at Park City. The find was on the intermediate level and has a width of 12 feet, says Manager Snyder. Assays showed 35% lead and twenty-two ounces of silver to the ton. The ore also carries zinc to an extent that will require it to be subjected to concentration, and to meet this need preparations are being made to start up the company's mill June 1st.

Assistant Manager E. Bamberger of the Daly-West mine, at Park City, says additional ore bodies are being opened up in the Quincy ground of the Daly-West Co. The find was made on the 300-foot level, on south side of porphyry dike and consists of 3 feet of bigh-grade ore.

The Brown-Eagle M. Co. has been incorporated to develop ground in the Elkhorn district, near Park City, by F. D. Aubery, O. F. Johnson, G. Wilson, J. H. McDonald and F. J. Hansen. J. H. McDonald is manager.

The Sunrise claim, near the Woodside mine at Park City. has been leased to J. Allen et al. for three years.

Last week the pump at the 800-foot level of the Wabash mine at Park City was started up and work resumed with full complement of men.

Tooele County.

Operations will he resumed at the Overland mine, near Mercur, before June 1st, says the Reporter. The Overland is a low-grade gold mine.

The management of the Honerine M. Co. at Stockton has arranged for the construction of a sampling mill. The plant will have a capacity for handling 1000 tons per twenty-four hours.

The Ophir Hill mine and mill at Ophir have been closed down, throwing 100 men out of work and cutting off a source of considerable ore and concentrates from the valley smelters, says the Reporter. No reason for the action has been given out. It is thought, however, the suspension will be only temporary. W. A. Clark, of Butte, Mont., is owner.

WASHINGTON.

Cowlitz County.

At St. Holens, for $5000 cash, the Royal Flush group, consisting of four unpatented claims, has been sold to C. M. McCurdy et al., of Ionia, Mich. The ledge has been exposed by an open cut and a small shaft which shows 5 feet of smelting ore. McCurdy proposes to incorporate the property and carry on development work all season. It is estimated this summer there will be 500 men employed in the mines of St. Helens, and at least two plants will be built. Manager Coe is completing arrangements for a smelter on the Mount St. Helens Con. E. A. Sessions, of Sessions & Simpson, interested in the Cascadia, expects to begin building a plant on that property. The mines of the district are owned and controlled mainly by Portland, Or., men.

Stevens County.

Last week furnaces Nos. 4, 5 and 6 at the Northport smelter of Le Roi C. Co. were blown in. Ore shipments are going from Le Roi mine at Rossland, B. C., daily.

Manager G. A. Tuttle of the Copper Mountain M. & M. Co. of Copper City, Or., says they have bought four claims in the Skookum group, west of Valley, next to the King G. & C. M. Co. property. The claims carry gold and copper. The price was $46,000 in cash and stock. He expects to put men to work next week.

Development work is progressing on the Defender group, near Bossburg, under Superintendent J. T. Dolan. The group consists of eight claims, embracing 160 acres. It is on Tanlow mountain, 1 mile from Orient, in the western part of the Pierre Lake district. There are four parallel veins traversing the group. There is said to be a dike of porpbyry, interspersed with quartz veins, whicb have been exposed hy erosion. The development consists of three sbafts, two tunnels and several open cuts in tbe ledges. The ore carries values in gold principally. The Defender group is owned by the Defender M. Co. of Waukegan, Ill. J. A. Walford is president. Tbey have planned to sink the shaft in the Defender 300 feet, and crosscut at 100-foot levels; also to sink the Gold Crown shaft 300 feet and crosscut. Superintendent Dolan is putting up an experimental cyanide plant on Bear creek, which affords an abundance of water. Later the company will build a larger plant and treat all the ore on the property.

Okanogan County.

W. R. Clark, of Spokane, part owner of tbe Ben Franklin mine at Chesaw, says the Ben Harrison has made a strike of carbonate ore running in silver, copper and lead.——The Opal Co. has increased its number of men and intends to push development work. The Crystal Butte Co. is working a double shift of men. The Grant property on Buckeye mountain is progressing. The Rainbow Co. is working its mine, which has copper ore.——At the Ben Franklin group, near Strawberry lake, a 10-foot ledge has heen uncovered, with values uniform. Assays show average of $20 a ton in gold, silver and copper.

Preparations are being made to put in an electric plant and a 100-stamp mill on the Palmer Mountain Tunnel property near Loomis, says D. M. Drumheller of Spokane, part owner. The tunnel is in 4000 feet. For the last year they have been drifting on the ledges. The company has water rights on Coulee creek and will put in an electric plant costing $100,000 to operate the mine. The ore is free milling.

FOREIGN.

AFRICA.

Abyssinia.

Included in a report on Ahyssinia hy U. S. Commissioner Skinner at Marseilles, France, he says that little serious prospecting has been done in mining. A French engineer, M. Comhoul, hy direction of the Emperor, made a number of interesting discoveries, which would douhtless have been put to profit before this, had he lived. The principal gold mining venture resulted from his initiative. From samples gathered here and there, the presence of gold, silver, iron, coal, tin, zinc, porphyry, feldspar, kaolin, mica and bitumen is supposed to have been traced in quantities. At Dire Douah, M. A. Levertois, the owner of a concession, has specimens indicating the probable presence of diamonds, rubies and emeralds. The desert is covered with a large quantity of stones, brought down by the torrential rains from the mountains above, including quartz, agate and marble. Mining enterprises, seriously planned and hacked hy reasonahle capital, would be supported by the Government. The Ahyssinian plateau being the result of volcanic action, deposits of basalt and trachyte are numerous, particularly the former. Granite, quartz, feldspar and porphyry are found in ahundance. Mica is frequently obtained, from which sheets of good dimensions can be taken.——The existence of gold has been recognized in Abyssinia for centuries. The inhabitants of the west and southwest provinces engage in placer mining. The value of the gold-bearing sand is low. The Gallas, who appear to monopolize this industry, devote themselves to it only during the leisure remaining to them after tending their flocks and fields. After the exhaustion of a given point where placer mining has been carried on, it is abandoned until another rainy season is passed, when work is renewed. Recently researches have led to the discovery of veins of gold-bearing quartz which give promise of values. At the present time, with the exception of the Wallaga mines, helonging to a Milanese company, the gold production is nearly all in the hands of the Emperor. However, even under existing circumstances, native merchants sell about 926 pounds of gold per annum. The price per 2.2 pounds varies from $579 to $585. The gold dust as mined is placed in quills, and after its first change of hands is worked into malleable rings of pure metal and in this form reaches the market.——Numerous deposits of lignite have heen found in Abyssinia, the more important heing at Debre Levanos, fifteen hours from Addis-Ahaha. Traces of coal have also heen found at Ankober. Recently samples have been obtained from Tagoulet, near Debre Levanos. Iron ore seems to exist in all parts of tbe Empire. The samples are generally pure and bave usually been obtained near the surface under considerations favorable to economical mining. Owing to the absence of fuel other than wood and the present impossihility of transporting ore to tbe coast, the industry gives no present promise.

Rhodesia.

The Rhodesian Chamber of Mines at Bulawayo reports tbe gold output for month of March amounted to 17,756 ounces (Mataheleland, 14,628 ounces, Mashonaland, 3,128 ounces). The monthly returns have been as follows:

	Gold		Silver.
	1904.	1903.	1904.
	Ounces.	Ounces.	Ounces.
January	19,359	16,245	3,521
February	18,673	17,090	3,461
March	17,756	19,626	5,453

AUSTRALIA.

Queensland.

The annual report of the Under Secretary for Mines shows that gold, copper, tin and coal made substantial increases during 1903, and the value of the year's output reached £3,686,096 ($17,868,566), an increase of £375,496 ($1,821,056). A season favorable to miner and mill owner alike conduced to these results, permitting ore to be transported and crushed throughout the greater part of the year and allowing alluvial mining to be carried on steadily. "The varied ore of the Etheridge, the copper of Cloncurry and the silver and lead of Lawn Hills continue to be subjects of speculative interest rather than sources of material prosperity." —— The year's gold yield was £2,839,813, exceeding that of 1902 hy £119,174. The dividends paid by the gold mining companies amounted to £983,679. —— The general tendency to restore the diamond drill to its position as an aid to prospecting is noted. The success of the Goldfields Diamond Drilling Co. of Western Australia and at Mount Morgan seems to have convinced mine owners that tho improved modern drill is the most effective appliance for cheap and expeditious exploration, and arrangements have been made for a series of bores in tbe principal section of the Charters Towers field. —— At Charters Towers considerahle progress and development, as well as output, was made in all of the principal mines.——The value of the gold yield from Croydon field was £135,136, an increase over 1902 of £14,585, the improvement heing attrihuted to the fact that the principal mills had command of a water supply which enahled them to carry on crushing operations throughout the greater part of the year. The Golden Gate mine was the largest producer and the Golden Gate Consuls paid the largest dividends. —— The principal producers at Gympie were No. 2 South Great Eastern, Scottish Gympie, South Glanmire and Monkland. —— At Mount Morgan the report says: "For some years past the gradual decline in the value of the ore of the Mount Morgan mine has heen met hy a steady decrease in the working costs. The most striking innovations last year were: The installation of the steam shovel for the purpose of removing waste rock lying about good ore that is known to exist, hut has hitherto been inaccessible; and the initiation of a system of prospecting the lower levels of the mine by means of diamond drills. The steam shovel, started in the first week of September, had, by November 30, excavated 48,000 tons, and Manager G. A. Richard in his report of November 30 says that 'expenditure in procuring the sbovel has been amply justified hy results, and the cost per ton and capacity has more than confirmed the estimate.'" —— The principal silver-lead producer has been the district around Chillagoe. —— Tin shows an increase for 1903, the largest producer being the Vulcan mine at Irvinebank, which yielded ore of value of £24,560. Tho main shaft of the Vulcan is down 900 feet. The Stannary Hills M. & T. Co., Ltd., at Herberton, produced tin ore of £15,848 value; the Lancelot, £15,102. —— The increase of £100,000 in value of the copper output for 1903 over 1902 was due to Herberton and Mount Perry districts. —— The abundant rains allowed opal mining to be carried on under conditions more favorable than obtained for several years. The opal industry in 1903 employed a total of 170 men. The principal need of the opal fields of Queensland is a water supply. Sapphire mining at Anahie is progressing and has become an established industry.—— "The increase in the year's production of coal is to some extent discounted hy the decline in price, which has fallen to 6s 6d per ton, the lowest figure yet recorded." The following is a synopsis of the production of minerals other than gold:

Mineral. Total Quantity Won.	Tons.	Value.
Tin	3,708½	£243,149
Silver	*642,125	65,538
Lead	3,795	43,639
Coal	507,801	164,798
Copper	4,916	285,122
Opal	.....	7,300
Wolfram	197	7,870
Manganese	1,320	5,332
Bismuth	11	2,523
Bismuth, wolfram and molybdenite	24	2,100
Lime	13,612	8,060
Gems	.....	7,000
Iron	9,808	3,852
Totals	515,192½	£846,283

*Ounces

Western Australia.

Bewick, Moreing & Co. are now general managers for the Great Boulder Perseverance G. M. Co. Ltd., and R. Nichols remains resident mining manager at Kalgoorlie, Western Australia.

BRITISH COLUMBIA.

Boundary District.

H. Pemberton of Montreal, manager of the Montreal & Boston Con. C. Co., is arranging to start the company's smelter at Boundary Falls. A payment on the Dominion C. Co.'s property has been made. The combination will take over the Montreal & Boston Co.'s smelter, the Sunset mine, the Dominion C. Co.'s group —the Brooklyn, the Rawhide and the Stemwinder—the Morrison, probably the Athelstan - Jackpot, and Mackenzie & Mann's interest in the Emma.

Work will be started this month on the Last Chance mine at Skylark camp, acquired by the Spokane Boundary M. Co. of Spokane, Wash., men.

Toronto reports tell of a consolidatiou of mining interests at Camp McKinney. An agreement has heen arrived at whereby the Kamloops, Minnehaha and Sailor M. Cos. come under one management, and resume operations in all of the properties mentioned.

Plans are being drawn for an electric drill plant, ore crusher and picking helt for the Paragon mine near Boundary Falls. The mine is owned hy Spokane, Wash., men, with F. S. Ernest as manager.

East Kootenay District.

The mines at Morrissey, as also at the other collieries, Coal Creek and Michel, are practically closed down at present, says the Rossland Miner. The reason why the Great Northern is not taking any more coal is not made public.

The numher of men working at the St. Eugene mine at Moyie, near Fort Steele, has heen increased to 180 men. About sixty of these are at the upper workings of the mine. The concentrator is grinding steadily, running day shift only, hut a douhle shift will be put to work as soon as the required number of experienced mill men can he secured. The mill is heing fed hy ore from the Lake Shore workings.

Lillooet District.

Manager Burnett of the Highland Valley group of copper mines, near Ashcroft, says work progresses and ore is being opened up. Development will be increased. Next month it is expected forty men will be at work.

Nelson District.

W. J. Hughes of Ymir, manager of the Pilot (Ymir) G. M. Co., says he is arranging to put up a stamp mill on the company's property, which consists of two claims a mile east of the Foghorn mine, near Ymir.

Slocan District.

Work started last week on the Mahon group at Ten Mile.——The Payne at Sandon is adding another magnetic separator to its zinc plant.

The Slocan Star at Sandon resumed operations last week, all danger of slides baving passed. The Slocan Star has received more machinery for the concentrator. When the mill is completed the Star expects to ship forty carloads a month of zinc, lead and silver ore.——The Ivanhoe mill is turning out silver-lead concentrates at the rate of ten tons to a shift.

At the Payne mine at Sandon a shaft has heen started in No. 8 tunnel. It is down 40 feet and in ore all the way. It is expected to extend down and connect the workings of Nos. 9, 10 and 11.

Vancouver Island.

Manager S. Matson of Victoria says a company of London, England, men has taken over the Lenora mine at Mount Sicker, the Breen & Bellinger smelter at Crofton, the Mount Sicker Railway, connecting them, and Lloyd's sawmill, which supplies lumher for the mill. All will he operated in conjunction. It is expected the smelter may require an increased capacity.

Yale District.

Machinery for a 75-ton silver-lead concentrator is heing arranged for by the Alice Broughton mine, near Creston. A tramway will he put in.

CANADA.

Alberta.

The Alherta Coal & Coke Co. last week sold outright all of its coal lands at Cowley to E. Restor of London, England, and J. H. Thorburn of Edinburgh, Scotland, for $100,000 and full payment of all sums due by the company to the Dominion government o account of the lands in question. The lands sold consist of 6400 acres at Cowley, on the line of the Canadian Pacific Railroad, east of Frank. They were acquired from the Dominion government, with the right of purchase, two years ago, and lie to the north of the railway line. Breckenridge and Lund's coal lands are on the other side of the track.

By July 1st the International Coal & Coke Co. of Coleman expects to be shipping 2000 tons of coal and coke a day. The company is preparing to put in additional machinery, including 300 coke ovens. Some of tbe machinery is on the ground. It has been shipping 100 tons of coal a day for the past six months, but beginning with July 1st the output will he 2000 tons a day. Of this about 500 tons

will he made into coke. The company has a contract with the Canadian Pacific Railway Co. and the entiro output will be delivered to it. The coal company's head office is in Montreal. S. H. C. Miner is president.

MEXICO.

The Treasury Department has issued a report, including the following reports during the first seven months of the fiscal year 1903-04 to Feb. 1, 1904, as declared in the custom houses in Mexican currency:

Mineral products—	
Mexican gold coins	$11,422 00
Foreign gold coins	1,237 06
Gold in bars	11,500,758 13
Gold in other forms	537,838 12
Total gold exported	$12,051 255 25
Mexican silver dollars	$15,324,181 00
Foreign silver coin	45,704 00
Silver in bars	28,141,792 95
Silver in other forms	8,878,276 61
Total silver exported	$52,390,254 66
Copper	$12,546,748 11
Lead	2,946,398 45
Other mineral products	891,106 36
Total sundry minerals	$16,384,252 92

Guanajuato.

S. Morado, of Siloa, and J. M. Wiley will dovelop a cinnabar mine which thoy have hought on the Encinal ranch, near La Duz.

J. Lopez will develop tin properties which he owns near San Felipe.——F. R. Rocha, of San Nicholas, will develop his gold and silver bearing claims.

Jalisco.

Etzatlan reports say the properties of La Guadalupe and Camicho, the former operated by H. H. Sawyer and the lattor by C. Romero, I. Garcia et al., are hoth showing progress. They have not yet reached the poiut of shipping. —— The Amparo M. Co. has ore and is shipping regularly. Owing to the railroad company not being able to supply them with enough cars, shipmeuts are curtailed, says Superintendent E. J. Callahan.

H. M. Moran et al. have "solicited title" covering 20 mining pertenencias on a tin bearing vein adjoining the Esperanza mine in the Paso de Sotos municipality, near Teocaltiche, says the Jalisco Times of Guadalajara.

P. Brusky et al. are preparing to put in a 3-stamp mill at their mine near Ameca.——M. Valle is preparing to develop a silver and copper mine near Etzatlan.

Lower California.

George P. Brown, superintendent of the Esperanza mines, Cedros island, has bought the plant of the National Smelting & Refining Co., National City, Cal., and will move it to the Esperanza property.

T. Fermin and T. Agruel, of Ensenada, have a concession from the Mexican government to develop oil prospects near Mulege.

Nuevo Leon.

The Torreon Smelter Co., of Torreon, E. Madero president, has leased the Cabrillos mine near Monterey for four years with the privilege of renewing the lease for another four years. According to terms of lease, the Torreon Co. guarantees the Cabrillos M. Co., F. Zamhrano president, the royalties from the ores of the property will amount to not less than $250,000, of which amount they agree to pay $120,000 the first year. The Cabrillos mine is a silver-lead proporty said to carry enough iron ore to make it a valuable flux. The lessees propose to put in machinery and begin increased development.

Sonora.

The Cananea Con. C. Co. at Cananea has been granted hy the Mexican Government four concessions to build railways that will connect the Sonora railway with the Mexican Central railway over routes in northern Sonora and Chihuahua. The first is for a line of railway from San Jose station, on the Cananea, Yaqui & Pacific railway, to the Chihuahua State line, at a point about 20 or 30 kilometers south from the international boundary; the second is for a line from that point to some point on the Rio Grande, Mexican & Pacific, at or near Casas Grandes; the third, for a line from the last indicated point to the Mexican Central road; and the fourth for a line from the Cananea, Yaqui & Pacific railway to the Sonora railway. When completed, a railway built under those concessions will supply rail connection between the capital and gulf coast all in Mexican territory.

SALVADOR.

The mineralized zone of southern Salvador, extending from the mines of Encuentros on the west to Salamanca on the oast, or about 20 miles, contains many outcroppings and a few mines. It may be said to consist of three districts, none larger than 1 mile of proven value along the strike of tho vein. Some of the following mines have mills in operation and all of them have been exploited to a greater or less oxtent in the past, generally to the water level: The West group or district contains the Encuentros mine, silver-lead sulphide with free gold, carries also zinc and copper. It is 15 miles east of San Miguel.——Loma Laga mines, farther east, comprises many claims. The ore is principally silver-lead sulphide and sphalerito (zinc sulphide). Oxidized ores are being treated hy cyanide. The Devis-erdero mines, still farther east, carries values in gold principally.——The Central group, 15 miles east, contains tho San Sobastian mine. This mine has been operated with varying success for many years. Tho ganguo is quartz with iron sulphides, carrying high-grado gold values.——The East group, 5 miles east, contains the Salamanca mines, and other veins of small value as far as opened up. The general striko of all the veins is northwesterly. The veins' walls are usually well marked, and near the surface or above water level, much broken, requiring close timbering in mining.——The Saiamanca mines, owned and operated by the Salvador M. & M. Co. of New York, is 2½ miles north of Santa Rosa, in the department of La Union, and some 30 miles north from the port of La Union on Fonseca hay, to which all supplies and machinery are shipped. The vein has a strike of north 65° west and dips from 45° to 70° north. The width varies up to 5 feet, with an average of 1½ feet for the shoot. The quartz is often shattered; sometimes hard and massive, and again of cellular structure. Manganese, prohably as manganite (MnO) (OH), occurs, deposited from water and associated with iron oxide. It is also found coating the vugs of the cellular quartz. In the San Sebastian mine tellurides and nickel salts are found and the green nickel sulphate is prominent in the richest parts of the mine. In the Salamanca vein rich ore is indicated by the dentritos (a form of manganese oxide) found in a thick palm-leaf like form. The value is principally in free gold and the ore yields by straight milling and amalgamating about 65% of its gold value. The percentage of sulphide from the result of the mill's runs is about one-sixth of 1%, or 3 pounds of sulphides to 1 ton of ore.——There are no taxes of any kind on lands or mining and milling properties. Bullion, concentrates and ore may be exported free of duty and taxes, and the Government is assisting the mining industry as much as possible. All necessary machinery and supplies for mining and milling purposes are admitted free of duty, except for a port of Government stores tax of one-half cent silver per kilogram (2.2 pounds avoirdupois) gross woight.

Obituary.

WM. COLE, a pioneer mining man of Boise Co., Idaho, died at Ola, Idaho. Deceased was a native of Virginia, 77 years of age.

A. P. JOHNSON, a pioneer mining man of Mono Co., Cal., and later interested in Tuolumne county, died at Sonora, Cal., April 28. He was part owner in the Bonanza mine at Sonora.

J. H. MATTHEWS, president of the Copper Chief M. Co., which owns the Copper Chief mine on Equator hill, in the Jerome district, Ariz., died in East Orange, N. J., April 13, from the effects of an accident.

G. W. KRAMER, vice-president of the Colorado Midland Railway Co., and vice-president of the Utah Fuel Co., operating coal mines in Carbon Co., Utah, died in Denver, Colo., on the 4th inst. Deceased was born in Sandusky, Obio, in 1851.

G. GOODWIN, a pioneer mining man of California, died at San Francisco, Cal., on tbe 7th inst., at the age of 75 years. Deceased was a native of Ronsperg, Bohemia, and went to the placer diggings of California in 1854. He later engaged in the manufacture of artificial stone.

Trade Treatises.

"Hydro-Carhon Paints," from the Hydro-Carbon Manufacturing Co., New York and Denver, describes and illustrates their application.

A commendable little treatise from the Jos. Dixon Crucihle Co., Jersey City, N. J., discusses the value of their handy graphite rope dressing for wire ropes.

The engine and boiler catalogue from James Leffel & Co., Springfield, Ohio, is of interest to steam power users. There are numerous full page and many smaller illustrations. There is much detailed information nbout engines and hoilers. The book will be sent to any one nddressing tho company.

Personal.

L. H. MITCHELL, M. E., is now located in Los Angeles, Cal.

R. G. BROWN of San Francisco, Cal., hns gone to Honduras, C. A.

J. G. SAWYER is now superintendent Seigel Con. mines, Aurum, Nev.

J. A. VEATCH of Napa, Cal., is in San Francisco, Cal., on mining business.

J. J. BROUGHALL of Salt Lake City, Utah, hns returned from Denver, Colo.

F. U. BOWERS of Sonora, Cal., is in San Francisco, Cal., on mining business.

J. PERELLA is foreman for the Alaska-Juneau group of mines, near Juneau, Alaska.

B. LINDENBERGER of Black Diamond, Cal., is in San Francisco, Cal., on mining husinoss.

FRANK KEITH is the new superintendent of the Tonopah Co.'s mines, Tonopah, Nev.

E. W. GIDDINGS, a mining man of Colorado Springs, Colo., is in San Francisco, Cal.

L. L. LANE of San Francisco, Cal., is at Juneau, Alaska, examining mining properties.

E. B. CONELY has assumed charge of the Butie and Gold Center mines, Olinghouse, Nev.

SUPERINTENDENT H. T. TRIPP of the Sumdum mine is at Juneau, Alaska, for the summer.

W. L. COLE succeeds Lewis T. Wright as general manager Mountain Copper Co., Keswick, Cal.

S. W. CLAWSON is mine superintendent Copper Queen Co., with headquarters at Douglas, Ariz.

W. D. WASHBURN of Chicago, Ill., interested in mines in Arizona, is in San Francisco, Cal.

D. M. HARVEY is superintendent of the Ora group of claims at Olinghouse, near Wadsworth, Nev.

A. R. WILFLEY of Denver, Colo., is spending some time in Missouri, taking a much needed rest.

J. MURPHY is manager of the placer properties of the Cœur d'Alene G. M. Co. near Murray, Idaho.

L. L. PATRICK, who has mining interests at Tonopah, Nev., is in San Francisco, Cal., on business.

W. O. EMERY has been appointed head of the chemistry department of the New Mexico School of Mines.

F. C. ALLSDORF of the Cuprite C. Co. of Morenci, Ariz., is in the East in the interests of that company.

A. B. EMERY, who has mining interests at Rossland, B. C., is in San Francisco, Cal., on mining business.

S. F. PARRISH, manager of the Le Roi C. Co., returned to Rossland, B. C., last week after an extended absence.

L. R. BELLMAN, manager of California mine, near Sumpter, Or., is in Minneapolis, Minn., on company business.

F. L. SIZER of Helena, Mont., is manager of the Whitlach-Union group of mines at Unionville, near Helena.

G. F. OBER, engineer and mineral surveyor of Denver, Colo., is doing professional work at Atlantic City, Wyo.

J. S. ACKER returned to Prescott, Ariz., last week from a six months' visit to Cincinnati, O., on mining business.

THOMAS DERBY, superintendent of the New Almaden quicksilver mines in Santa Clara county, is in San Francisco, Cal.

J. H. ROBESON is manager of the Pay Rock Extension M., M. & D. Co., owning the Pacific group, near Georgetown, Colo

G. W. SPARKS, president Fairhanks-Morse Co., who has been traversing the Pacific coast, has returned to Beloit, Wis.

G. W. CROWE, consulting engineer for the Ruby G. & C. Co., near Oriz, Sonora, Mexico, is in New York on company business.

J. W. O'DONOGHUE of the Con. Virginia mine at Virginia City, Nev., has gone for a month's visit to points in the East.

J. HOLLINGER of Ursine, Nev., interested in Pike's Diggings, near Stateline, has returned there from Salt Lake City, Utah.

THOS. J. BARBOUR, consulting engineer of the Risdon Iron Works of San Francisco, Cal., has returned from London, England.

D. W. HARTSHORN is superintendent of the Pacific group of the Pay Rock Extension M., M. & D. Co., near Georgetown, Colo.

F. D. SMITH, manager of the Snow Creek, Or., mine, returned to Sumpter, Or., last week from an extended mining trip to Mexico.

W. C. RUTTER of Seattle, Wash., manager of the Big Four M. Co. at Granite, Or., is superintending operations at the company's mines.

H. PEMBERTON of Montreal, Quebec, has gone to Boundary Falls, B. C., as manager of the Montreal & Boston Con. C. Co. mines and smelter.

C. M. FUELLER, mining engineer and metallurgist of Denver, Colo., has heen examining mining property near South Pass, Wyo., the past week.

J. B. MONTGOMERY of San Francisco, Cal., has gone to the Yakutat section of the Copper rivor country, abovo Valdez, Alaska, on mining business.

COMPTE DE GABRIAC of Paris, France, secretary of tho La Grange Hydraulic Co., is on a visit to the company's property, near Weaverville, Cal.

G. A. OVERSTROM takes the chair of mine, plant and mill designing in the State School of Mines, University of Utah, Salt Lake City, Utah.

L. G. LILLEY, manager of the Baby McKee Con. M. Co., operating tho Last Chance mine, near Sumpter, Or., is in the East on company business.

A. J. MCMILLAN, managing director of Le Roi mine at Rossland, B. C., has returned there from London, Eng., where he has been for the past six months.

H. W. CROWTHER of Salt Lake City, Utah, managing director of the Continental M. & S. Co., is in Mexico examining mines for his company and New York men.

W. J. ADAMS, E. M., has returned to San Francisco, Cal., from Mokelumne Hill, Calaveras county, Cal., where he made a study of the geology of that district.

A. H. ELFTMAN, M. E., of Minneapolis, Minn., is touring the west half of America in inspection of mines he is developing, and is this week in Park City, Utah.

RICHARD EAMES, JR., of the Associated Security Co., 10 Wall street, New York, has gone to Mexico to secure suitable representatives of his company in tbat country.

H. A. SHIPMAN, formerly manager of Stratton's Independence, Ltd., at Cripple Creek, Colo., has been appointed manager of the Golden Horseshoe mine of Kalgoorlie, Western Australia.

M. TORPHY, superintendent of the Newell-Caffe quarry at Carthage, Mo., has been transforred hy the company to the superintendency of the Pennsylvania Zinc & Lead Co.'s mines at Neck City, Mo.

PRESIDENT C. R. MCCORNICK of the Chase Creek C. Co., near Clifton, Ariz., is in Paris, France, to attend the annual meeting of the Gold Roads M. Co. of Mohave county, of which he is a shareholder.

J. P. BOYLE, until recently superintendent of the Ivers properties in Lincoln county, Nev., has gone to Roosevelt, in Thunder Mountain section, Idaho, to assume superintendency of the Lost Packer mine.

CHARLES F. WALLACE has resigned the general managership of the Illinois Central Railroad to assume the position of chief engineer in the construction work of the Panama canal, for the Panama Canal Commission, at an annual salary of $25,000.

PROFESSOR ALBERT W. SMITH has resigned as head of the Department of Mechanical and Electrical Engineering at Stanford University, California, to assume charge of the Sibley School of Engineering, Cornell University, Ithaca, N. Y., where he succeeds the late Professor R. C. Thurston.

H. V. CROLL, who has heen in charge of the Salt Lake City, Utah, office of the Allis-Chalmers Co. for several years, and who was before that the representative of the E. P. Allis Co. at Spokane, Wash., has been appointed to the charge of the Allis-Chalmers office in San Francisco, as the successor of George E. Ames, who has resigned. Mr. Croll's San Francisco office is 623 Hayward building.

Commercial Paragraphs.

R. D. TOMLINSON has assumed charge of the condenser department of the Allis-Chalmers Co.

A. V. DICKERSON, 1505 Monadnock Blk., Chicago, is agent in that territory for Arthur Koppel of New York, manufacturer and builder of complete railways for mines, etc.

THE Pittsburg office of the Sullivan Machinery Co. of Chicago—Geo. W. Favor, Pittsburg, manager—is removed from 339 Fifth avenue to rooms 1112-13 Farmers' Bank Building.

J. FITZ BRIND, president of the Insoloid Fuse Co., Denver, Colo., was in San Francisco last week arranging to ship fuse from Europe direct, San Francisco to be a distrihuting point for coast trade.

I. A. TAYLOR, who has for many years heen connected with the electrical industry, hoth on the manufacturing side and as consulting engineer, associated with A. B. Herrick, has joined the staff of the Engineering Co. of America.

SAYEN & SCHULTZ of Thirteenth and Commerce streets, Philadelphia, manufacturers of packing, mechanical ruhher goods and hose, are now represented on the Pacific coast hy John T. Roberts, whose offices are in the Crossley Building, San Francisco, Cal.

U. S. CONSUL G. BIE RAVNDAL, Beirut, Syria, writes that there is a market there for an oil engine of simple construction. The following named firms might be addressed: Michel J. Nasser, Beirut, Syria; American Exchange Co., Haifa, Syria; Meshaka & Nachman, Damascus, Syria.

A. LESCHEN & SONS ROPE CO. have the large offices, 163-165 Washington street, New York City, for carrying a larger stock than in the past. Their new manufacturing plant, with their main offices, are at 920-922 North First street, St. Louis, Mo.; their other branch offices are located in Chicago, Denver and San Francisco.

THE Canadian husiness of the Allis-Chalmers Co., which recently acquired the Bullock Electric Mfg. Co. of Cincinnati, O., will hereafter be conducted hy a new organization hearing the name Allis-Chalmers-Bullock, Ltd. The works and principal offices of this important, new Canadian company are in Montreal, Canada.

B. C. RIBLET has a contract from the Metropolitan G. & S. M. Co., which owns the Triune mine near Ferguson, B. C., for the erection of a douhle-rope aerial tramway, at a cost of $20,000. The tramway will carry the ore from the mine to the wagon road, and do away with rawhiding down the mountain side. It must he finished by August 4, 1904. The mine is to be equipped with air compressor and drills.

THE demand for Crane patent pop safety valves has made it necessary for Crane Co., Chicago, to increase the capacity of their manufacturing departments on these goods. They have also brought out a number of new forms of pop valves for stationary, marine, locomotive and portable boilers and a variety of cylinder reliefs, water reliefs, high pressure and hydraulic relief valves for general purposes and pressures.

ALL of the material used hy the contractors on the new Moffat Railroad has been purchased hy the S. H. Supply Co., of 22nd and Larimer streets, Denver, Colo. This is one of the largest purchases of its kind ever made, there heing sixty-five carloads of material. This comprises all of the tunnel plants of air compressing and drilling machinery used hy hoth Geo. S. Good & Co. and Orman & Crook, nine air compressors, with hoilers, drills, steel, etc., two electric drilling plants, and thousands of feet of pipe and rail.

THE Taylor Iron & Steel Co., of High Bridge, New Jersey, manufacturers of manganese steel castings of every description for heavy mining machinery, as well as the larger types of armor-piercing projectiles, will have two interesting exhihits at the St. Louis Exposition. Both of these are located in the Mines Building. On aisle "H" in hlock 73 the firm has a space 27 by 42 feet, where will he shown manganese steel castings in great variety. Deserving of special mention is a revolving soreen of 60-inch inside diameter with 21-foot screening surface. The perforated plates and all wearing parts of this screen are of manganese steel. Among the other large castings in the exhihit are parts of large "Gates" crushers, coal rolls and jaw crusher parts. Mine car wheels, sprocket wheels, gears, detachahle link helting, teeth and lips for steam shovels, lips and bushings for dredge huckets are also shown, as also a variety of the regular steel (not manganese) castings in gears, dredge parts, etc. The manganese steel castings now furnished to many of the larger gold dredging plants throughout the West hy the Taylor Co. are giving such excellent satisfaction to dredge operators that this department of the plant at High Bridge is running full on bucket hases, connecting links, tumhlers, gears and ladder castings, both for new dredges and renewals. The second Taylor exhihit at St. Louis is also in the Mines Building, and forms a part of the display of the International Nickel Co. It consists of nickel steel castings, including mining and crushing machinery, car wheels, dredger parts and armor-piercing projectiles. The Taylor plant now has a department for the production of nickel steel castings on a large scale.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING MAY 3, 1904.

758,807.—STEAM GENERATOR—G. W. Arper, Oakland, Cal.
758,950.—CUT OFF—B. C. Ball, Portland. Or.
758,954.—CUT OFF—F. P. Bell, Fairfield, Wash.
758,812.—SLAG CAR—Bennette & Jones, Tacoma, Wash.
758,734.—BISCUIT CAN—C. G. Blickle, S. F.
759,153.—CONCENTRATOR—F. J. Bonnington, S. F.
758,817.—APPLYING INSECTICIDE—Brown & Winship, Seattle, Wash.
758,818.—SHOE SOLE—G. C. Calentine, Tacoma, Wash.
758,744.—WIRE MATTRESS—W. E. Fisher, Seattle, Wash.
758,962.—FOLDING MACHINE—R. B. Friend, Oakland, Cal.
758,642.—TENT—F. H. Gotsche, S. F.
758,911.—CAN SOLDERING MACHINE—J. J. Griffin, S. F.
758,913.—LINK CHAIN—C. G. Hampton, Ryde, Cal.
758,914.—MECHANICAL MOVEMENT—W. Hanson, Calistoga, Cal.
759,109.—FEED CUTTER—W. Houghton, Snohomish, Wash.
759,189.—PLOW—T. J. Hubbell, Pomona, Cal.
758,970.—CLOSET CISTERN—F. Jackson, Oakland, Cal.
758,760.—KEYBOARD—J. H. Kohlmoos Jr., S. F.
759,116.—SLIMING GATE—J. L. Lawrence, Cloverdale, Or.
758,770.—FOLDABLE BASIN—J. W. McCann, Republic, Wash.
759,005.—PARING KNIFE—G. W. McLeod, Tacoma, Wash.
758,767.—GAGE GLASS PROTECTOR—T. Mirk, S. F.
759,000.—VEHICLE WHEEL—W. E. Mitchell, Stockton, Cal.
758,926.—DRILL SHARPENER—D. G. Morgan, Chinese, Cal.
758,846.—FARE REGISTER—S. Paduveri, S. F.
759,011.—GAS GENERATOR—F. E. Pfister, Oakland, Cal.
759,126.—BUSHING—Pfluger & Christensen, Portland, Or.
758,685.—TRANSOM LIFT—B. Phelps, Seattle, Wash.
759,220.—TREATING ORES—L. E. Porter, Los Angeles, Cal.
658,691.—FARM GATE—C. U. & J. L. Reams, Suisun, Cal.
758,940.—WEARING APPAREL—A. Siminoff, Los Angeles, Cal.
758,941.—LOCK—N. B. Stone, Outlook, Wash.
758,874.—TREATING PINE NEEDLES—C. M. & O. C. Terrell, Tarts Pass, Or.
758,946.—ELECTROREATER—E. R. Waterman, S. F.
758,879.—BANJO BRIDGE—C. S. Weber, San Jose, Cal.
759,145.—PUMP—P. M. Wing, Boyd, Or.

Notices of Recent Patents.

Among the patents recently ohtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUXILIARY FARE INDICATOR FOR STREET CAR REGISTER.—No. 758,846. May 3, 1904. Felix Paduveri, San Francisco, Cal. This invention relates to a device for use on street cars and the like as an adjunct to the ordinary cash fare and transfer registers and adapted to he operated simultaneously with the latter to give an audible signal at that part of the car where the register signals are not generally heard. The object of the invention is to prevent the continuous and material loss to the companies hy dishonest conductors failing to ring always the correct number of fares.

CAN SOLDERING MACHINE.—No. 758,911. May 3, 1904. J. J. Griffin, San Francisco, Cal. One-half assigned to A. W. Livingston of same place. This invention relates to improvements in apparatus for soldering cans, and particularly polygonal cans. The object of the invention is to provide a machine wherein the cans will he advanced and turned to present the several angles of the cans to the successive acid and solder baths, and especially to provide a machine having a continuous movement in contradistinction to those of intermittent movement commonly in use, whereby the output of a machine may be greatly increased.

DRILL SHARPENER.—No. 758 926. May 3, 1904. D. G. Morgan, Chinese, Cal. This invention relates to a machine for sharpening rock drills, and particularly drills of the type having a hollow shank and radially disposed cutting bits. By this machine all the hits of a drill are fulled or spread and sharpened simultaneously. The numher and character of the dies may he varied according to the number and character of the bits of the drills sharpened. By removing the pin or mandrel and changing the dies the machine is adapted to sharpen ordinary solid drills.

DETACHABLE LINK CHAIN.—No. 758,913. May 3, 1904. C. G. Hampton, Ryde, Cal. This invention consists in the construction of the sides of the links with elongated slots punched through them, said slots at one end having an enlargement and the slots at the other end being adapted to receive the ends of tubular sleeves, which are also formed and hent separately so as to be removable from the side links. The pin connecting the adjacent links passes through the tuhular sleeves and is flattened at the ends to interlock with the narrower portions of the slots of the links with which it is engaged.

Books Received.

During the week three valuahle publications have been received from the United States Geological Survey, viz.: Bulletin 208—The Descriptive Geology of Nevada South of the Fortieth Parallel and Adjacent Portions of California, by J. E. Spurr. This is the result of a geological reconnoissance hy the author and does not purport to be a complete and final dissertation on the subject. It is illustrated hy half-tone engravings and numerous maps and diagrams. Bulletin No. 225, being Contrihutions to Economic Geology in 1903, by S. F. Emmons and C. W. Hayes. It deals with mineral deposits in Alaska, Maine, Vermont, Oklahoma, South Dakota, Utah, California and other States and covers a variety of subjects. Professional Paper No. 12—The Geology of the Globe Copper District of Arizona, by F. L. Ransome. Illustrated with engravings and maps.

Latest Market Reports.

SAN FRANCISCO, May 13, 1904.

METALS.

SILVER.—Per oz., Troy: London, 25⅞d (standard ounce, 925 fine); New York, har silver, 55¼c, refined (1000 fine); San Francisco, 55¾c; Mexican dollars, 44½c San Francisco, 44¼c New York.

COPPER.—New York: Standard, $13.50; Lake, 1 to 3 casks, $13.50@13.50; Electrolytic, 1 to 3 casks, $13.25; Casting, 1 to 3 casks, $12.87½; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £57 10s spot per ton.

LEAD.—New York, $4.65; Salt Lake City, $3.50; St. Louis, $4.25 San Francisco, $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 6½, sheet 7, har 5¾c: pig, $4.85. London: £11 17s 6d ℔ long ton.

SPELTER.—New York, $5.25; St. Louis, $5.00; London, £22 5s 0d ℔ ton; San Francisco, ton lots, 6¾c; 100-lb. lots, 7c.

TIN.—New York, pig, $27.50@27.65; San Francisco, ton lots, 29½c; 500 lbs., 30c; 200 lbs., 30½c; less, 31c; bar tin, ℔ lb., 32½@35c. London, £125 7s 6d spot.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $19.00 ℔ Troy oz. Platinum ware, 75@82c ℔ gram.

QUICKSILVER.—New York, $45.50@46.50, large lots; London, £8 5s 0d; San Francisco, local, $43@44 ℔ flask of 76½ lbs.; Denver, $46.00. Export, $43.00@43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 19.00c; San Francisco, Plumhers', 100-lb. lots, 16.50c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb., .04c.

NICKEL.—New York, 50@60c ℔ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $14.00 @14.35; gray forge, $13.00; San Francisco, bar, 3c ℔ lb., 3½c in small quantities.

STEEL.—Bessemer hillets, Pittshurg, $23.00@23.00; open hearth hillets, $23.00 @23.00; San Francisco, har, 7c to 12c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½c ℔ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50 @5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00 @35.00.

NAILS.—This week the hasic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4 and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $1.25 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $2.15@2.65 ℔ bbl.; California carload lots, $2.10 f. o. b. at works; small lots, $2.45 ℔ bhl. in sacks, 4 sacks to hhl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7¾c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tapo, $3.60 per 1000 feet; douhle tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ℔ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, johhing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, hhls., $1.20@1.40 ℔ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, hhls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

BONE ASH.—Extra No. 1, 5@6c ℔ lb. No. 1, 4@5c.

OILS.—Linseed, boiled, hhl., 49c; cs., 54c; raw, hhl., 47c; cs., 52c; Lucol oil boiled, bbl., 44c; cs., 49c; raw, hbl., 42c; cs., 47c. Kerosene—Pearl, per gal., 20½c; Astral, 20½c; Star, 20½c; Extra Star, 24½c; Eocene, 23½c; Elaine, 26½c; Water White, in hulk, 14c; Mineral Seal, iron bhls., 19c; wooden bbls., 21½c; cs., 25c; Mineral Sperm, cs., 26½c.; Deodorized Stove Gasoline, hulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in hulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E W. S., hhl., 75c; cs., 80c; Neats-foot Oil, pure, hhl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 70c; Bleached, do., 80c; Whale Oil, cs., 52@57c.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.00; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymho, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $11.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $11.50, long ton.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb., 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. hags, 8@9c ℔ lb.

BORAX.—Concentrated, 6@7c ℔ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ℔ lb., 60c.

SODIUM.—Metal, ℔ lb., 50c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.00 ℔ lb.

CHROMIUM.—90% and over, ℔ lb., $1.00.

PHOSPHORUS.—American, ℔ lb., 70c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittshurg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ℔ lb., $3.50.

(These prices are wholesale, f. o. h. San Francisco, unless otherwise noted.)

MINING AND SCIENTIFIC PRESS

Whole No. 2287.—VOLUME LXXXVIII. Number 21. SAN FRANCISCO, CAL., SATURDAY, MAY 21, 1904. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Chinese in British Columbia.

In British Columbia the owners and operators of the coal mines have again secured a decision of the full bench of the Supreme Court that they may employ Chinese in their mines. A few months ago James Dunsmuir was fined $2000, or $20 for each one of 100 Chinamen employed in his mines, contrary to the provision of the provincial law. This fine was imposed by a magistrate at Nanaimo. The mine owner was allowed to carry a case direct to the court with the above result, the court declaring the legislative act ultra vires (beyond the powers conferred upon the legislators). The Provincial Government will take the matter before the judicial committee of the privy council in London—the last court of appeal. This question was previously taken before the privy council, in another case, and the mine operators won. The legislature at once proceeded to strengthen the coal mines act, making the employment of Chinese a misdemeanor, and now the Supreme Court declares that the legislature has no jurisdiction. Previously, the law applied to all aliens, but now it is directed toward those only who are unable to comply with the simplest regulations as to education, etc., and is directed particularly at the Chinese.

Uniform Nomenclature Needed.

If the nomenclature of mine, mill and smelter were more uniform in the English language, it would be of undoubted advantage to those interested in the business. In different districts in the United States there are found a variety of names for the same object or thing, while in the English colonies and in England, mining terms are so widely different from those used elsewhere as to often leave a doubt in the minds of those who are unfamiliar with these localisms and colloquial expressions, as to what is meant. In some parts of Australia ore is called "stone," in other parts "dirt." In Gilpin county, Colorado, ore is weighed by the cord. In some parts of Utah the output of base ore is stated in pounds, a practice confusing and unwarranted. Hoisting of the United States has become "winding" in South Africa. In measuring water or referring to the amount used, as in concentrating and milling operations, there is great diversity. In one section the number of inches (miner's inches) is given; in another the number of gallons; in still another the cubic feet, and in still other places the quantity is stated in tons per day. Given any of these quantities, one interested can figure out the amount in terms corresponding to those with which he is familiar, and reach a conclusion, when making a comparison of methods, but it seems like a needless waste of time and mental effort. One in time might become familiar with such expressions as "a parcel of stone sent out," when a shipment of ore is meant, and may possibly comprehend the meaning of the statement that "often pieces of the ore weighed two stone," but to those unfamiliar with such expressions they seem odd to say the least. The various mining engineering societies may find in this an opportunity to bring about a change which would make a common nomenclature for all English speaking miners. In these days there is a vast amount of technical literature on mining and ore treatment and the man who wants to keep abreast of the times must read much of it, but he is often hampered by the uncertainty of the names employed and by a lack of uniformity in method of expression.

Old Dominion Smelter, Globe, Ariz.—See Page 344.

THE various representatives of the several gold-dredging companies operating on the Feather river and elsewhere in California have organized what is known as the Dredge Miners' Association, the object of which is to advance and protect the interests of the dredge operators in that State. The dredging industry has grown up from an experiment to one of the foremost branches of mining industry in that State, and those interested in it believe that greater success and possibly greater economy may result from organization.

PRELIMINARY steps have been taken by a number of chemists, assayers and metallurgists of Denver, Colo., to organize the Society of Western Chemists, Assayers and Metallurgists. A temporary organization has been formed at Denver, with F. W. Traphagan, president pro. tem., and H. C. Parmalee, secretary pro. tem. It is proposed, if 100 members enroll, to make the organization permanent.

Old Dominion Mine and Vicinity, Globe, Arizona.—See Page 344.

Important Legal Decisions.

Judge De France of Colorado has rendered an interesting decision in the case of the Big Five Miniug Co., which sought to condemn a right of way across the Christmas claim, in Spauish Bar mining district, Clear Creek county. The Supreme Court of Colorado has denied all right of tunnel owners to drive through the property of others to reach their veins beyond, but in the iustance above mentioned the Big Five Mining Co. also claims to be a transportation compauy, and, therefore, a common carrier, and consequently in a sense a public utility. In some localities the mine owner has beeu enabled to condemu rights of way from his mine over the surface of the property of others to reach the nearest available means of transportation, by means of what has been legally termed "lateral railroads," but the law recognizing such roads requires that they may be subject to use by others, if required, making them essentially public in character. It has been held that in the case of a mine owuer claiming the privilege to condemu a right of way he cannot do so for the purpose of transporting the product of his own mine only; such use is of a private nature aud not applicable to the law of eminent domain. The law has reference to surface transportation, and it is presumed that iu the decision recently rendered in favor of the plaintiff in the above mentioned case the court considered that the law applied with equal force to tunnels driven for a purpose similar to that contemplated in the law.

Another decision of interest and importance was recently made by the United States Supreme Court in affirming the decision of the circuit court of appeals, in the case of the St. Louis M. & M. Co. of Montana and W. Mayger, appellants, vs. The Montana M. Co. (Limited). In this case the St. Louis Co. owned a patented lode location, adjoiniug a lode claim, also pateuted, owned by the Montana Co. Within the boundaries of the St. Louis claim was a lode other than the discovery vein having its apex within the boundaries of the St. Louis claim, but in its dip passing out of the side line of the St. Louis claim into the Niue Hour claim, owned by the Montana Co. A crosscut was driven 260 feet from the St. Louis vein into the Nine Hour claim to reach the parallel vein referred to. The crosscut run horizontally through barren country rock, and would not intersect any other vein between the two known veins. It was not intended by the St. Louis Co. to extend the crosscut beyond the vein referred to, and only intended to work this vein through the crosscut and workings already made on the discovery vein.

The circuit court enjoined the further prosecution of the crosscut, and the injunction was sustained by the circuit court of appeals of the ninth circuit. The St. Louis Co. appealed to the Supreme Court, which affirmed the decision of the circuit court of appeals. In delivering the opinion of the court, Justice Brewer said, the situation and the question could be easily presented by consideriug the significaut lines as lines of a right-angled triangle; the vein descending on its dip being the hypothenuse, the tunnel the base line, and the boundary between the two claims the side line of the triangle. The St. Louis Co. being the owner of the vein may pursue and appropriate the veiu on its dowuward course, although it extends outside the vertical side lines of its claim and beneath the surface of the adjoining Nine Hour claim, but the court denies the right to work the vein from the veiu lying back of it through the medium of a crosscut. It must be opened by a shaft on the vein from the surface, proving the identity and continuity of the vein throughout, as both identity and continuity of a vein are involved in the exercise of the extralateral right. To just what limitations the owner of a vein must confine himself in crosscutting and working the vein, vein system or zone, can only be determined in each particular case by geological conditions. The law requires that, in following his vein downward, the apex proprietor must keep within it when he has passed beyond the plane of the side line of his property extended downward vertically. He can not crosscut to his vein to reach it. This is the law as interpreted by the Supreme Court of the United States, and the decision above noted iudicates that the court intends to live up to the "spirit and the letter of the law." It seems like a hardship upon the owner of a mine in which there are several veins, as is not uncommon in many places. As a notable instance may be mentioned the Keystone mine in Amador county, Cal., where there are five distinct veins within a short distance of each other, all of which have been extensively worked, mostly through two shafts sunk on one of them, the other veius being reached by cross cuts. If the letter of the law must be observed, it is as reasonable to require that a shaft must be suuk throughout its depth directly in or upon the vein, though in its dip the vein in its downward course may be so sinuous as to make numerous changes of angle in the shaft—a condition at once expensive and undesirable. All miners prefer a straight shaft, and iu the case of an inclined shaft sunk in straight alignmeut aud at a uuiform angle it may have the vein on the hanging wall side part of the way, and part of the way on the foot, and it may be partly in the vein. An iustance may be mentioued where an inclined shaft starts in the hangiug wall country rock 60 feet distant from the vein on the surface. The shaft, being steeper thau the vein, cuts it between 300 and 400 feet. From that point to the 1000-foot level the vein lies in the hauging wall, and at one place the vein is at least 100 feet from the shaft in the hanging and far beyond the boundary of the claim. There are many thiugs in the mining law which seem to require readjustment, but none more so than that of the extralateral right.

A third interesting decision has been hauded down by the Supreme Court of the United States iu the case of the Clipper Mining Co., plaintiff in error, vs. the Eli Mining & Land Co. et al. In this case a placer claim was located in 1877 within what are now the limits of the city of Leadville, Colo. The following year the locators applied for patent. The application was adversed and patent denied, on the grounds that the land was not in fact placer ground. Later a second applicatiou for pateut to a somewhat smaller tract of the same land was made, which was rejected by the Commissioner of the General Land Office, and his decision was affirmed by the Secretary of the Interior. Subsequently—in November, 1890—four lode claims were staked on the alleged placer claims, ou which the owners had regularly performed assessment work. The owners of the four lode locations applied for a patent, when defendants in error—the owners of the placer location—filed an adverse claim. Judgment was rendered for plaintiff by the District Court of Lake county, Colo., which judgment was affirmed by the Supreme Court of Colorado. Thereafter a writ of error was sued out and the case went to the Supreme Court of the United States, which decides that when rejecting the application for patent to the placer claim, as neither the land office, the Commissioner nor the Secretary of the Interior declared the location of the placer claim void, the claim remained in force and was valid—even though the land office may still set aside the claim upon notice aud restore the land to the public domain. But it has not done so, aud, therefore, it is useless to consider what rights other parties might theu have The court says: "Our conclusion, therefore, is that one may not go upon a prior valid placer location to prospect for unknown lodes aud get title to lode claims thereafter discovered and located in this manner, and within the placer boundaries, unless the placer owuer has abandoned his claim, waives the trespass, or by his conduct is estopped to complain of it. * * * Under the authorities, a prospector may not enter upon a prior placer location for the purpose of prospectiug for, or locating, unknown lodes or veins; and to uphold the judgment we must presume that the evidence before the trial court showed that the veins or lodes upon which defendants' grantors based their locations were unknown when they entered upon the Searl placer for the purpose of prospecting."

Another important decision is in relation to failure of co-partners to contribute their proportion of assessment work. The case mentioued was that of W. S. Elder, administrator of the estate of R. Wilsey et al., vs. Horseshoe Mining Co. et al. of South Dakota. Wilsey and one C. H. Havens located a claim in the Bald Mountain district, 7 miles south of Deadwood, S. D., in 1878. Shortly thereafter Wilsey died, but Havens continued to do assessment work for eight years, when he served notice on the heirs of Wilsey demanding their share of the expenses in performing the work—$400. They paid nothing and neglected to take advantage of this opportunity to secure their original half interest in the property, and subsequently, in 1889, Havens advertised them out. Later, methods of successfully treating the telluride ores of that section having been discovered, the claim increased rapidly in value. In December, 1893, the heirs of Wilsey offered to pay their share of annual assessment from the date of location of the claim, which offer was refused. Havens then sold the property, and the heirs of Wilsey sued for au undivided one-half interest in the claim. The District Court decided in favor of plaintiffs, but the decision was reversed by the Supreme Court of South Dakota The case being carried to the Supreme Court of the United States, the judgment of the Supreme Court was sustained. The fact that a teuder was made in settlement after being dispossessed of their iuterest by legal process was giveu no consideration, and the claim of plaintiffs that no names were mentioned in the publication of the notice was declared by the court to have no force, and that the names of the heirs were not necessary. The notice was addressed to "Rufus Wilsey, his heirs, administrators and to whom it may concern." The claim of plaintiff that at the time of publication of the notice there was no administrator of the estate, the former administrator having died and his successor not having been appointed, was equally unavailing.

IT is stated in Wall street that a large portion of the money realized by the Japanese loan recently negotiated is for the purpose of buying silver, presumably for coinage with which to pay the soldiers and to defray such other expenses as may be paid for with silver during the war with Russia. Japan, it is said, has recently bought 2,000,000 Mexican dollars. Should the war continue for some time longer it cannot fail to have a direct effect upon the mining industry of the United States. Under the circumstances both silver and copper, and possibly also lead, may be expected to advance somewhat in price under the continued demand for those metals by both Japan and Russia.

CONCENTRATES.

THE certificate of location is the basis for a mine patent, and the monuments on the ground determine the outline of the claim. Errors in the survey are subject to correction.

✤✤✤✤

LEAD POISONING from working in dry carbonate mines cannot be cured except by cessation of such work. But as an antidote or preventive it were well to drink water, in each quart of which is two drops of sulphuric acid.

✤✤✤✤

MEN can work in caissons under an air pressure of upwards of fifty pounds per square inch without feeling any immediate ill effects, but the lives of men who work continuously under such conditions are known to be shortened thereby.

✤✤✤✤

MACHINE DRILLS furnish a certain amount of fresh air to underground mine workings, but it is an expensive method of ventilating a mine. Ordinary rotating ventilating fans give more satisfactory results and are a more economical means of ventilation.

✤✤✤✤

THE first dredging operations in California, of which there is any record, were in 1850, on Ousley's bar on Yuba river. But successful dredging was not carried on in that State until the '80s, though dredging was employed in New Zealand twelve to fifteen years previous.

✤✤✤✤

MINE SAMPLES are of little practical value unless the width of ore represented by the sample, in feet or inches, be also taken. A hand specimen affords little information that is reliable, as it represents only that particular piece of rock, and a doubt remains as to how much more of the same kind is in the mine.

✤✤✤✤

THE theory that petroleum oil only occurs in the crest or dome of anticlinal folds may have a tendency to keep prospectors from testing formations not having this assumed prerequisite condition. Oil is not known to occur in large amount in synclinal folds, but it has been found abundantly where the strata lay horizontal or nearly so.

✤✤✤✤

THE assay of battery samples in a quartz mill is not as important as the assay of tailings. If all, or nearly all, of the values are saved, as shown by tailings sample assays, then the value of headings is also known. It is necessary, however, to have mine sample assays to avoid sending rock to the mill having too little value to pay for milling.

✤✤✤✤

THE iron black water-worn rock from Yukon basin, Alaska, is hard hematite, a variety of iron ore. It has evidently been carried by the water some distance from the place where it originated in the rocks. Ore of this character occasionally contains gold. The common name by which it is known by placer miners is "iron rock." It contains no tin.

✤✤✤✤

IN a case where final payment has been made on a mine patent and receipt issued by the Receiver of the Land Office therefor, this is equivalent to and just as good as a patent unless the Land Office returns the money and for stated cause refuses to issue the patent applied for. Assessment work may cease on a claim when final payment has been made.

✤✤✤✤

IN Mexico the vara is a yard—3 Spanish feet, or 32⅞ English inches. In Mexico most land measurements are made by the metric system. A pertenencia is the unit of a mine concession. It is 100 meters square on the surface, but is of indefinite depth—to the center of the earth. There are no extralateral rights in Mexico. The boundaries of the claim limit mining operations to their planes extended downward vertically.

✤✤✤✤

AN ordinary rectangular ore skip may be converted into a baling skip by cutting an aperture in the bottom and providing it with a hinged valve, having a rubber or leather gasket. In an inclined shaft the hinges should be placed on the upper side, or otherwise the valve may be thrown back so far as not to close when the skip is raised. Valves are sometimes fitted with springs or back stops to keep them from overturning when the skip is filling with water.

✤✤✤✤

IT is the aim of Concentrates to answer questions relative to the economies of mining and metallurgy and cognate sciences: mining law and questions concerning geology and mineralogy. All questions should be as clear as possible, that it may be known what is wanted. Questions cannot always be answered in the issue following their receipt, as it is sometimes necessary to wait some time to secure an answer, and also because other questions previously received take precedence.

✤✤✤✤

A DRY RETAINING WALL in a mill is all right if properly built, and if the ground back of it is not too loose or likely to produce too great a pressure against the wall. In selecting a site for a mill on a hillside where terraces are to be cut for the several floors of the mill, it is unwise to choose a site where the rock pitches from the hill toward the mill, as the removal of rock to form the terraces weakens the support of the rock strata and during a wet season a landslide may result, which a retaining wall of any kind may be unable to obviate.

✤✤✤✤

TINSTONE is usually associated with tourmaline in some form. In the South Dakota tin veins the tourmaline (mostly black) occurs in the form of distinct crystals of all sizes, from fine needle-like prisms to large three-sided crystals having curved faces, often a foot or more in diameter. In the southern California deposits near Corona, Riverside county, a mass of fine needles of black tourmaline is usually the matrix of the cassiterite. In the Australian tin mines tourmaline is of frequent occurrence. The appearance of tourmaline is not an index of the presence of tinstone, though so frequently associated with it.

✤✤✤✤

A SHAFT may be sunk diagonally on the vein for the purpose of following the downward trend of the ore shoot. This is an idea not often attempted, but has been successfully followed out in a number of instances. A notable instance is that at the Idaho-Maryland mine near Grass Valley, Cal., where a shaft was sunk on the vein from the surface at an angle of 65° to the point where the ore shoot is encountered where it turns off at an angle of 40° on the shoot. It may be considered an economical method of prospecting, but is not recommended for extensive mine operations.

✤✤✤✤

THE so-called Potter sulphide process consists in treating tailings or crushed ores containing sulphides of the base metals with a dilute solution of sulphuric acid, which is heated to the boiling point, when it is claimed that small bubbles form and attach themselves to the small particles of sulphide mineral present, rising with them to the surface, when they are removed. Salt cake (sodium sulphate, $Na_2 SO_4$) is also present in the solution. It is also claimed that by proper manipulation a differentiation of sulphides can be secured, due to the fact that some sulphides are more quickly attacked than others, zinc blende being the first to rise.

✤✤✤✤

THE magnetic needles which do not work well, being sluggish, have probably become demagnetized. The magnetism may be restored by drawing the north pole of a common magnet (either one of horseshoe shape or a straight one) a dozen or more times along the needle from the center to the end of the south half and the south pole of the magnet along the north half. After each stroke remove the magnet several inches from the needle. Do not bring a magnet near the needle when it is in position on the pivot, as it interferes with its accurate working and may even cause the north pole of the needle to become the south pole, though in time the needle will assume its true position.

✤✤✤✤

THE relation of air pressure at the compressor and at the drill in the mine is influenced by the distance the machine is from the compressor, the amount of leakage between the two points and the difference in temperature of the air at the compressor and at the drill. A compressor which is discharging air at ninety pounds pressure per square inch should result in a pressure of seventy-five pounds at a machine 2000 feet from the compressor without reheating, if there are no leaks of consequence in the mine. It is not economy to put in a pipe line of too small diameter between the compressor and the drills in the mine. The friction in small pipes—less than 3 inches inside diameter—is too great for economy and results in greatly reducing the efficiency of the air.

✤✤✤✤

THE oil wells of California have a wide range of altitude. Those at Summerland, in Santa Barbara county, are at sea level, and some actually below it, the wells being started from a pier extending out into the ocean. The highest are in the Timber Mountain and Sulphur Mountain districts, in Ventura county, at an altitude of 2500 feet. The shallowest producing well is 260 feet deep. One well in Santa Barbara county, in Lompoc district, is 2500 feet deep and is reported producing 350 barrels daily, and one in Orango county, at Fullerton, is 2404 feet deep and produces 300 barrels daily. The heaviest producer reported is at Coalinga, Fresno county. It is 1020 feet deep and produces 1200 barrels daily.

✤✤✤✤

A NORMAL SOLUTION is one containing in one liter the equivalent of one gram of hydrogen. When standard solutions are to be prepared, in which the active reagent cannot be weighed in an absolutely pure state, it is customary to dissolve a little more than the amount of the reagent than that which is theoretically necessary and make up one liter, determining the strength of the solution by titration, employing a positive standard. The quantity of water to be added then can be calculated to make the solution of exact strength. The solution may be diluted to 1050 cubic centimeters, and then 50 c.c. taken for determining its strength, leaving 1000 c.c. (1 liter) to be diluted to bring the solution to exact strength. A normal sulphuric acid consists of hydrogen 2 parts, sulphur 1 part, oxygen 4 parts. The respective atomic weights are hydrogen 1.00, sulphur 31.83 and oxygen 15.88, making a total in the compound of 97.35, or 48.675 grams to one liter.

✤✤✤✤

BISMUTH is not mined extensively in the United States. The reported production in 1901 was about 318 tons and in 1902, 375 tons, worth about $87 per ton at the place of production, Colorado. The State ore sampling works at Denver has been a buyer of bismuth in the past. Johnson, Matthey & Co. of London, England, are buyers. Bismuth is often associated with silver, gold, tin, cobalt and other minerals. Bismuth is obtained from low-grade earthy material containing it by heating in inclined tubes or pipes placed over a charcoal fire. The metal, owing to its low fusing point, flows out from the crushed material, runs down the inclined pipe and falls into pots placed there to receive it. By wet method bismuth oxychloride is obtained by treating finely pulverized bismuth ore in tanks having filter bottoms, with a solution of common salt, saltpeter and sulphuric acid. The liquor flows through a series of vats, which results in the formation of a concentrated solution of bismuth, which passes to a vat where it is diluted with water, and the precipitate collected, dried and smelted into metal. Bismuth has the property of lowering the fusing point of alloys, in some cases to a lower point than that of either of the metals composing the alloy.

✤✤✤✤

THE magnetic north varies with every change of position along an east-west line. The lines of variation are not straight like the meridian lines, and, moreover, they are slowly changing at every point. Lines of abrupt variation are roughly coincident with the trend of mountain ranges. In the United States the line of no variation is far from straight, though it has a general trend to the west of north. It enters the country from the southeast, near Charleston, S. C., passes through eastern Tennessee and Kentucky, through Ohio and Michigan and northward into Canada. The variation in southern California is about 15° east of north; in Oregon, about 20° east of north; in the Lake Superior copper region, about 2° east of north. In addition to this magnetic variation the magnetic needle is also influenced by iron, magnetite, etc., in the rocks and in mines. For this reason surveying in and about mines with the needle is unsatisfactory. There are other causes which influence the magnetic needle, electric storms, etc. In the United States the annual change in direction of the needle is from five to fifteen minutes, the declination becoming more westward. True north can be ascertained in the northern hemisphere by observations of Polaris (the north star) taken at the proper time.

✤✤✤✤

CORPORATIONS (mining or otherwise) organized under the laws of another State or Territory, or of a foreign country, which are now doing business in the State of California, or maintaining an office in that State, must file in the office of the Secretary of State of California a certified copy of their articles of incorporation, or a copy of their charter, if a chartered company, and a certified copy thereof, duly certified by the Secretary of that State, in the office of the county clerk of the county where its principal place of business is located, and also where such corporation owns property. Failure to comply with the requirements of the law as above indicated when commencing operations subjects such company to a fine of not less than $500. It is the duty of the Secretary of State when advised that any corporation has failed to comply with the law in this regard to inform the Governor, who shall instruct the district attorney of the county wherein such corporation has its principal business, or the Attorney-General of the State, or both, as soon as practicable, to institute proceedings to recover the fine provided for. The foreign corporation must also designate an agent who shall be its legal representative in the State upon whom all legal processes, etc., may be served. The mere selling of stock cannot be considered as actual operation, as that is not supposed to be the sole purpose for which the corporation was created.

✤✤✤✤

IN taking samples from a diamond drill hole, where the material being cut through is soft and affords no core, as is often the case in soft slate and schist, or friable granular rocks, it is essential that the sample can placed under the pipe be not permitted to overflow. As often as it becomes full it should be removed and another can placed in its stead. All of the material coming from the hole must be saved, the water allowed to settle and the greater part poured off when clear. The balance is then filtered or evaporated and the sample for assay taken from all of the sediment resulting from the operation. If the can is allowed to overflow the sample is either impoverished, as is likely to be the case if the values are associated with tellurides, or enriched, if values are in sulphides. Where solid cores are obtained these represent almost exactly the rock being drilled through, the only loss being where the rock occasionally breaks off in joints. While the drillings which are carried out with the water do not afford an absolutely reliable knowledge of values, it has been found that they will average up fairly well. This is due to the fact that the material being cut will be distributed throughout the length of the drill hole, often several hundred feet in length, and the heavy particles will have a tendency to cling to the rough surfaces along the lower side of the bore hole, but it is all eventually washed out. If a rich, narrow streak is cut by the bit several hundred feet from the beginning of the hole, and a wider barren streak follows it, if no core is produced, the slow progress of the drillings from the bit backward to the mouth of the hole may lead inexperienced drillers to believe the wider streak to be the one carrying the values, particularly in the case of free gold, which washes out slowly. Diamond drilling is work requiring experience and care, and the work, to be of value, should be in competent hands.

Concentration of Low-Grade Copper Ores.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by W. J. ADAMS, E. M.

GRADE No. 2.—This grade had an approximate assay value of 2.9% of copper.

FIRST SERIES.—Taken 11.67 kilos, crushed dry to pass a ¼-inch mesh screen. Speed of jig, 350 revolutions a minute, with throw of eccentric ⅝-inch, and an artificial bed of lead shot. This parcel assayed 2.682% copper, or 53.646 pounds copper in each ton.

JIGGING.

CLASS.	Assay Copper Per Ton, %	Per Cent Weight Saved	Pounds Copper Per Ton Saved Referred to Ore	Per Cent Copper Saved Referred to Ore
Hutch	6.42	3.770	4.840	9.022
Bed	8.50	7.540	12.818	23 893
Middlings	4.50	10.968	9.871	18.400
Tailings	0.90	60.840	16.913	31.527
Slimes	3.70	14.653	9.204	17.157

JIGGING AND OIL CONCENTRATION.

CLASS.	Assay Copper Per Ton, %	Percentage of Weight Saved.	Per Cent of Copper Saved	Per Cent of Copper Lost
Jig Concentrates:				
Hutch	6.42	3.770	9.022	.....
Bed	8.50	7.540	23.893	.....
Oil Concentrates:				
Middlings	10.46	30.1% of 10.968% = 3.300	12.465	.....
Tailings	8.00	11.324% of 60.840% = 6.890	19.994	.....
Slimes	6.80	5.204% of 14.653% = 0.760	1.933	.....
Final Tailings:				
Middlings	1.35	.....	.....	5.935
Tailings	0.55	.....	.....	11.532
Slimes	2.94	.....	.....	15.224
Totals	.....	22.26	67.307	32.691

In the individual steps of the oil conceutration there were saved from each class as follows:

From one ton of middlings.....67.743%
From one ton of tailings.....63.420%
From one ton of slimes.....11.266%

Here the tarnishing of the mineral is very strongly shown, and is proved by the tests in the other two series.

SECOND SERIES.—In this the parcel of ore weighed 2 kilos and assayed 2.77% copper. It was crushed dry to pass a screen of 30 mesh, was then thoroughly moistened and fed to jig, into which had been placed the artificial bed of lead shot. The middlings were treated with oil without drying; and the sand and slimes of tailings were mixed together, aud after siphoning off the clear water were also treated by oil.

JIGGING AND OIL CONCENTRATION.

CLASS.	Assay Copper Per Ton, %	Percentage of Weight Saved.	Percentage of Copper Saved	Percentage of Copper Lost
Hutch	4.10	25.00	36.939	.....
Bed	6.90	4.75	11.802	.....
Oil concentrates from middlings	3.25	6.79	7.951	.....
Oil concentrates from tailings	6.57	13.75	32.555	.....
Tailings of middlings	0.38	.....	.....	2.944
Final tailings	0.76	.....	.....	7.806
Totals	.....	50.29	89.247	10.750

The oil was cold and viscous and it absorbed an excess of gangue, which materially reduced its value in copper content.

THIRD SERIES.—In this the parcel of ore weighed ½ kilo, or 500 grams, and assayed 2.659% copper, was crushed to pass a screen of 30 mesh, and was treated by oil direct.

CLASS.	Assay Copper Per Ton	Percentage of Weight Saved	Percentage of Copper Saved	Percentage of Copper Lost
Concentrates	4 50%	56	92.89	.....
Tailings	0.43%	..	.....	7.11

Again the oil was cold and viscous and the concentrates coutained an excess of sand, while the same objections apply to direct application of oil on this grade, as were stated to exist in that of the poorest grade, No. 1.

GRADE No. 3.—This grade had an approximate assay value of 3.8% copper.

FIRST SERIES.—Taken 10 kilos, crushed dry to pass a ¼-inch mesh screen; speed of jig 350 revolutions a minute, with throw of eccentric ⅝-inch, and an artificial bed of lead shot. This parcel assayed 3.8% copper, or 76 pounds copper in each ton.

The middlings from jigging carried so much sulphurets that they were crushed after drying to pass a screen of 30 mesh; were then rejigged, and the operation of oil concentration carried on as previously, but the speed of jig was increased to 400 revolutions a minute, and the throw of eccentric was reduced to ⅜-iuch.

The surface of the tailing tank was bronzed with chalcopyrite, but through the siphoning of the water none of this was lost.

JIGGING.

Final Tailings:				
Tailings	1.00	.....	.....	14.509
Slimes	3.84	.....	.....	16.911
Middlings	1.23	.....	.....	1.723
Second Tailings.	2.85	.....	.....	5.530
Totals	.....	.....	24.666	63.250 38.673

In the individual steps of the oil concentration there were saved from each class as follows:

From one ton of tailings.....42.186%
From one ton of slimes.....15.050%
From one ton of middlings.....58.240%
From one ton of second tailings.....16.420%

As far as could be observed, the priucipal losses, outside of the 0.3% locked up in coarse sand, was entirely tarnished mineral, as this could be detected by the eye, but which, with the greatest persistency, could not be made to adhere to the oil.

SECOND SERIES.—In this the parcel of ore weighed 2 kilos and assayed 3.54% copper. It was crushed dry to pass a screen of 30 mesh, was then thoroughly moistened aud fed to jig into which had been placed the artificial bed of lead shot. The middlings, and sand and slimes, were separately treated without drying by oil, after siphoning off the clear water.

JIGGING AND OIL CONCENTRATION.

CLASS.	Assay Copper Per Ton, %	Percentage of Weight Saved.	Percentage of Copper Saved	Percentage of Copper Lost
Hutch	8.20	17.00	39 389	.....
Bed	9.10	6.00	15.428	.....
Oil concentrates from middlings	3.80	7.50	8 053	.....
Oil concentrates from tailings	5.50	18.50	28.751	.....
Tailings of middlings	0.50	.....	.....	2.965
Final tailings	0.65	.....	.....	5 411
Totals	.....	49.00	91.621	8 376

THIRD SERIES.—In this the parcel of ore weighed 460 grams and assayed 3.358% copper. It was crushed to pass a screen of 30 mesh and was treated by oil direct.

CLASS.	Assay Copper Per Ton, %	Percentage of Weight Saved.	Percentage of Copper Saved.	Percentage of Copper Lost
Concentrates	6.00	51 087	91.26	.....
Tailings	0.60	.....	....	8.73

In the trials on several other grades higher in copper there was no material differeuce in the results arrived at; practically the same percentage of copper was locked up in the coarse sand and the concentrates were richer, owing to a deeper bed and less proportion of iron pyrites in the ore; but in reality, it became only a question of repetition, and a steady gain of percentage saved, owing to the increased skill acquired by each succeeding test.

After all the grades had been separately treated, every point studied and the difficulties, as much as possible, overcome, a final and conclusive test was made with 5 kilos of ore of about No. 2 grade, which assayed 2.32% copper.

The initial operations of crushing and jigging, and non-desiccation of the middlings and tailings, were the same as in the previous operations; but the oil concentration was that which would be employed in actual practice of three applications only, and with no experimenting throughout the entire test; so that the results can be relied on as proving the percentage that can be saved at the very poorest handling of the ore, as with jigs, for instance.

JIGGING AND OIL CONCENTRATION.

CLASS.	Assay in Copper, %	Percentage of Weight Saved.	Percentage of Copper Saved.	Percentage of Copper Lost.
Hutch	4.92	4.40	9.355	.....
Bed	7.81	5.50	18.563	.....
Oil concentrates from middlings	8.66	4.80	17.963	.....
Oil concentrates from tailings	9.00	6.20	38.893	.....
Tailings of middlings	0.60	.....	.....	1.907
Final tailings	0.47	.....	.....	13.608
Totals	.....	20.90	84.774	15.215

In other words, the ore was reduced from five tons to one, with a total saving of 84¾%, and the concentrates were not only freed from a rebellious and barren gangue, but they were capable of direct and cheap smelting. There was still locked up in the gangue at least 0.4% of copper, which could be freed and saved if the cost of the process would warrant a crushiug through a finer screen of, say, 50 or 60 mesh.

These deductions are borne out by the official facts of the plant established last November at the Le Roi No. 2 mine at Rossland, B. C., where an ore from the dumps, only carrying 0.75% copper, was crushed to pass a 60-mesh screen, and after rapid concentration on tables was treated by oil with a final loss of only 0.1% copper.

(TO BE CONTINUED.)

The Mines of Globe District, Arizona.*

From a Staff Correspondent.

In Globe mining district the Old Dominion Co. is working to its full capacity iu both mine and smelter, and also carrying forward extensive additions to its works. Its new shaft of six compartments, including a manway, is down several hundred feet. It is equipped with a modern hoist and steel gallows-frame, situated 600 feet west of the old shaft. A 1500-gallon pump will be installed on the tenth level and two 750-gallon pumps on the fourteenth level. A modern smelter is being built, with three stacks 42x 180 inches in the clear; also two stands of converters in connection with it. A dust chamber is being constructed with a self-supporting steel stack 14 feet in diameter and 200 feet high. A concentrator of 300 tons daily capacity will be built and will be in operation by fall, and the new smelter will be in operatiou by July. The old plant is turning out 25 tons of copper per day. The illustrations on the front page show the surface works of the mine and the smelter of the Old Dominion Co.

A new power house is iu course of construction, having four boilers of 300 standard H. P. A 500 H. P. engine beltcd to the main shaft runs an electric motor. There are two blowers and two modern converter blowing engines, which supply 3500 cubic feet of free air each per minute; also a 200 H. P. tandem compound steam engine direct connected to a No. 9 blower.

The consolidation of the Old Dominion and United Globe properties is in statu quo in the courts.

Adjoining the Phelps-Dodge property are three claims owned by the Arizona Commercial Co., known as the Copper Hill group, of which W. S. Sultan is superintendent and P. Rose foreman. It has been closed since October last and it is uucertain when its owners—S. W. Fay of New York president—will resume operations. There is a 600-foot shaft on the property and a 1000-foot tunnel, with 3500 feet of drifting.

Northeast of this are six claims of the Iron Cap M. & M. Co., with a shaft 118 feet deep and considerable supplementary work. G. H. Way of Globe is president and manager. Nothing is being done at present.

Buffalo Mountain C. & G. M. Co. occupies the summit and northern slope of that mountain with thirteen patented claims. It lies 1000 feet from the Old Dominion shaft. Ten thousand dollars worth of work has been done, but it is uow idle, pending a sale.

J. F. Hechtman of Globe is president and manager of the Globe M. Co. The property is 2½ miles from Globe and includes twenty-two claims known as the Mineral Farm group. It is traversed by iron dikes. Between two of these a shaft has been sunk 170 feet and will be continued to 500 feet. The same company owns a group of seven gold claims 6 miles south of Globe, in the Pinal mountains, called the Eagle Pass

*See illustrations on front page.

group, which it will develop. A gold-bearing ledge from 2 to 20 feet wide outcrops from the bottom of a canyon to an elevation of 2000 feet on the length of four claims.

R. M. Force controls the Arizona Copper Belt G. M. & M. Co., 3 miles from Globe. There are twenty-one claims, all of which have been prospected. There is one incline shaft 153 feet and another double-compartment shaft 200 feet, now in ore. The ore is red oxide of copper and carries values in gold and silver. The property is well equipped and development work is being carried forward. Mr. Force has recommended the installation of a smelter.

The Black Oxide group, owned by P. Rose, consists of ten claims lying east of the Copper Hill. There is a 300-foot tunnel and other development.

An important property adjacent to the Old Dominion is the Globe-Boston Copper Co., locally known as the Mallory group. Geo. Andrus of Globe, deputy United States mineral surveyor, is superintendent and R. L. Bell foreman. They have a hoisting plant and considerable work has been done.

Work will start soon on the Old California, owned by Lyman C. Woods Co. It has copper and silver-bearing ore in the 300-foot tunnel and there is a 65-foot shaft on the property. Mr. Woods is manager of the Copper King and Copper Queen, lying north of the Old Dominion.

The Black Warrior mine, 6 miles west of Globe, has a large plant, which appears not adapted to the ore. A large sulphuric acid plant stands above the leacher and smelter and the acid for the process was made on the ground. Mr. Niles, the superintendent, is in Mexico. It is stated that development work will be resumed.

South of the Black Warrior is the Pinal Copper Co., in charge of Chas. W. Slack.

South of this is the Keystone mine, owned by Finletter & Harvey. It contains a large deposit of chrysocolla. It occurs in a fissure vein. On the upper levels the vein was 2 feet wide, with occasional larger chambers, and the ore averaged over 20% copper. As depth is attained the vein widens and carries about 15%, and on the 300-foot level there is a 10-foot vein. The ore is hauled to the Old Dominion smelter. About $45,000 worth of ore has been taken from the mine. It is trammed out of a tunnel and then packed on burros 1 mile and rehandled. The owners are planning to install reduction works, in case the property is not sold.

West of the Black Warrior is the Lost Gulch group, owned by E. F. Kellner. Considerable work is being done and the stamp mill on the property is being overhauled and will be started some time in June.

Up this gulch 1 mile is the Kasser G. M. Co., twelve claims, owned by an Eastern company, of which J. J. Gibbons of New York is president. A stamp mill stands on the property. Prospect work is being done by G. W. Hamilton, the foreman.

Aside from its ore deposits, there is, some 8 miles north of Globe, a deposit of marble-onyx, owned by H. F. Sanders and N. Hackney, that may assume importance. It is variegated in color.

Globe, Ariz., May 1.

It has been announced that the electric currents which naturally play around the summit of Pike's Peak, Colo., are to be gathered by collecting devices in the form of lightning rods on the poles of an electric railroad, conducted to some central point and stored for use in running the cars of the road. The promoters of this novel scheme do not explain how this is to be accomplished, and electrical engineers do not view the proposition with confidence. Should the "thing work," there are many places where this free power can be similarly controlled and applied to useful purpose. The electrical displays in the Black Hills of South Dakota during the summer months are often terrific, and enough "electro-motive force" could be stored during a single night in June or July, when a storm is raging, to run all the mining and milling machinery in the Hills for a year—if it works.

Mill Construction, Milling and Amalgamation.*

NUMBER IV.—CONCLUDED.

Written by I. ROSKELLEY.

SCALING PLATES.—Worn out plates, before being cast aside, are scaled to get all the gold from them. The process of scaling is as follows: One-half pound sal ammoniac is mixed thoroughly with one-half pound niter and one-half pound spirits of salt, and a pint of water is added. This mixture is applied to the plate with a soft brush, and the plate is allowed to stand for about fifteen minutes. Afterwards the plate is heated over a good fire. When it has become quite black, which will be in about half an hour, it is dipped into a bath of water, when the scaling can be washed off. Some millmen drive off the mercury before applying the above mixture; others do so afterwards. Should all the scaling not come off, the parts needing it are treated over again. The scalings are afterwards collected and mixed as follows: One part scalings, one part sulphur, one part borax and one part sand. This is melted in a crucible and the gold extracted.

MILL SAMPLES.—Two samples should be taken in the mill—one before the pulp passes over the plates and another when it leaves the mill. The first, if properly taken, should show the value of the rock crushed, and the latter should indicate the value of the pulp leaving the mill, and the two together should show the extraction on the plates. Undoubtedly, the proper place to take the first sample is at the screen. I find that the sample obtained in the following manner is very near the actual extraction. A sheet iron lip, about an inch wide, is bolted to the bottom of the screen to carry the pulp clear. Each shift is supplied with an enamelled bucket with a cover, and an enamel sample tin 1 inch wide, 1 inch deep and 12 inches long, with a handle at one end.

This tin is taken the full length of the screen under the lip once every hour, and the contents are placed in the sample bucket. The contents are assayed separately daily. Each shiftman has his own bucket and tin, so that should a careless sample be taken the offender can be readily detected. When I mentioned this method of sampling in this society some time ago it was suggested that, although it was a sample of the screen pulp, it was not a sample of the ore brought to the mill, since an appreciable quantity of free gold would remain in the sands in the mortar box. This objection I have not found a real one, for when the mortar boxes are cleaned out after three months' running, the sands are but little richer than those which pass over the plates.

The sample taken at the bottom of the plate is obtained in the same way as the screen sample.

In the foregoing notes I have sketched briefly the chief points in mill construction and milling, and in conclusion I should like to emphasize a few of them.

In the construction of a mill it is attention to the details that we require. Some of the improvements I have mentioned may to an outsider seem somewhat trivial, but the cumulative effect of these small defects is great, and causes enormous waste of time and labor.

I would emphasize the necessity for thorough work on the part of the rock crushers, for however good the work done in a mill, it is to a great extent hidden and does not show itself in high crushing capacity if the rock crushers are neglected. In amalgamating, I consider outside amalgamation, pure and simple, has proved itself to be as good as, if not better, than any other method in gold extraction, and to be the method in which losses of all kinds are reduced to a minimum.

Whether crushing should be done in one or more stages is a question which should be taken up experimentally and settled at once. As has been already pointed out, the present, when many mills are not running at their full capacity, is the time for this, so that when labor comes and we are all doing full work, we may have the assurance that nothing is lost through old time methods.

And, finally, I would emphatically state as the result of milling experience that when cyanide is used in the mill every precaution should be taken to most carefully conserve the plate dressings and thus prevent any contamination of the mill water.

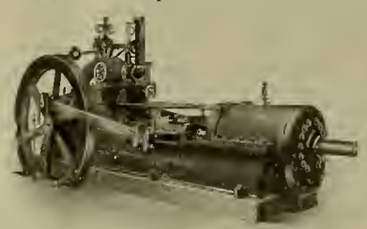
*Abstract Trans. Jour. Chem. Met. and Min. Soc., S. A.

Hudson River Tunnel.

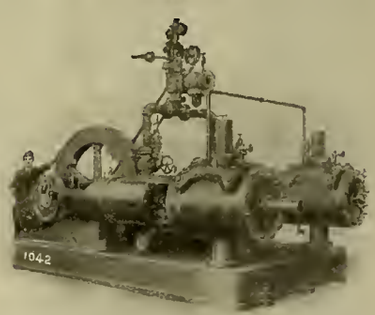
While several other tunnels are in the course of construction under the Hudson and East rivers to connect New York with its neighbors, the completion of the original so-called "Hudson River" tunnel under the charge of Chief Engineer C. M. Jacobs has attracted unusual attention, for, from the start compressed air was used, not only to operate the rock drills, but to hold back the sand and mud and overcome the obstacles, which made subaqueous tunneling so hazardous. The consequent developments of the shield method, in which compressed air is essential, came as the tunnel advanced, and the methods which proved successful in this instance have since been adopted for other undertakings of a similar nature to meet the requirements of the work.

When the Hudson Improvement Co. began operations two years ago, Ingersoll-Sergeant compressors were installed and have supplied the air necessary in the headings on both sides of the river.

There are two power houses, one in Jersey City and the other in New York. The Jersey City power house contains four compressors, one of the class H



Straight-Line Type of Compressor Used in Hudson River Tunnel Work.



Ingersoll-Sergeant Compressor, Duplex Type.

duplex type, with steam cylinders 16 inches in diameter, duplex air cylinders, 20½ inches in diameter by 16 inches stroke, and three of the class A straight line type, with 22 inches steam cylinders and 24 inches stroke. Of the latter, two have air cylinders 26¼ inches in diameter and the other with an air cylinder 22¼ inches in diameter.

The equipment at the New York power house includes two duplex class H compressors, similar in size to the one at the Jersey end of the tunnel, and one straight line class A machine with steam cylinders 22 inches in diameter, air cylinders 22¼ inches in diameter and 24 inches stroke. These machines are being used in building the second bore, which is to be parallel to the other.

The New Camp of Goldfields, Nevada.—See Page 354.

Concrete in Mining and Metallurgical Engineering.*

NUMBER V—CONCLUDED.

Written by H. W. EDWARDS.

CONCRETE STRUCTURES.—In the construction of concrete flues for work 4 inches in thickness and under, I recommend the use of rock or slag crushed to pass through a 1.5-inch ring. Although concrete is not very refractory, it will easily withstand the heat of the gases from a set of ordinary lead or copper smelting blast furnaces, or from a battery of calcining or roasting furnaces. I have never noticed that it is attacked in any way by sulphur dioxide or other furnace gas.

DUST CHAMBERS.—Shapes the most complicated can be constructed of concrete. The least suitable design, so far as the construction itself is concerned, is a long, wide, straight-walled empty chamber, which is apt to collapse, either inwards or outwards, and, although the outward movement can be prevented by a system of light buckstays and tie rods, the tendency to collapse inwards is not so simply controlled in the absence of transverse baffle walls. The tendency, so far as the collection of mechanical flue dust is concerned, appears to be toward a large empty chamber, without baffles, etc., in which the velocity of the air currents is reduced to a minimum and the dust allowed to settle. In the absence of transverse baffle walls to counteract the collapsing tendency, it seems best to design the chamber with a number of stout concrete columns at suitable intervals along the side and end walls—the walls themselves being made only a few inches thick with woven-wire screen or expanded metal buried within them. The wire skeleton should also be embedded into the columns in order to prevent the separation of wall and the columns. This method of constructing is one that I have followed with very satisfactory results as far as the construction itself is concerned.

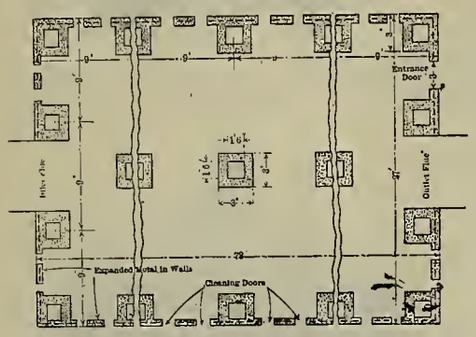


Fig. 2. Concrete Dust Chamber for Smelter at Sudbury, Ontario.

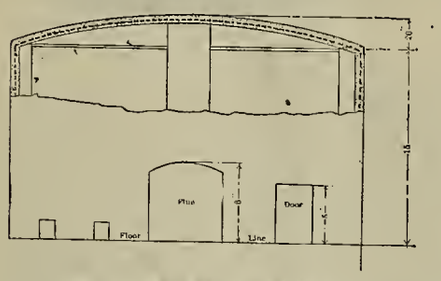

Fig 3.—End Elevation of Fig 2.

Figs 2 and 3 show a design for the smelter at the Murray mine, Sudbury, Ontario, in which the columns are hollow, thus economizing concrete material. For work of this kind the columns are built first and the wire netting stretched from column to column and partly buried within them. The crib is then built on each side of the netting, a gang of men working from both sides, and is built up a yard or so at a time as the work progresses. Doors of good size should be provided for entrance into the chamber, and, as they will seldom be opened, there is no need for expensive fastenings or hinges.

FOUNDATIONS FOR DYNAMOS AND OTHER ELECTRICAL MACHINERY.—Dry concrete is a poor conductor of electricity, but when wet it becomes a fairly good conductor. Therefore, if it be necessary to insulate the electrical apparatus, the concrete should be covered with a layer of asphalt.

CHIMNEY BASES.—Fig. 4 shows the base for the 90-foot brickstack at Don Guillermo, Palomares, Spain. The resemblance to masonry is given by nailing strips of wood on the inside of the crib.

RETAINING WALLS.—Figs. 5, 6 and 7 show three different styles of retaining walls, according to location. These walls are shown in section only and show the placing of the iron reinforcements. Retaining walls are best built in panels (each panel being a day's work), for the reason that horizontal joints in the concrete are thereby avoided. The alternate panels should be built first and the intermediate spaces filled in afterward. Should there be water behind the wall, it is best to insert a few small pipes through the wall in order to carry it off; this precaution is particularly important in places where the natural surface of the ground meets the wall, as shown in Figs. 6 and 7. If a wooden building is to be

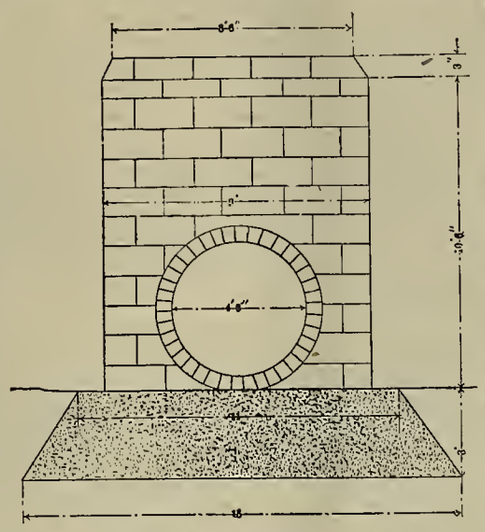

Fig. 4.—Concrete Base for Chimney at Smelter.

erected on the retaining wall, it is best to bury a few 0.75-inch bolts vertically in the top of the wall, by which a wooden coping may be secured (Figs. 5, 6 and 7), which forms a good commencement for the carpenter work.

Minimum thickness for a retaining wall, having a liberal quantity of iron embedded therein, is 20 inches at the bottom and 10 inches at the top, with taper preferably on the inner face. In the absence of interior strengthening irons, the thickness of the wall at the bottom should never be less than one-fourth the total height, and at the top one-seventh of the height; unless very liberal iron bracing be used, the dimensions can hardly be reduced to less than one-seventh and one-tenth, respectively. Unbraced retaining walls are more stable with the batter on the outer face. Dry clay is the most treacherous material that can be had behind a retaining wall, especially if it be beaten in, for the reason that it is so prone to absorb moisture and swell, causing an enormous side thrust against the wall. When this material is to be retained, it is best to build the wall superabundantly strong—a precaution which applies even to a dry climate, because the bursting of a water pipe may cause the damage. In order to avoid horizontal joints it is best, wherever practicable, to build the crib work in its entirety before starting the concrete. In a retaining wall 3 feet thick by 16 feet high this is not practicable. The supporting posts and struts can, however, be completed and the boards laid in as the wall grows, in order not to interrupt the regular progress of the tamping. A good finish may be produced on the exposed face of the wall by a few strokes of the shovel up and down with its back against the crib.

In conclusion, I wish to state that this paper is not written for the instruction of the civil engineer, or for those who have special experience in this line, but rather for the mining engineer or metallurgist whose training is not very deep in this direction, and who is so often thrown upon his own resources in the wilderness, and who might be glad of a few practical suggestions from one who has been in a like predicament.

*Abstract Trans. Am. Inst. Min. Engs.

Quicksilver Recovered in the Cyanide Process.

Written for the MINING AND SCIENTIFIC PRESS by E. J. SWEETLAND.

Before considering the quicksilver recovered in the cyanide process, it is not out of place to briefly consider the manner in which it enters into the tailings.

In careful plate amalgamation very little quicksilver is lost, and that which is lost passes into the tailings as metal in a very finely divided or "floured" condition; but in pan amalgamation the loss is not as easily accounted for, nor is it as easily prevented. This loss is usually attributed to "flouring," but in some instances the loss is due to certain reactions among the chemicals added to the charge, the constituents of the ore and the mercury.

The chemicals added to the charge are usually salt (NaCl) and bluestone ($CuSO_4$), and many of the reactions that take place are obscure; but we have good reason to believe that a large amount of the quicksilver lost in pan amalgamation passes off, chemically combined with other elements.

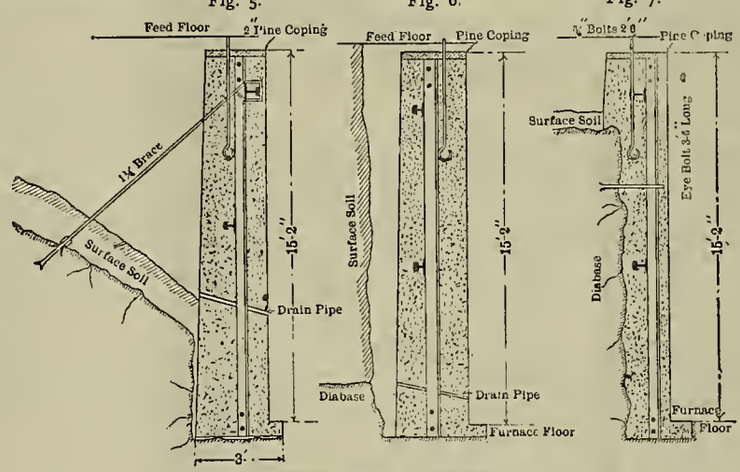
The amount of quicksilver known to exist in Comstock tailings is about 1½ pound per ton, and only about 33% of it is dissolved by the cyanide solutions after six days contact. From this it is reasonable to assume that a large part of that which is dissolved is in the form of a salt more readily attacked than the metal, since metallic mercury is known to be very sparingly soluble in cyanide solutions.

Notwithstanding the low percentage above mentioned, I have seen as high as 1500 pounds of the liquid metal recovered at the monthly clean-up of a plant treating 2400 tons of tailings per month.

This is not merely of interest from a chemical standpoint, but from a commercial basis as well, since such a production as above cited increases the profits of the plant by about 30 cents per ton. This is, perhaps, a better recovery than is enjoyed by most plants, but I dare say that most cyanide plants working on pan-mill tailings recover sufficient mercury to materially increase the profits of the plant.

The income from this source should not be underrated, as it is produced without any additional effort or inconvenience other than retorting the precipitates after they have been refined with sulphuric acid in the usual manner. In other words, if we take care of the gold and silver extraction, the quicksilver will take care of itself. This is easy, indeed; but investigation upon the subject might show that some modification of the processes ordinarily employed would result in a further recovery that would amply repay the operator for the extra trouble involved. Of course, nothing could be considered that would effect the extraction of the gold and silver.

Fig. 5. Fig. 6. Fig. 7.



Retaining Walls of Concrete.

As the mercury enters the solution it combines with its equivalent of potassium cyanide, as is shown by the following equation:

$$4KCy + Hg + 2H_2O = K_2\,Hg\,Cy_4 + 2KOH + H_2.$$

But a smaller loss of cyanide is really experienced in practice than would be expected from the above reaction, the total consumption in the case above referred to being only about 1½ pound per ton.

As the mercury-charged solution comes in contact with the zinc in the precipitation boxes a reaction of especial interest takes place, since through the deposition of the mercury upon the zinc a medium is formed whereby the most dilute gold and silver-bearing solutions are perfectly precipitated.

I have seen solutions, so dilute as to show no trace of free cyanide when tested with silver nitrate, enter the zinc boxes assaying from $1 to $3 in gold and silver, and leave carrying only from 6 cents to 10 cents per ton, which I consider practically a perfect precipitation.

This unusual precipitation is due to the formation of a galvanic couple between the zinc and mercury, which I consider more effective than the lead-zinc

couple formed by immersing the zinc in a solution of lead acetate.

When the solution carrying the double cyanide of potassium and mercury comes in contact with the zinc the following reaction occurs:

$$K_2 Hg Cy_4 + Zn = K_2 Zn Cy_4 + Hg.$$

the metallic mercury forming a gray deposit upon the zinc.

During the action of this galvanic couple an amount of zinc is consumed proportional to the amount of quicksilver recovered. This proportion depends upon the atomic weights of the two metals and is as 65 : 200, or about one part of zinc consumed to three parts of quicksilver recovered.

Ore Deposits of Rossland, B. C.*

NUMBER II.—CONCLUDED.

Written by EDMUND B. KIRBY, E. M.

The Josie and Center Star - Le Roi vein, being crossed more squarely by the fault system, afford the best indications of its effects. The Josie dike, or more probably an undetermined fault accompanying this dike, has caused a displacement, which is indicated in the Josie and Number One to be a north throw going east. Proceeding east from fault to fault they are found to have the same throw up as the faults at the junction of the Le Roi - Center Star territory, after which the steps occur in the other direction, with a throw to the south.

DISTRIBUTION OF ORE AND ORE SHOOTS. — The pyrrhotite mineralization has been abundantly distributed through the larger veins, but the secondary deposition of gold and copper-bearing minerals has been more localized, occurring in the more favorable places. The bodies of favorable ore thus found are sometimes lenses, tapering out at the edges, and sometimes blocks terminating against faults or dikes. These ore bodies are found distributed within more limited portions of the vein area, which in the practical sense thus constitute the ore shoots, and indicate those portions of the area to which the gold and copper bearing solutions had the best access. The shoots are upon a large scale and of such irregular form that their shape and limits have been developed slowly, and the largest and best defined up to the present date are those of the War Eagle, Center Star and Le Roi mines.

The War Eagle shoot has a dimension of 300 to 450 feet along the vein, and an almost perpendicular trend upon its plane. It is so located that its median line roughly coincides with the line of the main shaft.

The Center Star main shoot is located in the space between the shaft and the Le Roi end line, and appears to have a dimension of 300 to 500 feet along the vein, with a steep trend to the east. The Center Star east ore shoot is several hundred feet east of the shaft, but has not yet been sufficiently developed to determine its length along the vein or its trend, although the latter now appears to be either perpendicular or very steep towards the east.

The Le Roi ore shoot on the 350 level is near the east end of the claim, and descends perpendicularly, then assuming a westward trend. The structure of the shoots and of the pay ore bodies within these shoots everywhere points to the conclusion that their location and shape are due entirely to the accidental conditions directing the upward flow of the mineral bearing solutions.

The marked difference between the proportions of gold, silver and copper in the Center Star ore shoots and those of the other mines suggests that the solutions in the Center Star came from a different region than those which furnished the other deposits. The fact that the Center Star was somewhat nearer to the volcanic center than the others, and that its ore shoots trend in that direction, may account for this.

These shear zone fissures, more or less shattered by repeated movements, have afforded permeable channels for the ascending mineral solutions, which have penetrated and decomposed the country rock, replacing its rock minerals wholly or partially by metallic minerals. In places the entire width of the shear zone has thus been transformed into ore, while in other places the mineralization has been narrow. The solutions have frequently jumped across from one set of plating fissures to another, shifting the pay streak from the hanging to the foot side, or to intermediate positions, as the case may be. In the Center Star-Le Roi vein the foot wall fissure is the one which is the most regular and distinct, and is marked by a vein of small interlacing calcite seams, which has been found a very reliable indicator of the position of the vein. As a rule the heaviest ore deposition has taken place near this foot wall, and mineralization extends to irregular distances on the hanging side, gradually falling into the country rock. In the War Eagle vein the hanging wall is generally the most distinct and best mineralized, with irregular extension into the foot wall side.

While many of the dikes and faults merely occasion small displacements, with no effect upon the mineralization, a number of them evidently occurred before this mineralization was begun, or at least before its completion, and acting as partial barriers to the flow have so deflected the solutions as to greatly increase the deposition on one side, although they have not themselves been mineralized. In the War Eagle sixth level solutions rising through the fractured ground, caused by a fork in the vein, have been stopped by a large dike, and were so deflected and accumulated in rising along its under side as to produce exceptionally large and rich ore bodies. In the Josie vein the Tramway dike has in a similar way produced the Annie ore shoot, and the Josie dike has had the same effect upon the Le Roi and Black Bear veins. In both these veins the solution towards the west end seems to have been more or less confined to the space between the Josie dike and the partial barrier afforded by a fault. The phenomena throughout the Center Star ground everywhere show the tendency of mechanical barriers to deflect or accumulate the solutions. In the Center Star the principal channel has been that portion of the vein between faults. In the lower levels heavy deposition has occurred on both sides of a fault, while on the second level it has been mainly on the east side, and, at the horizon, is also accompanied by a deposition of ore along the plane of the fault. This is exceptional, and is the most clearly marked case of deposition within fault planes. In the few other instances there is some doubt as to whether the material is not dragged ore or an original vein. As a rule, the faults do not appear to have been accessible to the solutions.

The numerous instances of displacements by faults and dykes where the severed portions of the vein on each side are alike, prove that some of the dikes and some of the faulting occurred after the ore formation. If the dikes were studied in detail and classified they would probably be found to belong to two or more different periods, some of which were later than the deposits. As to faults, the facts observed accord fully with what is known as dynamic action during the long period while volcanic activity is expiring. Shocks and movements occur repeatedly at increasing intervals. Early fractures would afford planes of weakness, which would not only be kept open by the repeated movements, but would be multiplied and extended by branches and interlacing fissures. Such action probably continued long after the ore deposition and also after the dike formation, since these are found to be cut by faults.

It is noticeable that the later solutions introducing the gold and copper bearing minerals with quartz have as a rule followed the pyrrhotite deposition, and do not seem to have sought or found new permeable channels in the rock where these minerals might deposit by themselves. On the contrary, they seem to have been unmistakably restricted to the ground already impregnated with pyrrhotite, and the greatest enrichment has as a rule occurred where the previous pyrrhotite deposition was most extensive.

There seems to be no reason to believe that the pyrrhotite had chemically any more influence on the subsequent deposition than ordinary country rock would have. It may have been that the friable pyrrhotite ore presented such local weaknesses as to become especially shattered by subsequent movements, and thus afforded the most permeable channels. What probably occurred, however, was that there was one continuous flow which gradually changed in chemical contents and conditions of deposition. The altered solutions at the time of the secondary deposition merely followed the channels of flow which were already established, possibly modified more or less by a refracture or brecciation of the pyrrhotite ore.

CONCLUSIONS. — The conclusions derived from a study of these deposits are as follows:

(1) The pyrrhotite was deposited from aqueous mineral solutions ascending through the more fractured and permeable portions of the shear zone fissures.

(2) The gold bearing chalcopyrite, pyrite and arsenopyrite with quartz were deposited later from the same flow rising within the same channels but restricted to those portions of the channels which still remain unfilled, or which were reopened by further fracturing of the friable pyrrhotite ore.

(3) The main faults and some of the dikes existed before the formation of pyrrhotite began, or at least before its principal deposition.

(4) Their intersections with the shear zones made barriers which more or less directed the flow, accumulated the solutions, and determined the position of the main ore bodies.

(5) After the ore formation more dikes appeared. Faulting was repeated intermittently, continuing probably up to recent times, and the early fractures were kept alive.

The writer is well aware that the origin of pyrrhotite is still in dispute by eminent authorities, but believes that a study of the Rossland deposits must remove any remaining uncertainties as to this question. All observations, from the occurrences of the pyrrhotite as mineral replacements, veinlets and films in the rock to the effect of dikes and fractures in massing its formation, point to deposition from mineral solutions. In these deposits at least, it is impossible to even consider "direct igneous origin" or "magnetic segregation," and no evidence has been found to suggest any difference between their origin and that of ore deposits of pyrites or other minerals whose genesis is now established.

The evidence does show, however, that the conditions necessary for pyrrhotite deposition prevailed at an earlier time than those required for chalcopyrite, pyrite, arsenopyrite and quartz. It is well understood that during the period while heated waters are ascending in the vicinity of cooling eruptive masses the chemical contents of the solution slowly change, and so do the conditions of deposition. For the same flow to first yield pyrrhotite, and then so alter as to produce the other minerals, is no more exceptional than the well-known excessive deposition in veins of the more common minerals. It may be that the only difference between their origin and that of pyrrhotite is that the latter requires exceptional depth, heat and pressure. The heat would be greatest during the earlier stages of circulation, and the great erosion noted by the Geological Survey indicates the prevalence of unusual depth and pressure at that time.

EFFECT OF STRUCTURE UPON MINING METHODS.— There are peculiar difficulties presented to exploration work within an ancient volcano. Every dike and every zone of fissures constituting a fault creates a gap or blank in the formation and to these are added the gaps due to vein displacement. Systematic crosscutting aided by diamond drilling is necessary on account of these displacements, vein-branching, the variations of vein thickness and the shifting of ore from one set of planes to another. If carelessly placed a crosscut or drill hole encounters so many of these blanks as to afford no information, or what is worse, indecisive results. It is very difficult to make such work efficient, and it calls for every resource of care and skill.

In the War Eagle and Center Star mines structure details are carefully kept up, and it is endeavored, so far as possible, to make crosscutting effective, to avoid work in belts of dike systems or belts of shattered ground, and to direct the principal explorations to the main channels of flow.

*Abstract Trans. Canadian Mining Institute.

Cyanide in Amalgamation.

TO THE EDITOR:—In the issue of May 14th, during the continuation of the article on "Mill Construction," etc., by I. Roskelley, I have read with interest his ideas on the use or disuse of cyanide of potassium in amalgamation, and I wish to add my quota of knowledge to those millmen of practical experience as against the cyaniders; that the employment of this chemical is necessary in gold amalgamation on plates, as well as in the clean-up pan in both gold as well as silver amalgamation. It does not hurt subsequent cyaniding, but helps it, because it removes the grease. It does not dissolve gold that could be saved afterwards unless put in the battery with the ore and used to excess. In other words, cyanide of potassium acts first on grease, and if any surplus remains is then destroyed entirely by the quicksilver before the fine gold can be attacked. Of course, if put into the battery it will dissolve the fine gold before the quicksilver has absorbed it, and if used in great excess on the pulp after leaving the battery might affect the floured gold, but these suppositions imply very faulty mill amalgamation and should not be considered.

Nothing has been found to take the place of cyanide for dressing of plates and the most efficient amalgamation; and it has yet to be proved that its proper employment has diminished the extraction by subsequent methods, or increased the total loss in the original value of the ore. W. J. ADAMS, E. M.

San Francisco, Cal., May 16.

Mining Methods in Alaska.

C. W. Purington, geologist and mining engineer, will investigate placer mining methods in Alaska for the United States Geological Survey. Accompanied by Sidney Paige, he will visit the most important and interesting camps of the Territory. After spending a few days in the vicinity of Juneau they will make the rounds of the Atlin, Klondike, Forty Mile and Birch creek regions, and possibly the newly discovered placers of the Tanana. In the Seward peninsula, the more important camps of the Nome, the Council City, the Topkok and the Solomon river districts will be visited. As a result of the summer's work, Mr. Purington expects to write a report on the present conditions of placer mining in Alaska, supplying information for which there is at present much demand.

L. M. Prindle, assisted by F. L. Hess, will continue work of the past season in the placer district between the Yukon and Tanana rivers and along Forty Mile and Birch creeks. The party will start from Eagle, moving southwest toward Fairbanks, where the important discoveries of the last two years will warrant careful studies. From there they will go north toward Rampart, finishing the season's work in an investigation of the mining district about Baker and Minook creeks.

Petrified Forests and Painted Desert of Arizona.*

Written by PROF. OSCAR C. S. CARTER.

The physiographic division of Arizoua is extremely simple and well marked. There is a high plateau in the northern half of the State and a low desert area in the south; a high wall or escarpment separates them. This escarpment enters Arizona from Utah on the north and trends from the northwest to the southeast; it is really the southern border or end of the great Colorado plateau, which includes parts of Utah, Arizona and New Mexico, and extends from part, near the middle, the desert is about 75 miles wide. The slope, of course, is toward the Colorado river. It is called the Painted Desert on account of the bright colors of the sandstones, shales and clays.

Mesas of bright red sandstone are commou. The shales are eroded into bizarre and fantastic shapes; all of these forms of erosion are colored—blue, yellow, red or green, as the case may be—and, with the brigbt sunligbt and clear, dry air, the coloring is ofteu brilliant. The petrified forest is near tbe southern border of the Painted Desert, between the Rio Puerco and Zuni river, which are tributaries of the Little Colorado. The Painted Desert is not much of a depression in this southern part of its area, as the average elevation is over 5000 feet above tide; the still smaller station of Carrizo, which can be reached by a drive of 20 miles or more. If we take a folder of the Santa Fe Railroad, we will see a flag station named Adamana, which is the best place to reach the forest. It is simply a signboard or mile-post marked 233 Adamana, and is near the southern border of the Paiuted Desert, although the desert does not have the rich colors wbich the shales give it farther north. The forest is found scattered over from 8 to 10 square miles of territory, principally in Township 17. Adamana is about 21 miles east of Holbrook. The conductor will have no compunction about dumping you down in the desert among the sage and soapweed, providing you keep on the alert aud remind him not to run past the mile post. Wheu the train rushes by you can see Adam Hanna's ranch iu the distance, from which the station takes its name. The river fringed with cottonwoods (Populus monilifera), known as the Rio Puerco, or Dirty river, runs lazily past the ranch. It is well named dirty, for it is always the consistency and color of strong chocolate. It is so muddy that no living creature is fouud in its waters.

On consulting a map we get the impression that it is a fair-sized river; but it is a river merely by courtesy. There are no large rivers in the arid district of the Southwest. The rainfall is slight, only 10 inches

Natural Bridge of Agate, 111 Feet Long.

Agatized Log Called the Cannon.

Utah southward, often as a series of gigantic steps. It is called the Colorado plateau on account of the river of that name, which has cut in the plateau the most stupeudous gorge in the world—"the Grand Canyou of the Colorado." Portions of this plateau are more than a mile higher thau the desert area in the southern part of the State, and, as Merriam has pointed out, it acts as a barrier to the passage of animals and plants, but it must not be supposed that the boundary is always a cliff.

In this uorthern plateau in Arizona there is a vast depressiou or basin called the Painted Desert, which is the drainage area of the Colorado Chiquito or Little Colorado, which empties into the Colorado. The corrosiou of the stream and its tributaries, which are often dry, and all the other forces of erosion have cut this basin and its channel aud wideued it. From near the mouth of the Little Colorado this Paiuted Desert extends southeasterly for a distance of 200 miles, and even enters the border of New Mexico. In its widest

neither has it any conuection whatever with the low desert area in the southeru part of the State. It is wholly in the plateau country. The petrified forests of Arizona may be classed among the strange corners of our couutry and lie more or less off the beaten track. The general public do not as yet visit this locality as they do the Yellowstone or the Yosemite, yet it is quite accessible. More than 3000 people visit the Yellowstoue annually, and the number is increasing; yet Adam Hanna informed me in 1889 that he had about a dozen visitors annually to his ranch ou the Painted Desert, which is the nearest place to the petrified forest.

Thousauds of visitors at the World's Fair became iuterested in the petrified forest when they admired the logs and polished slabs of petrified wood of various colors, bright red predominatiug. Sometimes they are cut iuto tabletops and pedestals. Very few, however, had any idea as to how the forest may be reached. The Mormon town of Holbrook is always associated with the petrified forest, probably because it is the only town of any size near the forest, except

a year, often less, and evaporation rapid; hence, large rivers are out of the question and some of them disappear entirely under the summer's torrid sun. It is no unusual sight, in the desert region farther north, to see a copious shower of rain falling from the clouds above, which never reaches the parched and dry shales of the desert because the hot, dry air above the desert evaporates and absorbs it so quickly that it soon disappears. Even when a cloudburst occurs and the rain comes down in sheets, a common occurrence in July and August, and the arroyos are full of turbid streams of liquid mud several feet iu depth, in a few hours the desert is dry aud there is no evidence of a shower, except the alkaline water standing for a short time in the mud-bottomed pools. The Rio Puerco in the summer can be forded by horses, but after cloudbursts in the higher plateau country a stream of liquid mud 10 feet deep spreads from the mesa to the Santa Fe road.

Adamana is the nearest and best place to reach the forest.

There is a charm about the desert, with all its dis.

*Abstract of Journal Franklin Institute of Philadelphia, Pa., to whom we are indebted for the engravings herewith presented.

advantages. The sunsets are beyond description. No matter how hot it is during the day, the nights are always cool. In that rare and dry atmosphere radiation is rapid, and the earth cools so rapidly that out of doors a blanket is comfortable at night. Cool nights on the desert are the rule much farther south also. The Giant cactus (Cereus giganteus), which attains a height of from 40 to 50 feet, and the large and striking cactus called pitahaya by the Mexicans, afford no shelter worthy of the name.

An interesting fact about subterranean water for irrigation is that abundance of soft water is reached at a depth of less than 50 feet on Adam Hanua's ranch. The underground water of the Southwest is often hard; Adamana is an exception.

The trip to the petrified forest is made in an hour after fording the Rio Puerco. The mesas rise to 60 or 70 feet above the desert. They are made up of white disintegrating sandstone, held together by a feldspathic cement. Between the layers of sandstone are layers of red shale. It is at the base and between these mesas that the petrified trees are found. The first indication of petrifaction one sees is bright red and yellow pieces of agate and chalcedony, showing the outlines of the bark; these are scattered over the ground long before one reaches the mesa, but no logs or large pieces are met with. A turn around the edge of the mesa and we see scattered over many acres enormous logs completely changed to agate, jasper or chalcedony. The sections or ends of the logs show brilliant reds, yellows and dull blues. The

Weathering of Shale and Sandstone in Petrified Forest.

Agate Logs 15 to 20 Feet in Circumference.

bark is not brilliant, but dull and wonderfully well preserved, being almost lifelike in its naturalness. Some trees show even the knots to perfection; but even these trees, spread over many acres, are not the finest.

After a short drive between the mesas and another turn, we come to some large logs. These are 4 feet in thickness and from 10 to 12 feet long. They have no branches, but the hundreds of small pieces, varying from a couple of inches to 1 foot in diameter, are probably in some cases the remains of branches. After a drive of several miles along the base and on top of the mesa, through many hundreds of petrified trees, we failed to see a tree with branches or one standing upright. Another important fact is that no tree, except one, was found which showed the entire length. There were many logs from 3 to 30 feet long. The one exception to this was well worth a visit. After clambering across the mesa, we come to a ravine 50 feet in depth in the deepest part. In the bottom is growing a clump of cedars, the only trees about the mesa. Spanning this ravine, which is 44 feet wide, is a petrified tree which measured 4 feet in diameter in the thickest part. The tree does not end on the edge of the chasm, but continues across the sandstone mesa and enters a ledge of sandstone, making the length of the tree that is visible 111 feet. How far it extends into the sandstone we can not tell. This is the only perfect tree we saw. It is interesting to account for the preservation of this entire tree and also to account for the fact that logs, instead of trees, are the rule.

(TO BE CONTINUED.)

THE speed with which sinking has been carried on at the Long Tunnel mine, says the Australasian, was due to the enthusiastic co-operation of the men working in the shaft. This has been accomplished by taking advantage of even the physical features of the rock. The sinking was with the strata, and the country was alternate bars of slate and exceedingly hard elvan, so that "fitchering" was a common experience. To overcome this, cruciform steel bar bits were brought into use. Then the bottoms of the skips were shaped at the angle at which the rock would blow out from the face, and with the use of extension rails the skip was lowered to the level of the dirt, so that 3 feet of a vertical lift in the shoveling was saved. As each skip contained a ton and a half of material, and these went to the surface at the rate of twelve per hour, the labor saved in this way alone was very great. Apart from that, the drilling was always done from the western side of the shaft, and, as the shooting was from east to west, the dirt was heaped up by the force of the explosion on the western side of the shaft above the level of the skips. This also allowed the skips to be filled most expeditiously. At the surface, also, owing to the automatic appliances provided, bracemen were entirely dispensed with, and the whole of the dirt hauled each day was removed from the bin in two hours' trucking by one man, using 27 cubic feet side-tipping trucks. The same man during the rest of the shift was occupied in sharpening drills for the drill machines, two of which were employed in each section. The result of all this method in both the survey and the planning of the actual work was that the two sections of the shaft met true to line and that 2250 feet sinking and about 358 feet of driving was done in a little over twelve months.

Method of Working Mines of Santa Eulalia, Chihuahua, Mexico.*

NUMBER II.—CONCLUDED.

Written by EDWARD G. CAHILL.

In some of the mines which are working on deep vertical pipes of ore the system described above was attempted; but, either through carelessness or lack of knowledge, the filling was neglected and great caves occurred, as much as a thousand vertical feet of the ore going down 60 or 70 vertical feet bodily. The situation now is this: A block of ore 1000 feet high by from 50 to 150 feet in diameter is loose sand and boulders. In the midst of the ore are great blocks of lime broken off the casing walls as the ore body slipped by. By the old method only one of the 70-foot levels can be entered and worked. This is so because the ground under foot is no longer solid. It is loose stuff which will furnish no footing for timbers. You can enter it at the top and work down safely, but it is impossible to produce a sufficient tonnage from a bottom of such limited area to make the low-grade ore pay. If the ground is entered below, there is no telling at what moment another cave will occur which will engulf the upper levels; so the plan of working with square sets from more than one level must be abandoned. It is possible to enter the caved ground with bulkheads from one level only.

The plan that is adopted is this: The vertical pipe of ore will in general have an approximately circular cross-section. A drift is run in the solid limestone entirely around the ore body and about 15 feet from the contact. The caved body is then tapped every 20 feet by a short crosscut. This is done on each level. The mine is now ready to produce. Miners stationed in each crosscut attack the soft ore in front of them with picks, shovels and hoes. They stand all the time in the ends of the solid lime crosscuts perfectly safe from any movement of the ore body, and draw the soft, earthy ore into their tunnels and cars. The ore body, being bled all around at every 70-foot level, keeps moving down all the time as the support under foot is hoed out from beneath it. Occasionally the boulders arch up over one of the tapping crosscuts and nothing comes down for a long time. When a crosscut hangs up in this manner it is left for a while. Sooner or later the continuous movement of the mass will break the arch and the tunnel will again become a producer. There is one advantage to this system. The caved ore brings down with itself hundreds of tons of lime boulders. When possible, they are allowed to pass on and go down; but they often get stuck in the mouths of the tapping tunnels, and thus considerable waste must be broken and handled. To work this system successfully, an absolutely solid limestone casing around the ore body is necessary. If the crosscuts tap the ore through lime which has been shattered by the force of the original cave, through the 10 feet next to the contact, they are of no use, because sooner or later any piece of broken rock, even if it weighs 100 tons, in contact with the moving mass, will be carried down. Obviously men can not work with such a shattered rock for footing. This is purely a caving system and is very difficult to operate successfully. It is, however, very cheap, the ore being mined and delivered to the shaft chutes for 80 cents a ton, Mexican silver. The best example of the method in Santa Eulalia is the Santo Domingo mine of the American S. & R. Co.

The third system of mining employed in the district is applicable to the more or less horizontal lenticular masses. If possible, the shaft is sunk in solid lime. This is a common feature of the three methods. Crosscuts are run to the ore body; a raise is made on the contact of the limestone and ore. It is continued until the roof is found, then across the entire body and down on the other side. Similar raises are made along the whole length of the body, which may be from 100 to 1000 feet. Then the top 5 or 6 feet of ore is taken off the body over the whole of its area, leaving a space some 6 feet high between the solid lime roof and the ore. This having been done, skilled miners are put into the stope, who shoot the hard lime roof into an arch, clearing off all boulders, corners and projections of lime and all pieces of ore which may be sticking to it. When the roof is solidly arched, the mine is ready for production. The ore is mined by underhand stoping entirely, and one slice after another is taken off the body until none is left. The stope is worked by a series of benches where the ore is hard, but most of it is so soft that it is merely shoveled into the cars. As successive slices are removed from the top of the body, the ore gradually recedes from the roof. No timbers are, however, necessary, as the hard arched lime supports itself. As they go down, the miners thoroughly clean off projecting corners of lime from the walls, so that they, as well as the roof, will be safe when the work is hundreds of feet below. The shaft is kept down below the workings and the ore handled from the stope bottom to the levels by means of chutes. Boulders of lime will inevitably be met with as the ore is sliced off. If they are small, they are broken and hoisted to the dump. If large—100 tons or more—they are not touched. The slicing of the ore goes on all around a big one until the general surface level of the ore is some 30 or 40 feet below its base. Then a box or two of dynamite is put under one side of the rock, and it is tipped over the edge into the stope level. After that the ore which was under it is taken out. Later this process is repeated and the boulder thrown back. Thus it is shunted from side to side out of the way, time after time, and is carried to the bottom of the stope and eventually left there. Of the three systems this is by far the best and most economical. There is absolutely no danger of caving. The lime roofs of the old caverns, hundreds of feet in width and height, which were worked out by the early Spaniards, have stood for hundreds of years. The great saving is effected in the timber bill. None is used. Another advantageous feature is the small amount of waste which is handled.

The diamond drill is extensively used in the Santa Eulalia district for prospecting. The tripods dot the hills for miles around the camp and many companies use them in the drift and crosscut faces. The value of the diamond drill as a prospecting agent is illustrated by the fact that the Santa Eulalia Mining Co., owned by the Hearst estate, has drilled over 9000 feet in six months.

The Santa Eulalia ore being entirely a smelting proposition, the subject of cheap transportation soon became an important question in the development of

*Abstract Cal. Jour. Technology.

the district. To-day two narrow gauge custom railroads move the ore from the camp to the Mexican Central line near Chihuahua. One of them comes to within 2 miles of the camp. The other takes the ore from the mine chutes.

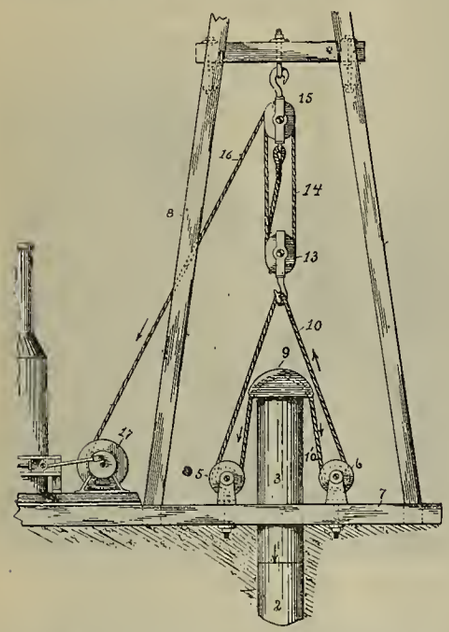
The Santa Eulalia ore is almost self-fluxing, requiring only silica to go into the furnace. Mexican smelters are overburdened with siliceous ore, and therefore seek this ore eagerly and smelt it at about $3.50 gold per ton. After deducting mining, transportation and smelting charges, the uet profit per ton varies from $3 to $6. The companies producing large tounages are making fortunes, new companies are being organized every day and mining in the camp is booming.

Mining and Metallurgical Patents.

PATENTS ISSUED MAY 10, 1904.

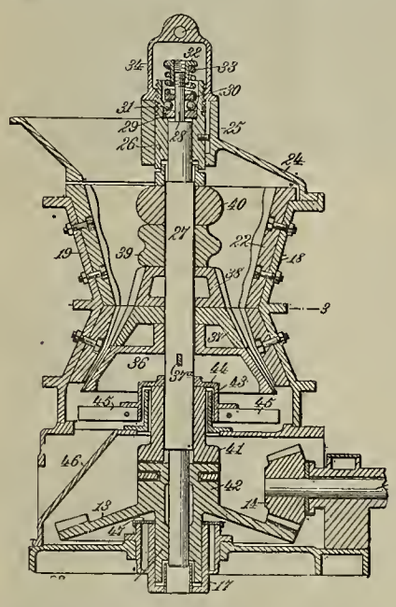
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MEANS FOR SINKING OIL WELL CASINGS.—No. 759,412; E. J. Beane, San Francisco, Cal.



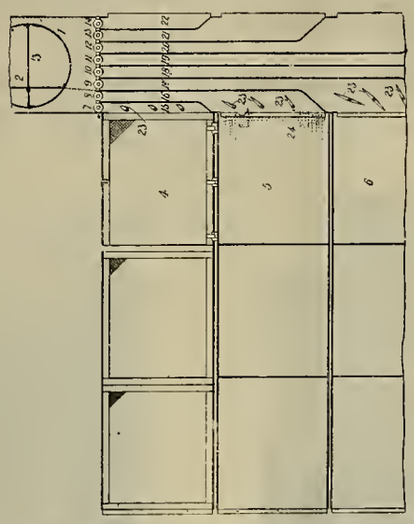
Mechauism for sinking well casings, same comprising endless pressure cable, anchored sheaves located at opposite sides of well and through which endless pressure cable works, one bight of cable passing over top of casing section to be forced downward, and hoisting means connected to opposite bight of cable, so that upward strain exerted thereon imparts to first-named bight of pressure cable downward strain.

CRUSHING AND GRINDING MILL.—No. 759,643; T. L. Sturtevant, Quincy, and T. J. Sturtevant, Wellesley, Mass.



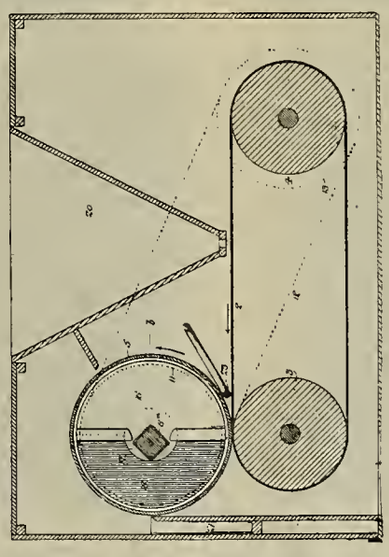
In vertical crushing machine, combination with vertical shaft having portion which is of polygonal shape in cross-section and which shaft is provided at upper end with hoisting head, of rotating crushing elements loosely strung on polygonal portion of shaft, upper bearing from which shaft is supported, mill casing formed in two parts one of which is vertically hinged to other so that it may be swung aside horizontally when access to crushing member of mill is desired, and removable key which supports lowermost of rotating crushing elements; whereby, when key is removed, shaft may be hoisted out of mill, leaving rotating crushiug elements free to be removed horizontally from chamber of mill when hinged portion or door of casing is swung aside or opened.

APPARATUS FGR SEPARATING METALS FRGM THEIR CRUSHED ORES GR MATERIALS CONTAINING SAME.—No. 759,775; W. N. Turner, Ipswich, England.



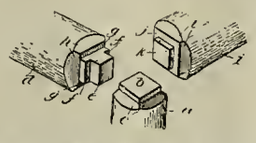
Ore separating apparatus, combination with separating tables, of receiving vessel, division plates therein, and means for distributing matter under treatment to several tables, consisting of series of chauuels, vertically adjustable gate at one eud of each channel, and series of sets of adjustable baffles, one set for each table, sets progressively increasing in size from set nearest receiving vessel.

MAGNETIC ORE SEPARATOR.—No. 758,655; W. L. Imlay, Philadelphia, Pa.



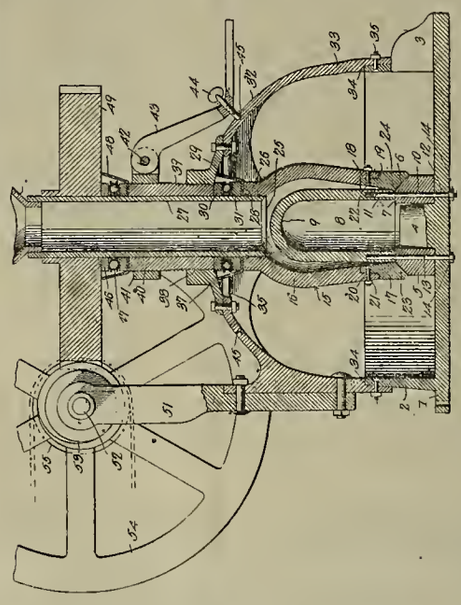
Magnetic ore separating apparatus cousisting of rotating drum containing magnet, magnet having hub carrying two sets of segmeuts forming drum and wire wound ou drum, certain of segments being of magnetic material and forming pole pieces of magnet and others beiug of non-magnetic material and serving to retain wire in position.

MINE TIMBER.—No. 759,418; D. W. Brunton, Denver, Colo.



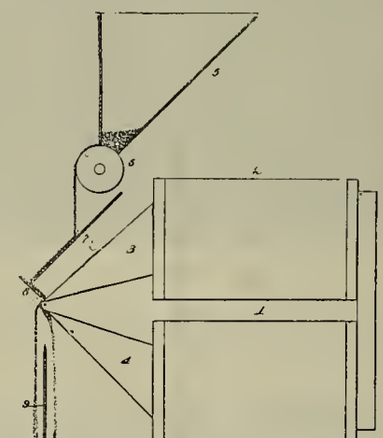
Round mine timbers having rectangular tenons projecting from flat bases at ends of timbers, sides of timbers next bases being beveled.

QUARTZ MILL.—No. 759,497; E. Booker, San Diego, Cal.



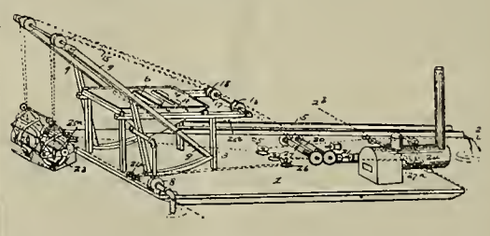
In quartz mill, base having upwardly tapering centering plug, annulus eugaging plug and having beveled portion at outer upper edge, cylindrical member supported upon flat upper edge of annulus and having screw-threaded bores, screw-threaded rods extending through base and annulus into bores, and nuts upon lower threaded ends of rods.

MAGNETIC SEPARATING APPARATUS.—No. 759,358; T. A. Edison, Llewellyn Park, N. J.



Magnetic separator, comprising two tapering magnetic poles sustained adjacent to each other, with narrow gap between and upper pole slightly overlapping lower, in combination with meaus for feeding pulverized magnetic and non-magnetic particles directly to upper surface of upper pole near its edge, whereby magnetic particles will by lines of force be deflected toward and fall below under surface of lower pole without passing through gap, and dividing board below lower pole for separating the magnetic and non-magnetic particles.

APPARATUS FOR EXCAVATING AND SLUICING GRAVEL OR OTHER MATERIAL.—No. 759,108; F. K. Hoover aud A. J. Mason, Kansas City, Mo.



In apparatus of character described, combination with suitable platform, of boom swinging thereon on rockers, excavator suspended from boom and actuating devices for excavator which by continued movement first raise the excavator and subsequently move it, with boom inwardly over platform, in substantially vertical plane of boom's movement.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

The United States Census Bureau has issued a preliminary report on mines and quarries in the United States, which shows that in 1902 the total value of all minerals produced was $884,040,869, as compared with $444,012,998 in 1889—an increase of nearly 100% in the thirteen years covered by the statistics. Pennsylvania was the leading mining State both in the number of wage earners and in the value of products; Ohio was second in value of products and third in wage earners; Illinois second in number of wage earners and sixth in value of products and Michigan third in value of products and fourth in number of wage earners. California ranked seventh in value of products, but first in diversification of minerals, with Virginia second in this class and New York and Pennsylvania tied for fourth position, each reporting twenty-three of the different classes of minerals. The report says: "Accepting the census of 1900 for manufactures and agriculture and the census of mines and quarries of 1902 as representing conditions at the beginning of the twentieth century, the total gross value of products of the productive industry, exclusive of fisheries, amounted to $18,575,224,735. Of this amount, manufactures formed $13,039,279,566, or 70.2%; agriculture, $4,739,118,752, or 25.5%, and mining $796,826,417, or 4.3%."

ALASKA.

Arrangements have been made between Manager J. MacDonald of Treadwell mines at Douglas and the Nowells to resume on the Kensington property at Berner's bay. The deal carries with it an option on the Nowell holdings at the bay and an agreement to carrry out a certain line of development work already agreed upon. MacDonald says men will be put on the Kensington tunnel next week.

Prospectors returning from the Sawtooth range, 60 miles north of Nome, report quartz finds, all free gold, the decomposed material on the surface panning $1 to the pan. The ledge is said to be traced for 4 miles, and locations have been made the entire length. Benches along many of the Nome creeks have been prospected the past winter to bedrock, it is reported, and dumps are accumulating that will wash from $10,000 to $30,000 in the spring cleanup. These are along Buster, Cripple, Otter, Center and Dry creeks. On the Blue Stone there is considerable work under way, in anticipation of a ditch being built this spring. More dredgers will be operating in the Nome district this season than ever before, says the Valdez News.

L. M. Prindle, of the United States Geological Survey, assisted by F. L. Hess, will continue his work of the past season in the placer district between the Yukon and Tanana rivers and along Fortymile and Birch creeks. The party will start from Eagle, moving southwest toward Fairbanks, where the discoveries of the last two years will warrant studies. From there they will go north toward Rampart, finishing the season's work in an investigation of the mining district about Baker and Minook creeks.

ARIZONA.

Gila County.

The Old Dominion mine and smelter at Globe made production of blister copper for month of April of 1,500,000 pounds. It is said the company's net earnings for March amounted to $39,000; and as a higher average price was realized for the April product, it is expected the net earnings for last month should be about $50,000. However, the cost of all underground work is now charged against the net earnings, and from the March figures $6000 was deducted, which represented the cost of sinking the new shaft.

Graham County.

The Kenache M. Co., below Solomonville, is reported preparing to put in a concentrating plant. The company is composed of Detroit, Mich., men. Manager Jaynes states its ore will go 12% copper.

Mohave County.

H. F. Best and L. M. Teale of Savannah, Mo., president and superintendent respectively of the Treasure Hill M. Co., operating near Stockton Hill, are preparing to put in a pumping plant to unwater the mines to the 200-foot level. Recently a flow of water was encountered in the mine, which interfered with further exploration of the property.

At the Sun Cloud mine the mill was started up last week. The property is owned by the Sun Cloud M. Co., of which R. Wheeler is superintendent and H. M. Garwood general manager. The mines are said to show a tonnage of ore blocked out averaging $55 to the ton. Twenty-four men are working at the mill and mine, and this number will be added to. The camp is 4 miles south of Signal, on the Big Sandy.

Considerable water is being encountered in the De la Fontaine mine at Stockton Hill. The shaft has reached depth of 400 feet, and at that point levels will be run to open up the ore bodies. It is intended to put in a milling plant at the mine.——Manager Mensch, of the Stockton Hill interests of the Fletcher M. Co., reports satisfactory results from the work being carried on in the Indian Boy and other mines.

Manager W. A. Mensch has men at work on the mines bonded to W. S. Fletcher of Los Angeles, Cal., near Stockton Hill. These claims have produced gold and silver ores. The Fletcher M., M. & S. Co. has been organized in Los Angeles, Cal., with a capital of $5,000,000, to take over all the interests acquired by W. S. Fletcher in Mohave and Pinal counties, Ariz., and in San Bernardino county, Cal. At Needles, Cal., a load stack will be added to the smelter and that plant remodeled and blown in this summer.

Oshorn & Wardwell, who have been working men on a group of mines, in the Empire Flat country, near Needles, Cal., have opened up bodies of gold and copper ores. The mines are near the Colorado river and are easily reached by wagon. The haul to the river is 6 miles, and it is expected that a reduction plant will be built on the river bank.

Santa Cruz County.

Near Harshaw, at the Trench group of mines, being operated by the Humholdt M. Co., President R. Farrel is preparing to increase development. P. E. Murray is manager and A. Morgan superintendent.

Three miles from Patagonia the Santa Cruz M. Co., W. Schwartz manager, is preparing to put in pumps and boilers to handle the water to clear the shafts and resume sinking. This company has several properties, on which three shafts have been sunk, all in ore. The deepest is down 118 feet. In all three workings they have been driven out by water, which is reached at a depth of 100 feet.

Pinal County.

(Special Correspondence).—A body of concentrating ore has been opened in a crosscut on the 800-foot level of the Alice mine at Troy.

The steam hoist at the Copper Butte mine is in operation and sinking the double-compartment shaft is in progress.——The Arizona Pacific Co. is putting in a pump and air compressor.

A considerable area of the country around Mammoth has been located for the purpose of drilling for oil. One derrick has been built and others will go up.

Mammoth, May 15.

W. & H. Beard have a working bond on the Troxel and the Beard-Cansler mining claims, in Mineral Hill mining district, near Florence. They have incorporated a company with Oklahoma and Kansas men, and work was started this week. Two carloads of ore will be taken out and shipped to prove the value of the ore.

Yavapai County.

The Val Verde smelter has been sold to the Bradshaw Mountain C. M. & S. Co., which has mines near Crown King, southeast of Prescott. The consideration for the smelting plant, all the buildings and equipment and the land and water rights embraced in the Bowers ranch, on which are the smelter and town of Val Verde, amounting in all to about 1000 acres of land, was $175,000. The Val Verde smelter has a capacity of 250 tons per day and is a semi-pyritic plant. It is 23 miles southeast of Prescott on the Agua Fria river and has an abundance of water. There is a spur of the P. & E. Railroad, ½ mile in length, that runs to the plant. G. W. Middleton, vice-president and manager of the Bradshaw Mountain C. M. & S. Co., has men at work grading for additional railroad trackage at the smelter and is arranging for enlarging the smelter to 600 tons per day. At the company's mines in the Bradshaw he will put on 150 more men, who will begin taking out ore for the smelter. Custom work will be done and the company's ore will be run when the custom work does not occupy the time of the smelter. The present plant will be started up, however, and run while the addition to the smelter is being made. It is further expected the company will, within the next year or eighteen months, build a steel smelter of not less than 1000 tons daily capacity.

A 5-foot Huntington mill has been set up at the Golden Cross mine, near Prescott. This mill has been added to the 10-stamp mill in operation at the mine and will increase the capacity of the plant to fifty tons per day.

H. L. Dooley of Rock Island, Ill., and P. Federson of Davenport, Iowa, interested in the Cypress and Burlington mining properties, near Prescott, report they will put in additional machinery, among which will be an air compressor. This will be set up at the Cypress mine, near the Burlington, and a pipe line will convey the compressed air to the latter mine for running drills, etc.

D. J. Sayer, president of the Sayer G. M. Co., is opening up the Churchill group near Martinez.

CALIFORNIA.

Amador County.

The Madrone mine in Pioneer district, 5 miles from Volcano, and 2 miles from the Defendor mine, is being operated by C. S. Leslie & Co. About 100 tons of ore are on the dump. A 100-ton test will be worked, and Manager Leslie estimates it at $40 per ton. The $7 rock is set aside until a mill can be built on the property.

At the Defender mine at Defender ore is being taken from the south drift on the 200-foot level, the breast of the drift being 200 feet south of the shaft. The stamps in the mill are dropping steadily.——G. S. Andrews is unwatering his mine, the Grand Prize, the south extension of the Horn mine.——At the Glenn & Robinson mine, the Whitmore, Glenn and the Robinson Bros. have a 4-stamp mill running steadily. The ledge is said to be 3 feet wide and has a porphyry hanging wall and a blue slate gouge on the foot wall. The mine is easy of access.——O. Lofsted will begin operations on the Red Tape mine next week. He will unwater the shaft and sink it deeper.——Superintendent Nowman, in charge of the Sawyer mine, will begin operations before June 1st, and is getting the mine in readiness to start up.

At the South Eureka mine, at Sutter Creek, the mill has been shut down temporarily, or until a larger one can be built, says the Amador Ledger. About thirty men are working underground, cleaning out the tunnels at the various levels, to ascertain value and extent of rock already in sight.

At the Oneida mine, near Jackson, the 60-stamp mill continues in steady operation. The rock being milled is from the 2200-foot level. There are 130 men employed.

About sixty men were laid off at the Kennedy mine at Jackson last week as the company proposes to stop milling and hoisting operations at the old works. The 40-stamp mill will be taken down, and rebuilt as an addition to the 60-stamp mill near the east shaft, making 100 stamps under one roof. The addition to the mill will be hurried to completion this summer. The reduction in the number of men is thus only temporary, although a permanent saving is expected to be effected in the working force and material, by the concentration of the milling capacity, and the hoisting of all ore through one shaft.

Calaveras County.

The Black Oak mine near Altaville is being prepared to resume operations. It is owned by the Black Oak M. Co. and the water has been taken out. The shaft is down 220 feet, with a dip to the east below 60 feet from the surface. There is also another ledge to the west of the shaft. F. A. Moore, superintendent, says work of crosscutting will be let by contract.——Eighty acres of the Biasch land on the Calaveras river at Petersburg, near San Andreas, has been bonded to G. Prusia, E. L. Atkinson and W. Goldsworthy for mining purposes. The channel of the river runs through the land.

W. B. Lake of the Cataract and Wide West placer mines at Echo, 5 miles east of Murphys, is enlarging operations. A derrick has been put in place to handle the large boulders. Piping will be started next week.

At the Chris Anderson mine, near San Andreas, Superintendent Juchter says he is working within the rim of the channel and that from $12 to $15 are daily taken out of the cemented gravel that is being removed in development work.

In the Emma mine at Campo Seco, on the 400-foot level, a strike is reported made last week. At a point 250 feet north of the shaft the main vein has been cut with satisfactory showing, says Superintendent Maher. The vein at the 200-foot level is opened up for 215 feet, both faces, north and south, being in ore. There the vein flattened out to 50° dip. The pitch of the vein is so flat that it will give about 600 feet of ore from this level to the surface. A 10-stamp mill on the Birdina mine, owned by the same company, will be moved to the Emma.

El Dorado County.

J. C. Moore is putting up his 2-stamp steam quartz mill, near Garden Valley, and will begin to crush rock next month.

Inyo County.

The work on the traction road being built by the Pacific Coast Borax Co. between Ivanpah and its borax mines in Death valley has been completed. The engines and wagons are expected to arrive this week.

Kern County.

The S. K. M. Co. has been organized in Los Angeles and will begin active operations on its ground, 2 miles from the Angelus group, near Randsburg. —— The Angelus placer claims at Fremont's Peak, 18 miles southeast of Randsburg, have been sold to C. A. Giffen, chief owner in the Midnight Sun M. Co. of Alaska, and G. M. Giffen of Los Angeles. Water has been developed and the new owners will put in a 200-ton cyanide plant. M. Wilson, former owner, is manager for the company.

Mono County.

The Crystal Lake mill at Lundy is not running at present, but will probably start up next week. About thirty-five men are working at the tunnel, mine and at the power plant. Ore is being taken out.——A. A. Travis has men at work digging the canal to drain the upper part of Lundy lake. This will allow the tailings in the lake to be gotten at and worked by the Lundy Cyanide & Development Co.

Supplies are on the ground for remodeling the Standard Con. M. Co. cyanide plant at Bodie for use of the Moore filtering process, says Superintendent T. Hoover. Operations on the slum pond will start next month.——The Bodie Railway Co. is extending its track as far as the old Standard dump. A number of men are also at work clearing and repairing the roadbed. Trains will be running this week.

Nevada County.

At the Standard mine, near Grass Valley, work is under way on the hoisting works under W. C. Body.

A company headed by J. C. Camphell, superintendent of the Mountaineer mine at Nevada City, has closed a deal for the East Orleans mine, on Gold Flat, and operations will be started this week.

The Osceola G. M. & Dev. Co. has been incorporated by E. B. Power, C. W. Alisky and A. C. Porterfield of San Francisco; C. P. Wells of Oakland; C. W. Porterfield, G. J. Rector and L. S. Calkins of Nevada City, to develop the Osceola quartz mine in Osceola ravine, a mile south of Rough and Ready. Machinery will be set up and a shaft will be put down. The vein has been prospected near the surface and carries gold values.

Superintendent H. Egan of the Spanish Ridge mine, near Nevada City, proposes enlargement of his milling plant and will in July make an addition of twenty stamps. The mill has twenty stamps at present and is crushing steadily. Egan has seventeen men employed and is running a tunnel to crosscut the ledge. The tunnel is expected to tap the ledge at a distance of 150 feet more.

At the Zeibright mine in Little Bear valley, south of Grass Valley, the mill is running steadily on ore from the ledge on which the tunnel has been driven a distance of 270 feet. This ledge varies in thickness from 10 to 18 feet. A high-grade shoot is reported opened at a point 800 feet above the level of the tunnel. The tunnel will be driven to tap this and is expected to reach it within a distance of 600 feet. The company will put in an air compressor plant, and later will increase the milling capacity by adding to the present complement of ten stamps. Seventeen men are at work. F. Zeitler, of Nevada City, is manager.

Placer County.

At Ophir the Three Stars mine is running with sixty men at work. The 20-stamp mill is crushing ninety tons of ore per day. B. F. Hartly is superintendent. While fitting up some of the lower levels for stopiug, part of the ore is coming from the Peardon & Hawken dump. The management have been laying a track to the Almont, and when opened and going another ore producer will be tributary to the mill. The Gold Blossom is being made ready to start to pump. Men are overhauling the machinery and the pipe line, says Superintendent Harmon.——C. A. Reed is repairing his mill preparatory to running.

Plumas County.

J. Rawling of Grass Valley says he will begin development next week on a group of claims near Eclipse. The ledge is large and shows free gold. A tunnel will be run in on it. Later a mill will be put up.

E. J. and H. Skewis of Minneapolis, Minn., having bought the Golden Star quartz mine on the Middle Fork of Feather river, near Quincy, intend to run another tunnel for development. This tunnel will be lower than the present one and is expected to be between 300 and 400 feet in length.——J. D. Whitney, superintendent of the New York mine, near Greenville, reports work in the mine progressing and he has twenty men on the payroll.

San Bernardino County.

The Fletcher M. M. & S. Co. of Los

Angeles has bought the Needles smelter at Needles and will put in two new stacks, one for copper and one for lead, says the Needles Eye.

Sierra County.

M. H. Mead of the Keystone mine at Sierra City says the company operating the mine is making preparations to build a quartz mill this summer.

Manager J. W. Morrell for the Alleghany M. Co. of Alleghany has made final payment on the $10,000 for the Telegraph gravel claim of 160 acres. This gives the company 1100 acres of land lying in one body along the Red, the Blue and the Keystone channels. There are said to be a number of promising quartz ledges in the claims to which attention will be devoted later. One of these veins is thought to be an extension of the Plumbago. The main tunnel, in 270 feet, will be driven ahead. There is another tunnel in 920 feet tapping the front channel, and this shows a body of gravel. Tunnel No. 3 will be put through, and through this latter the gravel will be handled by water pressure, says Superintendent J. F. Bovee.

Siskiyou County.

A. Pereira took out of his claim at Hawkinsville, between McBride and Rocky gulches, below Hawkinsville, 2 miles north of Yreka, a quantity of nuggets last week, and among others was one which weighed thirty-four ounces, worth about $600, says the Yreka Journal. It contained a small amount of quartz. This find was taken from an old pillar in the claim. An $800 nugget is said to have been taken out near the same locality some years ago.——J. Frager reports cleaning up $2000 from the winter's work at his claim near the above claim at Hawkinsville. It is a dry section in summer, hence must depend on winter rain and snow for ground sluicing and box sluicing.

Work is being increased in the Poverty Point hydraulic mine on Klamath river, near Oak Bar, under superintendence of H. J. Barton.

Tuolumne County.

The new shaft and the old workings at the Don Pedro mine, south of Chinese, have been connected by a tunnel 487 feet long and at depth of 160 feet. The steam hoisting machinery has been set up.

M. Bottini has bought the Gem (formerly the Monitor) quartz mine, 4 miles east of Confidence; also the Royal New Brunswick adjoining, and the Gem millsite and water right on Sugar Pine creek.

The cyanide plant at the Confidence mine at Confidence is in operation and twenty-five men are at work. The number underground will be increased this week. The mill will start up June 1st.

Water power will be put in to run the mill at the Republic mine, near Parrott's Ferry, near Columbia. The gasoline engine used was reported unsatisfactory.——A 10 H. P. gasoline engine was put in last week at the quartz mine on Saratoga hill, north of Sonora, being operated by Restano Bros. & Sierra.

Manager R. B. Stanford says he is putting in a boiler and engine at the Doyle Ranch gravel mine, near Columbia. Work was started last week at the Doyle Ranch gravel mine. A gallows-frame is being built and they will also put in a 3-stamp mill to crush the gravel.

T. F. McAvoy, of Alameda, for $10,000 has bought a three-quarter interest in the New Era (the Hunter) quartz mine; the Chilcoot Pass quartz mine, being south extension of the New Era: the Plateau quartz mine; also water right of 500 inches flowing in Hunter creek, southeast of Carters.

Fourteen men are at work in the Crystalline mine, near Jamestown. A drift is being run east of the shaft to strike a shoot which was worked in the Little Gem mine and which is said to dip into the Juanita mine, owned by the company operating the Crystalline.

At the Draper mine, near Soulsbyville, they are putting in a dynamo to furnish electric lights for the mine and surface works. A 10-drill compressor is being set up and repairs are being made to the mill. There is still 60 feet of water to be pumped from the shaft. —— The Black Oak mine at Soulsbyville is running full handed and the 40-stamp mill is crushing high-grade ore, says Manager G. W. Campbell.

COLORADO.

Boulder County.

(Special Correspondence).—The Maxon Gold Leasing & Mining Co. has a shaft down 65 feet and expects to sink 75 feet deeper. The company is operating through a tunnel, which cuts the vein at a depth of 600 feet, and is drifting each way from the tunnel on the vein. Telluride and free gold ore is said to be obtained in both drifts. Ore in a 4-foot vein averages $16 per ton. They are not shipping any of the ore at present, but expect to put in a mill. R. C. Lamb is superintendent.

Gold Hill, May 15.

(Special Correspondence). — Plans for extending the Colorado & Northwestern Railroad to Eldora, Jimtown, Gold Hill and Rowena up Left Hand gulch are being prepared. It is understood a plant for handling the ore will be built by the railroad company at or near Boulder.

Boulder, May 15.

The Big Five M. Co., of Idaho Springs, is preparing to complete its Dew Drop mill in Boulder county, and President Daniels says next week they will begin to build the sampler and concentrator at the Central tunnel. The plans for the mill are completed and all surveys made. The track from the tunnel to the site of the mill with bridge and trestle across the creek has been in place for some time and preliminaries to actual work on the mill are completed. The management expects to have the mill in operation by January, 1905.

The Surprise G. M. Co. has bought two mines at Sunshine and one at Magnolia. The Surprise mine at Magnolia is near Keystone, near the Mountain Lion, Keystone and Senator Hill mines. The company is running a tunnel on the trend of the Surprise vein and expects to cut other mines and feeders before it reaches a point under the top of the mountain, which will give a back for stoping 1000 feet in depth. The Nelly Bly mill is said to be treating the ore for $5 a ton and saving 90% of the metals contained. At Sunshine the company has bought the Climax and Cardiff gold mining claims. These mines are being developed by tunnels from opposite sides of the same mountain and may be operated through the Cardiff tunnel.

Chaffee County.

The company operating a group of claims on Free Gold hill, east of Buena Vista, under supervision of H. Segoin, intends to place machinery on the group with another shaft and increase development work. The vein is a contact between porphyry and granite, the general trend being east-west. They have 3 feet of ore in the bottom of a 100-foot shaft which assays $40 in gold. They have saved a car for shipment.

The Buena Vista S. & R. plant at Buena Vista has been rebuilt and is ready to be blown in. Manager Hinkson says no date has been set for reopening, but it is expected the smelter will be in full operation next month. The ore being taken from the Mary Murphy at Romley is being milled at that point. They are also blocking out ore awaiting resumption at the smelter.

Clear Creek County.

The Ward mill, near Idaho Springs, began operations last week on ore from the Ward lode, owned by Anderson, Carlson & Tanner. The mill has a battery of ten stamps, plates and a concentrating table. It is intended to add the cyanide process for treatment of the slimes.

J. J. White has a bond and lease on the Washington lode, in Montana mining district, near Georgetown, for $15,000. He is arranging for operations and men will be put to work next week.

Idaho Springs reports say work of extending the Sun & Moon raise from the Newhouse tunnel will be resumed next month. It is understood arrangements have been completed with the Gem management for the extension of a line of air pipe from the Sun & Moon compressor plant down the Gem shaft to furnish air for the drills to operate in the raise. The Sun & Moon mine is producing steadily 1600 tons a month from the lower levels of the upper workings. It is understood that work there will be continued as heretofore and this production will not decrease until the completion of the raise, after which all work will be done through the Newhouse tunnel.

Custer County.

Arrangements for the 200-ton mill of the Silver Bar M. Co. at Rosita are going ahead. It will treat chloride ores.——It is reported that the Little Bernice Co. proposes the introduction of a matte smelter to handle ore from its property.

El Paso County.

The $15,000 cyanide plant just completed in Colorado City by the United States R. & R. Co. was started up last week. As soon as the tanks are leached the concentrator attached to the Colorado-Philadelphia mill will be put in operation. The two plants will treat the dumps lying around the Standard and Philadelphia mills. After the dumps are exhausted the cyanide plant will be used to treat Cripple Creek ore.

Fremont County.

The refinery of the United Oil Co. at Florence is treating all the oil produced in the Florence field, with the exception of the Florence Oil Co.'s output, and 3200 barrels are put through daily. About 500 barrels of this are produced by the independent companies. From time to time, according to the increase in petroleum production, additions have been necessary to care for the oil output. In this refinery thirteen distinct products are said to be made from the crude oil.

Gilpin County.

During the month of April the shipments of smelting and other ores, tailings and concentrates from the Black Hawk depot to the Denver smelters and to outside points for treatment reached a total of 213 cars, or 4260 tons.

The Penobscot M. Co., operating near Rollinsville, in which Valley Falls, Kan., parties are interested, is preparing to build a stamp mill. The company has been driving a tunnel to open up the Penobscot group and has been in ore through the last 100 feet. It also has ore in the shaft at a depth of 200 feet. Two shifts are at work.

The stamp mill built at Phœnix for the Blue Grass M. Co. is dropping its ten stamps steadily on ores from the Champion, Lone Star and Tenderfoot mines of that company.

Sternberger Bros. are getting ready to work their East Calhoun group in Leavenworth gulch, near Central City, which has been idle for several years. A steam plant of machinery will be set up and a shaft building erected. This shaft is reported to be down 200 feet, is filled with water. They will sink the shaft another 100 feet.

The Hall mine in Russell district has been leased to H. Snyder, E. A. Came and G. S. Crilly of Central City and the lessees have started operations in the 100-foot level. They are working on both sides of the shaft, where there is said to be both milling and smelting ore, and they are hoisting, milling and concentrating. The shaft is down 130 feet.

The Ingalls G. M. & L. Co. is increasing developments at its Straub or main shaft on Gunnell hill, near Central City. At the 400-foot level crosscutting is being done for exploring the known ore body opened up above that point. The 500-foot east level is being extended. The ores opened up are said to give values of one and a half ounces gold per ton. The company has sunk the shaft to the 515-foot point, or an increased depth of 400 feet. They have also extended the levels for about 500 feet and done some 520 feet of crosscutting since taking the group. It is intended to put in a larger plant of machinery, made necessary by reason of deeper workings. They will also add to their top buildings. W. Ballantyne is superintendent.

The Gilpin M. Co. has taken a lease and bond on the London mine on Gunnell hill, near Central City, and W. Kiley is superintendent. A 12 H. P. gasoline hoisting plant was put in last week and the shaft building has been enlarged. The shaft is 160 feet deep and it is intended to sink another 100 feet as well as carry on drilling. Milling ores have been taken out and the smelting ores are reported to have brought net returns of $50 per ton.

Gunnison County.

The Brooklyn M. Co. is operating the Harper group on Galena mountain at Elko. A tunnel is being driven to cut the ore bodies at depth. In the upper workings ore is showing and when the tunnel cuts it the company expects to have a heavy producer.——The Gothic S. & M. Co. is preparing to start operations on its group, near Gothic. It last fall completed a smelting and milling plant, but decided to wait until spring before starting up its plant permanently. The sylvanite mine will furnish ore for the plant. Other properties in the district will be operated.

The Racine M. Co., composed of Denver, Colo., and Racine, Wis., men, is increasing development work on its group on the ridge east of Tomichi dome, near Bowerman, says Manager Belden of Racine, Wis. B. E. Burnett is manager. The company owns ten lode claims in Crook's gulch, southeast of Bowerman. An air compressor and other machinery will be put in. A body of lead ore is reported in the tunnel, running 12% lead. The tunnel is in 100 feet and cuts the vein 65 feet from the surface. The shoot crops at the surface. The main vein carries gold, copper and silver values. A wagon road will be completed this month and then the company expects to start shipments.

Lake County.

(Special Correspondence).—A strike is reported in the Annie mine on Long and Derry hill in Iowa gulch, near Leadville. The Annie is owned by Mansfield Bros. of Leadville, and adjoins the Ready Cash mine. It is stated they have a vein 4 feet wide which runs eight ounces in gold per ton. These properties are said to be on the projected line of the Leadville-Denver M. T. & T. Co.

Leadville, May 16.

C. T. Carnahan, at Leadville, says the Resurrection mill will resume this week. The Resurrection mill was closed down during the winter. Repairs have been made. During the inactivity of the mill the Resurrection mine has been shipping about 600 tons of ore a month. The resumption of the mill will give employment to more men and will turn out 150 tons of ore a day from the mill. The shipment of ore will also continue.

Manager Owers says the second drill hole on his properties on Western Rock hill, near Leadville, will be started by the United M. & Dev. Co. The machinery is being set up by Superintendent Stanton. This hole will be sent down at least through the formations disclosed in the first drill hole on the Mike, and probably to a total depth of 1000 feet. The original plan of the company was to sink ten holes on the Owers properties on a line drawn east and west through the drill hole on the Mike. The second hole will be 1½ mile west of the first hole.

Last February the Harvard shaft of the Fryer Hill M. Co. at Leadville was started, and at a depth of 375 feet the ore body was cut. The shaft is ½ mile from the El Paso, north, and about 1000 feet from the Cady shaft of the Progressive M. Co. The finding of the ore body in the Harvard proves that the Fryer hill shoot extends into Big Evans gulch, and possibly farther north into Canterbury hill, says the Times. The drift run from the El Paso to connect with the Harvard shaft is nearly all in ore, a distance of 3000 feet. This drift will have to be driven about 75 feet farther to get under the Harvard shaft, and the connection will be made by June 1st. When this is done the Harvard will become the principal shaft of the company and will be equipped with hoisting apparatus and will have double-decked cages. The work of sinking the Harvard is being retarded by a heavy flow of water. When the sinking on this shaft is finished work will be resumed on the Pride of the West shaft, which is north of the Harvard and was closed down last fall on account of the heavy flow of water. The shaft is 400 feet deep. Another shaft that will probably be started on the same ore shoot and north of the Pride of the West is the Price shaft, which had to suspend operations on account of the water. The territory will be drained when the Harvard reaches the El Paso drift. In addition to the work carried on at the El Paso and the Harvard, the company is shipping ore from the Tip Top and the Silver. From the El Paso shaft, south, a drift is being run to the old shaft of the Miami and is in 300 feet. The drift has gone through a porphyry dike, with ore on both sides of it.

The zinc situation in the Leadville district continues to improve and there is much activity among the zinc producers and increased production, says the Times. The present zinc tonnage amounts to 250 tons a day, about 90 tons of which are zinc concentrates. The heaviest zinc producer in the camp is the Moyer mine of the Iron Silver M. Co. The latest shipper is the Quadrilateral property. The Wolftone is also arranging to resume shipments.

J. F. Campion of Denver, manager of the Ibex M. Co. at Leadville, says that while the company will operate Nos. 4 and 5 shafts, the territory embraced in shafts Nos. 1, 2 and 3 will be leased in blocks. There will be from 300 to 400 men at work on this property next month. In addition to work by lessees, the company will open new ground at a depth of 1300 feet through the Ibex No. 4 shaft, at which point the Yak tunnel has tapped this shaft.

La Plata County.

(Special Correspondence).—Prospectors are coming in daily for the season's work. The district has hardly been scratched by the pick, except close down to the La Plata river and at the head of the East Mancos. The ore bodies vary in character from high-grade telluride veins a few inches in width to veins of sulphide ores up to 14 feet thick, carrying $8 to $10 per ton in gold on an average. It is proposed to build at Mancos a plant for the treatment of these sulphide ore bodies by making sulphuric acid, which will be largely utilized to leach the copper from the low-grade copper ore found at the head of the East Mancos creek and Bedrock gulch.——Near Mancos are veins of bituminous coal, much of which makes good coke.

The May Day mine is working fifty men on mining and construction and it is expected the air drills will be in operation this week.——The Chief M. Co. is putting up additional buildings and working a few men in the mine. They have the extension of the May Day and are steadily shipping ore. Returns give $300 per ton. A twenty-five-ton shipment was made last week.

The Empire M. Co. has started its com-

pressor and air drills and is making good headway in development work.——The Comstock mine has made a ten-ton shipment to the Durango smelter and shipments will be continued regularly.

Mancos, May 15.

Pitkin County.

Aspen reports say n rovival in mining is taking place in Aspen district. Operations are being increased by D. M. Hyman et al. on the Enterprise mine and they report a body of ore opened up showing values in silver and lead. This strike has been made between the A. J. workings and the shaft in the Enterprise ground. D. R. Brown will begin development work on the Homestead mine, near Aspen. Operations on this property will be carried on through the Cowenhoven tunnel, under management of G. B. Brown. He is changing the course of the Cowenhoven tunnel. A drift will be run around the Smuggler stope which will do away with the anneyance caused by gas from the Smuggler workings, which has in the past interfered with operating of the tunnel. Bodies of lead ore have been found in the Homestead, but development has been retarded by water. With installation of an electrically operated Cornish pump planned by the company work will proceed.——The Percy-LaSalle mines, operated through the Newman tunnel, have resumed operations after a temperary shutdown caused by repairs on the flume and setting up of more machinery. H. R. Woodward is manager.

Rio Grande County.

The Golden Income M. & I. Co. of Embargo, G. P. Wilson president, proposes to build a mill on its mine, near Del Norte.

San Juan County.

The Ruby Basin mine, in the Ruby basin, south of Mineral, near Silverton, has been under development during the winter with satisfactory results, says the Silverton Standard. The Ruby Basin M. & T. Co., G. A. Schemerhorn president and T. J. Hurley manager, increased its number of men to twenty last week and the erection of a fifty-ton capacity roll-jig mill will be started next month.

San Miguel County.

The Yellow Mountain M. Co., owner of the Carriheau-Montezuma group of mines, 1 mile from Ophir, has the Carriheau mill running, after an idleness of eight months. While the present capacity of the mill is only ten stamps, capable of treating thirty tons of mineral in twenty-four hours, it is expected it will be enlarged and additiens made from time to time as extended development in the mine justifies, says F. T. Axtell, resident manager.

On the property of the Ophir Con. M. Co. at Ophir Loop a vein of tungsten ore is reported opened up. While driving the fifth level on the Ida vein a branch vein was cut, which, on being followed, shows a streak of tungsten ore. The ore will not be treated extensively at this time because of the mill being utilized for the treatment of Ida ore, which is free milling gold rock, says the San Miguel Examiner.

The Mayflower group is in Gray's basin, a tributary of Bridal Veil, 5 miles south of Telluride. E. L. Davis, resident manager, says the company has a lease on the Philadelphia 10-stamp mill, at head of Bridal Veil, 1½ miles below the group, and as seon as the snow disappears a wire rope tramway will be built connecting the mines and mill. It is expected this and other improvements will be ready for operation in June, when the mill will be started. The operators plan to equip the property with a larger mill, trams and heavier machinery.

A portien of the Gold King 40-stamp mill, in Gold King basin, near Telluride, was started up this week. Leasers have been at work in the Gold King mine all winter, and have blocks of ore cut out ready for breaking down and transportation over the tramway to the mill. The product is free milling and no attempt is made to save the values other than on the plates by amalgamation. The ore is low grade, but the vein is large and is said to carry uniform values.

The Tomboy mine, near Telluride, is increasing development on its properties, near Telluride. Work has been resumed on the Cincinnati shaft, which has been sunk on the Cincinnati and Argentine vein to a depth of 180 feet. The shaft will be sunk 100 feet deeper, and it will be enlarged throughout. It is from the Cincinnati and Argentine vein that the Tomboy Co. has been getting its principal returns the past three or four years, says the San Miguel Examiner. It carries gold values. The smaller Tomhoy mill, which has been idle during the winter for lack of water for milling purposes, will be started up by June 1, as there will be an abundance of water from the melting snow. This plant has a capacity of 225 tons daily. It will treat ore from the Tomboy mine proper, on which a number of lessces have been at work during the winter.

The E. Field half interest in the lease on a dump of the Sheridan mine on the Smuggler vein, near Telluride, has been sold to J. Wagner for $3000. The other half interest in the lease is owned by M. Robbins. The lessees have put men to work sortiug ore from the dump, and have started the 20-stamp mill at the head of Marshall basin to treating the product The lease also includes the claim on the Smuggler vein known as the 76, which will ho worked this season by the lessees.

Summit County.

Hoyle & Hoyle are steadily working their lease on the Puzzle-Gold Dust group, near Breckeuridge, and are keeping the Westside concentrating mill running one shift a day on second-class ore from the lease. Owing to heavy inflow of water from above, the driving of the raise was suspended until the water lessens. The concentrates made from the Puzzle-Geld Dust ore carry iron and lead sulphides, with values in gold and silver. Hoyle & Hoyle's shipments average two carloads per week.——The 500-ton mill run on ore from the mine, made at the 40-stamp and cencentrating mill of the Jessie group in Gold Run, was satisfactory, says T. R. Griffith, who with others has a lease on hoth mine and mill. They are putting up additional buildings and are having additieral foundation prepared for an air compressor which will drive the power drills. The 14-foot vein shows 200 feet of stoping ground between the Quincy and the Jessie levels. Besides the gold secured by amalgamation on the ceppor plates of the mill, several carloads of auriferous concentrates were made. The concentrates will he shipped.

Teller County.

The Cripple Creek Enterprise G. M. Co. has a twenty-year lease from the city of Cripple Creek to werk under the streets and alleys and resumed operatiens last week after a close-down of several months. Manager Hanley started the pumps to working to drain the shaft of water and will lower it to the 300-foot point. Since work on the Enterprise was started a great advantage to the company is that tho drainage tunnel has taken away a considerable flow of water that was formerly encountered and the advantage will be increased as the drainage tunnel advances.

It is estimated there was distrihuted threughout the Cripple Creek district last week $520,000 to miners and others engaged in the mining industry for the month of April. The payroll is increasing. There are nearly 4000 miners at work on the different mines in the district. Miners alone drew from the above figures $450,000, the rest going to ore haulers, assayers and men employed in mining offices and other men allied to the mining industry in this district. With the exception of the Gold King-Hull City placer and Last Dollar mines every old-time producor in the camp is working a full force and the number of lessees at work exceeds that for several years past. There are more men employed on the Gold Coin mine under the leasing system than there was by the company.

The new rates established by the American S. & R. Co. and the United States R. & R. Co. have been announced, effective fer Cripple Creek ores as follows:

	Per Ton.
Up to one-half ounce gold	$ 5 75
Up to three-quarters ounce	6 50
Up to one ounce	7 00
Up to one and one-half ounces	8 00
Up to two ounces	9 00
Two to five ounces	10 00
Five to ten ounces	11 00
*Over ten ounces	7 50

*Plus the freight.

Manager Balderston of Stratton's Independence at Independence, says he is sending out 165 tons of ore daily on an average. Sylvanite ore is reported being taken out. The pump at the 1400-feet level has been hoisted to surface and the lewer levels of the mine, at least for the present, abandened. There are two pumps at the 900-foot station and whenever necessary they will be called into use, as to that depth the property can be profitably worked. About 400 men are working on Stratton's Independence. Manager Baldersten says the rush of applications for leases continues, but nothing is being done with them as yet. It is thought no leases will be let for several months to come.

The Homestake G. M. Co. of Cripple Creek has taken over the Magna Charta, Quartzite and Annex lodes for $85,000, says the Gazette.——The Ajax company is pumping out the water in order to reach the bottom level of the mine, which is 1200 feet in depth. When the water is out work at that point will be started.

Work has so far progressed on the Ophelia tunnel, near Cripple Creek, that it has become necessary to discontinue the work of the 40 H. P. air-compressor locomotive at present and mules are being used to haul out the train of cars, says the Gazette. The locomotive heretefore used is designed to run 2½ miles without recharging the air. The tunnel being over 1½ miles in length, the locomotive cannot make the trip without recharging. The management expects to put in a station in the tunnel so that the engine can he recharged in the mine.

The El Paso M. Co. at Victor shipped during the month of April thirty-four carloads of ore, hut from this comparatively light tonnage the net smelter returns were $78,000. The net profit of the company was $57,000. There were shipped the first ten days of May fourteen cars of ore of an average value of $60 a ton. The shaft has attained a depth of 720 feet. A station will be cut at the 700-foot point, which is 104 feet below the drainage tunnel level. When this station is completed Manager Bainhridge says he will explore cautiously for water. The flow, it is anticipated, will he struck in the main El Paso vein that on this level lies 35 feet west of the shaft. The Tillery vein, another producer, according to surveys, will he cut in the station, hut no flow will he feared there. Every precaution will be taken as the main vein is approached, and the crosscut will be hulkheaded at the first sight of water in any volume. At the same time the company is prepared to handle any ordinary flow. The bulk of the ore is coming from the main El Paso and C. K. & N. vein. The new vein at the 480-foot level (the Eaton vein), has been drifted on for 100 feet and averages 7 feet in width. The mineral between walls is said to average $30 a ton. Under instructions from Colorado Springs last week, work ceased in the Elkton heading on the drainage tunnel. The main Elkton contact was between 100 and 150 feet distant when work ceased, hut as the water flow has shown no increase for weeks and the tunnel is effectually draining the mine which centributed mainly to its construction, the managoment decided to cease operations on the tunnel fer the present. The water in the Elkton shaft is now but a foot or two above the eighth level and the working of that level is expected to bo recovered by June 1st. The Mary McKinney lower workings are dry and other properties on the same water course are lowering their water level and the flow continues from the tunnel portal at the rate of 7000 gallons a minute.——The Julia V. Co., oporating the Henry Adney, anethor Beacon hill mine, under bond and lease, sent out a shipment of twenty-five tons of ore last week of a value of $200 per ton.

IDAHO.

Ada County.

The Ironsides mine, in Black Hornet district, near Boise, will be worked this season. The property has been idle for several years. Mrs. H. Adams is manager of the company.

Boise County.

The Checkmate mill at Pearl was burned last week. It had not been in operation for some time, says Superintendent Linney. The plant cost $17,000. It was insured for $10,000. E. H. Dewey, the owner, says he will rehuild.

G. W. Stiffler and A. George of Missouri and F. W. Pralle, superintendent of the X-Ray Co., owners of the Three Brothers quartz claims, Nos. 1, 2 and 3, on Banner creek, near Idaho City, are starting development work to determine the value of the claims.——H. J. Kinkaid has a lease and hond on one of the claims of the Twin Sisters group, near Centerville.

The mill at the Lincoln mine, near Pearl, of which J. T. Hodson of Salt Lake City, Utah, is manager, will start up this week. The plant has been undergoing repairs.

Lemhi County.

The Salmon City Recorder reports that E. Benedict and E. E. Edwards of Gibbonsville and F. W. Vogler of Red Reck have bought the A. D. & M. mines and mill at Gibbonsville. The deal includes thirty patented mines and the cyanide mill. This property has been tied up in litigation for the last feur years. The price is reported at $10,000.

Shoshone County.

B. F. Wells of Boston, Mass., a stockholder in both the Cœur d'Alene M. Co. and the Eagle Creek M. Co., near Murray, has a lease on all the properties of the Cœur d'Alene M. Co. and has started work. He has fourteen men repairing ditches and flumes and preparing to work the high wash between Dream gulch and Missoula gulch.

MICHIGAN.

Mining operations for April in the Michigan copper district recorded the largest output for any month in its history, covering a period of sixty years, says the Mining Gazette. The official figures of production are not reported monthly by all of the mines. The output, however, is estimated at 8700 tons of copper, which would indicate a present rate of production per annum of nearly 209,000,000 pounds of copper.

MONTANA.

The receipts of gold from Montana at the United States Assay Office in Helena for month of April amounted to $191,333, as compared with $172,365 for April last yoar. An increase in almost every mining county in the State is shown. Fergus county loads with $111,589. Outside of Montana the amounts received were: Idaho, $3352; Nevada, $4456; Washington, $379; British Columbia, $7439.

Broadwater County.

J. Johnson reports making profitable shipments to the East Helena smelter from the slag dump of the abandoned smelter near Townsend. The saving of precious metals was not close, with the result that Johnson is having the slag resmelted for its gold, silver and lead values. Johnson has taken over the slag heap at the Gregory smelter, 20 miles south of Helena. They were worked by hand and jig, hut are still found profitable to smelt again.

Choteau County.

To develop the oil fields of northern Montana, the Great Northern Oil Co. has been incorporated with headquarters at Chester. The company has leases on 800 acres of land, and it is expected hering for oil will be beguu by June 1st. The directers are G. Bourno of Hill, L. Crichten, F. B. Wilbur aud P. A. Heater of Chester, and G. E. Howe of Browning.

Fergus County.

In Cone Butte section operations are said to he progressing on the McIntyre properties on West Maginnis creek near tho Chicago mine, near Kendall. On the Blackhird greup (the McIntyre claims) the place has been reached in the tunnel where the ere assumes the vortical position, and as depth is gained the appearance of the ore improves. A mill will he built on the Blackbird this summer by Caird & Hawksworth of Helena, part owners.

Superintendent J. H. McCormick of the North Meccasin M. Co., operating near Kendall, says the new hoist for the North Moccasin group is in place on the Santiago claim and has started working. The hoist has been placed on the shaft in the gulch at the south end of the group, near the gulch in which is the Kendall mill. The shaft was sunk 120 feet last winter and will be continued to depth of at least 200 feet, after which drifting for the ere will begin. A milling plant is also proposed for the North Meccasin group.

Jefferson County.

The Minah group of mines near Wickes has been bonded to a Butte company composed of Wayne, Kirk & Clinton.

Jensen & Co. of Norwich, Conn., have secured a controlling interest in the Rose gold mine, at head of Golconda creek. They will build a mill to treat the product of this and other mines taken over. There is said to be a 95-foot vein of ore in the Yellow Jacket mine.

Lewis and Clarke County.

The company organized by Canell & Martin of Helena to develop the Whitlach-Union properties at Unionville is heginning work with F. L. Sizer as manager. Machinery will be put in consisting of a steam hoist, pumps, cables and other equipment to sink the shaft. The heist is capable of sinking 1000 feet. Manager Sizer will sink a vertical shaft 500 feet as the first undertaking, and no attempt will be made to utilize the old workings in the present development.

J. H. Morrison of Helena reports copper at his claim, west of Fort Harrison, between Helena and the Red Bird mine. It will be developed.——The Amador copper mine, on Cedar creek, 12 miles from Helona, is increasing development. The machinery is run hy water power. The company is alse building a flume 2½ miles long to develop water power fer tho smelter, which will be built at Iron Mountain statien. A townsite is being laid out. An electric tram, cennecting the mine and railroad station, will be built this season.

M. Edwards is putting in a cyanide plant at the Gloster mine, near Marysville. He says there is ore on the dumps which will average $5 a ton.

Madison County.

J. J. Maloney, manager of the Toledo and Grant mines, near Brandon, says the Toledo mine is showing progress in development. The vein carries values in gold. They are shipping four carloads of concentrates per week. As soon as they are sure of the water for power purposes they will put on the third shift in the mill, which will make it possihle to ship a carload of concentrates daily. The company is furnishing the town of Sheridan with electric lights.

Meiklejohn & Northey have leased the

Mascott lode and will operate it during the coming summer. D. F. Meiklejohn has charge of mining operations near Norris, including the Gold Hill mine, operated by the W. W. Wishon Ore Co., and the Standard, owned by F. Lohse. The Gold Hill is shipping from Norris two carloads of ore per week and the Standard one.

The Carmin mill, at Pony, will begin crushing ore from the Oregon mine this week. Water was turned into the ditch this week to soak up the wheel, and the mill is being overhauled. C. T. Wiedeman has the lease on the Oregon and will treat the second-class ore taken from the mine.

R. Knox, manager of the property of the Montana Revenue M. Co., at Revenue, says he is preparing to build a mill at the mines of the company, 6 miles from Norris. The mill will have a capacity of 75 to 100 tons of ore per day. There has been a mill at the mines of the company, but they are tearing it down to make room for the new one, which Manager Knox expects to have in operation by Aug. 1. The mill will be a dry crusher and will have a cyanide annex. The old mill had a cyanide plant in connection with it, and some of the tanks used in it will be set up in the new plant. The mine continues in operation and high-grade ore has been taken from its levels and shipped. The shaft is 300 feet deep, with crosscuts and levels from surface to bottom. There are 15,000 tons of ore on the dump ready to be run through the mill and ore blocked out in levels.

Silver Bow County.

The mine property bought by J. C. Cory in Mitchell gulch, near Helena, has been turned over to its new owner, and, with a clean ditch, a strong head of water is flowing that is expected to last until late in the fall. The prospect is good for the season's run. Below the Cory group Young Bros. began on their placers last week. They have a ditch.

All of the principal mines of Butte are at present in operation, says the Record. These mines include those of the Anaconda C. Co., Boston & Montana C. & S. M. Co., Butte & Boston Co., Washoe C. Co., Parrot Co., Pittsburg & Montana M. Co., Colusa-Parrot Co., Speculator Co., Colorado C. Co. and the United C. Co., the latter of which takes in the property of the Montana Ore Purchasing Co., the Hypocka Co., the Johnstown M. Co., the Cora & Rock Island C. Co. and the Basin Reduction Co. Outside of these corporations, there are several other companies operating on a smaller scale, one of which is the Reins C. Co., which is developing the Combination claim in Meaderville; the Brittania Co., the property of which, southwest of the city, is being worked under lease, and the Butte C. M. & S. Co., the property of which, the Dutton mine, is being worked under lease. The Lexington M. Co., the Alice M. Co. and the Moulton, silver and gold producers of the district, are doing little, so far as reduction of ore is concerned, but all of their claims are yielding ore under the leasing system. The east end of the Lexington contains copper ore, but it is said no portion of the veins of either of the two companies contains this class of rock in commercial quantities. In addition to these mines of the companies, there are other claims from which large quantities of ore are being extracted by individuals. The Sunnyside, under lease, is yielding good rock; the Wild Bill, also under lease, is another producer, and also the Old Glory, in Centerville. The latter is owned by the Amalgamated C. Co., J. B. Leggat and F. A. Heinze. The Ophir is also yielding ore, but the mine is not being worked extensively. —— The daily output in the Butte district is estimated at 13,000 tons, of which quantity the Amalgamated Co. mines 9700 tons, the United C. Co. 1500 tons, W. A. Clark 1000 tons and the other companies and individuals 800 tons.—— F. A. Heinze is putting in a larger air compressor for his Cora mine.

NEVADA.

Churchill County.

Oil is reported struck in the new town of Fallon in Churchill county. The strike was made on the property of R. L. Douglas at a depth of 40 feet. Fallon is said to be located at the point of greatest depression in the State.

Esmeralda County.

Superintendent Colcord of the Esmeralda Con. M. Co. reports the mill running steadily, with fifteen stamps dropping.

C. D. Lane of San Francisco, Cal., has an option from F. M. Ish at Diamondfield, near Goldfield, on two claims for $200,000. Men have been put to work by Lane, with C. W. Tozer in charge, to develop the property. The claims are Black Butte, Nos. 1 and 2. They adjoin the Vernal M. Co. ground near the Harvey lease. The agreement contemplates the installation of a stamp mill. Lane says the water question will not bother him, but he will pipe water from White mountain or Rye Patch.——The pay streak in the Sweeney & Hennessey lease on the Florence group is reported maintaining satisfactory values. The coarsest gold in the camp is said to be found there. —— The January is taking out values to exceed $2500 per day.——The Combination is hoisting good grade of sulphide ore and shipping large quantities weekly. —— The completion of the pipe line from above Rabbit springs has brought a supply of living water for Goldfield. —— Goldfield, an engraving from a recent photograph of which is shown on page 345 of this issue, is 28 miles south of Tonopah and west of the Nye county line. The principal properties include the January-February group, the Combination, the Jumbo, Blue Bull, Daisy and Red Top. The January is under lease to Z. Kendall, Reilly, Jones & L. L. Patrick. The January and the Combination are as yet the only shippers of much ore. J. F. Bradley has a lease on the Red Top near the base of Columbia mountain.——In the Combination the drifts from the 135 and the 185-foot points are being driven ahead. The Combination is held by the Marquette Exploration Co. of Chicago, Ill., on a $75,000 bond.—— The camp is 60 miles from a railroad, but when the road gets into Tonopah in June it will be only 20 miles from railroad transportation.

Humboldt County.

At the Sheba mines, south of Mill City, the mill is running and turning out concentrates. The company has under construction a gravity tramway, ½ mile in length, which will connect the lower tunnel with the mill. C. D. Morrison is superintendent of the mine and mill of the Sheba G. & S. M. Co., operating the group. Samples which show the presence of silver have been taken from the face of the south drift off the lower tunnel, at which point are 2 feet of ore.—— At the De Soto mine, adjoining the Sheba, work has been started with a few men, who are taking out ore.

Lincoln County.

The work of putting in plants at the April Fool and the DeLamar tailings dumps at DeLamar has been started. It is estimated that there are 500,000 tons in the dump averaging $2.50 per ton, which can be treated at a net profit of $1 per ton.

At Knob Hill, 18 miles north of Searchlight and west of El Dorado, the Knob Hill G. M. Co. reports work progressing. Since absorbing the Wagner mines the company owns twelve claims, together with a 3-stamp mill and water rights. Manager L. W. Walker reports that he is making mill tests on the Daisy Bell ore. He finds that only part of the values are saved on the plates and that the bulk are in the concentrates, which he will ship. The main shaft on the Daisy Bell is down 105 feet. W. P. Dewey is president of the company.

The Iyanough M. Co. of Searchlight has been incorporated to work in Camp Duncan, near Searchlight, by P. Thacher, C. D. Houghton et al. of Los Angeles, Cal. They have taken over the O. K. group, consisting of the O. K., Peek-a-Boo and the Peek-a-Boo No. 2. P. Thacher is manager. Assays show gold, silver, lead and copper values. A contract has been let to sink a 100-foot shaft on the O. K.

Nye County.

The Tonopah stamp mill at Tonopah has resumed operations after being shut down eight weeks for alterations and repairs.

The annual report of the Tonopah M. Co. of Tonopah, submitted to the stockholders last week, shows that notwithstanding the fact that the mine development has been discontinued since January 1, 1904, the net returns received from ore shipments for the past fiscal year aggregate $598,224. The management has discontinued further development work till the railroad is completed to the camp. It is expected to have the road in operation for the full 60 miles separating Rhodes and Tonopah by July 1. The report of President J. W. Brock covers the operations of the company for the fiscal year closing February 29, 1904. The company is having practical tests made of the ores found in its property, both at the mines and elsewhere. An experimental plant to treat the ores coming from this company has been built at Waverly, N. J. The following work was done during the year: Sinking, 1884 feet; drifting, 4631 feet; crosscutting, 2028 feet; raising, 286 feet. During the year 15,000 tons of ore were hoisted through the shaft, as well as 22,687 tons of waste. During the same period 4066 tons of ore were shipped and 11,228 tons of ore placed on the dump. Since the first of 1904 the operations at the mine have been limited to the shipment of such quantities of ore as could be transported on a favorable basis. The report states that the company has closed a contract with the American S. & R. Co. for the sale of 100,000 tons of ore, with the option on the part of the smelting company to buy an additional 50,000 tons on a basis, both as to smelting and transportation charges, that will enable the company to realize from the medium grade ores produced a better result than could be obtained by milling from any of the processes thus far tried. The contract will commence to show results from the first of June. The Tonopah Railroad, being built by the Tonopah M. Co., is to have a 3-foot gauge, corresponding with the road it connects with, and is being laid with 50-pound rails. For present requirements three locomotives and thirty-five 20-ton freight cars have been secured to start iuitial shipments. The receipts for the year were as follows: Balance March 1, 1903, $187,329.10; receipts from smelter for ore, $598.224.29; royalties, $12,430; other receipts, $4821.03; total, $802,804.42. The disbursements, including operation, mining, superintendence, machinery, insurance, taxes and freights, total $480,-404.74. F. A. Keith succeeds F. J. Siebert as superintendent and T. L. Oddie has been appointed general agent.

NEW MEXICO.

Grant County.

(Special Correspondence).—Near Lordsburg there is little work being done at present. The American Con. C. Co. has a concentrator at Lordsburg, and it is expected the mine will be opened up by June 1st. The concentrator is equipped with four Huntington mills, four Wilfley tables, three Standards, one Bartlett and a 65 H. P. Corliss engine and 80 H. P. boiler.

F. J. Campbell and W. Blackburn own the Nellie Bly group of three claims in Pyramid mining district, 9 miles south of Lordsburg. There are four shafts, respectively 60, 60, 90 and 75 feet deep, with several hundred feet of drifts and showing bodies of sulphide copper ore. Development is in progress.

Lordsburg, May 15.

Superintendent Patterson of the American Con. C. Co. has started work on the company's mines at Lordsburg.

OREGON.

Baker County.

It is expected extensive placer mining will be carried on on Eagle creek, near Baker City, during the coming season, says the Democrat. The Hillsboro Placer M. Co., of Hillsboro, after having tested the ground and performed preliminary work last season, is preparing to increase work. The company owns the Merritt ditch. They will repair it and increase its capacity to 3000 miner's inches. A hydraulic elevator will be put in. The holdings consist of 250 acres of auriferous ground, seven claims having been acquired by purchase and the remainder by location.

The Red Boy mine, near Baker City, was last week sold by the receiver, under order of the court, being bid in by A. Prussing of Chicago, Ill., at $80,000. Reorganization will be effected and operation resumed.

At his Monumental mine, near Sumpter, C. J. Allen is preparing for the season's operations. The roads are improving sufficiently to permit preliminary work. The Monumental stamp mill, with its roaster, pan amalgamators and silver devices, will be converted into a plant for saving gold and silver values by amalgamation and leaching. The ore bodies in the mine have been proven on the lower level, and raises were made through to the upper or old level last year.

Either a 10-stamp or Chilean mill of about same capacity, with concentrators, cyanide percolating tanks and slimes agitation plant, will be put in by the Mountain View G. M. Co., near Sumpter, this season, says W. Techow, manager. The power plant for the mill will be gasoline, as wood would be costly at the altitude of the Mountain View. Should the Rock Creek Co. deliver electricity in the Cracker basin, that would be considered by the management. The Mountain View is a Portland company, composed of H. M. Cake, H. L. Pittock et al. It has been developed by crosscuts, shafts, raises and drifts until depth of 300 feet has been attained on the vein. A shaft is being sunk below the lower adit level to prove depth of ore body. Development will be continued steadily while the milling plant is being set up.

H. M. Cake, president of the Mountain View mine, near Sumpter, reports it is the company's intention to build a mill on the mine this season.

Gleason & Doane are arranging to start development work on their Buckeye group in Rock Creek district, near Sumpter.——The Cracker-Highland mine, near Sumpter, has changed its general offices from Sumpter to Portland, with W. G. Perkins as secretary.

Crook County.

The Oregon King mine has been taken over by the Geiser-Hendryx Co. of Sumpter, says A. Geiser. He is arranging for opening work and effecting improvements with a view of increasing the output of shipping product and concentrating the milling grades of ore. Manager Hendryx says a milling plant is proposed, and it is intended to build a concentrator of 200 tons daily capacity. Mine equipment will be looked to first. The Oregon King has been regarded as a silver producer, with gold values and a percentage of galena. Hendryx says gold will dominate. The mine has been opened by a shaft 600 feet deep, from the six stations of which drifts have been extended on the lode and numerous crosscuts made. This lateral work is said to have proven the mineralized zone is 600 feet wide, and through it run veins carrying ore bodies of 4 to 16 feet in width.

Josephine County.

A company is being formed by H. Perkins et al. to operate on Mt. Reuben creek, near Leland. A saw mill is being built on the creek. Hoisting works will be put up to handle the boulders. The miners report having done well this winter, as they have had a long run and more ground washed than before. On Jump-off-Joe creek, Superintendent Crane of the Lucky Queen is running two tunnels—one over 100 feet. He has struck paying ledges in both tunnels. Rich rock is sacked up to send away for milling. The property is under bond. It is expected a mill will be built. Across the creek is the Dick mine. The owners have run a tunnel 200 feet.

The Golden Drift M. Co., of Grant's Pass, shipped last week six bars, weigbing twenty pounds in the aggregate, representing one-half of the annual cleanup for these mines for the season, says the Telegram. But one giant was operated and this one but for thirty-five days. The six bars are valued at $5000, and aside from these Manager Ament says he bas picked up a number of nuggets and larger pieces. All the gold from the Dry Diggings, which is the field covered by tbe placers of the Golden Drift Co., is said to run over 900 fine. Nearly all the sluices and the boxes are yet to be cleaned up. The Golden Drift Co. will put men to work next week completing the power dam across the Rogue river below the Dry Diggings, and to place the heavy machinery — pumps, turbines and power plant equipment — next season. Three giants will be operated.

In Galice district, near Grant's Pass, among the hydraulic properties that are working is the Royal Group, formerly the Old Channel. These placers are under management of J. R. Harvey. Two 6-inch giants, under a gravity pressure of 500 feet, are operated, and this battery will have ample water till late in June. The Galice Con. Co. is preparing to make available for pipe and giant all the territory recently added to its holdings at the mouth of Galice creek. The main ditch is being extended, and with the 1000 feet of new piping that will be laid, all of the ground at lower end of the creek and out on Rogue river bar will be in reach of the giants. A tubular elevator will also be put in, says Manager A. B. Cousin. The battery of three giants is in steady operation.——T. K. Anderson is operating the Harmon & Green hydraulic mines under lease this season. Two giants are operated and the water supply is expected to hold out till July 1st. —— The Rocky Gulch placers are operated this season by Lewis & Jewell. The main body of the gravel of this group lies along Rogue river.

Lane County.

L. Zimmerman, of the Lucky Boy mine at Blue river, states the mill will begin dropping its forty stamps this week.

SOUTH DAKOTA.

Lawrence County.

Work of unwatering the workings of the Dizzy M. Co. at Maitland is completed and development work will be resumed.

The territory of the Potsdam M. Co. in the lime belt of the Ragged Top plateau, west of Lead, is surrounded on two sides by the Spearfish G. M. & R. Co., operating a 250-ton cyanide mill, and the Deadwood-Standard G. M. Co., running a 100-ton mill. The Spearfish company has developed two ore deposits, one on the surface of the lime having a known length of 1500 feet, and average thickness of 12 feet. Underlying the surface ore shoot, another of equal proportions and value is developed 34 feet lower down; on still another floor below the latter the third deposit is being developed. These, the Black Diamond ore bodies, and other developments are said to be estimated to give the Spearfish company five years' run of ore for the mill of 250 tons daily capacity. The output of this mill is about $40,000 per month. Across John-

son gulch from these deposits, and bounding the Spearfish company on the west, is the Potsdam ground of 550 acres, extending on the east to within 400 feet of the Spearfish mill, adjoining the Gold Hill Co. on the south, the Deadwood-Standard on the southeast, and Spearfish creek on the west. Ore is shown in open pits, drifts and shafts at points on the Potsdam ground. Among recent developments is an open pit being driven from the escarpment of the plateau overlooking the Spearfish, into the surface blanket, showing 20 feet in thickness of ore, from the surface down. The cut has penetrated this ore 60 feet. The canyon of Spearfish creek, which surrounds this group of mines on the west and northwest, shows the Carboniferous lime formation to have a thickness of 700 to 800 feet overlying the Cambrian shales and quartzites and limestones.

UTAH.

Beaver County.

M. Lorin and C. Morrison, who are developing the Indian Queen group of mines 1½ milo from Newhouse, report work progressing with satisfactory results. The tunnel with which it is proposed to tap the ore-bearing channel in the Queen on its dip has advanced 100 feet, with connection to be made at a point 200 feet farther in. The ores contain silver, lead, copper and gold.

Iron County.

Manager Wobber, working the Good Hope mine, 2 miles above Stateline and on the main road to the Deer Lodge district in Nevada, has a bond and lease on the Creole mine at Stateline and has men at work there. This property has been idle for five years.

Manager C. E. Milner, of the S. B. Milner iron lands, says little is being done on the property at present. He proposes first to secure patents for the ground before doing anything on a large scale. The Colorado Fuel & Iron Co., he states, has started prospecting at Desert Mound with diamond drills. The machinery has capacity for depth of 1500 feet. At least four drill holes will be put down at Desert Mound, to ascertain the thickness and further determine the value of the deposits there.

Juab County.

The headquarters of La Reine M. Co., operating near Eureka, will be at Provo hereafter, with R. E. Allen, secretary, in charge. Plans are being perfected for the consolidation of the property with that of the Bullion-Beck Tunnel Co.

Salt Lake County.

The Alta-Peruvian M. & M. Co. has been incorporated to operate a group of mining claims in Little Cottonwood mining district, near Alta, viz., the Utah Nos. 1, 2, 3 and 4. The officers are F. J. McAuliffe, D. O. Ashcroft, J. Henderson, A. Johnson, W. A. Warthen and T. R. Kelley.

The management of the American S. & R. Co. proposes the addition to its smelter at Murray of two furnaces, says the Salt Lake City Reporter. This will give the plant a battery of ten furnaces and a capacity of 2000 tons of ore per day.

To meet the requirements of an increased output and the levy which is being made on its Murray smeltor, near Bingham, the American S. & R. Co. will, as soon as conditions permit, add two more furnaces to the battery of eight now in commission. The increase in production of lead ores within this jurisdiction has caused necessity for this, says Manager Whitney. With two more furnaces, such as designed, the capacity of the Murray plant will have been increased 25%, enabling it to reduce a volume of ore exceeding 2000 tons daily.

Manager Wiswall, local representative at Salt Lake City of the Green Reduction Co. of New York, which has a lease on the tailings dumps on the Geyser-Marion mine and mill, near Bingham, says preparations for starting the Geyser-Marion mill are being made.

Figures given to the stockholders of the United States M. Co. last week place the cost of the lead smelter under construction at Murray at $500,000. It is figured the company will derive a net profit from this source of $250,000 per annum.

Summit County.

J. McGregor of Salt Lake City, manager of the Pinyon Ridge M. Co., says he is preparing to start work on a tunnel that will ultimately penetrate the ore zone for 10,000 feet.

The superintendent of the New York mine of Park City says the raise from the 400-foot level on the west has broken into 12 feet of ore, assaying fourteen ounces silver with some gold.

Tooele County.

Superintendent E. J. Raddatz of the Honerine mines at Stockton reports the water coming out of the tunnel shows no signs as yet of receding. It continues to pour out of the adit at rate of 9000 gallons per minute.

Uinta County.

J. McAndrews of the Gilson Asphaltum Co. of St. Louis, Mo., owning asphaltum mines near Duchesne, says, pending construction of the line of railway between Mack, on the Rio Grande Western, and the mines, a distance of 54 miles, the production of the hydro-carbons has been practically suspended. However, this will be resumed as soon as connection with them by rail is effected, and the material will be produced from five different sources.

Utah County.

T. P. Rigney, manager of the ozocerite or "mineral wax" mines and reduction works at Soldier Summit, says he will resume sinking and establish another level at depth of 275 feet, or 100 feet below the present workings. He has been forwarding the output to New York and Germany.

WYOMING.

Carbon County.

A. Fehringer of Colorado Springs, Colo., has started work on the Home Run C. M. Co.'s properties, near Grand Encampment. This company owns sixty acres adjoining the Rudefoha mine and is said to be on the same dike as the Rudefeha. The company expects to get shipping ore during this season.

FOREIGN.

AUSTRALIA.

New South Wales.

At the Proprietary mine at Broken Hill the second of the three hall ore-dressing mills has been put in operation with satisfactory results reported. Shipments of sintered material have been increased from 1000 to 1500 tons weekly, while at Port Pirie another smelter has been blown in, and the production of bullion correspondingly increased. The new zinc plant is nearing completion.

Two of the imported blowers for the new nickel works, Dapto, have arrived at the smelting works, and the finishing touches are being put upon the newly erected stack.

Queensland.

Baker Brothers have taken over the Queen Silver mine, on the Severn river, near Stanthorpe, and they propose to unwater the mine, open it up and concentrate the ore. The mine is within 100 yards of river water supply.

Plant's Day Dawn Deep mines, at Charters Towers, has arrangod to build a surface plant, winding gear and compressor, at a cost of £11,000.

Cairns reports state there is activity in the wolfram market, and at the wolfram camp at Lappa Lappa the ore is bringing £70 on the field, and four miners secured nine tons in six weeks.

Victoria.

The Long Tunnel incline shaft, at Walhalla, has reached a total depth of 2240 feet.——The deepest gold mine in Victoria is reported to be the New Chum Railway, at Bendigo, which is 3896 feet deep.

During a period of five months, ended January 9th, the Ovens Valley Dredging Co., at Bright, handled 119,850 cubic yards of dirt for 680 ounces gold, equal to about forty-one ounces per week of the actual time worked. The profit on operations was £1483 15s 3d, and, after writing off £1292 5s 5d for repairs to dredge, a balance remained of £869 18s 1d.

Application has been made by the Iron, Steel & Metals Mfg. Co., Ltd., of Melbourne, for lease of the land containing the iron ore deposits at Lal Lal, formerly held by the Federal Iron Co. The company is adding the area to the concessions it already holds outside of the Commonwealth. The method of reduction adopted is said to be direct from the ore to steel or wrought iron, without requiring an intermediate stage to produce pig iron. Works are being completed in Melbourne for production of the metals on a commercial scale.

BRITISH COLUMBIA.

Boundary District.

During the first four months of 1904 the Boundary district sent out 280,000 tons of ore. The tonnage for month of April was smaller than for March, repairs to several furnaces at the two smelters, after long and successful runs, being accountable for this. In March the total shipments from Boundary mines were 72,000 tons. In April the total was 60,000 tons. The following are the figures from the different mines for the month of April: Granby mines, 42,870 tons; Mother Lode, 14,144 tons; Emma, 640 tons; Oro Denoro, 2214 tons; miscellaneous, 150 tons; total, 60,018 tons. The following are the monthly totals to May 1: January, 75,458 tons; February, 72,007 tons; March, 72,651 tons; April, 60,018 tons; total for four months, 280,134.

Cassiar District.

The Bull Creek Hydraulic & Dredging Syndicate, near Atlin, will resume operations this week, under management of A. Carmichael, says the Atlin Claim. Men with supplies have gone out to the property, and it is expected piping will start by June 1st.

East Kootenay District.

Control of the mines of the Sullivan Co., near Fort Steele, has been taken over by C. Sweeny of Spokane, Wash. The finishing work on the smelter will be started next week and the smelter and mine put in operation. The mine is at Marysville.

Rossland District.

(Special Correspondence).—The annual report of the Rossland Board of Trade for March, 1903-March, 1904, shows the following details of the output of Rossland mines for 1903:

Mine.	Tonnage.	Gold Value.	Silver Value.	Copper Value.	Gross Value.
Le Roi	194,151	$1,326,621	$46,072	$561,818	$1,935,441
C'nt'r Star	82,257	747,303	16,327	205,275	968,905
War Eagle	60,093	518,943	32,803	228,026	780,672
Le Roi No. 2	21,314	.....	.....	.....	325,981
Jumbo	4,395	52,740	.....	.....	52,740
Spitzee	450	3,517	238	1,745	5,500
L. N. L.	2,000	12,000	.....	.....	12,000
Ross.-Koot	7,489	81,460	266	4,737	86,463
Velvet	3,376	.....	.....	.....	67,520
Iron Horse	40	.....	.....	.....	320
Wh'e Bear	300	1,550	79	1,608	3,237
Giant	643	11,410	4	.....	11,414
O. K.	25	625	.....	.....	.....
Homest'ke	90	300	175	200	675
Totals	366,625				$4,251,393

According to the statement of the Associated Boards of Trado, the ostimated value of mineral produced in southern Kootenay and southern Yale in 1903 reached a total of $9,881,639.10, of which Rossland produced $4,251,463.

The following is a statoment (in feet) of the amount of development work done in the mines mentioned during the year 1903:

Mine.	Shafts.	Drifts and Cross-cuts.	Raises.	Diamond Drilling.	Winzes.
Le Roi	140	6,264	588.5	6,125.5	69
War Eagle	..	1,125	125	1,200	23
Center Star	..	1,844	230.5	1,800	79
Ross-Kootenay	..	1,121.8	71.1	....	210
Jumbo	15	250	....	....	...
Spitzee	120	500	....	....	03
Le Roi No. 2	..	1,200	....	3,900	...
Giant	..	135	....	....	...
White Bear	350	4,000	....	....	...

The number of men employed in the principal mines of Rossland in 1903 were:

Le Roi	350
Center Star	138
War Eagle	130
War Eagle and Center Star Concentrator (construction)	70
Le Roi No. 2	150
Jumbo	30
Spitzee	18
L. N. L.	7
Rossland-Kootenay	50
Giant	12
Velvet	40
White Bear	36
Homestake	10

Rossland, May 15.

Slocan District.

For $20,000, the Donelly group at Sandon has been bonded by R. Watson and J. Young. There are seven claims on which considerable work has been done. The group is within the city limits of Sandon and a railway runs near its upper tunnel.

Vancouver Island.

(Special Correspondence).—The Tyee C. Co., Ltd., at Duncans Station, reports the smelter returns for month of April as follows: Smelter ran 30 days; 6715 tons of Tyee ore smelted, giving a return after deduction of freight and refining charges of $80,373. C. Livingston is local director.

Duncans Station, May 14.

The following were the foreign coal shipments from the Nanaimo and Extension mines during the month of April, says the News-Advertiser: Western Fuel Co., 16,972 tons; Extension (Wellington Colliery), 30,135 tons; total, 47,107 tons.

West Kootenay District.

Arrangements have been made for a $20,000 double-rope aerial tramway by the owners of the Triune mine, near Trout Lake, in the Lardeau. The tramway will carry the ore from the mine to the wagon road and do away with rawhiding ore down the mountain side. The mine will also be equipped with air compressor and drills and new buildings are to be put up. The average value of Triune ore is said to be $145 a ton. Last year 11,378 tons were shipped from the mine and the returns were $16,000. The Triune mine is on Triune mountain and is owned by the Metropolitan M. & Dev. Co. of Detroit, Mich.

BRITISH GUIANA

The surtax of 5% heretofore prevailing has been repealed and among others the following articles have been transferred to the free list until March 31, 1905: Rails used for mining purposes and mechanical tools, writes G. H. Moulton, U. S. Consul at Demerara.

CANADA.

Quebec.

U. S. Consul-General W. R. Holloway, of Halifax, Nova Scotia, transmits the followiug from the Halifax Review: Minerals containing radium have been found in the Province of Quebec. The ore from which radium and oxide of uranium have been extracted was taken from a white-mica mine, 18 miles back of Murray bay, in Charlevoix county. White-mica deposits exist at several points in Quebec and eastern Ontario, and these will be developed next summer by an electrical company.

MEXICO.

Chihuahua.

The Pan-American M. & S. Co. is shipping from its Grenadena mine, near Parral, two carloads of ore daily. This ore averages per car 20 grams gold, 600 grams silver and 3% copper, says the Enterprise. They have put in a 60 H. P. hoilor. The company is sinking a new three-compartment shaft on the Iguana mine. This company is shipping from sixty to ninety tons of ore daily from the Quebradillas mine that averages sixty ounces silver and some gold. It is making extensive improvements on the Quebradillas and has two 60 H. P. boilers, a 320-gallon station pump and a sinking pump on the ground, to be set up.

J. D. Knotts is working his Santa Romana gold mine near Guadalupe y Calvo in the southwestern part of the State. He is preparing to put in machinery for a 5-stamp mill and will use plate amalgamation and cyanide.

Near Morelos, B. F. Deathridge, C. D. Hovoy and T. C. Shoemaker of Kansas City, Mo., interested in mining property near Morelos, report development under way. They have a small Huntington sampling mill up and additional machinery will be put in this summer. The company is the Southern M. Co.

C. Barbier and F. Ramirez have the Burns mill at Buenos Aires, in the Cusihuiriachic district, running on ore from La Reina mine.

The new company owning the Pinos Altos mines at Pinos Altos, of which E. M. Ray is manager, is preparing to enlarge the 60-ton mill to 250 tons with a cyanide plant.

Coahuila.

J. J. Murphy of Murphy & Ihlsing, of Chihuahua, is building reduction works and concentrating plant at Muzquiz. The firm has leased some old Spanish mines and dumps which will be treated.

The Mazapil C. Co. of Manchoster, Eng., has been granted a concession for building a smelter at Saltillo. They propose to put in two 100-ton furnaces.

Mexico.

El Oro M. & R. Co., at El Oro, reports for the month ending March 31 mill ran twenty-nine days, crushed 9397 tons, producing from 100-stamp mill $124,177; producing from cyanide plant, $3,774. Total production, $127,951. Working expenses and development were $61,854. The profit from the railway for the month was $11,000. There has been expended on permanent improvements $34,924, including $30,880 expended on new mill.

Michoacan.

The Luz de Borda mine at Tlalpujahua reports a strike of high grade gold and silver ore. B. von Steinaecker is superintendent.

Sonora.

The Transvaal M. Co., O. L. Neer superintendent, will build a silver-lead smelting plant at Cumpas for the treatment of its ores. It is stated the company has 300 men at work on development.

Near Cerro Prieto, in Magdalena district, a Los Angeles, Cal., company is developing the San Francisco and La Maria gold mines. E. A. Grey of Los Angeles, Cal., is part owner.

M. P. Wright and F. Smith of Nogales, Ariz., have taken Los Amigos mining group, east from Llano station, on which they are doing development work. They have a 6-foot ledge giving assays of $15 in gold.

The Cieneguita placer properties, near Altar, formerly held by the Henrietta M. Co. of Washington, D. C., which corporation permitted the lapse and forfeiture of their denouncements, have been redenounced by A. F. Solano, B. Koering et al. of Magdalena, who will develop and operate them.

Operations are under way at La Brisca placer fields of W. C. Greene of Cananea. This gold placer field is on the San Miguel river, near Cucurpe, 75 miles southeast from Magdalena. Supplies and machinery are being freighted in.

E. Verrue, superintendent of the Richfield M. Co., is developing copper mines 12 miles east from Tuape, on the San Miguel river in northern part of the Ures district, near Magdalena district line. There are forty-five men at work in the Richfield camp. There is said to be on

the dump 40,000 tons of high-grade copper ore which has been taken out in course of development work. In grading for two hoists copper ores were uncovered.

Twenty miles east from Imuris, H. P. Griswold, C. H. Sherman and M. Diaz of Magdalena are working the Caballo Rosio mine, an "antigua" property, on which there is considerable old working — one shaft being 110 feet deep. The property includes fifty pertenencias, through which runs a 4-foot ledge, carrying lead, copper, gold and silver. — H. P. Griswold of Magdalena has received titles for the Anita mines near Cucurpe, in Magdalena district, near the San Miguel river. They include thirty-four pertenencias, through which run several ledges, carrying gold, silver and copper. The ledges vary in width from 10 feet to 130 feet, and into them Griswold says he has put 1000 feet of development work, principally tunnels. The Anita is an antigua mine (the Aguirre).

W. O'Neill and L. Coombs of Hermosillo bave bought the Monterey group of mines near Sahuaripa for $20,000. Under terms of tbe contract operations will begin before June 1. Ore has been already developed and further development will be done. The Monterey group has facilities for economical reduction of ores. An extensive water power is 3 miles from the mine, on the Yaqui river, where there is a site for a reduction plant, to which a tramway from the mines could readily deliver ore.

RUSSIA.

U. S. Consul Cbambers, at Batum, reports tbe following figures for output of all petroleum products from Baku district in 1903:

Month.	Illuminating. Gals.	Lubricating. Gals.	Residuum. Gals.	Crude. Gals.	Total. Gals.
January	46,000,000	3,880,000	13,490,000	4,150,000	67,525,000
February	38,795,000	6,455,000	16,570,000	3,565,000	65,385,000
March	68,310,000	7,020,000	128,880,000	11,820,000	210,940,000
April	76,440,000	7,880,000	193,760,000	14,350,000	291,470,000
May	71,175,000	8,710,000	214,880,000	14,040,000	308,805,000
June	67,415,000	7,540,000	213,255,000	15,215,000	303,425,000
July	60,925,000	5,750,000	187,055,000	25,915,000	280,255,000
August	74,420,000	7,940,000	197,410,000	19,340,000	299,110,000
September	73,655,000	7,855,000	180,045,000	14,950,000	276,505,000
October	64,025,000	8,615,000	148,010,000	6,080,000	222,280,000
November	47,790,000	6,170,000	15,580,000	1,485,000	71,025,000
December	42,940,000	5,200,000	17,500,000	485,000	66,525,000
Totals	731,790,000	83,005,000	1,522,765,000	132,025,000	2,403,650,000

The total product for 1902 was 2,554,775,000 gallons. Total number of wells in the Baku fields on Dec. 31, 1903:

Condition of Wells.	Balakhani-Sabunchi.	Ramani.	Bibi-Eibat.	Total.
Producing	1,133	159	128	1,420
Trial pumping (exploitation)	18	4	5	27
Drilling	196	67	95	358
Drilling deeper	53	17	26	96
Cleaning out and repairing	169	48	40	257
Standing idle	1,096	134	46	1,276
Totals	2,665	429	340	3,434
Rigs ready for drilling	38	3	7	48

The total number of wells Dec. 31, 1902, was 3431, with 53 rigs ready for drilling. Wells completed, with average depth and average daily production for month:

Month.	Wells. No.	Average Depth. Feet.	Avera'e Produc'n. Barrels.
January	11	1,499	377
February	9	1,232	256
March	11	1,225	304
April	19	1,305	353
May	24	1,260	610
June	23	1,162	265
July	10	1,484	320
August	17	1,295	156
September	29	1,260	263
October	10	1,386	302
November	16	1,470	268
December	10	1,450	169
Totals	189	1,296	317

The total number of wells completed in 1902 was 236; average depth 1302 feet and average daily production of 292 gallons.

Trade Treatises.

Dean Bros.' Steam Pump Works, Indianapolis, Ind., send a specimen of art, depicting their several makes.

Dixon's Ticonderoga Graphite Grease is described in a leaflet issued to those interested in lubricants by the Jos. Dixon Crucible Co., Jersey City, N. J.

Personal.

C. H. FENNER of Sumpter, Or., is in Tonopah, Nev., on mining business.

J. M. DAVIDSON, a mine owner of Yreka, Cal., is in San Francisco, Cal.

E. HILDERBRAND, a mine owner of Tepic, Mexico, is in San Francisco, Cal.

H. E. ROBINSON is superintendent P. I. Mining Co., Manila, P. I., U. S. A.

F. W. HOAR of Globe, Ariz., is in Michigan visiting the Lake Superior copper section.

J. S. BROWN of Duluth, Minn., is examining his mining interests in Baker county, Or.

H. K. WHEELER of Los Angeles, Cal., is examining gold properties in Nye county, Nev.

W. E. DOWNS, a civil engineer of Sutter Creek, Amador county, Cal., is in San Francisco, Cal.

G. MOORE of Salt Lake City, Utah, inventor of tbe Moore slimes process, bas gone to Europe.

E. W. GRIFFITHS and G. Wilson of Salt Lake City, Utah, are examining mines in Nevada.

M. BIEN of the United States Geological Survey is in San Francisco, Cal., from Washington, D. C.

O. A. TIBBITTS of Salt Lake City, Utah, is in southern Arizona sampling a copper proposition.

A. MCLEAN of the Enterprise mine of Trinity county, Cal., bas gone to Australia on mining business.

H. A. COHEN of Salt Lake City, Utah, is in California on mining business after an absence in Alaska.

F. MANDEL of Hailey, Idaho, returned tbere last week from a business trip to Salt Lake City, Utah.

D. R. FINLAYSON, JR., of Reno. Nev., will go to Chihuahua, Mexico, where he will engage in mining.

W. KILEY is superintendent of tbe London mine operated by the Gilpin M. Co., near Central City, Colo.

J. W. DUNN of Brandon, N. D., is visiting mining property in Crook county, Or., in which he is interested.

L. T. WRIGHT, general manager of the M. C. Co., returns from London, England, to Keswick, Cal., this week.

D. R. THOMAS is superintendent of Le Roi Two C. Co. mines at Rossland, B. C., vice F. J. Stevens, resigned.

E. M. HOLLAND of Sonora, Cal., interested in Tuolumne county mines, is in San Francisco, Cal., on business.

H. C. BOSWORTH of Denver, Colo., proposes to engage in the business of assay supplies in the City of Mexico.

BERNARD MACDONALD, manager of the Cornucopia mines near Sumpter, Or., is examining mines in Mexico.

WM. MAGENAU bas taken an engagement as cyanide metallurgist for the Rossland Power Co. of Trail, B. C.

A. L. JACOBS of Salt Lake City, Utah, manager Butler-Liberal mines, has returned from a trip to Germany.

STATE MINE INSPECTOR BELL of Idaho has returned to Boise from a business trip to Salt Lake City, Utah.

F. HARRIS of Salt Lake City, Utah, interested in mining in eastern Oregon, has gone East on mining business.

WALDEMAR LINDGREN has completed the resurvey of the Cripple Creek, Colo., district and is in Washington, D. C.

A. H. MAYNE of Salt Lake City, Utah, has gone to Sodaville, Nev., to manage an Esmeralda county mining property.

B. E. BURNETT is manager of the Racine M. Co. of Racine, Wis., operating at Bowerman, Gunnison county, Colo.

L. COCHRANE of Denver, Colo., is in Mexico looking after the assay department of the Mine & Smelter Supply Co.

C. T. CARNAHAN returned to Leadville, Colo., last week from an extended trip through the mining sections of Mexico.

J. T. THOMPSON is superintendent of the Kenross mines at Whisky Slide, near Mountain Ranch, Calaveras county, Cal.

G. P. WILSON is president of tbe Golden Income M. & I. Co., operating near Del Norte, Rio Grande county, Colo.

J. W. BURTON of Salt Lake City, Utah, is in Piocbe, Nev., inspecting recent developments at the Pioche-Nevada Con. mine.

E. F. FREUDENTHAL, manager of the Manbattan M. Co. group of mines, near Piocbe, Nev., has returned from an Eastern trip.

V. H. ROOD, vice-president and general manager Jeanesville Iron Works, has returned to Jeanesville, Pa., from a California visit.

S. MCINTYRE, president and manager of the Mammoth mine of Tintic district, Eureka, Utah, returned last week from the West.

C. KIRCHEN, assistant superintendent of the United States smelter at Bingham, Utah, returned last week after a visit in New York.

A. FEHRINGER of Colorado Springs, Colo., is at Grand Encampment, Wyo., resuming work on the Home Run C. M. Co.'s mines.

J. H. COX is in Denver, Colo., after a three years' stay in Seckondi, West Africa, where he is manager of mines for an English company.

E. H. STAGG, manager of the Bagdad M. & M. Co., operating at Bagdad, San Bernardino county, Cal., has gone East on a business trip.

A. E. CHODZKO, M. E., has returned to San Francisco, Cal., from Shasta county, Cal., where he went to make examination of mining property.

T. H. OXNAM of Los Angeles, Cal., of the Palmarejo & Mexican G. F., Ltd., operating in Mexico, is in London, Eng., on company business.

R. B. STANFORD is manager of the Ranch G. M. Co. operating the Doyle & Woodside gravel mines, near Columbia, Tuolumne county, Cal.

L. D. SIVYER, a mining engineer of Los Angeles, Cal., is in San Francisco on professional business in connection with mines in Tuolumne county, Cal.

G. A. HANCOCK last week returned to Salt Lake City, Utah, after an extended visit in tbe East and will again devote his attention to mining interests.

M. L. REQUA, president of the Pacific Steel & Wire Co. of San Francisco, Cal., has returned to San Francisco from New York and other Eastern cities.

P. THACHER is manager of the Iyanough M. Co. of Searcblight, Nev., whicb has been organized to operate at Camp Duncan in Lincoln county, Nev.

PRESIDENT T. JACOBSON of the Columbus Con. C. Co. of Salt Lake City, Utah, has returned from Chicago, Ill., and other Eastern cities on business.

E. VERRUE, formerly at the Amarillas mine near Opodepe, Sonora, Mexico, is superintendent of the Richfield M. Co., east of Tuape, near Ures, Sonora, Mexico.

H. M. CROWTHER of Salt Lake City, Utah, manager of the Continental-Alta mine at Alta, Utah, returned last week from an examination of mines in Mexico.

THERE is no truth in nor foundation for the statement that W. S. Cole succeeds Lewis T. Wright as general manager Mountain Copper Co., Ltd., Keswick, Cal.

F. H. PERKINS, a mining engineer of Salt Lake City, Utah, returned there last week from Kansas City, Mo., where he bas been for several months on mining business.

M. B. PLACE, vice-president and manager of the Pittsburg & San Jose R. & R. Co., operating at San Jose del Sitio, Chihuahua, Mexico, is in Chihuahua from Mexico City.

H. A. TOBELMANN has resigned as chemist for the Old Dominion C. Co. He has accepted a similar position with the Compania Metallurgica de Torreon at Torreon, Mexico.

E. W. SEBBEN, M. E., Denver, Colo., examined the Clover Mountain Con. Mines Co.'s properties at White Pine, Colo., last week, in the interest of Rochester, N. Y., clients.

F. W. BRADLEY, E. M., of San Francisco, Cal., has gone to the Oneida mine, Amador county, Cal., and later will visit mines in Mariposa county, Cal., of which he is general manager.

P. S. COULDREY, manager of Le Roi No. 2 Co. mines at Rossland, B. C., for nineteen months, has gone to London, Eng., from which place he will go to Australia for the same interests.

MAJOR CASSIUS E. GILLETTE, U. S. Corps of Engineers, returns to his former station at San Francisco, Cal., as engineer officer of that division, relieving Lieutenant Colonel T. H. Handbury.

W. F. MCINTIRE of Chicago and F. W. Downs of Davenport, Iowa, owners of the Cripple Creek-Homestake Co., visited the Spar mines, White Pine, Colo., last week, which they recently purchased.

G. A. ROBERTSON, formerly superintendent of the Sioux-Ajax tunnel at Eureka, Utah, will go to British Columbia to look after development of a mining proposition for the same company.

G. W. CROWE of Nogales, Ariz., consulting engineer for the Ruby G. & C. Co., has gone to New York on company business. From New York he will go to South America on mining business.

C. D. MORRISON is superintendent of the mines and mill of the Sheba G. & S. M. Co., south of Mill City, Humboldt county, Nev., with J. A. Kunkel as mine foreman and G. E. Forrester mill foreman.

J. A. EDE, consulting engineer for the Illinois Zinc Co., and for several years Utah representative of Messrs. Leiter, has returned to Salt Lake City, Utah, from Mexico, after an examination of mining properties.

F. J. STEVENS has resigned as superintendent of Le Roi Two C. Co. mines at Rossland, B. C., to accept a similar position with the Guanajuato Con. M. & M. Co. at Guanajuato, Mexico. E. M. Macdonald is manager.

PROFESSORS W. R. APPLEBY AND VAN BARNEVELD, with eleven students from the School of Mines of the Minnesota State University at Minneapolis, Minn., are at Grass Valley, Cal., studying the mines of Nevada county. Before going to California they spent six days at the smelters at Pueblo, Colo., and two days at the chlorination works at Colorado City, Colo.

C. W. PURINGTON of Denver, Colo., is in Washington, arranging the details of an extended Alaska trip. As special envoy of the United States Geological Survey, Mr. Purington will make a thorough inspection of the placer fields of Alaska and northern British Columbia during the coming season. On his return a report on the dredging, hydraulic and otber methods employed will be issued by the Alaska division of the Geological Survey, in charge of A. H. Brooks.

Commercial Paragraphs.

THE Globe Engineering Co. of San Francisco, Cal., have moved from their old quarters, 146 First street, to 115 New Montgomery street.

THE Standard Paint Co. of 100 William street, New York City, have an exhibit in block 65, Palace of Liberal Arts, Exposition, St. Louis, Mo.

THE Wellman-Seaver-Morgan Co. of Cleveland, O., will supply twelve Hulett patent excavating buckets to the M. A. Hanna & Co. ore docks, Ashtabula, O.

MANUFACTURERS' CATALOGUES in great variety and of the latest editions are kept on file in this office for the convenience of our readers and visitors.

THE Chrome Steel Works has its new plant at Chrome, N. J., completed. Geo. W. Myers, Hayward building, San Francisco, Cal., is the company's Western representative.

IN the great Exposition at St. Louis, at block No. 30-B, Mines and Metallurgy building, tbe Wood Drill Works of Paterson, N. J., bave a nickel-plated drill, with several other of their appliances, showing their various specimens of machinery for different kinds of mining and quarry work.

Obituary.

F. S. MATTHEWS, a mine operator of Eureka, Nev., died at Salt Lake City, Utah, on the 6th inst. Deceased was 38 years of age.

J. W. BOOTH, a pioneer miner of Colorado and California, died at Pueblo, Colo., on tbe 10th inst. Deceased was born at Columbus, Ohio, in November, 1825.

J. S. DYMOCK, vice-president of the Calumet & Arizona M. Co., and interested in other Michigan and Arizona mining properties, died on the 18th inst. at Calumet, Mich., aged 66 years.

W. H. BROWNE, Secretary for Mines of Queensland, Australia, died at Brisbane, Queensland, April 12th. Deceased was born in London fifty-seven years ago, and went to New South Wales in 1866, engaging in mining, later to Tasmania, tbence to Queensland. He was a member of the Legislative Assembly from Croydon for the past eleven years.

Latest Market Reports.

SAN FRANCISCO, May 20, 1904.

METALS.

SILVER.—Per oz., Troy: London, 25 15/16d (standard ounce, 925 fine); New York, bar silver, 55½c, refined (1000 fino); San Francisco, 55½c; Mexican dollars, 44½c San Francisco, 44½c New York.

COPPER. — New York: Standard, $13.12½; Lake, 1 to 3 casks, $13.12½@13.25; Electrolytic, 1 to 3 casks, $13.00; Casting, 1 to 3 casks, $12.85; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £57 2s 6d spot per ton.

Copper shows signs of weakness, with a slight drop in price, due to no unusual demand. The foreign stock on hand is comparatively light, being 6576 tons on May 2, 1904. On May 1, 1900-01-02 there were over 20,000 tons in stock, and on May 1, 1903, about 9000 tons. On January 1 last this had gone down to 5601 tons, but has since increased to the above figure. The large bulk of copper sold the past few months has been supplied by dealers from stocks on hand, but these being about exhausted somewhat higher prices may now be anticipated, as the producers are likely to ask more than the dealers.

LEAD. — New York, $4.65; Salt Lake City, $3.50; St. Louis, $4.25 San Francisco, $4.50, carload lots; 1c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, $4.85. London: £11 5s 6d ₱ long ton.

SPELTER.—New York, $5.25; St. Louis, $5.00; London, £22 3s 2d ₱ ton; San Francisco, ton lots, 6¼c; 100-lb. lots, 7c.

TIN.—New York, pig, $28.00@28.12½; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 30½c; bar tin, ₱ lb., 32½@35c. London, £126 spot.

PLATINUM. — San Francisco, crude, $18.50 ₱ oz.; New York, ingot, $19.00 ₱ Troy oz. Platinum ware, 75 @ 82c ₱ gram.

QUICKSILVER. — New York, $44.50@45.50, large lots; London, £8 2s 6d; San Francisco, local, $43@43.50 ₱ flask of 76½ lbs.; Denver, $46.00. Export, $43.00@43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER. — Half-and-half, 100-lb. lots, 19.00c; San Francisco, Plumbers', 100-lb. lots, 16.50c.

ZINC.—Metallic, chemically pure, ₱ lb., 50c; dust, ₱ lb., 10c; sulphate, ₱ lb., .04c.

NICKEL.—New York, 40@47c ₱ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $13.60 @13.85; gray forge, $13.00; San Francisco, bar, 3c ₱ lb., 3½c in small quantities.

STEEL. — Bessemer billets, Pittsburg, $23.00@23.00; open hearth billets, $23.00 @23.00; San Francisco, bar, 7c to 12c ₱ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½c ₱ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER. — (Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50 @5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00 @35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4 and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $1.25 country, $1.25 city ₱ bbl.

CEMENT.—Imported, $2.15@2.65 ₱ bbl.; California carload lots, $2.10 f. o. b. at works; small lots, $2.45 ₱ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY. — New York, Cookson's, 7¾c; Hallett's, 6½c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE. —Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tapo, $2.65; Hemp, $2.10; Coment No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ₱ set; 14 oz., 40s., 10c.

CHEMICALS. — Cyanide of potassium, 98%-99%, jobbing, 23@24c ₱ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ₱ 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ₱ lb.; Cal. s. soda, bbls., $1.20@1.40 ₱ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, Fronch, 3½@3½c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ₱ lb.; copper sulphato, 5¼@5½c; chlorido of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ₱ lb.; nitric acid, carboys, 8c ₱ lb.

BONE ASH.—Extra No. 1, 5@6c ₱ lb. No. 1, 4@5c.

OILS.—Linseed, boiled, bbl., 49c; cs., 54c: raw, bbl., 47c; cs., 52c; Lucol oil boiled, bbl., 44c; cs., 49c; raw, bbl., 42c; cs., 47c. Kerosene—Pearl, per gal., 20½c; Astral, 20½c; Star, 20½c; Extra Star, 24½c; Eocene, 25½c; Elaine, 26½c; Water White, in bulk, 14c; Mineral Seal, iron bbls., 19c; wooden bbls., 21½c; cs., 25c; Mineral Sperm, cs., 26½c.; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 70c; Bleached, do., 80c; Whale Oil, cs., 52@57c.

RED LEAD.—500 lbs. and over at one purchase, ₱ lb., 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ₱ lb.

BORAX.—Concentrated, 6@7c ₱ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ₱ lb., 60c.

SODIUM.—Metal, ₱ lb., 50c.

BISMUTH.—Subnitrate, ₱ lb., $2.10.

MERCURY.—Bichloride, ₱ lb., 77c.

MOLYBDENUM.—Best, $2.00 ₱ lb.

CHROMIUM.—90% and over, ₱ lb., $1.00.

PHOSPHORUS.—American, ₱ lb., 70c.

SILVER.—Chloride, ₱ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ₱ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ₱ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRIC RAILWAY.—No. 759,453. May 10, 1904. T. Mahoney, San Francisco, Cal. This invention relates to improvements in electric railway systems of the third-rail type. The object of the invention is to do away entirely with a separate feed wire and to obviate the necessity of using the car tracks as return conductors by connecting the two ends of the third rail direct to the dynamo and providing means for shunting the current from the third rail through the track and back to the third rail again.

OIL BURNER.—759,445. May 10 1904. E. W. Jackson, Sausalito, Cal. This invention relates to a device for the combustion of oil in furnaces of various descriptions. It is especially designed for the more perfect combustion of the crude forms in which certain hydro-carbons occur. It consists in the combination in an oil burner of a stove or furnace casing having a non-conducting filling with an inclined surface forming a wall of an air-admission passage; an inclined diaphragm forming the opposite wall of said passage; a damper plate in the passage and movable toward and from said diaphragm to regulate the air supply; a burner; said filling separated from the burner to form a tortuous passage with which the air admission passage communicates, and means for supplying oil to said burner.

PNEUMATIC CARPET RENOVATOR.—No. 759,452. May 10, 1904. A. Lotz, San Francisco, Cal. Assigned to Sanitary Compressed Air & Suction Dust Removing Co. of San Francisco, Cal., a corporation. The object of this invention is to remove the dust from such fixed fabrics without loosening or taking them from the floor or other place where they may be fixed. It consists of a centrally located nozzle in the form of a long, narrow slit through which a blast of air or equivalent fluid medium is forcibly directed against the article to be cleansed, whereby the dust is thoroughly loosened and raised from the surface or nap, and in the combination with said blast nozzle of similar elongated suction nozzles located upon each side of the blast nozzle whereby the dust when loosened is instantly drawn into the suction nozzles and prevented from being spread about or again deposited upon the cleansed article.

QUARTZ SCREENS
A specialty. Round slot or hurred slot holes. Cast Steel or American planished Iron, Zinc, Copper, Brass or Tin Screens for all purposes. CALIFORNIA PERFORATING SCREEN CO., N. E. cor. Fremont and Howard Sts., San Francisco.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING MAY 10, 1904.

759,403.—RECOVERING METALS — I. Anderson, Whitehills, Ariz.
759,412.—SINKING OIL WELLS.—E. J. Beane, S. F.
759,497.—QUARTZ MILL—E. Booker, San Diego, Cal.
759,802.—QUARTZ MILL—E. Booker, San Diego, Cal.
759,810.—PICTURE FRAME—L. Brand, Los Angeles, Cal.
759,591.—LOCK & LATCH—A. M. Carrier, Fruitvale, Cal.
759,673.—DOOR FASTENER—Coleman & Gregory, Index, Wash.
759,505.—MASSAGING INSTRUMENT—M. Doerr, San Jose, Cal.
759,434.—TOOL HOLDER—T. J. Gorman, S. F.
759,290.—TELEPHONE—Houghton & Potter, S. F.
759,813.—WRENCH — M. F. Hudson, Los Angeles, Cal.
759,372.—VALVE—J. H. Hussey, Spokane, Wash.
759,374.—PIPING FLUIDS—Isaacs & Speed, Oakland, Cal.
759,445.—OIL BURNER—E. W. Jackson, Sausalito, Cal
759,378.—GRAIN RIDDLE — E. A. Jones, Sunset, Wash.
759,379.—SWAGE—F. W. Jones, Santa Paula, Cal.
759,618.—DOUGHNUT FRIER — J. Korbel, Los Angeles, Cal.
759,451.—HOLDER FOR BOILING HAMS—H. A. Kurlinke, S. F.
759,452.—PNEUMATIC CARPET RENOVATOR — A. Lotz, S. F.
759,453.—ELECTRIC RAILWAY—T. Mahoney, S. F.
759,454.—FISHING TOOL—Munn & Evans, Oil Center, Cal.
759,738.—HARVESTERS — McCown, Loundagin & Williams, Walla Walla, Wash.
759,822.—OIL BURNER—D. H. Mosteller, S. F.
759,307.—BUTTON SHANK FORMER—Mary V. Quinn, Seattle, Wash.
759,314.—PHOTO EXPOSURE INDEX—H. C. Rosslow, Spokane, Wash.
759,474.—PLOW—E. J. Rubottom, Felton, Cal.
759,637.—BURGLAR ALARM—G. A. Sachs, Eugene, Or.
759,476.—CIGARETTE ROLLER—C. Schopke, S. F.
759,761.—THERMOMETER CASE — H. A. Sievert, Walla Walla, Wash.
759,772.—GARMENT HANGER—M. Terletzky, Goble, Or.
759,781.—COFFEE MILL — S. T. Wallace, Los Angeles, Cal.
759,782.—CULTIVATOR—L. J. & L. U. Ward, Olex, Or.
759,784.—AIR BRAKE COUPLING — R. J. Weken, Everett, Wash.
759,336.—JAR COVER HOLDER—W. T. Wiley, S. F.
759,337.—TYPEWRITER—C. D. Williams, Dillard, Or.
36,011.—DESIGN—H. L. Rothschild, S. F.

HELP WANTED.

WANTED — EXPERIENCED ELECTRICAL Engineer, one who understands the operation of alternating current motors. Preference will be given to man with mechanical ability. Salary $150 per month. References required. Address, stating age and full particulars, Bully Hill Copper Mining & Smelting Co., Winthrop P. O., Shasta Co., Cal.

The Business Men's Clearing House, Century Building, Denver, Colorado, furnishes mining companies in United States and foreign countries with managers, superintendents, engineers, mill men, assayers, electricians, bookkeepers, stenographers, etc.; good positions for competent men.

SITUATIONS WANTED.

ASSAYER AND CHEMIST DESIRES POSITION at mine, mill or smelter Is competent. State salary when writing. Address C. A., this office.

ASSAYER, WITH KNOWLEDGE OF BOOKkeeping, wants position with mine or mill. Address J. L., this office.

CYANIDE MAN AND ASSAYER, WITH 12 years' practical experience, desires position. Address K.C.N., care of this office.

EXPERIENCED MACHINIST ON MINE AND mill work wants a position. Large experience with steam, air, gasoline and pumping plants. Reference furnished. Address H.R., care of Mining and Scientific Press.

EXPERIENCED SUPERINTENDENT, ENGIneer, Metallurgist; technically and liberally educated; 15 years handling men and machinery of smelters, mills and mines. See testimonials. Address Prof. Stickney, Mountain View, Cal.

MANAGER OR SUPERINTENDENT FOR A gold, silver or copper property; 20 years' experience in different parts of the country. At reference. Can furnish any bond. Mexico preferred. Address D., this office.

MILL AND CYANIDE SUPERINTENDENT wants position. Thoroughly understands milling of gold ores and the cyaniding of same. Good assayer. Address D. A., this office.

MINE MANAGER DESIRES CHANGE; 20 years' western U. S. and Mexican mining, milling, cyaniding and assaying experience. At credentials. Address H. B., this office.

MINE SUPERINTENDENT IS OPEN TO ENgagement with a live company. Thoroughly understands his business. Address B. R., this office.

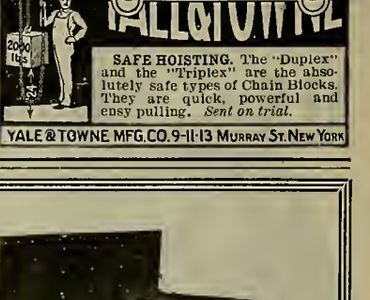
MISSOURI SCHOOL OF MINES GRADUATE; '04 practical miner; familiar with mining and milling methods of the West; desires position with mining company where practical knowledge and technical training is desired, on or before June 15. Reference given. Address Clarence Woods, Rolla, Mo.

POSITION AS MINE FOREMAN OR SUPERintendent; 18 years' experience in California, Alaska and Mexico. References. Address 74 Duhoce Ave., San Francisco, Cal.

SUPERINTENDENT, TECHNICAL EDUCAtion, seven years' experience in mining, milling and cyaniding, desires to change location. At present employed as superintendent of mine and mill in Mexico. Address T.L.B., care of this office.

WANTED — JOB AS SUPERINTENDENT, Foreman or Contractor; 22 years' practical experience, gold and copper. Highest recommendation. Address D. G., care of this office.

WANTED—SITUATION AS SUPERINTENDent or General Manager of a mining property. Over 20 years' experience at mining, and mill and smelter construction and metallurgy. Make a specialty of working base gold and silver ores by the newest methods. Best of references given. Address "Superintendent," care of this office.



YALE & TOWNE
CHAIN BLOCKS
2000 lbs
SAFE HOISTING. The "Duplex" and the "Triplex" are the absolutely safe types of Chain Blocks. They are quick, powerful and easy pulling. Sent on trial.
YALE & TOWNE MFG. CO. 9-11-13 MURRAY ST. NEW YORK

OUR LOADER

Will save some people its entire cost in less than a year. Maybe YOU belong to that class—it will do no harm for you to find out. We can post you.

What is your situation? Do you load into box cars? What material? How much to load per day?

If you will tell us just how you stand, we can figure it all out for you. Will you give us this opportunity?

If you load box or stock cars, we can save you money.

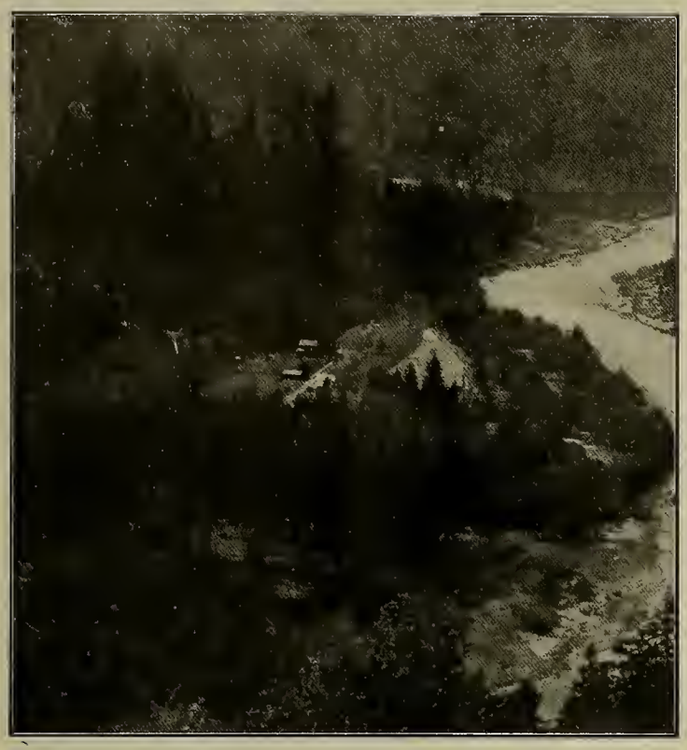
FOR SALE.

FOR SALE—SALA U'YE-LEVEL,
New, reasonable. "Poduska," Cottage Grove, Ore.

200 SECOND-HAND TRANSITS AND LEVELS, CHEAP.
ARCHITECTS' & ENGINEERS' SUPPLY CO.
1010 Grand Ave., Kansas City, Mo.

For Sale---Elevator Gold Dredger,
Electrically operated. Bucyrus make. Five-foot ouckets. Practically good as new. For full particulars, write
Bedrock Dredging Co., Placerville, Idaho.

FOR SALE.
A few Carbons for Diamond Drill Work.
Every stone has been tested and is guaranteed to be of best quality.
T. J. PARSONS, 400 Front St, San Francisco.



MINE FOR SALE

A LARGE BODY OF GRAVEL 1½ miles long, fronting on Klamath river, Siskiyou Co., Cal. (see cut). For particulars, call on or address M. L. GORDON, 194 Oak St., San Francisco, Cal. Hours 10 to 12 A.M. except Sundays.

DIFFERENT, AND BETTER!
U. S. Automatic Injectors have special features of their own that make them superior to any other automatic injector sold. The DRIP-COCK is one of these features worth considering for a moment. It drains the injector and keeps it clear of water when not in use. By opening the Drip-Cock the injector can be started at lower steam. It enables you to take hot water out of a hot suction pipe in a long lift. It is always handy for drawing hot water for any purpose when the injector is working. Every engineer will be glad to have a copy of our "Engineers' Red Book." A copy sent free if you will write to-day.

A Foster Class "W" Valve
is an appliance that will add to the efficiency and economy of any steam plant, for it will maintain a constant delivery pressure regardless of variation in the boiler pressure.
See a Foster Catalog for details and description of this as well as of our Back Pressure, Free Exhaust, Non-Return, Combination and other valves.
Foster Engineering Co.
NEWARK, N. J.
Pacific Hardware & Steel Co., San Francisco, Cal. Agents.

LUNKENHEIMER

The "Victor" is a common-sense valve specially designed for use in high pressure power plants. Iron Body, brass mounted, in screw or flange ends, 2 inches and larger, in weights for working pressures not exceeding 125, 175 and 250 lbs. Provided with single disc, double-seated, with or without by-pass, with stationary stem, or outside screw and yoke. A strictly modern up-to date valve, in keeping with the latest engineering requiremeuts. Specify *Lunkenheimer* and order from your dealer. Write for catalog.

A Penalty for Industry.

It is incomprehensible that the majority of the people of a community or section like Shasta county, Cal., will encourage by their silence, or permit at all, the attempt being made to impose a great hardship and unnecessary expense upon the leading industrial enterprise of that county—the Mountain Copper Co.—under the pretext that the sulphurous fumes from the reduction works at Keswick are doing great injury to the agricultural interests of the vicinity, and more recently the claim that the forests were suffering irreparable damage, suit having been brought by the Government against the Mountain Copper Co. All those familiar with the condition of agriculture generally in Shasta county, and of the "forests" near Keswick, know how absurd this claim is. The soil of the bench land in Shasta county is for most part unsuited to agriculture or horticulture. There are scores of ruined, deserted "farms" in that county, and that, too, in districts far removed from the smelters at Keswick or any others, and where the taint of sulphurous gas has never been known. There are always those, however, who can see in every great industry an opportunity to make something from nothing, and this instance at Keswick forms no exception. The Mountain Copper Co. is going through an experience now similar to that of some other companies in other States. In Montana the copper reduction companies have had much trouble over this same plaint. The experience is that wherever a smelter has been closed down and new works built at a distance from the closed plant, and in a region where there are few inhabitants or none at all, that a new town at once springs up about the smelter, and only the limits of the company's property keep the new settlers from getting within a hundred yards of the "obnoxious" stack. It recalls the instance of a miner who was working in a drift gravel mine in Nevada county, Cal., some years since, who expressed the hope that the company employing him would soon resume hydraulicking, for, said he: "I have a little ranch down here a bit that ain't worth much at present, but if this company begins hydraulicking they are sure to cover it up with slickens, and then, I guess, I ought to be able to get about $3000 out of it." There seems to be method in this species of madness, too.

Oil Lands in Nevada.

An interesting situation has developed in the recently discovered oil fields in the Carson sink, Churchill county, Nevada. Prospectors, quickly following the discovery of oil, located a large area of the adjacent lands uuder the placer location Act, as provided by law. The hydrographic branch of the United States Geological Survey is engaged in extensive reclamation of desert lands. This is the outgrowth of the investigations made during the early years of the Survey, when under the direction of J. W. Powell. These projects are located throughout the Western States. The lands which it is intended to reclaim by irrigation methods have been withdrawn from all eutry except under the homestead Act, it being the desire of the Government that these lands be taken up in small farming tracts, not exceeding 160 acres for each person who may make such entry, and the tract in Nevada where oil was recently discovered chances to be within one of these reclamation areas. As the value of the land for the oil it may produce is unknown, and as without irrigation it is practically valueless for any other purpose, the Governmeut may possibly make an exception in this case and allow the original locators to hold their oil claims, for it seems unjust that the original claimants should be dispossessed of their locations of 20 acres each in favor of later locators appropriating 160 acres each, and who at their option may also bore for oil. Notices have been posted informing oil locators that the land is not subject to location in any manner other thau as homestead tracts.

WITH this issue this journal enters upon its forty-fifth year of continuous and successful existeuce.

Efficiency of the Gravity Stamp.

Whether the limit of economy in the weight of stamps at about 1400 pounds has been reached or not is a questiou upon which all mill men do not agree. Twenty-five or thirty years ago stamps ranged from 450 to 750 pounds in weight (with a few possible exceptions). The weight was subsequently increased to 850, 900, 1000, 1200 and to even 1400 pounds. It is necessary, with increasing weight of stamps, to construct mortar blocks—whether of timber or concrete—with increasing care and massiveness, and the battery frames must also be suited to the weight of the stamps and the number of drops per minute. A light frame cannot long endure with heavy stamps, but, when properly constructed and sufficiently heavy, the largest stamps can be operated successfully through a period of years. In the case of the heavy steam stamps, such as are used in the Lake Superior copper region, each stamp has a separate frame, which tapers upward from a broad base. This style of construction has not been attempted in the placing of gravity stamps in batteries of two or more stamps, the usual style being a rigid, upright frame of posts and joining girders. The effectiveness of a single blow of the gravity stamp may be said to be directly proportional to its weight, with the same height of drop and area of crushing surface. The usual method of figuring the effectiveness of a stamp in crushing is by the foot pounds per minute per square inch of crushing surface. This includes the area of stamp on the crushing face; weight of stamp, height of drop and number of drops per minute. In this way a comparison may be made between a heavier and a lighter stamp—the heavier stamp falling fewer times per minute than the lighter stamp when the height of the drop remains the same. The capacity of the stamp changes with any change in auy of the factors affecting it. A stamp of given surface area with stated height of drop and number of drops per minute will crush more ore than another stamp operating under similar conditious but having less area, though of the same weight. In the same way a change iu weight, change in height of drop, or in the number of drops per minute, must directly affect its capacity. When stamps are increased abnormally in weight this demands an increase in the power required to operate them. It would seem that a stamp of somewhat greater diameter than that commouly in use—8 to 9 inches—with the same weight might be expected to have a greater crushing capacity. This increase in diameter is limited by the facility with which ore may be fed under the stamp to advantage. Teu inches is permissible and possibly a still greater diameter might be suceessfully employed, but apparently the limit of economy in this direction would be reached, if not passed, at 12 inches. The discharge is always affected by the distance from the shoe to the screen, but this distance could be maintained with an increased width of shoe, though in most cases it would involve a new model of mortar suited to the wider shoe. In most mills, particularly those crushing low-grade ores, large capacity is desirable and in many cases necessary for reasons of economy. In experimenting, with a view to securing the greatest capacity of a stamp mill with the least expense, it will generally be found that it is more economical to employ a lighter stamp with a greater number of drops than a heavier stamp with fewer drops per minute. If heavy stamps are considered desirable, then, as previously stated, the mortar blocks and battery frame must be constructed accordingly—for a battery frame that gives perfect satisfaction with 1000-pound stamps dropping 6 inches ninety-six times per minute may not be able to withstand the heavy pounding and vibration incident to 1300-pouud stamps dropping 6 inches over 100 times per minute.

IN view of the great value of the detailed investigation of certain mining districts in the United States by the United States Geological Survey, and the publication of the reports and maps—the result of such investigation—the Canadian Geological Survey is being urged by those interested to make a similar investigation of the geology and ore deposits of the Rossland district, British Columbia. The structural geology of that district is complex, and such a detailed investigation as that made of the Cripple Creek district of Colorado by the United States Geological Survey cannot fail to be of interest and value to the miners of that province.

Requires a Deeper Drainage Tunnel.

What is known as the El Paso drainage tunnel, in the Cripple Creek district of Colorado, was first taken under consideration in November, 1902, and a committee appointed to inquire into the necessities of the proposed drainage scheme. It required a great deal of persuasion to bring all directly interested into the scheme in a financial way, but the work on the El Paso tunnel was started early in January, 1903, a report of which was published herein in the issue of January 17th of that year. Subsequently the progress of the work has been reported upon at length and the result has been viewed with interest by mining men not only throughout Colorado, but the mining world. Shortly after the tunnel was well under way, the necessity of making a new survey for a still deeper drainage adit was commented upon, and this was earnestly seconded by those who realized its importance, but nothing has been done in regard to the proposition so far as known, except to discuss it. The tunnel has long since proven its usefulness as well as making it apparent that a deeper tunnel is not only desirable, but imperative, if deeper mining is to be carried on in that portion of the district.

The driving of the El Paso tunnel has been discontinued for the reason that the sum of money subscribed by the various companies interested—$85,000—has been exhausted. It is said, however, that an additional subscription is contemplated to complete the El Paso project, and those who are looking to the future are earnestly advocating the commencement of another and larger tunnel to be driven lower than the El Paso tunnel, the cost of which is estimated at $350,000. It is stated that the contemplated tunnel would give an average depth 750 feet below that of the El Paso. It would require more than three years to complete such a tunnel and the rate of drainage will not be as rapid as that of the older tunnel, as there is an increasingly greater amount of territory to drain with increasing depth.

The new project should be started just as soon as possible to insure the continuous operation of the mines along its line, but it docs not seem possible that this can be done, startiug at this time, though the longer the problem is deferred the greater will be the ultimate loss, unless, indeed, sufficient ore be found in the levels above the El Paso tunnel to keep the mines steadily producing during the interim. It always seems easier to accomplish such dead work during the period of active and profitable production than to undertake it when the mines are forced to close down owing to the great volumes of water which it is kuown exist in the depths of those mines. It is not probable that a dry zone will be encountered in that district at any point above the natural drainage level of the district. In other regions where deep mining is being carried on—below 3000 feet—it has in many cases been proven that at that depth, and below, the mines make comparatively little water, but in each of these instances—as in the Lake Superior copper mines, the deepest mines of California, and those of the Rand, South Africa—the workings are far below the natural drainage level of the region. To enjoy this benefit, it is absolutely essential to tap the water at as low a poiut as possible with a tunnel, or to hoist it by mechanical means from the zone of saturation, and prevent the water from following down the workings to the deepest levels. The work of beginning the proposed deeper tunnel should not be delayed. The El Paso tunnel drains mines along its course to a depth of 1200 to 1600 feet. The amount of ground which would become readily accessible by a tunnel 750 feet deeper is apparent to all students of the geology of that interesting district. There are few mines of importance in the district that have not benefited by the El Paso tunnel, and a deeper drain cannot fail to make its influence felt to a greater extent. Such a tunnel as that now proposed would more than pay for itself in improved and less expensive ventilation, in transportation of ores and materials, and in greatly reduced expense of draiuage, if the operation of the mines below the El Paso tunnel level is possible at all to a material extent.

CONCENTRATES.

THE exhaust from steam engines should never be turned into a brick stack or flue, as it will have a tendency to disintegrate the mortar, and in time render the stack insecure.

✤✤✤✤

TO prevent baling skips leaving the track in an incline shaft upon striking the water, a plank spiked to the hanging wall timbers, arranged to come close to the skip, will usually suffice.

✤✤✤✤

THERE are numerous dams in California mountains over 100 feet high which have stood for many years and are still in good condition. Some of these dams are over 400 feet in length on top.

✤✤✤✤

SOME mine superintendents believe the use of small oil lamps in place of candles underground a means of lessening the likelihood of setting the timbers on fire. Candles carelessly left on timbers have probably caused more mine fires than any other one thing.

✤✤✤✤

BASALTS are among the most recent eruptives. The volcanic rocks flowing from modern volcañoes are all types of basalt. Granite is often referred to as the primitive rock, but many granitic intrusions are known to have occurred within well recognized geological ages.

✤✤✤✤

THE dampers in mine ventilating pipes, employed to deflect the air currents from one portion of the mine to another, should be made of wrought iron plates. Sheet iron is too light to be serviceable, as the concussion of blasting frequently causes them to double up, when they become useless.

✤✤✤✤

ALTHOUGH embankments, when first made, usually occupy more space than the earth in situ from which the material came, they subsequently shrink. The approximate shrinkage of different kinds of earth is stated to be: With gravel or sand, 8%; loam, 12%; clay, 10%; loose surface soil, 15%; puddled clay, 20%.

✤✤✤✤

A NARROW MORTAR will discharge the pulp more rapidly than a broad one when all other conditions are equal, as to character of ore, height of discharge, mesh of screen and amount of water employed. Where slow crushing with inside amalgamation is practiced a broad mortar and high discharge are recommended.

✤✤✤✤

WHERE mines have been opened on agricultural patents, such mines have no extralateral rights, except special agreement be made by the owner with the buyer that the apex owner on such patent shall have the right to follow his vein wherever it may go within the lines of the agricultural patent extended vertically downward.

✤✤✤✤

FOR the inspection of stopes and drift backs which are too far above the head to be readily lighted by candles an acetylene lamp is useful. It can be held at any angle and will throw a strong light 20 to 30 feet in the stope. The lamp will also burn when candles are extinguished by carbonic acid gas, though there is always danger where a candle will not burn.

✤✤✤✤

PEARLS are minerals, but perishable, being composed largely of calcium carbonate, which by ordinary fire is turned to calcium oxide (lime). Sapphires and diamonds are unaltered by ordinary high temperatures, but the latter under the powerful flame of the electric arc in a vacuum swells up and is reduced to a coke-like mass of carbon, and in air is burned to carbon dioxide with a small amount of ash.

✤✤✤✤

IT has recently been suggested that the addition of a small amount of slacked lime to the mortar when making concrete will be of advantage, particularly in cases where the concrete is to be laid in retaining walls, and through which water may subsequently slowly percolate. It is claimed the lime is dissolved out and redeposited on and near the surface of the concrete as an efflorescence, the formation of which will act as an impervious barrier to the further passage of water.

✤✤✤✤

ANTIMONY occurs usually in the form of sulphide, or as oxide, in ores. If it is associated with sulphide lead ores the antimony is generally also in the form of sulphide. In the blast furnace the sulphide of antimony acts much the same as galena, but is more volatile. Should it be decomposed by the metallic iron present, the antimony is more likely to combine with the lead than to unite as speiss with the iron. It may also be volatilized. Its presence in lead is undesirable, as it renders the metal brittle.

✤✤✤✤

AN experimental cyanide plant for testing ores can be made from a number of half barrels, arranged in terraced form — the uppermost one for stock solution, the next lower for leaching or agitation, a third below that for precipitating purposes, and a fourth for sump tank. No cyanide works should be built until thorough and satisfactory tests have been made of the ore to be treated. A plant such as suggested will handle 100-pound lots readily, and costs little. Small steel tanks may be used in the same manner.

IN ores containing calcium carbonate and pyrite or other sulphide, the roasting of such ore results in the formation of calcium sulphate (plaster of Paris). Such material, when treated with water, as in cyanide vats, will form impervious and very hard floors, due to the setting of the plaster of Paris. In Western Australia, at Kalgoorlie, it was found necessary to blast out layers of partially treated ore where this had occurred. In chlorination vats the crystals of gypsum often accumulate to the thickness of several inches.

✤✤✤✤

WHERE mine workings cause a cave of the surface ground to the damage of others, it is not a defense on the part of the mine owner to say he had worked the mine in a workmanlike manner. When he removes the ore, which is the natural support of the overlying ground, he substitutes artificial supports, but should these prove inefficient, the miner is responsible for the damage caused by the caving of his workings. Because it was the custom to remove all the ore, including pillars previously left for support, will not strengthen the position of the mine owner in a case of suit for damages.

✤✤✤✤

WHERE the slag from silver-lead smelting is too rich to be thrown on the dump, and re-smelting is of no advantage owing to the presence of zinc, the silver may be recovered from the slag by smelting with sulphide copper ore or copper matte. An instance of this kind is cited by H. A. Keller in Vol. XX, Trans. A. I. M. E., where he smelted a slag containing 5.3 ounces silver per ton with 13% sulphide copper ore containing 10% copper and 11 ounces silver per ton in a blast furnace, putting through 113 tons of charge with 10.9% coke. The result was 5.3% matte containing 20% copper and 92.7 ounces silver per ton—a saving of 80% of the silver in the original slag.

✤✤✤✤

LARGE TIMBERS in a shaft will longer resist decay than small ones. When a shaft is being sunk some consideration should be given the question whether the shaft will become an "upcast" or a "downcast" when connected with the other workings (shaft or tunnel) which may also reach the surface. If the collar of the shaft is higher than any other opening on the mine, the probability is that it will be an upcast shaft, and as timbers will rot more quickly in an upcast, carrying the foul air from the mine to the surface, the timbers should be heavier than those required in a downcast. In any event, it is economy to treat shaft timbers with some preservative preparation to prevent rapid decay.

✤✤✤✤

WHEN setting bolts in concrete foundations for the purpose of anchoring engines, compressors or other machinery, these bolts may be made more secure by turning an "eye" at the lower end and passing a piece of railroad iron through those constituting each set of bolts. This will make it impossible for them to move. By slipping a pipe of larger size than the diameter of the bolts over the latter it makes it possible to give the bolts a little "play" in order to have them enter the bolt holes of the base of the machine without difficulty. The bolts may then be fixed by pouring melted sulphur in the space between the bolt and the concrete, the pipes having first been withdrawn. If the machine does not set level it may be "shimmed up" with thin strips of steel or iron (never use wood for this purpose). Thin cement may be run in to fill any space between the bed plate and the concrete after shimming up.

✤✤✤✤

A SEGREGATED VEIN or ore deposit is one which is the result of what is known as magmatic segregation from the rocks within which it occurs. Some bodies of magnetite in various rocks and deposits of chromic iron in serpentine belong to this class of ore deposit. A "blanket vein" is a term which is usually applied, in a geological sense, to bodies or sheets of ore lying between beds of sedimentary rock and occupying a horizontal position or one approaching it. Some miners call fissure veins occurring in crystalline rocks dike schists or granite and lying at a low angle—20° or less—blanket veins. This is a misnomer and was not the original meaning of the term. Bedded veins are similar to blanket veins, in that they embrace a class of ore deposits occurring in sedimentary rocks, though they may stand at a high inclination—the difference between bedded vein and blanket vein being more in a mechanical than a geological sense.

✤✤✤✤

"HURDY-GURDY" WHEELS is the name by which the impact water wheels were originally known. One of the first impact wheels was that made by Hamilton Smith, Jr., at North Bloomfield hydraulic mine, Nevada county, Cal. The wheel was 18 feet in outside diameter and 17 feet 4 inches diameter to inside of the line of buckets, and 17 feet 8 inches diameter to the center line of the buckets which were flat, 4 inches deep, with flanges on the sides. The wheel was operated under heads varying from 312 feet to 335.9 feet, with differing types and sizes of nozzles. This wheel developed from 2.7 H. P. with small nozzle up to 15.9 H. P. with a nozzle 0.1017 foot in diameter. The power measured with a prony break. These experiments were made about 1875, and from this rude form of wheel was developed the various types of modern tangential, or impact wheels. The first curved buckets employed gave greatly increased efficiency over the flat buckets.

✤✤✤✤

TO ASCERTAIN the number of cubic feet of any particular ore required to make one ton in place in the vein, carefully weigh a good-sized piece—suppose it to weigh fifty pounds. Then, suspending the same piece of ore by a slender but strong cord or wire, weigh in water. (The water should be at 39.2° F., at which it reaches its greatest density, but if above this the result will not differ materially.) The difference of the weight of the ore in air and in water is due to the buoyancy of the water, and represents the weight of water displaced by the mass of ore. Presuming, for example, the ore weighs in water 12.5 pounds. Then divide the weight in air by the weight in water and the quotient 4 is the specific gravity of the ore—say, a mixture of quartz, galena, pyrite and blende. As a cubic foot of water weighs 62.428+ pounds, then a cubic foot of the ore will weigh four times 62.428+ = 249.79+ pounds. Two thousand pounds in one ton divided by 249.79 = 8.00+ cubic feet, the amount required to make one ton of ore.

✤✤✤✤

BRICK and good stone are both serviceable for boiler foundations. In some mining districts, notably some of those in California, are found beds of white or gray tuff, usually capping ancient river channels, which can be sawed into blocks or hewn with an ax to suitable size to make excellent boiler foundations. The same kind of stone is also employed as building materials. In some localities in that State also are found great massos of steatite, often 200 to 300 feet in width, from which large solid blocks may be sawed for foundations and walls of buildings, and other like purposes. This latter material is very refractory and may be used for furnace linings. It should be heated slowly when employed in this way, to drive out all moisture. If heated too quickly it is likely to spawl off, and render the furnace useless. These masses are found at many places in the counties from Madera to Nevada county, usually east of the mother lode.

✤✤✤✤

SOME engineers in shaft surveying use very heavy plumb-bobs (250 pounds) suspended from the surface by heavy copper or steel wires. It is claimed by those who use these heavy weights that the vibration can be more quickly stopped and the "bobs" brought to an absolute standstill in a few minutes by carefully retarding the swinging of the weights, and this without the use of a tub of water, oil or molasses, such as is generally employed for this purpose. In a shaft 2000 feet deep a 250-pound weight caused the wire to stretch a distance of 40 feet. The wire is lowered into the mine by attaching it to cage or skip, and the heavy weight is taken down on the skip and made fast below. This does away with any difficulty due to swinging in lowering the weight from the surface. The wire is then wound up at the surface by a reel until the proper height of the weight has been reached and all adjustments carefully made. In this manner the "bob" has little vibration when first raised from the floor of the level, and the desired alignment is quickly obtained and the survey carried forward with the least loss of time.

✤✤✤✤

AN abandoned mining claim is located in the same manner as though it were a new claim. It is not necessary that a new discovery be made provided a bona fide discovery had been made on the original claim. The new locator may make the former discovery answer for his own, and if he wish may do his assessment work in the same discovery hole, though it is not necessary that assessment work be done at the point of discovery. The most essential feature when locating a mining claim, after first making a discovery, is to properly and completely define the boundaries of the claim by posts or monuments, or both, so that the boundaries may be readily traced; then record the location with the county recorder, and also the district recorder if there be one, and later the assessment work. In some States preliminary work is required to be performed within a specified time, differing in the several States which have passed such laws, and as this is made a part of the act of location, it is necessary that it be complied with. These additional requirements are not in conflict with the federal law, but are an addition thereto, and such legislation is within the province of the States. The United States laws fix the minimum requirement, but this may be enlarged by a State Legislature.

✤✤✤✤

MINES having large roomy drifts, crosscuts and other workings, are more readily ventilated than those where the workings are small and crooked. Where there are not at least two outlets to a mine, as two shafts, or two tunnels, or a shaft and tunnel connected, mechanical ventilation is necessary, either by means of fans, blowers, furnaces, or other means. It is not the best practice to draw the air from the mine into the compressor to only send it back again laden with the foul gases accumulating in the mine workings. The compressor should take its air from the outside atmosphere where it is uncontaminated by impure gas of any description. Undoubtedly compressed air exhausted from machine drills and leaks along the pipe line help to supply fresh air to mine workings, but leaks are not economical, and the exhaust from the drills is only incidental. The mine should have an abundant supply of pure air from the outside equal to 100 cubic feet to the man per minute. To facilitate ventilation, or to lessen as far as possible the formation of carbonic acid gas in the workings, all old decayed timbers should be taken to the surface and not thrown into a disused drift, crosscut or stope. Timbers in place which are decaying furnish a large amount of this gas, but this cannot be avoided, but old timbers which have been replaced by new should be removed immediately.

The Morenci, Arizona, District.

From a Staff Correspondent.

The Detroit Copper Co. at Morenci has under way important additions to its preseut plant. The concentrator, which has a capacity of 500 tons per twenty-four hours, is being doubled in capacity. One half of the plant will be remodeled and increased at a time, while the other half continues in operation, and it will require eighteeu months to complete the change. It will have a floor area 166x240 feet. When remodeled there will be a total of 120 concentrating tables, 40 jigs, Chile mills, 6 sets of rolls 16x42, and 28 revolving screeus for sizing. Power to operate this plant will be furnished by gas engines with a total of 600 H. P. in 150 H. P. units. The concentrates will all be handled mechauically. Au important featnre of improvement will be the separation of the crushing plant from the concentrator. The new crnshers will occnpy a building west of the concentrator, and will have a capacity of 100 tons per hour, and all the crushing for the day will be done in ten hours. The sampliug mill will be located above the conceutrator aud ore will be conveyed to it from the latter on a belt conveyer 400 feet long. Crusher and sampler will both be operated by electric motors. The company has one of the most complete gas plants in the Southwest, and throughont the entire works—concentrator, smelter and converters—gas engines furnish the power, the only exceptions being steam power nsed on locomotives and miue hoists. New Mexico coal is used in the manufacture of the gas, and it has been found by the Detroit Co. to be the most economical power available. All power, with the exception of the 600 H. P. at the concentrator, will be localized at the new power honse, now under construction near the smelter. At present there is here a total of 825 H. P. developed by gas engines, and this will be increased by 500 H. P., giving a total of 1925 H. P. Steel bins of 2000 tons capacity will be iustalled at the smelter, aud steel trestles, and in this and the conceutrator a total of 700 tons of steel will be used.

At Metcalf the Coronado mine sends 300 tous of ore per day to the Clifton smelter. Recently considerable snrface improvemeut has been going on. Twelve portable dwelling honses, a new store and other bnildings have been erected. This aud the Metcalf mines on the opposite side of Chase creek beloug to the Arizona Copper Co., which also owns the Longfellow, Hnmboldt, Yavapai and Joey mines at Morenci, all of which are prodncers of the red metal. The sulphide ore of Morenci mines is concentrated at the plant there and the product sent to the Clifton smelter by way of Longfellow incline and the Chase creek narrow gauge road. The possibilities of ore production with this company are extensive.

During the past year the Shannou Copper Co. has brought its mines and smelter into the ranks of the producers. The mines adjoin the Arizona Copper Co.'s mines at Metcalf, and an incline road conveys the ore to the level of the narrow gange road in Chase creek, and by contract with the Arizona Copper Co. is hauled to the Shannon concentrator and smelter, 1 mile south of Clifton. As yet it has no converter plaut and the high-grade matte produced is sold to the Arizoua Copper Co. and refined at their Clifton plant. The Shannon concentrator will be operated within a week at its full capacity of 500 tons per day. Within the year a converter plant will be installed. Its two furnaces, 42x170 inches, have a capacity of 300 tons each. Besides their own ore, more or less custom work is done for the smaller properties of the vicinity.

The Monte Cristo property at Metcalf, owued by residents, is under lease to a company of local men, with A. D. McLean president and R. G. Murillo general manager. Mr. McLeau is the Arizona Copper Co.'s superiutendeut at Metcalf and Mr. Mnrillo is also employed by the same company, the Monte Cristo being a side issue. The mine is 1 mile above Metcalf. Since the present company took it, late in December of last year, four shipments of ore have been made to the Shannou smelter, with very satisfactory results, and work is steadily advanciug in its development.

East of the Shannon mine at Metcalf the property of E. Schumann and H. A. Arbuckle, known as the Buckeye and Sharpshooter, is being developed. The former claim has abont 2000 feet and the latter 1000 feet of shafts, drifts and tnnnels. High-grade ore, both sulphide and carbonate, is obtained. The work is in charge of J. A. Stewart. Seven men have been employed for two years past.

Adjoining this is the Antietam, with three claims. Ou this there is a 146-foot shaft. At the 70-foot level is a drift 115 feet long, which exposes a body of ore 36 feet wide, with an average valne of 4.4% copper, $2 gold and 7 onuces silver. At the bottom a crosscut of 26 feet fails to intercept the walls, and the values average 7% copper and $4 gold. More or less high-grade ore has been encountered in stringers throngh the ore body. Of ore takeu out aud shipped, oue lot of 300 tons averaged 16½% copper and a shipmeut of 600 tons yielded 6½% copper. In a total of 446 feet of work Paul L. Crowley, manager and part owner, states that he was never out of ore.

The Standard Copper Co.'s mines are on the east side of Chase creek, a short distance below Metcalf, and have been for several years past steady producers of high-grade ore. An aerial tram 3000 feet long conveys the ore to the Clifton–Metcalf road, and it is sent to the Shannon smelter. The property consists of eleven claims aud lies in the heart of the Clifton-Morenci district. Development is beiug carried forward in accordance with definite plans and its management is making it a payer from the start. About 400 tons per month of high-grade ore is shipped to the smelter.

Leaving Chase creek and passing eastward 2 miles over the mountain to the slopes of the San Francisco river is the property of the New England Copper Co., which by a recent merger with its neighbor, the Clifton Consolidated Mines Co., and now known as the New England & Clifton Copper Co., has become one of the important properties of the district, and comprises eighty claims, on which large bodies of ore have been developed, thongh none of the old New Englaud Co.'s ore has ever beeu stoped or shipped. The Clifton Con. Co. mined and shipped for several years before merging its interests. In the way of development a main tunnel, to be 1 mile in leugth, is being driven through the mountain. Abont midway of this an 800-foot shaft has been sunk, and work on the tuunel is beiug pnshed both ways from the foot of this shaft, and at both ends. Other shafts have been sunk and drifts ruu, all uncovering copper ore. It is the intention to bnild a coucentrator and transport the concentrates to the river by aerial tram, thence to Clifton by an electric line, to one or other of the old smelters, and not to erect their own reduction plant until the ore bodies shall have been blocked out sufficiently to justify it.

The Polaris Co., lying east of the New England and about 6 miles from Clifton, has recently added to its property the Poland–Nelsou claims, and uow has a total of forty claims. There are several leads on the surface, the most important one being the Black Prince, on which seven of the claims are located. This runs northeast aud southwest and is a strongly defined lead, with a maximum width of 70 feet. On it are two shafts, the None Such, 100 feet deep, all in ore, and the Fraction tunnel, 50 feet deep, with ore from within 2 feet of the surface. The Black Prince tnnnel is now being driven under these and has a length of 284 feet on the vein. With a length of 1500 feet it will intercept the None Such shaft. Above the Black Prince tnnnel is the Fraction tunnel, now in 162 feet, one level above the former. In the canyou below a tnnnel is being driveu at right augles to these workings, designed to intercept them and to cut several leads paralleling the Black Prince, and to serve as a main working tunnel to all. It is called the Phonolite tunnel and will intercept the Black Prince ledge 400 feet below the tunnel of that uame. The Phonolite is in 241 feet, almost to the Golden Eagle lead, on which a tunnel is being driven and a winze sunk to connect with the Phonolite. The Golden Eagle tunnel is yielding sulphide copper ore of high grade aud carries good values in gold. The lead is cut by a canyon, on the other side of which is a tunnel known as the Grey Eagle, from which good ore is being taken. L. F. Sweeting is manager.

The Morenci coal field is the most important unsolved problem of the district. It has not as yet beeu opened enough to give any indication of what may be expected. The Detroit Copper Co. promptly bought the prospect of the discoverer, J. Molder, and has opened the lead for a few feet in two places. The first shows a vein about 4 feet wide of mixed coal and clay, but the hole was abandoned and another started 500 feet east, on the creek bank. This at 20 feet depth shows 5 inches of coal of fairly good quality. The work is proceeding slowly and it will be some time before anything definite can be known of its extent. Meanwhile all the land within 3 miles of the original discovery is located by others. The Molder field is south of Morenci 3 miles. At Duncan, 35 miles southeast of Morenci, are coal indications, which are receiving attention, and the same distance beyond are still other prospects. At present it is impossible to say auything definitely in regard to the Morenci coal field. Until considerable work has been done it cannot be viewed as other thau a prospect. There is talk of utilizing diamond drills in prospectiug the field, bnt as yet none have been installed.

Mining and Metallurgy at the St. Louis Exposition.

The gold reduction plant which is being erected at the Exposition to show the milling methods in the Black Hills, South Dakota, and which will be operated and maintained throughont the Exposition by the Black Hills Mining Men's Association, under the South Dakota commission, is one of the many educational featnres of the Fair.

The appropriation made by the State of South Dakota was only $35,000. Out of this all the commission conld devote to the mineral exhibits was $6000. This sum will barely meet the cost of the exhibit in the Mineral Palace, which is original and unique. Each of the five stamps weighs 1000 pouuds, the same as are used in the Homestake mills at Lead, South Dakota. The mortar is of the shape known as the Homestake mortar. The amalgamation plates are full size and silver-plated and the cyanide tanks, pumps and machinery are also full size.

The plant will require 1500 tons of ore to keep it in operation. This will be shipped from the Black Hills, different mine owners shipping down about 100 tons each to keep it going. Separate runs will be made on each shipment, a cleanup made and an official certificate issued showing the value produced from each lot.

The total cost of this exhibit and its maintenance throughout the Exposition will be not less than $25,000. It will be an object lesson on modern methods of gold extraction as practiced in the Black Hills, showing how low-grade ores are treated.

In this plant the ore is handled by gravity, passing through a crusher, under the five 1000-ponud stamps, the free ore being then treated on the silver amalgamatiou plates aud the refractory ore by the cyanide process.

The cleanups will be made twice a month and the bullion retorted in the works, so every stage of the work can be seen.

B. C. Cook of Deadwood, cyanide operator, and R. P. Akin of Denver, representing the Colorado Iron Works, will be in charge of the plant.

The Potter Sulphide Process.

At a recent meeting of mining and metallurgical meu at Melbonrne, Australia, the Potter sulphide process was demonstrated in a small way by placing in a test tube some Broken Hill tailings and pouring on a dilute solntion of sulphuric acid. On heating the solution to near boiling point, bubbles of gas attached themselves to the sulphide particles and carried them to the surface, leaving the gangue absolutely devoid of snlphides. By using a larger vessel, the sulphides were removed as they rose to the surface. Mr. Clark, the demonstrator, stated that one merit of the process lay in the separation it effected between lead and zinc sulphides. As was well known, lead ores were no good if they carried too high a percentage of zinc, and zinc ores were no good if they carried too high a percentage of lead; yet they were both valuable if separated. This could be done to a great extent by Potter's process. The Delprat process differed from Potter's in that sulphate of soda or salt cake was also present in the former; but the acidulated solution used had precisely the same action in causing gas bubbles which attached themselves to and carried particles of sulphides out of gangue. Mr. Clark stated that while the application of Potter's process to such lead-ziuc compounds was most important. yet by a modification of it he believed that certain sulphides, like chalcopyrite, conld be separated from certain siliceous ores cheaper than by any existing method.

The action of the machine for working the process commercially was theu explained. It consisted of a shallow rectangular box with sloping ends and sides, the length being about 10 feet and the width 3 feet. In this shallow box another trough having a V-shaped cross section was lowered along its length, the point of the V not quite reaching to the bottom of the rectangular box and the sloping sides of the V overlapping the sides of the other box. Launders run aloug each side of the treatment vessel. Pulverized ore is fed iu at the npper end of the machine; scrapers draw it continnonsly towards the lower end. A solution containing 2% of snlphnric acid is run into the box. This is heated by a steam coil placed underneath the vessel; as soon as the temperatnre nears boiling (200° F.) the sulphides are attacked and bubbles become attached to them. These carry them to the bottom of the V-shaped box; they pass upwards and along the inclined boards and ultimately reach the side launder, into which they drop. As the ore is scraped along the bottom of the treatment vat, it becomes poorer aud poorer in sulphides, sulphide of zinc passing over readily amongst the first concentrates, sulphides of lead and zinc in the seconds. Assays of the prodncts are as follows:

	Lead. %	Zinc. %	Silver. Ounces. Per Ton.
Original ore	7.5	18.5	7.5
First concentrate	7.3	49.07	11
Second concentrate	10.83	40.51	14
Tailings after removal of concentrates.	7.8	5.48	3.5

The machine, which is very simple and easily constructed, is said to have a capacity of nearly one ton per honr. Later the machine was shown in operation, bnt the separation effected, until towards the finish, was not clean, owing to the temperature of the bath not reaching more than 85° to 88° C.; on the following day much better work was done. The process is iu active operation at Broken Hill Block 14 with profitable returns.

WHERE the mine is at some distance from the nearest eligible millsite the transportation problem is sometimes prohibitive, as far as a graded road is considered. Miuing companies not uncommonly expend thousands of dollars in the construction of a short road between the mine and mill for the purpose of ore delivery to the mill and snpplies to the mine. After construction the road is often unsatisfactory and a source of perpetual expense and annoyance.

Petrified Forests and Painted Desert of Arizona.*

NUMBER II.—CONCLUDED.

Written by PROF. OSCAR C. S. CARTER.

In the writer's opinion, most of these trees were broken into logs after they were petrified, and while they were imbedded in the solid rock. The entire plateau country comprising New Mexico, Arizona and beyond, was elevated in recent geological times (Tertiary) from 4000 to 8000 feet above tide. This elevation was gradual, but the strata, nevertheless, were subjected to pressure and strain, which fissured them and cracked the trees while they were still imbedded in the sandstone and shale, before they were loosened by erosion. This seems more reasonable than the statement that they were split into sections by heat and cold, although, doubtless, some were. This large tree spanning the ravine has been called the natural bridge of agate. Unfortunately, there are several transverse cracks in this tree, and one near the mesa seems to extend entirely through the tree, making the position insecure. This is shown in one of the accompanying engravings. It should be braced in some way so as to prevent the entire collapse of the tree into the ravine below, as it will always be a source of wonder and interest to tourists, when the area is set aside as a Government park, to which end a bill has already passed the House. It may be that these trees are not in situ, but floated there in past geological ages, perhaps, down an ancient river into an inland sea, where they were buried in the sand and mud near the shore after they became waterlogged. These layers of mud and sand became shale and sandstone in after years, when the sea receded or evaporated owing to a change in climate and other causes. It may be, however, that these trees grew along a shore line that was afterwards submerged, and they became buried in sand and mud. They are much crowded and the former view may be the correct one.

These mesas were once a continuous plateau of sandstone and shale, when a break, crevice or line of weakness once began, erosion soon completed the work and the gaps widened until finally the plateau was dissected into a series of mesas. As the disintegration of the sandstone and shale proceeded, the trees imbedded in the rock would be loosened and finally roll down to the foot of the mesa, where the most of them are now found. As these strata are of mesozoic age, many layers of rock must have disappeared since that time by erosion, so that the trees at the foot of the mesas and in the arroyos are not in place, but came from a higher horizon of sandstone which has disappeared by erosion. There are, however, many trees in place imbedded in the solid sandstone rock, their branches and trunks projecting from the edges of the mesas and plateaus; but most of these trees in place are in the highest part of the forest at an elevation of 5700 feet above tide; these trees in place are several hundred feet above the valleys and arroyos in which the loose stranded trees are found. The Natural Bridge is the largest tree in place, and most of the trees in place are found in a coarse-grained sandstone, with a feldspathic cement; the cross bedding indicates shifting currents or drifting of the sand by the wind. That layers of sandstone of immense thickness have disappeared from the top of the mesas one can readily see at a glance, because some of the trees are loose on top of the mesas where they were deposited when the rock eroded away. All of the trees have been changed to some form of quartz, either agate, chalcedony, jasper or opal. By far the greatest number have been changed to the varieties of silica which have a waxy luster. It is a well-known fact that quartz resists erosion of all kinds better than any other mineral. It is practically insoluble in mineral acids and also in cold water. The only solvent met with in nature besides some organic acids, from decaying wood and vegetable matter, is hot water containing the alkalies, potash and soda in solution. So we may consider quartz one of the most insoluble minerals known. When granite rocks are exposed to the action of waves along the shore line, parts of all the minerals of the rock dissolve in the course of time except the quartz, and that forms the beach sands.

We can easily see from this how the mesa in which the trees were imbedded has eroded, while the trees rolled down to the base of the mesa or were left stranded on top. Several peculiar mounds of rather striking appearance were noticed on the desert near the mesa, not far from the trees. These have been pronounced by some, after superficial examination, to be extinct geyser cones. There is no evidence whatever to support such a statement. The mounds are simply mounds of disintegrated colored shale, the peculiar form being due to weathering; no indication of geyserite was found. The mounds are certain to attract attention. They are due to erosion, and some mound-like forms were seen capped with a pin-

Indian Paintings on Rocks, Petrified Forest.

Petrified Logs Lying on Top of the Mesa, Petrified Forest.

Petrified Logs Embedded in Sandstone, Petrified Forest.

Peculiar Sandstone Shaft—a Freak of Erosion.

Agate Logs, in Petrified Forest.

*Abstract of Journal Franklin Institute of Philadelphia, Pa., to which we are indebted for the engravings herewith presented.

nacle of harder resisting sandstone. As soon as this topples over and disintegrates and is washed away by rains, then the underlying and softer shale will be moundlike in form. One of the most interesting forms due to erosion is a mound of peculiar shape at the base, surmounted by a shaft 25 feet bigh, on top of which was a slab; both shaft and slab are of sandstone. When erosion proceeds far enough and the peak topples over, one of those peculiar mounds will be formed. The geological horizon to which the sandstone and shale of the forest belong is in dispute. J. W. Powell, formerly director of the U. S. Geological Survey, claims to regard them as Jurassic, while the other evidence seems to point to Cretaceous age. Sections of this wood under the microscope show that it is conifer. In 1853 Mollhausen discovered a petrified forest in a ravine near the Little Colorado in Arizona. The wood was submitted to Dr. Goppert, who pronounced it a conifer belonging to the Abitineæ. Tbe Rio Puerco is a tributary of the Little Colorado. One of the logs in front of the U. S. Museum at Washington was taken from the mesa 2 miles north of Fort Wiugate, N. M., which is not far from the Rio Puerco and just over the Arizona line. They were studied by F. H. Knowlton, who states that they are the same as Goppert's Araucarites Mollhausianus. Not Araucarites as that genus is understood, but Araucarioxylon Arizonicum from the fact that most of the wood is found in Arizona.

P. A. Dudley, of New York, examined this wood and says it belougs to the genus Araucaria, and that Araucaria excelsa, the present Norfolk Island pine of the South Pacific, grows to a height of 150 to 200 feet. Other pieces, he says, resemble red cedar, Juniperus Virginianus. Be this as it may, many specimens show that the wood was going to decay before it was petrified. The writer believes that most of the petrifaction took place in the sandstone and shale, and was due to soluble silicates derived from decomposition of feldspar, which is the cement binding the sandstone. The silicate of potash or soda produced the petrifaction when it came in contact with the vegetable matter or trees that were imbedded. The silicates are soluble in rain water, and as they percolate through or over imbedded woody material the organic acids derived from the decomposition of the wood will decompose the silicate of potash and set free silica in the amorphous or gelatinous form, which will be precipitated ou the wood and in the pores until the substitution is complete. In Penusylvania pieces of petrified wood are found iu red sandstone; a feldspathic cement binds the grains of sand.

Near Hanna's ranch a small plant was erected by a Denver, Colo., company, who intended to crush the agate trees and use the powder for an abrasive ageut as a substitute for emery. At Sioux Falls, Dak., they polish petrified wood and make magnificent table tops and pedestals.

In the Yellowstone Park (U. S. Geological Survey Monograph XXXII, Part 2) are found many petrified trees, but they are standing upright. They do not rise to great height and are mostly trunks on the slopes of mountains, aud the highest of them rise to only 20 or 30 feet. They are found near Lamar river, the finest exhibit being on Amethyst Mount and Specimen Ridge, near the road between Mammoth Hot Springs and the town of Cooke, Mont. Yancey's fossil forest is 1 mile south of his hotel, on the slope of a hill 1000 feet above the valley. There are only two trees of considerable size, the largest stump being 15 feet high and 13 feet iu circumference. The bark is not preserved, so that the true diameter cannot be ascertained. They belong to the genus Cupressoxylon. Some trunks rise only a few inches above the ground. Some of the trunks near Specimen Ridge are sequoias. In early tertiary times these forests were supposed to have been buried under debris ejected from volcanoes and afterwards surrounded with water charged with silica, which petrified them. The largest trunk in the park is 10 feet in diameter. These trees which grew in tertiary times cannot, of course, be compared in age with the trees of the Petrified Forest, Arizona, which grew in mesozoic times.

U. S. Geological Survey Results.

The members of the United States Geological Survey in Washington recently celebrated the quarter-ceutennial auniversary of its organization. The more important results achieved by the Survey during the twenty-five years of its existence are set forth in its recent bulletin (No. 227) eutitled "The United States Geological Survey: Its Origin, Development, Organization, and Operations." This bulletin is intended for gratuitous distribution, and copies of it will be given away as souvenirs in connection with the Survey's exhibit at the Louisiana Purchase Exposition.

Since the establishment of the Survey a complete topographic map has been made of 929,850 square miles of the area of the United States, the Survey having finished the mapping, on more or less detailed scales, of 26% of the area of the country, including Alaska, or 31% excluding Alaska.

This great map of the United States, of which nearly one-third has been completed, is published in the form of an atlas. The portion completed consists of 1327 atlas sheets printed in three colors from copper-plate engravings.

The geologic mapping of the surface formations has been extended over about 171,000 square miles and 106 geologic folios have been published, while nearly an equal number are in various stages of preparation. Each of these folios presents a practically complete history of the topography, geology, aud mineral resources of the area described.

The Survey, through its hydrographic branch, including the reclamation service, has recorded, during the last fifteen years, the maximum, minimum, and mean discharges of all the more important rivers, and for shorter periods the same facts concerning all the lesser tributaries of the many hundreds of streams in the United States. The physical characteristics of the river basins have been studied in respect to their forestation, soil covering, etc., aud a vast amount of data has been accumulated from which it is possible to estimate closely the volume or run-off of each of the streams.

Data have been gathered concerning irrigable public lands and their relation to possible water supplies. A large number of reservoir sites have been examined and surveyed, and the lands which the reservoirs would serve have been withdrawn from sale or occupation pending more detailed studies. Surveys of the irrigable lands as well as of canal lines have been made, and several irrigation projects have been approved for construction by the reclamation service.

The Survey, by its division of geography and forestry, has examined iu detail 110,000 square miles and has made a classification of the lands as forested, grazing, desert, and arable.

The immediate value to the people of the Survey's work is best shown by the aid it renders in developing the mineral resources and in forwarding important engineering projects. The investigation of the mining geology of Leadville has guided exploration and secured economical mining in a district that has produced between $200,000,000 and $300,000,000. It has also taught the mining engineer and the miner the practical importance of geologic study in their work. The investigation of the origin and geologic relations of the Lake Superior iron ores and the publication of numerous reports on that region have directed the prospector in the discovery of deposits and have suggested to the miner the most ecouomical methods of development. The result is that this region now leads the world in the production of iron ore.

Coal Lands in Alaska.

The last Congress passed a bill relating to the taking of coal lands in Alaska which is briefly in effect as follows:

Auy persou or association of persons qualified to make entry under the coal land laws of the United States, who shall have opened or improved a coal mine or coal mines in any of the unsurveyed public lands of the United States in the district of Alaska, may locate the lands upon which such mine or mines are situated in rectangular tracts containing 40, 80 or 160 acres, with north and south boundary lines run according to the true meridian, by marking the four corners thereof with permanent monuments, so that the boundaries may be readily and easily traced. And all such locators shall, within one year from the passage of this act, or within one year from making such location, file for record in the recording district, and with the register and receiver of the land district in which the lands are located or situated, a notice containing the name or names of the locator or locators, the date of the location, the description of the lands located and a reference to such natural objects or permanent mouuments as will readily identify the same.

Such locator or locators, who are citizens of the United States, shall receive a patent to the lands located by presenting, at any time within three years from the date of such notice, to the register and receiver of the land district in which the lands so located are situated, an application therefor, accompanied by a certified copy of a plat of survey and field notes thereof, made by a United States deputy surveyor or a United States mineral surveyor duly approved by the Surveyor-General for the district of Alaska, and a payment of the sum of $10 per acre for the lands applied for; but no such application shall be allowed until after the applicant has caused a notice of the presentation therefor, embracing a description of the lands, to have been published in a newspaper in the district of Alaska published nearest the location of the premises for a period of sixty days, and shall have caused copies of such notice, together with a certified copy of the official plat or survey, to have been kept posted in a conspicuous place upon the land applied for and in the land office for the district in which the lands are located for a like period, and until after he shall have furnished proof of such publication and posting, and such other proof as is required by the coal land laws; provided, that nothing herein contained shall be so construed as to authorize entries to be made or title to be acquired to the shore of any navigable waters witbin said district.

During the period of posting and publication, or within six months thereafter, any person or association of persons having or asserting any adverse interest or claim to the tract of land or any part thereof sought to be purchased shall file in the land office where such application is pending, under oath, an adverse claim, setting forth the uature and extent thereof, and such adverse claimant shall, within sixty days after the filing of such adverse claim, begin an action to quiet title in a court of competent jurisdiction within the district of Alaska, and thereafter no patent shall issue for such claim until the fiual adjudication of the rights of the parties, and such patent shall then be issued in conformity with the final decree of such court therein.

All the provisions of the coal land laws of the United States not in conflict with the provisions of this act shall continue and be in full force in the district of Alaska.

Concentration of Low-Grade Copper Ores.

NUMBER IV.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by W. J. ADAMS, E. M.

The additional value of gold and silver would, of course, add materially to the amount of ore available, even if very low in copper; but in the tests of the writer no attention was paid to the presence of the precious metals, the sole object being to find out whether a merchantable copper product could be made with only a slight loss in the tailings and knowing well that the other values would go with the sulphurets with which they are combiued, unless in a free state.

From the foregoing the following deductions can be derived: Unless the costs of mining bar the process by being greater than the total value of the ore, or where there are dumps of insufficient size to warrant the outlay of capital requisite for the plant, the concentration by the above method will prove a commercial success.

The following suggestions are given where the ores are similar to those tested, and with proper modifications should apply to all ores amenable to the process:

First—Broken by rock breakers, the ore should be crushed wet, to pass a screen of 30 mesh, or, if of sufficient value in gold and silver, to pass a 50-mesh screen.

Second—It is then to be concentrated on Frue vauners of the corrugated type, or by Wilfley tables, but a clean and coarse concentrate only must be saved, and the only attention paid to the tailings is that there is no loss—or a very slight one—in coarse sulphurets, no observation at all being made on the losses in the slimes. This will require a more rapid progress of the pulp over the machines than is generally employed where low tailings as well as high-grade concentrates are both desired.

Third—The tailings from these machines, water and pulp, sand and slimes, are then passed through point boxes—known as spitzkasten—and separated into their constituent parts of slimes, which overflow, and sands which are drawn out at the bottom of the V of the box. Care and experience must now be employed until such a separatiou is effected (and it can be doue), so that the overflow will carry all the free mineral left in the tailings, and the sands only that modicum of $\frac{2}{10}$% copper or so, still locked up in them, due to the coarse crushing. As the oil will have no effect, or very little, when the contained mineral is exposed, they can be sluiced to the waste dump and reduce by that much weight and bulk the amount to be subsequeutly treated by the oil process. In this way the size of the special oil concentrating plant can be reduced from one-half and possibly even to two-thirds the original size that it would be if the entire bulk of pulp had to be passed through it.

Fourth—These slimes run continuously through the three mixing cylinders of the process and finally flow away to the waste dump. Fresh oil is added to the pulp in each cylinder, and the oil and coucentrates are separated from the pulp, after passing each cylinder, by a spitzkasten, and run by gravity from it to the centrifugal separator, while the tailiug slimes from the last separator flow directly to the waste dump. The concentrates and oil are heated to 80° to 90° F. beforc entering the separator, and where the layer of mineral is so thick that there is danger of loss with the escapiug oil the admission of the saturated oil is stopped, and hot water is added to displace as much of the remaining oil as possible. This oil is then pumped back to be used over agaiu on fresh pulp, and the concentrates and water are transferred to a second separator with a basket filter, where the water is removed, and absolutely dry concentrates are left, except for a small amount of oil, which adds to its fusibility, and, if these concentrates are shipped, prevents any loss on its transit by dusting. This loss of oil is very small, as shown by long-continued work, and does not exceed, at the very most, one and one-quarter gallons per ton of ore actually treated.

With a plant having a capacity of treating 500

tons crude ore per day, there would be removed from 10% to 15%, and perhaps 20%, in the concentrates from the vanners, leaving from 450 to 400 tons only to enter the spitzkasten; and here, from the result of the sliming tests, there will be a further reduction of at least 50% of the weight, or 225 to 200 tons, on the waste sands. This leaves, at the most, only about 200 tons to be treated by oil, or a plant of four units, instead of one of ten units, if all the ore had been treated by oil.

In conclusion, it can be stated that, contrary to belief, the process is cleanly and the costs very small. These costs have not been compiled by the writer, but the total of crushing and concentrating should not exceed 75 cents per ton.

Tonopah District, Nev.*

Written by S. A. KNAPP.

The Tonopah mining district is situated partly in Nye county and partly in Esmeralda county, in the State of Nevada, and on the western slope of the southern portion of the San Antonio range of mountains, this range here being broken up into isolated buttes and rolling hills with a gradual easy slope to the San Antonio desert, the contour in some places being very rugged, and in others having small plateaus and wide ravines or washes.

Until the year 1900 the whole area was comparatively unknown, except to a few cattle and range men, and very little of its mineral possibilities were realized. In May, 1900, J. L. Butler, while prospecting, came across the outcrop of a series of ledges and took samples with him. The quartz was unpromising in appearance, but the veins were large and the outcrop prominent. He took some of the ore with him to Klondyke, a camp 10 miles south of the present town of Tonopah, where he left a piece with an assayer to be tested, who thought so little of it that, when Butler left for Belmont, threw it out of the window without testing it. Mr. Butler on his return to Belmont told T. L. Oddie he had found large ledges of this material in the southern desert, but had not had it tested. Arrangements were made between them and the ore sent to Austin to be assayed, and it was found to contain high values in gold and silver (about $600 to the ton). The returns were delayed in reaching him, and Mr. Butler returned to the locality and proceeded to locate the claims covering this outcrop, this being done in the latter part of August, 1900. During September, October and November, he, with T. L. Oddie and W. Brougher, completed their locations, and in November the news got abroad that good ore had been found, and a number of miners from Silver Peak, about 40 miles distant, came in and were given leases by Mr. Butler and his associates on portions of the ground. Leases of 100 feet in length along the outcrop, with the right to follow the veins down, were the rule. By the middle of December, 1900, five leases were in operation. Butler and his associates started a small shaft on what is now known as the Mizpah ledge and were down about 25 feet.

At that time others had commenced to come in. An examination of the property was made by S. A. Knapp and a report sent to J. R. Delamar, who acquired a bond on the property to permit examination and sampling for $200,000. In January the examination was made, and the man sent to examine the property concluded that there was at least $750,000 worth of ore available that could be counted upon from the surface or by development which had been made at that time, but as fuel and water were not known in any quantity the conclusion on his part was that the outlay necessary to commence operations would be very heavy, and without further development he would not be warranted in paying that price. During these negotiations other parties had come in and other leases were given, and the output and shipment of ores had commenced.

Up to March, 1901, the leases had all been given with the proviso that in the event of a sale the leases would be abrogated. This prevented systematic exploration and development on the part of any of the leasers, and necessitated their gouging out their ore day by day, thus leaving the property in bad shape. Realizing this, Mr. Butler notified all the leasers that, sale or no sale, they would be given until January 1, 1902, to operate their leases, they paying to himself and associates 25% of the amount extracted. By this means, having something definite to go on, the leasers commenced systematic development and opening of the ground allotted to them, with the result that by January 1, 1902, they had, it is reported, extracted ores of the value of about $3,000,000. The high grade of the ore attracted widespread attention, and in April the property was bonded by Price & Brent. Owing to a disagreement between themselves and Mr. Butler and his associates, the bond was thrown up.

About June 1st, O. A. Turner of Grass Valley, attracted by an article descriptive of the property which appeared in the MINING AND SCIENTIFIC PRESS in May, came up and made an examination of it, and was convinced of its great value and secured a bond on the property for $336,000, and agreed to pay $50,000 down on July 1st. He telegraphed his principals; a hurried examination was made by experts and parties connected with the matter from Philadelphia. The first payment was made in accordance with the contract, and in due course of time the property was paid for and passed into the hands of what is now known as the Tonopah M. Co. The royalties from ores extracted by the leasers up to January 1, 1902, more than covered the amount paid by this company for the entire property. The leasers crowded all the men they could into their ground with a result that some of them penetrated to a depth of 200 feet, showing the ledges to be large, strong and carrying high values; the average of the entire mass of ledges ranging from 5 to 10 feet in width, the ore running about $100 per ton, of which about 25% was gold and the remainder silver.

The property was taken over by the Tonopah Company on January 1, 1902, and its systematic development undertaken. One shaft, known as the Siebert shaft, was started, being a three-compartment shaft, well timbered, and has reached the depth of 950 feet. Another shaft, known as the Valley View, was also commenced, and has reached a depth of 740 feet. What was known as the Brougher shaft, which was sunk by the leasers originally, was extended to the 700-foot level. From these shafts a series of levels have been driven on the 300, 400, 500 and 700 on the Mizpah ledge, and connections made with the Valley View, upon which a level of 1000 feet in length has been driven. The 300 level on the Mizpah ledge is 2600 feet long; the 400 level is 412 feet in length; the 500 level is 1776 feet in length, and on the 700 level a long crosscut has been driven to a connection with the Valley View shaft. The Mizpah ledge and the Valley View ledge run east-west and dip to the north—the Mizpah at an angle of 60° and the Valley View at an angle of 45°. Between these two ledges are the Burro No. 1 and the Burro No. 2 veins, which show upon the surface and have been cut on the 300 and 700-foot levels. This system of work shows that the Mizpah ledge ranges from 5 to 11 feet in width down to the 700-foot level. The Valley View ledge, which on the surface consists of a number of parallel ledges, at the 300 level is 68 feet wide, and shows a ledge on the hanging wall of very high-grade ore, ranging from 6 to 10 feet wide, the remainder of the ledge being a lower grade of ore, and consisting of porphyry with streaks and stringers of quartz through it.

Up to the present time only the highest grades of ore have been extracted and have been shipped to the various smelting points for reduction. This has entailed a heavy cost for team freight, railroad freight, smelting charges and percentages deducted by the smelters, and, as the ores which have been shipped have averaged about $150 per ton net, the cost of shipment, reduction and percentage deducted is approximately $50 per ton on this class of ore. Realizing that it would not be policy to continue this loss, the Tonopah Company has been looking about for means of reducing the ore on the ground or in the vicinity, and by this means reducing this expense. In order to obtain the fuel, water, salt and chemicals necessary, and to transport supplies at a lower rate, they are now building a railroad from Rhodes Marsh, a station on the Carson & Colorado Railroad, to Tonopah, a distance of 60 miles. It is expected that this road will be completed the present month.

The geological features of the Tonopah mining district are complex. The country is made up of eruptive rocks, which have apparently been erupted at different periods. The underlying formation, so far as known, which is locally called the lode porphyry, is andesite, and this has been fractured and fissured, which has permitted the formation of the ledges. So far as developments go, the principal ore bearing ledges are confined to this underlying formation, which was only exposed and known upon the surface in the ground now owned by the Tonopah M. Co. Although apparently extensive, it was covered by subsequent flows of different characters of porphyry, volcanic mud and showers of volcanic ash.

An early examination convinced other parties that this porphyry containing these ledges extended under these surface flows, and work to determine this was commenced. The first absolute proof of the correctness of this theory was made by the Tonopah Fraction M. Co., which, in sinking their shaft, encountered the lode porphyry and ore at 280 feet. A number of companies are engaged in this development work, and gradually the area of this underlying formation containing veins is being widened. Wherever encountered thus far, the veins and ledges are of a similar character, and the ores are of a generally similar nature, the ores which have been unoxidized being a silver sulphide combined with an iron sulphide, and intimately associated with quartz. Where the surface waters have penetrated and oxidizing influences have obtained, these ores have changed in part to sulphates, oxides, carbonates and chlorides.

*Abstract from the Resources of Nevada.

The Small Sawmill in Mine Development.

Written for the MINING AND SCIENTIFIC PRESS by DENNIS STOVALL.

The small sawmill is gaining an important place in the development of placer and quartz mines. Well it should, as it is proving a great money and labor saver. Many of the quartz and placer mines of Oregon and California own their own mills, especially in those districts where there is an abundance of timber. Properties that are located in remote districts cannot purchase and haul in lumber for less than $30 a thousand. The small sawmill can cut it for less than $6 a thousand.

The mill shown in the accompanying illustration is installed at a hydraulic mine, and "can be loaded on a pack pony," as the old sawyer expresses it, yet it cuts from 5000 to 7000 feet of lumber a day. Power is supplied by a Pelton wheel, and the water is derived from the pipe line feeding the giants. It requires but three or four men to operate the mill, and about that number in the timber, felling trees and sawing logs. A mill of this kind can be torn up and made ready for transportation in a short time, and can be readily set up again.

Quartz mines are also making use of the small sawmill for sawing mine timbers, lagging and lumber, and the placer miners use them for cutting lumber for flumes.

Small Sawmill at Mine, in Oregon.

Remarks of "Dry Washer Bill."

TO THE EDITOR:—The Oakland ferry had just come in, and to one not a dweller in San Francisco it was interesting to see the fast-moving, clean-appearing throng swarming out like bees from a hive. Suddenly my hand was grasped by a broad, athletic figure with a grip like a rock crusher, and while a suspicious flash of bunco man crossed my mental vision, it was dispelled in an instant by a recognition of the genial face of "Dry Washer Bill," one of the best mining scouts and prospectors on the coast, one for whom extremes of space and variation of climate are no hiudrance—no mountain too steep to climb, no desert too forbidding to cross, and no work nor hardship too great to endure; often without sufficient food and, perhaps, worst of all, no tobacco; one season digging away the moss and sinking in the frozen muck of Alaska; then, out of luck and disgusted, to the other extreme of wandering, parched of tongue, over the hot sands of the Mojave. A thorough quartz miner and judge of ores, expert and honest, he could be steadily employed at good salary, but he prefers to "play a lone hand," never doubting his ability to "strike it richer than ever," for he has discovered and sold out for a song mines that are worth millions.

Successful work near Goler with a dry washing machine during the first rush to those limited but rich-in-spots diggings fastened on Bill the handle of "Dry Washer;" and so he is known, whether in Butte or Bisbee.

"Well, well, but I am glad to see you," said Bill. "It's good for sore eyes to see somebody who isn't a permanent resident—not that I'm particularly dowu on that class of inhabitant, but I can't do any business with 'em, and it sort o' hurts my feelings. While I don't owe this town a cent, I can't keep away from "Frisco" when I've got the price. There's nothing doing here, though, for me. I must say it's the hardest place in which to work up a good, square mining deal I was ever in. Oh, yes, there's plenty of money—oodles of it—but precious little of it can be had to work a prospecting mine. Everybody in the mine business hereabouts wants a developed mine—and they want it cheap. Why, if I had such a mine as nearly all you Californians are asking for, I wouldn't sell it for any price. Developing a mine means to sink shafts, run drifts and block out ore. This means that somebody has first to spend money and take a chance of losing it in searching for the ore, which must be found before it is blocked out. And yet, so many talk about 'legitimate mining'—'legitimate mining.' It makes me tired to hear the words.

"Never has a quartz mine been opened up, in any part of the world, which did uot require a chance to be taken that the openings made would be in ore and contiuue to be pay rock in sinking, driving and raising. The men or companies who work their properties, make no false reports and pay their bills, are doing legitimate mining, whether they have ore in sight or not. Legitimate mining implies the taking of legitimate mining risks as well, and yet people talk as though it meant 'sure thing' in money making, which is not good sense, for you can't apply that term to any kind of ordinary business. Mining records fewer failures, though, when once established.

"Anybody, even a correspondence school graduate, can pass on the value of and, after a fashion, work a developed mine, with ore bodies all blocked out, and get some pay from it. But somebody had to pay for the explorative work, and if a risk had not been run, unless someone had courage to back his judgment the developed mine would not be there, ready to turn out its visible wealth.

"Men so timid that they must be coaxed into investing their money by the assurance that they can not lose are not the ones to help along the mining industry. No; they're not the same in other States. Colorado people will jump at a chance that some of you Californians couldn't be dragged into with a yoke of bulls.

"If it wasn't so I wouldn't be here now with a wad of greeubacks in my inside pocket. Sold a claim there, up above timber line—10,500 feet elevation; had to pack my ore on burros down a narrow trail 4 miles to a flat car; then hundreds of miles by railroad haul to a smelter; snow up to your necktie eight months in the year. Why, some of you California mother lode miners couldn't be coaxed into looking at it—not even with first-class passage in an air ship. If Colorado miners and capitalists had California's advautages of known but undeveloped mines, its accessibility and climate, enabling them to do work the year round in the open air, as can be done in most situations where you are now mining, the gold and silver production of California would be a hundred millions per year in a short time. Why don't they come here and show us the trick? They're too busy—attending to their own business and developing their own State, as Californians might be doing. That's one reason.

"Yes, California miuing propositions are occasionally presented to Colorado men, but it seems so dead easy a thing to them that they can't help thinking there must be a catch in it. They have read about the courage and the progressive spirit of the California pioneer, and it is not easy to believe that such chances really exist.

"No, don't mistake me. I'm not saying a word against California miners; there are some of the best in the world in this State, even if they are, as a rule, a trifle too easy-going, and lack ginger, when compared with residents of colder climates and higher altitudes. Colorado much injured by the strikes? Yes, very much. It's hard to do anything in the way of getting a new property started until affairs are more settled. Who is to blame for this condition? Well, as I see it, both sides. When two men, each with a chip on his shoulder, butt up together, there is always a show for a scrap. Sometimes the bull-headed manager is as much to blame as the bullet-headed walking delegate. Many superintendents are working their mines and running right along without trouble. Perhaps 'Cousin Jack' is right when he says 'there are places for men, and men for places.'

"I believe in the right of men organizing to establish a uniform scale of wages. I believe, also, that a man should have the right to hire and discharge whom he pleases and manage his own business in his own way. Do I mean I should recognize the union? Most certainly. Why not—if the union recoguizes us first? Let no man outdo you in politeness."

At this I looked up into the face of "Dry Washer Bill," but couldn't make out whether he was joking or in earnest. But since my talk with him I have been thinking. CHAS. L. LANG.

Sonora, Cal., May 16.

The Ridgway Two-Belt Conveyor System.

The use of belt conveyors for handling material in bulk or package within the scope of this type of machinery is an established fact. Mechanical, mining, civil and consulting engineers appreciate it as a simple, cheap and economic labor-saving device where large quantities of material are to be conveyed, or elevated and conveyed. Plans are made and specifications drawn calling for belt conveyors, and it is now no longer a question of creating a demand, but of supplying it.

In the two-belt system an interior troughing and supporting belt runs over its individual head and tail pulleys, having separate take-ups, and is independent of the conveying belt proper. The conveying belt is threaded over its head and tail pulleys in the usual manner and has its separate take-up, so that the two belts, although moving together in the same direction at the same speed, are separate and distinct, to enable the conveying belt to be lifted off the supporting belt, out of the troughing blocks and passed through either a stationary dumper or a movable tripper.

The conveying belt has no work put upon it other than what is required to drive the lower carriers and its own head and tail pulleys, the carriers on the upper line being revolved by the inner supporting belt, the strains being thus divided.

The interior belt is driven by a compensating drive (roller or block chaiu sprocket drive) from the main driving shaft, and with the two belts in tension, just sufficient to prevent slip on their driving pulleys; both belts move at the same speed in the same direction. At the points where the conveying belt meets the interior supporting belt, a pair of concentrating rolls lifts the edge of the belt and drops it into the troughing blocks. This same method is used where the conveying belt leaves the troughing blocks at the opposite end.

Fig. 1 represents the carriers used in the two-belt system, straight rollers fastened to steel shafts revolving in babbitted boxes. The interior belt, by a compensating drive, is driven at the same speed as the upper carrying belt, and the two move together through their entire travel on both the upper and lower sides.

The inner or troughing belt carries the outer or conveying belt through the upper line of working travel and the outer belt carries the inner belt on its return and through its travel in the lower line.

Fig. 2 shows the assembled parts, the conveying belt proper resting on the blocks of the inner belt and producing a trough which conforms to the segment of a circle. This system is furnished by the Ridgway Belt Conveyor Co., 29 Broadway, New York, N. Y.

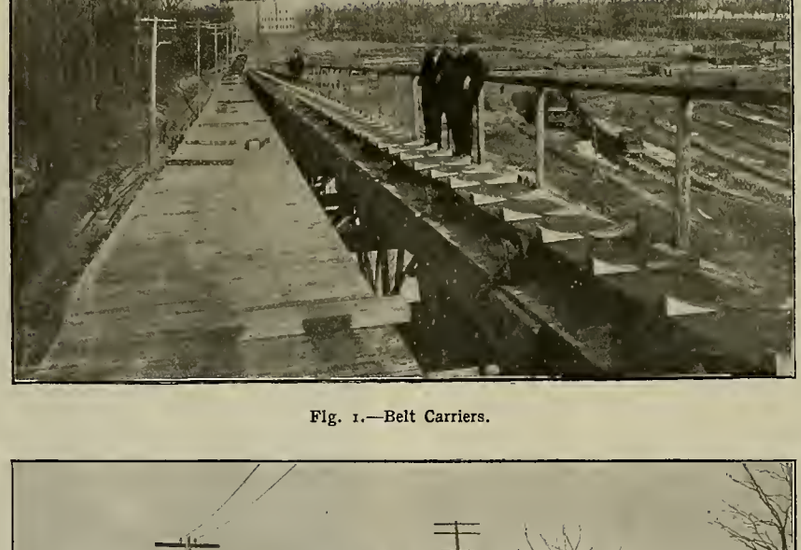

Fig. 1.—Belt Carriers.

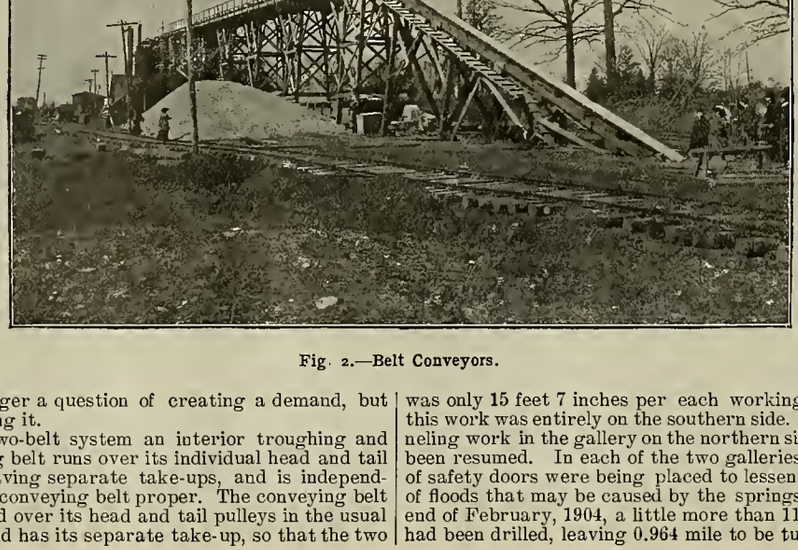

Fig. 2.—Belt Conveyors.

The Simplon Tunnel.

The Tribune of Geneva states that during the month of February the advance in the Simplon tunnel was only 15 feet 7 inches per each working day, and this work was entirely on the southern side. The tunneling work in the gallery on the northern side had not been resumed. In each of the two galleries a system of safety doors were being placed to lessen the effect of floods that may be caused by the springs. At the end of February, 1904, a little more than 11.295 miles had been drilled, leaving 0.964 mile to be tunneled.

Acid Making From Pyrrhotite.*

By E. A. Sjostedt.

Attempts at using pyrrhotite (monosulphide of iron, $Fe_n S_7$) instead of brimstone or pyrite (bisulphide of iron, $Fe S_2$) for acid making have often been made, but the same having repeatedly ended in financial failure, they came to be considered as foolhardy undertakings, and some engineers and professional men have even gone so far as to publicly pronounce it an impossibility, as will be seen from the following quotation:

"One of the most serious errors ever perpetrated in the manufacture of acid from pyrites is the attempted employment of pyrrhotite for pyrite. Aside from the greatly lessened proportion of sulphur—36% as against 53%—the pyrrhotite will not even yield freely what sulphur it contains, but crusts with oxide of iron, turns black, and is soon extinguished when treated in an ordinary pyrite kiln."

When, therefore, a few years ago the problem was presented to us of treating the Sudbury pyrrhotite so as to recover not only the nickel, cobalt and copper present, but to utilize its sulphur and iron contents as well, no sympathetic co-operation was to be expected, and open criticism was heard from many quarters. We are now able to announce that the question of economically using the sulphur from said ore has been solved, and herewith present such information and data as will prove to the engineering fraternity the value of the work done and the importance of the results obtained.

The Problem.—The Sudbury pyrrhotite as shipped for smelting purposes averages about 15% to 20% sulphur, 1% to 3% nickel and .5% to 2% copper, the balance being made up of a corresponding percentage of iron and gangue. Realizing the impracticability of using such low-grade ore for the purposes set forth, the first step taken was in the direction of concentrating it. The pyrrhotite being easily distinguished by its pale color from the deep yellow chalcopyrite, the separation of the same from the copper ore and the gangue was readily accomplished in the rock house, at the crusher and on the sorting table; and in this separation we obtained two workable grades of ore, one high in copper and gangue and low in sulphur, designed for the ordinary matte smeltiug process, and the other, low in copper and gangue but high in sulphur and nickel, intended for the acid plant. This latter grade usually averages about 28% sulphur, 3% nickel, .5% copper and 50% iron.

The plan proposed for utilizing the sulphur in this ore was to roast the pyrrhotite in a closed furnace, with the recovery of the resulting sulphur dioxide, which, after having been cleaned and cooled, was to be used for the following purposes:

1. In the manufacture of a "bisulphite liquor," of a character suitable for, and to be used in, the sulphite pulp industry.

2. In the manufacture of liquid sulphurous anhydride, intended as a reserve supply for the sulphite mill in case of any stoppage or interruption at the roasting plant, or when the pulp mill would call for more or a stronger gas than that furnished by the roasters in operation; also intended as a separate commercial product to be disposed of for the purpose of refrigeration, ice making, sugar refining, bleaching, disinfecting, etc.

3. In the manufacture of sulphuric acid—50°B, 66°B and 98%—for the great market open to such an industry, covering an extensive field from fertilizers to gold miuiug, and including manufacturers of fertilizers and soda water, oil refiuers, dyers, furriers, cotton bleachers, brewers and galvanizers, and also for the rubber and hat trade, the woolen and wire mill, the nitro-glycerine and dynamite manufacturers.

The Roasting Plant.—The question of greatest importance at this stage, consequently, was to find a method or roasting system by means of which a clean and sufficiently strong gas could be obtained at smallest cost. Roasting experiments were carried out in a systematic manner in shaft and reverberatory furnaces, and the first conclusion reached was that the ore, in order to be successfully treated, must be crushed to a powder. At this time a roaster for treating pyrite fines was brought to public attention, and, receiving some encouragement from the designer as to the feasibility of this furnace accomplishing the desired aim (a dead roasting of the ore without any auxiliary heat), one of these roasters was erected at this place for trial purposes. In spite of every effort, and after a long series of tests, however, we found that this roaster, as constructed, would not answer our purpose—the roasting heat not being maintained by the combustiou of the sulphur in the ore, and the gas produced being too diluted. The many excellent points embodied in this type of roaster being fully appreciated, attempts were at first made simply to improve on the weak points as applied to our special problem, but gradually a somewhat different type was evolved, containing important changes, by which the problem was eventually solved. These modifications consist of (1) a minimizing of the heat of radiation, (2) the application to best advantage of the roasting heat geuerated, (3) the exclusion as far as possible of an excess of air over and above that required for the oxidation of the sulphur in the ore, and (4) the applicatiou of an auxiliary source of heat, iu case of need. The special features embodied in the new roaster are the following:

1. The combination of four single furnaces in one battery, disposed equidistant from a commou center.

2. A minimum distance between the floor and roof of arches of the roasting chambers, made possible by the construction of the arm aud the manner in which it is secured to the center shaft, it being secured in position by a horizontal motion and a quarter turn.

3. A round rabble arm, with a perfectly secure locking device having both ends closed so as to prevent any inflow of air from the center shaft to roastiug chamber, the air of combustion being admitted through special pipes, provided with valves for a perfect control of the same.

4. Separate muffle chambers for the applicatiou of an auxiliary heat, aud having no connection with the roasting cbambers, the one under the bottom hearth being a combustion chamber, and those under the second and top hearths being heating chambers, through which the combustibles of the extraneous fuel pass from the combustion chamber, and thus utillzed to advantage in heating the corresponding roasting floors.

5. A screw device for feeding the ore from the hopper to the roaster, the same being propelled by means of an eudless chain from the main driving shaft.

(To be continued.)

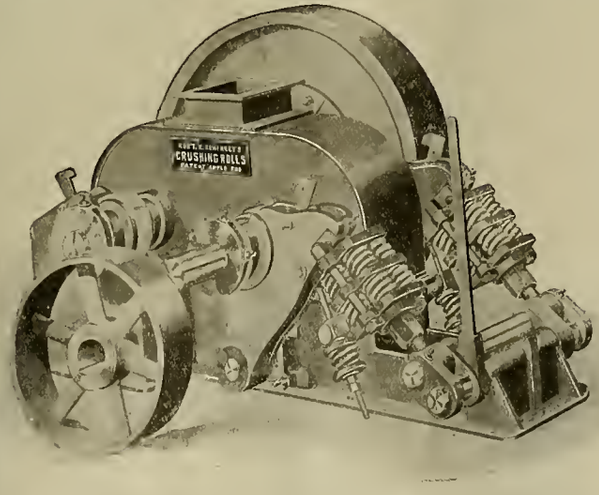
*Abstract Trans. Can. Min. Inst.

Temperature in Steam Pipes.

The measurement of temperature in steam pipes by a mercury steel pyrometer was described in a recent paper by R. K. Morcom, read before the Institution of Electrical Engineers, at Birmingham, England. The temperature is indicated by a pointer on a dial face, which has the appearance of a pressure gauge. The pointer is saturated by the expansion of mercury in a steel tube reacting on a spring. The instrument may be fixed in any position iu the engine room and connected by a fine steel tube containing any convenient medium to transmit the pressure to the spring. It is troublesome to calibrate, and requires frequent correction. A platinum wire pyrometer, he asserts, has frequently been broken by the rush of steam, and is too delicate for the testing plant of an engine works. The present arrangement comprises a thin, steel tube, screwed well into the steam pipe through a stuffing box, so that an asbestos packing may insulate it from the steam pipe. Oil is used in the tube instead of mercury, as it is found slightly more accurate. The author also referred to the method of inserting a thermometer into a cup screwed into the pipe, the end of the thermometer being immersed in a bath of mercury.

Crushing Rolls.

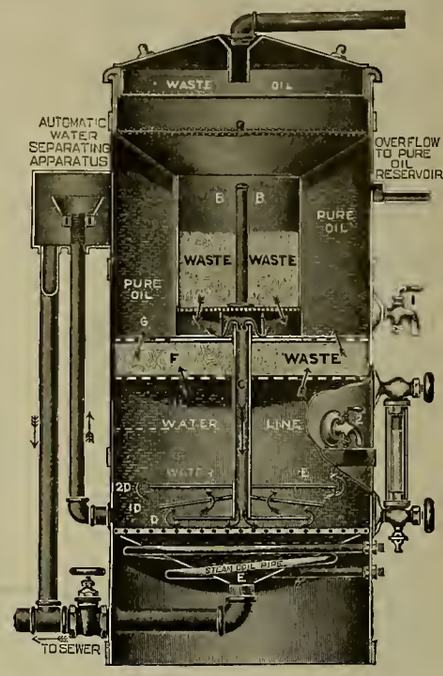
The accompanying illustration gives a good idea of the priucipal features of these rolls. There



are means for keeping the rolls in proper alignment, a lever to separate the rolls quickly in event of the machine becoming clogged, and straps and keys to hold the bearing caps. The caps are held in place on the main shaft by large yokes locked with steel keys, like battery keys, that the vibration of the machine may cause them to tighten instead of coming loose. The Colorado Iron Works Co., Denver, Colo., are manufacturing these rolls for Robert K. Humphrey of 1025 South Gaylord street, Denver, who is the inventor.

Saving Cylinder Oil.

The Burt Manufacturing Co. of Akron, O., make what they call their "Style B Oil Filter." As illustrated, the oil and water are poured in the top of the filter and then passes iuto chamber B, through the



layer of waste, to collect all the heavier impurities of the oil; from thence through the perforated bottom of chamber B, down in the direction shown by the arrows into tube C, thence to filter plate D, where the increased weight of the water has a tendency to keep the oil back in tube C. The pressure of oil in chamber B forces it down to spread over plate D, in a thin film, growing thinner as it travels from the center to the circumference of plate D, to expose the waste oil to the action of the water. It then flows upon plate D′ and D″, going through the same process in each case. Wheu the oil leaves the filter plate D″ it is in a finely divided state of separation, and mixed with water, whieh washes it out and from which it separates by gravity the impurities, which settle in chamber E to be removed by opening the gate valve at bottom of filter, which drains off the water and dirt. From plate D″ the oil again filters through the stratum of filtering material F, from there rises to the pure oil chamber and thence flows to the oil reservoir. The water is automatically separated after it passes down the tube C and reaches the bottom plate. The oil being lighter than water, as it reaches the bottom of the filter, it rises the surplus water passing into the tube which leads to the automatic water separating device.

The Production of Zinc.

The production of zinc ore in the Joplin district during the first quarter of 1904 was 65,500 tons, or at the rate of 262,000 tons per annum, which is a large increase over 1903. The production in the first quarter of 1903 was only 58,581 tons. The average price reported for the output in 1904 is $33.30, which is decidedly high, the average price of spelter at St. Louis having been only 4.673 cents in January, 4.717 cents in February and 4.841 cents in March.

The price for spelter has lately risen as was forecasted it would be likely to do, and, ore having failed to rise in the same proportion, the smelters gained a somewhat more comfortable margin, which, indeed, they were in need of. The increasing supply of ore, combined with an improved demand for the metal, has put them in this more satisfactory position. The miners are receiving so high a price for their product that they have no ground for complaint. An unusual feature at preseut in the Joplin ore market is the wide range in basis prices, ore being quoted at $34 to $37 ou 60% base, which means that inferior grades are purchased in proportion to $34 for ore containing 60% zinc; and superior grades in proportion to $37, this being due to very active competition for the fancy ore by certain smelters, who prefer that kind.

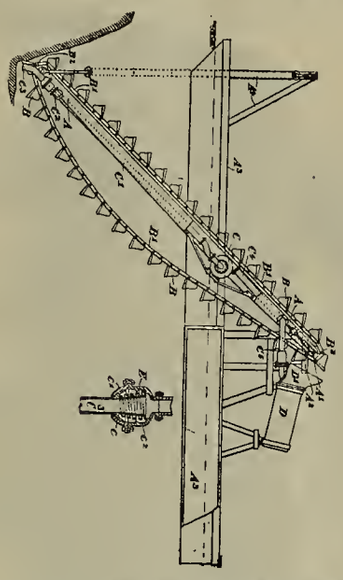
Should the Mountain Copper Co. determine to close down their works, the people of that vicinity would probably not be long in finding that there are worse things than sulphurous gas. This was illustrated last year at the time of the strike, when the works were closed for several weeks.

Mining and Metallurgical Patents.

PATENTS ISSUED MAY 17, 1904.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

COMBINED BUCKET AND SUCTION DREDGE.—No. 758,608; R. Andrew, Melbourne, Victoria, Australia.

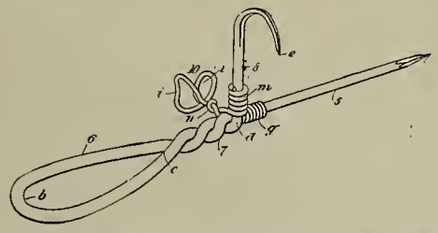


In combined bucket and suction dredge pump arranged between cheeks of ladder and having suction pipe which terminates in breeches pipe, ends of which lie at each end of and immediately behind lips of bucket.

FISHING TOOL FOR SUCKER RODS OR THE LIKE.—No. 759,454; O. A. Mann and W. J. Evans, Oil Center, Cal.

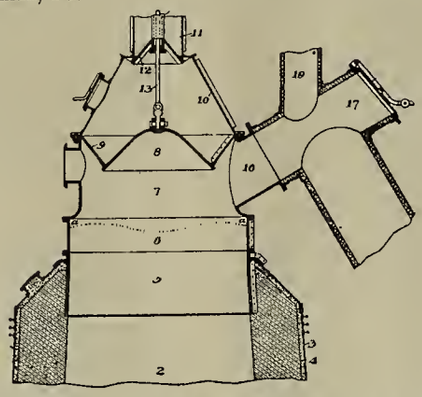
Device of class described comprisiug suitable body having central opening and hinged bifurcated clutch member normally resting on top of body and bridging central opening.

MINER'S CANDLESTICK.—No. 760,398; E. W. Packer, Mace, Idaho.



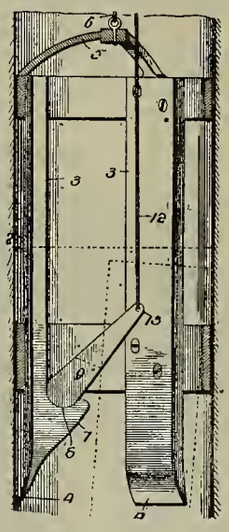
Candlestick formed of wire and comprising straight arm pointed at one end, wire being looped to form handle at opposite end, handle merging into twisted shank formed of same wire strand and from which extends hanger arm at right angle thereto and terminating at free end in hook, and clasp formed of bent wire so as to provide two curved loop members that are projected at one side of arm and looped handle, members having outer looped ends spaced apart and adapted to receive candle that is held at opposite side of straight arm and away from hanger arm and hook thereon.

BLAST FURNACE.—No. 759,991; G. K. Hamfeldt, Munhall, Pa.



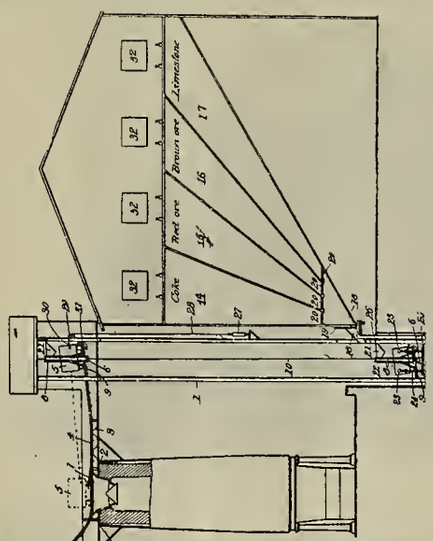
Blast furnace having annular metal shell with its lower portion within upper part of masonry stack, shell being extended above stack and having upper portion where dropping charge strikes it of smaller diameter than internal diameter of top of stack proper.

DEVICE FOR EXTRACTING RODS, ETC., FROM WELLS.—No. 760,219; J. Lisle, Sargent, Neb.



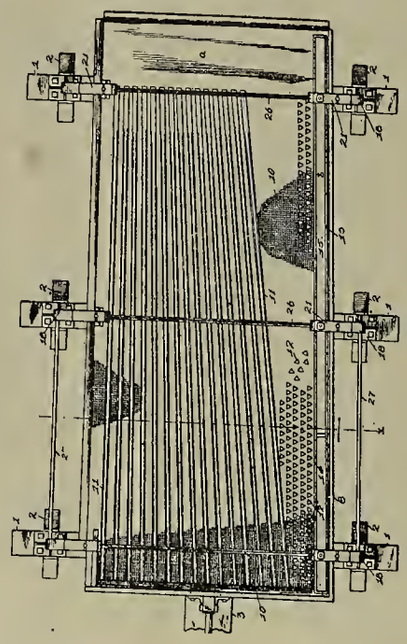
Device consisting of receptacle, catch pivotally supported therein, catch being thickest and narrowest at its pivoted end and broadest and thinnest at opposite edge, and having concave sharpened edge and projecting coruer and operating cord attached to corner.

PLANT FOR FEEDING METALLURGICAL FURNACES.—No. 760,189; A. P. Gaines, Bessemer, and E. R. Cox, Jr., Birmiugham. Ala.



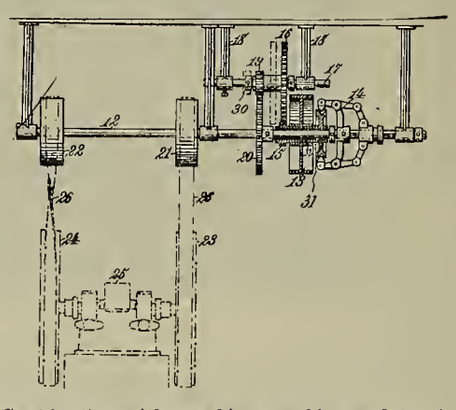
In plant for feeding materials to furnaces, combination with furnace, of vertical hoist, bridge connecting furnace with hoist, cage operating in hoist, car carried by cage and adapted to traverse bridge to furnace for discharging materials therein when cage is at upper landing, one or more bins provided with chutes arranged to deliver material into car while held stationary on cage at landing, and means for weighing loaded car at lower landing before hoisting.

COMBINED CONCENTRATING AND AMALGAMATING TABLE.—No. 760,213; J. Klein, Desloge, Mo.



Combined conceutrating aud amalgamating table, consisting of framework, flooring on same, covering for flooring, amalgamated wire gauze located on covering, series of ungraduated channels located on gauze, check blocks located on same, means for suspending table, means for giving table any degree of inclination and means for imparting motion to table.

APPARATUS FOR DRESSING CRUSHING ROLLS.—No. 759,931; T. L. Sturtevant, Quiucy, and T. J. Sturtevant, Wellesley, Mass.



Combination with crushing machine and turning tool device adapted for attachment to stationary part thereof iu position so that turning tool may engage crushing roll or tire, of power shaft from which crushing machine is driven, and which is so belted to pulleys of crushing rolls as to drive rolls in opposite directious with tops turning toward each other, and driving pulley loose on power shaft, clutch device by meaus of which pulley may be connected with shaft when crushing machine is to be run at crushing speed aud reducing gearing connectiug loose pulley with shaft when roll or tire is to be dressed by turning tool device.

STAMPING MILL.—No. 760,010; J. H. Montgomery, Denver, Colo.

In stamping mill annular mortar A, having wearing dies E, shaft H, journal boxes F, F, pulley G, and loose stamper J, having removable wearing shoes K, feed hole Y, and screen X.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ALASKA.

P. Early, H. H. Hunter and M. Kelly have put men to work to open their Washington & Alaska group, near Juneau.——J. B. Denny, of Juneau, is preparing to open up the Alaska-Reliance group at Sheep creek. Among the improvements planned is a crosscut tunnel.

H. C. Elliott of Chicago, Ill., president of the Hubbard-Elliott C. M. Dev. Co. of Valdez, Alaska, says he will resume operations on his company's copper mines in the Copper River country. He will take in men and an outfit, including two diamond drills, into the claims on Elliott creek.

ARIZONA.

Cochise County.

(Special Correspondence).—Paradise is a new copper camp being opened up. It is near the State line in Cochise county and 15 miles northwest of Rodeo, N. M., a station on the El Paso & Southwestern, 50 miles east of Douglas. The Chiricahua mountains surround the valley. Eight miles northwest of Rodeo the Paradise road enters the mountains by way of Cave creek and finally enters Turkey creek, on which the camp of Paradise is located. The country lies in parallel sections, including two mineralized zones. The Chiricahuas are mainly of granite and porphyry. Along this is a mineralized strip of lime and iron known as California district. At Paradise is the Galeyville silver mine. Galey built a small smelter and took out a pocket of silver, but the values changed to copper. The mine is being opened and the district is again being prospected. The most important developments at present are being made by the Chiricahua Dev. Co., whose property is 1½ mile northwest of Paradise. The company owns twenty-five claims and is composed of Michigan men. Superintendent J. H. Knowles says a 750-foot tunnel has been driven into the mountain, with a 100-foot winze and other exploratory work. Several buildings have been put up. Two 150 H. P. boilers are in place to supply power to a 150 H. P. and a 40 H. P. engine. A double drum hoist, 5 feet face, is on the ground, and a 20-drill compressor is at Rodeo. This machinery is expected to carry the three-compartment shaft, size 7x17, already down 75 feet, to depth of 2000 feet. It is proposed to sink 500 feet before starting crosscutting or other development work. Three sinking pumps, 300 gallons capacity each, and one station pump, 1000 gallons capacity from 1000 feet, will provide for handling water which may be struck. This machinery will be ready for operation by June 15th. Forty-five men are employed about the mine and fifteen more as woodchoppers. Water at present is pumped 1 mile from Jhu's canyon, over the divide, to a 15,000-gallon tank above the plant. The altitude is 6000 feet. There are two distinct ore zones on the property running at about right angles, and each averages 200 feet in width. The ore carries copper, with gold and silver values.

G. A. Walker and G. Myers own the Black Queen group of thirteen claims, near Paradise, on which there is a 50-foot shaft in copper ore. They also own the Leadville group of three claims, from which they have shipped twenty-nine carloads of ore averaging 40% lead and 10 ounces silver.

Six miles north of Paradise is Eagle City, in Chiricahua mining district, where three companies have holdings. Where Jhu's canyon and White Tail canyon intersect is the town of Copper City, which is near the proposed continuation of the railroad from Bowie to Rodeo. This townsite and surroundings to the extent of fifty-three claims have been sold to the Copper City Development Co. of Duluth, Minn. P. G. Carney of Copper City is part owner. They also own Horace mountain, east of the townsite, comprising sixteen claims.

——E. Sweeney and G. H. Crosby have bought seven claims south of the townsite, in the California district, for $75,000. Sweeney expects to begin development work next month.

Southeast of Eagle City, Morgan & Davis own twenty claims, with surface indications for copper ore. Over the divide, south of these claims, is Round valley, in which C. May has a group showing values in gold, silver and copper. Adjoining these is the property of the Savage G. & C. Co., in which J. A. Lewandowski of Douglas is interested.

In the same section H. Rowe and E. O. Gill own forty claims along Silver creek.

Paradise, May 21.

The Tombstone Con. C. Co. is keeping the usual number of men on the mines of the company and continuing development. The drainage of the lower levels is slowly being overcome. The pumping record maintains a daily average of 3,500,000 gallons. One proof that the water level of the district is being lowered is the fact that in the Emerald, 1½ miles from the pumping station, the men have sunk 65 feet below the original water level and are not bothered by the influx. A crosscut started at this depth in the Emerald last week is showing no water. The receding of the water has also been noticeable at the Silver Thread, a mile distant to the north from the central pumping station. At the 700-foot level in the main shaft the west drift is in 300 feet and the dike is being cut. The dike is 60 feet in width. The shipments of ore to El Paso, Tex., continue from the various levels of this shaft, the month of April showing an increase of five cars over the previous month. At the West Side preparations are being made to begin sinking and continue down as fast as drainage permits. The Silver Thread also furnishes its regular quota of ore, while in the Emerald men are crosscutting for the Emerald ledge. Shipments of 100 tons per day continue from the old dumps of the company.

Coconino County.

T. C. Woodworth of Denver, Colo., consulting engineer for the Anita C. Co., near Williams, says he will reopen the company's group and has put men to work removing the boilers, etc., from the old smelter building at Williams, same to be shipped to Anita and used in connection with the 6-drill compressor in sinking a double-compartment shaft.

Gila County.

J. F. Hechtman of Globe, president of the Globe M. Co., says plans for the hoisting plant and other machinery for the development of the company's Mineral Farm group are being considered.

The Tri-Bullion S. & D. Co., developing the Starlight group of mines, on the San Carlos strip, 8 miles from San Carlos, has driven the main working tunnel 900 feet and drifted 100 feet on an iron lead on which they are also sinking. Copper ore has been struck in a winze which is being sunk on another lead. The tunnel will have to be continued 375 feet farther, it is calculated, to cut the main lead, and at that point will gain vertical depth of 1200 feet. The shaft in this outcrop is 150 feet deep and the vein shows a width of 27 feet, says the Globe Silver Belt. Machinery is being put in, consisting of a boiler and air compressor, to operate drills. The Tri-Bullion is composed of Chicago, Ill., and Michigan men, with main office in Chicago, H. Pascal president. Development is under direction of J. C. Erman and forty-five men are on the payroll. This number will be increased.

Graham County.

The new Yavapai mine hoist, near Clifton, will lift double the capacity of the one displaced. This mine—a fraction—has for several years been sending up its average of eighty-five tons a day, the output of thirty men. Work on the 300-foot level calls for increased hoisting capacity. Yavapai ore is said to average 12% copper.

The Arizona G. M. Co. has been organized for taking over and developing eleven gold claims which have been under development by Clifton men. The claims are 6 miles above Clifton and near the Frisco river. The lodes carry gold and silver, which are being opened by tunnels driven in on the veins. On one of these claims a tunnel has been driven 200 feet showing the average width of the vein 2 feet. The ore averages $10 per ton. It is intended to drive the tunnel in 500 feet farther, when it will have a depth from surface of 450 feet. This work is being done on the Laura D lode. The company has a millsite on the river, but it is thought the plant will be placed at the mines, and the water pumped from the river, which would be cheaper than transporting the ore, besides which the tailings could be stored in the canyon. The officers of the company are E. M. Williams, W. Poland, J. R. Hampton, E. H. Franz, J. E. Holt, S. J. Forbes and A. G. Smith.

The Arizona C. Co. has started handling the tailings from its Longfellow plant, near Clifton. The tailings are stored in a series of bins and after they have become thoroughly dry they will be drawn from the bins and used for filling the stopes in the mines. This will relieve Chase creek from carrying the tailings from that plant. For some time the company has been disintegrating its slag by water, allowing it to find its way to the Frisco with the tailings from the plant. This system has been abandoned and the slag train again put into service. In addition to the slag the company is handling 400 tons of tailings daily by cars. The Shannon Co. also proposes to discontinue dumping tailings into the river. The tailings have been annoying to the farmers down the valley.

Maricopa County.

R. G. Williams of Denver, Colo., has bought the Ella mining claim in the San Domingo district, near the Ardath mine, said to contain deposits of vanadium ore. Assays show the ore to carry 4% of vanadium. There is a 100-foot shaft on the claim opening up a 4-foot lead of ore and about forty tons of selected ore are on the dump. The ore also carries values in wulfenite. Williams has also secured the Ramon Valencia copper mine in the Vulture section.

Mohave County.

E. B. Smith of Fremont, O., interested in the Swiss-American mines in San Francisco district, near the Leland and Vivian properties, near Acme, says the company will put in a gasoline hoist next month and start development work.

It is reported the Sun Cloud M. Co., operating south of Signal, has a bond on the gold mines of C. E. Price and will put men to work on them. The mines are below Signal. R. Wheeler is superintendent.

C. Baylor, of the Sorpresa M. Co., says he will begin construction of a mill at the mines of the company south of Kingman. Men will be put to work on the mines to get them in condition for outputting a large tonnage of ore. The mines of the company are north of the Bi-Metal, the Maguire vein, and are in the gold belt.

The Minnesota-Connor mill, near Acme, has been running for several weeks past on dump ores and making a good grade of concentrates, says the Kingman Miner. The inner part of the dump has been found too low grade to handle and hereafter the mill will be run entirely on ores from the mine. Another level will be opened up.

Pinal County.

(Special Correspondence).—The Lake Superior & Arizona Co. has put up an oil storage tank near the Florence depot.——Men are at work at the Fortuna mine, near Silver King. The tunnel is in 700 feet. As soon as the main ore body is reached the number will be increased.

H. Shaw and L. Citidini are putting in a crushing plant near the Ray mine. They will concentrate the ore not rich enough to ship as it comes from the mines.

G. Sarrick is working a copper claim near Kelvin.——Men are at work on the McSherry group, west of Kelvin.

Kelvin, May 16.

Yavapai County.

Men in the Lynx creek end of the Poland tunnel, near Poland, broke through the partition between them and the Poland end and a rush of air came through, showing the tunnel, 8071 feet long, completed. In addition to development of mineral veins, this tunnel will be an advantage to mining districts on the Lynx creek side of the divide in affording direct transportation facilities. A double-track electric railway will be operated through the tunnel to connect with the railroad on the Poland side. The work has been done by the Poland M. Co., of which F. M. Murphy is president and W. J. Martin superintendent.

W. A. Clark of Fool's Gulch, near Prescott, in charge of the Planet Saturn group of mines, says this property, which has been idle for several years, will be started up again.

Yuma County.

The Papago M. Co. has struck water at a depth of 232 feet in its well. It is the only water supply within several miles of the property. The group consists of ten mining claims in Agua Dulce mining district, 40 miles southeast of Texas Hill, a station on the S. P. railroad. The ore from these mines is largely free milling gold, and shows average assay of $100. Three shafts, with crosscuts and open cuts, have been sunk to the depths, respectively, of 60, 132 and 150 feet.

CALIFORNIA.

Amador County.

At the Argonaut mine, at Jackson, the old dump is being refilled with ore. The mill will not be started until development work has been carried to an extent that will insure its running indefinitely when once set in motion.——At the Madrone mine, near Volcano, ore is being taken out.

T. Mayon, who is working the Clark gravel claim, is arranging to run an 800-foot tunnel, near Oleta, to tap the gravel channel at a more convenient point.

Butte County.

A large number of men interested in dredger mining at Oroville met last week and formed an organization for the mutual protection of those interested in this industry and the discussion of matters of interest and benefit. Organization was effected by election of J. J. Hamlyn, superintendent of the Feather River Exploration Co., as president, A. E. Boynton secretary and H. E. Vail treasurer. The following executive committee was appointed: Hohl, Hamlyn, Mayhew, Junes Leggett, Brownell and Boynton. Col. Heuer of the U. S. Debris Commissioners and C. G. Yale of the U. S. Geological Survey were also present.

Calaveras County.

The Mayflower mine, near Murphys, will be unwatered by Carson and Klapp and development work resumed.——The Red Gold mine is shut down temporarily. Superintendent Stone expects work resumed next month.——W. F. Grider has taken charge of the Sugar Pine mine west of Carley's ranch and has put men to work. He expects to have the mill running next month.

Developments in the Chris Anderson mine, near San Andreas, operated by the San Andreas Gold Channel M. Co., continues. Though the east and west drifts from the bottom of the shaft have opened up 80 feet of gravel, neither rim has yet been found, says the Prospect. In the east drift the bedrock has pitched downward into a high-grade gravel. W. H. Miller, president of the company, is preparing to put in machinery for working the mine. A mill will probably be built for crushing the gravel and a permanent hoist put up. The shaft will be enlarged. Other property adjoining the Chris Anderson will be opened, one or more claims having been bonded.

Work has been started at the Duchess mine, near Vallecito, twelve men being on the payroll.

The T. M. Lane interest in the Alta mine, near Knights Ferry, southwest of Angels, has been sold to Manager Wright, who will continue to operate the mine as heretofore.

The Central Hill section, near San Andreas, will resume the output of placer gold. Two gravel mills are going up—five stamps on the Lloyd and ten on the Reed mine. The Spauolla mine, also in Central Hill district, has been bonded to W. T. Robinson and C. H. Clolp. Eight men are at work sinking a two-compartment shaft to cut the channel. The adjoining property on the north and the Cassinelli claim on the south have been shown to contain payable gravel.

C. W. Higgins, of Mokelumne Hill, has a bond on the Ready Bullion and Riverside mines, on the south fork of the Mokolumne river, 4 miles from Railroad Flat. Considerable development work has been done. There is a shaft down on the Riverside, 40 feet from which ore has been taken and worked by arrastra. At the Ready Bullion there is a shaft down 30 feet, which shows in the bottom a ledge 2 feet in width. The ore carries free gold, with sulphurets. Both of the properties are said to be favorably situated as regards power, timber facilities, etc.

Del Norte County.

Machinery is on the ground for the Monumental M. Co. mines, 40 miles from Crescent City, near Grant's Pass road. These mines are owned by T. W. M. Draper et al., and are said to carry gold in paying quantity. The company proposes to put in machinery for operating the mine, and will have 200 men at work by Aug. 1st.

Inyo County.

A new mining camp is being opened up at Cactus Flat, east of Haiwai. The Ella B., under bond to D. McLeod, measures 4 feet between walls, and is said to carry an average assay value of $14 in gold. The Forgot is an extension of the Ella B., and is owned by F. Elder, E. Walker and P. Giraud. The ledge shows from 1 foot to 4 feet in width, carrying $24 value. The principal interests in camp are owned by T. Boland, F. Elder and R. Lockett. This comprises nine claims and four mill sites. This group is bonded to D. McLeod. Work is being done on the White Star. There are forty claims owned by different persons. The facilities, with the exception of water, are reported good. Wood is plentiful and the ground easy to work. Water costs $1.50 a barrel, delivered at the mines from Haiwai Meadows. The main formations are granite and schist. The ledges run parallel, and nearly all pitch south at an angle of about 45°. The walls are sharply defined, and the ore free milling. The distance is 8 miles from Haiwai, to which point a natural roadway exists. From the camp to Olancha is 15 miles.

Kern County.

Bakersfield reports say a surveying party is at work between Sunset and the Pacific ocean laying out a route for a pipe line which will transport oil from the West Side districts to Port Harford or Ventura. H. W. McCray is at the head of the party. The company owns oil territory on the west side of Kern county, and heretofore there has been little or no transportation facilities. It has also been reported that A. Spreckels and the Crocker-Woolworth Bank people of San Francisco, who have large holdings in

that section, are planning a pipe line from Sunset to the coast. The distance from Midway to Port Harford is about 70 miles.

Mono County.

Superintendent Hoover of the Standard Con. M. Co. at Bodie says the company will make extensive improvements in its power plant at Green creek.——J. S. Cain has overhauled his custom mill at the South End. The ore from the Kennedy-Green lease at the Snowdrift mine will he put through.

Nevada County.

On Kentucky Ridge, near Grass Valley, Manager Kane of the Niagara mine, says he will resume operations next week. The surface plant is complete and he will drift on the vein in two directions and take out ore to test in the mill.

The "Elsie A" G. & S. M. Co. has been incorporated at Nevada City hy L. L. Myers, G. Bonney, B. S. Rector, A. Hongell, G. A. Hurst, H. Lane and J. M. Hadley, to open up and develop the Bonney & Hurst claim.

Plumas County.

The A. Cameron mine on the North Fork of Feather river, near Quincy, has been sold to W. D. Huntington, E. L. Dow and R. B. Mott of Oakland, who will start work next month. There is said to he timher on the property, also a water right.

San Bernardino County.

E. J. Delano of Los Angeles has a hond on the Bidwell group at Gold mountain in the Clark range, 25 miles north of Manvel. The property consists of the Colliseum No. 1 and 2. It is a low-grade proposition, said to average $4 per ton.

Shasta County.

The Clover Creek Quicksilver M. Co. has bought the quicksilver mines on Clover creek ahove Millville. H. S. Wilson, superintendent, says he is surveying a site for the plant, which will extract the quicksilver from the cinnabar. An experimental plant of fifteen tons capacity will be built first, and in the fall a plant which will handle 100 tons per day will he huilt. The mines are a mile from the Clover Creek falls and the reduction plant will be huilt on Clover creek helow the falls. A plant will be put in to generate electricity for power purposes in the mining and in the reduction plant.

Sierra County.

(Special Correspondence). — Several large nuggets have heen taken from the White Bear mine, near Downieville, this month, and the hest specimens will be sent to the St. Louis Exposition. One of the nuggets weighs thirty-three ounces. The mine is owned hy A. W. Lewis, W. J. Belcher and A. S. MacDonald.

Downieville, May 25.

A company has heen formed hy Downieville men for the building of an electric railroad from Marysville to Downieville. G. F. Taylor et al. are interested and have hegun the preliminary survey. The general course of the road will he along the North Yuha river from Downieville to near Bullard's Bar, thence out the main public highway, heading to Marysville. via Challenge Mills. This road will open up timber land, composed chiefly of sugar pine, also mineral land. The company has secured water rights which will furnish electric power for running the road, working mines, etc.

Siskiyou County.

J. Johnston of the Headwaters mine, Humbug creek, near Hawkinsville, is increasing work and will he ready for crushing ore in his mill next week. He will put in machinery for a sawmill, so that lumher for mining purposes can he made on the ground, where timher is abundant.

T. J. Nolton has hought the Pareira placer mine, ahove Hawkinsville, 2 miles north of Yreka, and also has an option on the Greenhorn ditch.

Trinity County.

Weaverville reports say J. Linderherg of Nome, Alaska, will prospect the gravel channel between Weaverville and Trinity Center. The channel is deep and is considered a good drifting proposition.

Tuolumne County.

The Calico M. & M. Co. has heen incorporated in Stockton hy A. Thompson of San Francisco, E. M. Crandall, J. J. Morris and R. A. Keller, to operate in Tuolumne county.

At the McAlpine mine, S. E. Rigg, superintendent, near Groveland, fifteen men are at work. Drifting is in progress and sinking will be resumed. The main shaft is down 300 feet. A heavier hoist will he put in.——W. Vincent is unwatering the Hull mine and operations will he resumed.

W. S. O'Brien says he has interested San Francisco men in his mining claims on the main Tuolumne river, near Groveland. Work has heen started on the Victor mine, one of the group, and a mill will he huilt. W. H. Scott is foreman and W. S. O'Brien, superintendent.

The Golden Harvest M. Co. of Los Angeles is starting up operations on a group of claims near Groveland, with J. C. Henderson as superintendent.

A drift is heing run east on the 400-foot level of the Golden West mine, near Sonora, to tap the hanging wall vein, says Superintendent McPherson. Operations heretofore have heen confined to work on vein matter lying in the slate on the footwall. The hanging wall vein follows the granite. The mill is being repaired and will he started up by June 25.

COLORADO.

Boulder County.

F. Mitchell, superintendent of the Nancy G. M. & T. Co., owning mines at Wallstreet, says on the Nancy development work is progressing. The 16-drill air compressor has been started up and the mill is ready. The mill has been converted from the chlorination to the cyanide process. It has a capacity of 100 tons daily. The crosscut tunnel is in 1600 feet. Five drills are running and more will he added. The mine and mill are lighted hy electricity. The mill is ahout 1300 feet from the tunnel and a tram will he huilt.

The Magnolia M. & R. Co. at Magnolia is overhauling its mill and will change to straight cyaniding. They are installing a cooling process, adding more tanks, and expect to treat 100 tons per day. W. H. Davis is superintendent.

Chaffee County.

(Special Corrospondence).—Mining operations in Monarch district of Chaffee county are increasing. Regular shipments are heing made from the Madonna, Lillie and Farrell mines. Others will resume as soon as the snow has sufficiently disappeared to admit of ore-hauling to the railroad.

Rock running well in gold and silver is being brought in from the mountains hetween Maysville and Cochetopa. This is a comparatively new country.——A body of gold ore has heen struck in the 400-foot level of the Gold Bug mine, in Turret district.

Manager Cavanaugh will resume development work on the Duke group, near Alder, on June 1st. A tunnel will be run to tap the hottom of the 179-foot shaft.

The Uncle Sam M. Co., of Peoria, Ill., is preparing for development on its mines in Larson hasin. —— Several companies will operate this season in the Chalk Creek district, near the Mary Murphy mine.

Salida, May 22.

F. Aude, superintendent of the Banker mine, 1½ mile above Winfield, in the Clear Creek mining district, says the Banker is a crosscut tunnel belonging to the Banker M. & T. Co. of Philadelphia, A. H. Stahler of Philadelphia being manager. The intention of the company is to drive a tunnel into the main range 4000 feet.

Clear Creek County.

The Stevens mill, near Silver Plume, which was closed down owing to scarcity of water, is again in motion. The new boiler is again in place. Manager F. Oliver says there is an ahundance of water to run the jigs and for other purposes.

The tramway huilt from the upper Mendota workings, near Silver Plume, to the railroad is in running order. Two ore huckets are used, each holding one ton, the loaded bucket in descending pulling up the empty one. Last week this company shipped two carloads each day, hut Superintendent M. Kester says 100 tons can be handled in a day (five carloads). The ores are heing shipped to the Idaho Springs mills for treatment.

Three carloads of high-grade ore were shipped from the Terrihle mine, near Silver Plume, last week, and four carloads of zinc ore. There is plenty of water in the stream to run the mill two shifts steadily. The number of men is heing increased and they have seven machine drills in operation, with more to he added. The work of retimhering and unwatering the main shaft will he started this week. Seventy men are on the payroll.

During month of April 1600 tons of milling and 140 tons of smelting ore were shipped from the Sun and Moon mine at Idaho Springs.

J. Morton of Chicago, Ill., principal owner of the Jo Reynolds group, up Silver creek, near Georgetown, has hought the Blue Ridge mill and millsite. It is the intention of the Jo Reynolds management to huild a tramway to the mill. The mill will be overhauled.

Gilpin County.

Work is heing resumed in the Lutz mine, near Russell Gulch, under management of G. K. Kimhall, Jr., of the Old Town mine. The Lutz is owned hy Dakota and Iowa parties and has heen idle for several years. Its ores are mostly pyritic. The main shaft is down 400 feet and the machinery and huildings, as well as the main shaft, will need overhauling before developments can be started.

It is reported Central City men will start up the Comstock mine on East Second High street. It is owned hy J. A. Thatcher, of Denver, and the shaft is reported to he 300 feet deep. It has heen idle for twenty-five years.

The Little Lallie M. Co. has heen incorporated, with W. E. Garver and C. A. Bell of Lawson, G. B. Wilkinson of Apex, and J. U. Garver, and P. C. Redfield of Chicago, Ill., as incorporators. The company will operate in Silver Creek district, near Central City, and in Lawson in Clear Creek county. They have a lease and bond on the Murray mine at Lawson. The property is equipped with a steam plant, to which will he added a sinking pump for handling the water. The main shaft is down 265 feet, and the company expects to get into payahle ore by drifting east. The company owns the General Funston group of three lode and one placer claims in Silver Creek district, on which they will start operations. W. E. Garver is manager.

The Gold Dirt mining property, hetween Perigo and Gilpin, which has heen worked under lease and hond hy Pittshurg, Pa., men, was sold last week for $120,000 to J. R. Anderson of Denver. No stoping operations have heen attempted, but in carrying on the dead work several hundred tons of good grade of milling and smelting ore havo heen extracted. This ore will be shipped to the smelters as soon as the Moffat road starts to receive ore for shipment. The owner proposes building a 50-ton reduction plant, which will later he increased to 100 tons. W. H. Knowles is manager.

Gunnison County.

C. T. Stills, owner of the Maple Leaf mine at Stillsville, says preparations are heing made to work the group. A plant of machinery, shaft houses and a 100-ton capacity mill will he part of the equipment.

G. Brant of Kansas City, Mo., manager of the Golden Islet mine at Pitkin, has hought the Chicago and Climax patented claims in the gold helt. They cover 3000 feet of the Islet vein on the north. Men have heen put to work on the ground crosscutting the vein and have struck ore. ——C. M. Carter of the Carter T. Co. has hought the Volunteer mine in the gold helt. The property has a producing record down to a vertical depth of 300 feet. Carter will unwater and re-timher the shaft, then sink on the vein. The Chloride and Volunteer are on the same vein.

Hinsdale County.

The Hidden Treasuro mine, near Lake City, operated hy L. Kafka, is shipping ore. Superintendent P. C. McCarthy has thirty men employed at the mine and mill.——W. F. Hood will develop his Lucrative group in Cinnamon hasin.——The Senator and Minnie Oppa are new locations, in Burrows Park, recorded hy G. H. Zacharias and J. W. Vickers.

Jefferson County.

It is reported J. Boyd et al. have secured control of the Carpenter smelter at Golden, agreements having heen fully ratified with the owners, and the smelter will start July 1.

Lake County.

The rehuilding of the Rex mine's shaft house, near Leadville, will he started next week hy the Keystone M. Co. of Pittshurg, Pa. The shaft houso was hurned last month. C. N. Priddy, one of the owners, states that the company will prepare to continue developing the mine. It is expected the work will be completed this autumn.

The Resurrection mill at Leadville has resumed. The mill will handle from 100 to 150 tons of ore a day. It is stated work will he continued in the Fortune mine this summer. The Fortune is northeast of the Resurrection and has heen operated hy J. McNeece, owner, and hy T. Raney, who had a lease on part of the workings. Raney's lease has expired and the entire mine will continue under control of the owner.

Las Animas County.

(Special Correspondence). — The military authorities in charge in the coal fields at Trinidad have issued an order that all striking miners must register and have their description written for future reference. Somo of the men refused to register and ahout eighty were deported. The men arrested and deported are mostly Italians.——The Western Federation has issued a statement regarding their view of the strike situation. This statement goes more into stating what should he done with the Governor and militia than as to the exact condition of affairs.

During the past week the property of the Denver, Lakewood & Gold Railroad was sold at Sheriff's sale. This road has heen operating between Golden and Denver. It is understood the new management will extond the system heyond Golden to Idaho Springs and other mining towns beyond and eventually make it a transcontinental line. S. Newhouse, of Salt Lake City, Utah, is interested.

During the past few weeks considerahle rain and snow have fallen in the mountains which has filled the streams and it is thought there will he plenty of water for all purposes during the summer.

Denver, May 23.

Mineral County.

(Special Correspondence).—The strike on at Creede over some slight disagreement is expected soon to be adjusted. Ahout the same amount of ore is coming out—one trainload every other day of standard-gauge cars.

Creede, May 22.

The ore production for Creede district during the month of April was 15,000 tons, 8000 of which were concentrated hy the Humphries and Solomon mills. The mines on the Bachelor vein continue to produce 90% of the production of the district, says the Times, the principal producers heing the New York and Del Monte, which are shipping 100 tons per day direct to the smelters.

Ouray County.

With the early melting of the snow, mines along Bear creek, near Ouray, are resuming. The Union, across the creek from the Grizzly Bear, has resumed. It is under bond and lease to T. J. York & Co., and a contract has heen let to drive a 50-foot extension of the lower tunnel to cut the vein. High-grade gold-silver has been produced by the Union.

Superintendent W. R. Kramer of the Governor mine on Mount Sneffels, near Ouray, says preparations are heing made to build a mill. A 10-stamp mill was originally contemplated. The mill site has been obtained a short distance down the gulch from the lower tunnel and in a secure place. Water for milling purposes will be piped from the main tunnel. The boiler and compressor that were put out of commission hy a snowslide will he placed in service and in such position as to make the plant safe against slides. The development work on the mine consists of two tunnels. Tho upper tunnel in the gold lead is in 600 feet. A crosscut on the upper working 50 feet from the gold vein cut the silver lead. The Governor mine is owned by Kramer & Heibler of Ouray and the Zangs of Denver.

Pueblo County.

The Ohio-Colorado S. & R. Co., owner of the smelter at Salida and of the Rocky Mountain smelter at Leadville, is planning to huild a plant at Pueblo, says the Colorado Chieftain. The management considered it would not he expedient to add to its other plants, as the problem of fuel and transportation of ores would not he solved hy centering the company operations at these points. Much of the husiness offered to the company could not be sent to Leadville or Salida and profitably handled. It is expected work on tho huildings will he started next month, and that the plant will he completed during the coming summer or autumn.

Sagnache County.

(Special Correspondence). — Bonanza camp is showing improvement on development and also in the mills. The Steele Creek Co. is going ahead with development.——Crestone camp is quiet. The 100-stamp mill is idle, hut the company is pushing development, hlocking out ore and doing considerahle dead work. Duncan camp is also quiet.

Ford creek, ahove Saguache, is showing high-grade gold and silver ore. Little development is heing done. The mine on Sierra Blanco, owned hy Winchel et al., situated at an altitude of 14,000 feet, is being worked steadily and ore shipments have hegun. Most of it is moved hy hurros, seventeen of them heing kept husy packing. A good part of the year there is considerahle snow there.

It is reported H. Barnsdale has hought the A. E. Reynolds interests at Summitville. The working force will he increased.

Saguache, May 22.

San Miguel County.

The Smuggler-Union M. Co. has put men to work on the Contention group, in Bear creek, 2 miles from Telluride and 1 mile from the Nellie and Ella mines. Before development was stopped on this group one year ago, it is reported, a hody of gold-hearing quartz was cut, and the men will develop this ore. A wire-rope tramway 2 miles in length was huilt from the group to the Smuggler mills at Pandora. The tram was later struck hy snowslides in two or three places and wrecked for a part of its length.

For several weeks past that portion of the Bear Creek mill, near Telluride, treating Nellie ore, has heen running only one shift, hut last week another crew was put on. Ten stamps are dropping, but with an increased output from the mine the milling capacity will he increased until forty are dropped. During the winter the Nellie and Ella mines have undergone

extonsive development. The ore is free milling.

Governor Peabody has declared martial law at Telluride at an end. While there is no change in the striko conditions as far as the members of the Western Federation of Miners is concerned, it is claimed by the operators that the mines of the district are working the same as when conditions were normal.

Teller County.

The Portland G. M. Co. at Cripple Creek has bought the Yule Tide, Pennant and Hatchet claims. The Portland property is producing 300 tons of ore daily and has on its payroll 550 men. President Burns of the Portland & Midget Co. says he will resume operations on the Midget claim Juno 1.

The Cripple Creek Times says last week nearly every mine in the camp was more or less affected from the surface seepage water caused by the heavy snow storm. In some of the mines the water rose 300 feet in the shafts, and the lower workings flooded. Some of the Bull, Ironclad and Tenderfoot hill mines had to shut down.——H. M. Gilbert has started work on the Hoosier mine on Tondorfoot. This property has been closed on account of the water.— Dugan & Bradley, working on the north end of the Gold Sovereign, have been hailing out water with a 200-gallon valve bucket.

A washing machine has been set up on the Abe Lincoln mine at Poverty gulch, near Cripple Creek, and the ore hoisted from the mine will be thoroughly washed before it goes to the sorter's table. The washing machine has a capacity of 200 tons of ore a day. The company is outputting between 1200 and 1500 tons of ore per month that will run 1½ ounce gold per ton.

The Homestake M. & M. Co., operating on Ironclad hill, Cripple Creek, which is arranging for a 1000-ton cyanide mill, is receiving its machinery. In the consignment under way are five rolls weighing 36,000 pounds each.

A contract has been made by the Stratton's Independence, Ltd., to Merryfield, Martin & Camphell, to treat and remove the dump of its Battle mountain mine. The lessees, who have been operating the dump for some time in a limited way, will contract to remove the pile of rock which is estimated to contain 1,000,000 tons, besides the amount which is dumped over the pile every day, making it another 500 tons daily. The lessees will put in a steam shovel, washing machines, sorting tables, etc., and after treating will dump the waste 200 yards away in the Midway lagoon, carrying it there by ore cars.

The Victor mine on Bull hill, Cripple Creek, owned by D. H. Moffat of Denver, will resume work on company account. The shaft will be sunk to additional depth, it being below the 1000-foot point.

Cripple Creek reports of the 22nd inst. say the drainage tunnel is lowering the water in the vicinity of the Elkton Co. at rate of 3 inches per day, and as the water is standing at a point 8 feet above the eighth level, it will take thirty-two days before it will be able to resume operations in that level without the use of a pump. The water standing in the shaft is extremely foul and the air is so bad that a man could not work in it. It is expected air from the compressor will be run down there. Even if the water were out of the level before the middle of June it is not expected work would be started in this level, as the company will not have completed reconstructing the ore house and installing the washing machine and sampling plant. With the sampling plant in operation the management will know each day the profit of the mine and how they stand. There is considerable ore broken in the eighth level. About 1000 tons of ore were broken there ready for hoisting when the heavy flow of water was struck.——D. Latimer of Victor has a lease on a block of the Rose Maud mine, and will operate through the Morning Glory shaft. The lessee will drive a crosscut and expects to cut the contact.

IDAHO.

Ada County.

The plant of the Highland Power Co. on the Boise river, 20 miles above Boise City, was washed away on the 23d inst. The loss is about $150,000. The river had been dammed with a crib and the power house built upon the river bank 60 feet below the dam. This plant was used for pumping water for placer mining.

Blaine County.

The Lava Creek M. Co. of Salt Lake City, Utah, has been incorporated with S. B. Smeltzer, W. A. Langford and L. W. Smeltzer as officers. The company's property is in the Lava creek mining district.

Five feet of ore has been opened in the properties of the Lipman M. & T. Co. at Hailey, says M. H. Lipman of Salt Lake City, Utah, manager. At depth of 100 feet in the shaft the find was made. He will not begin crosscutting until a level is established at 150 feet. Assays show thirty-six ounces silver and from $1 to $8 gold per ton, the metals occurring in a quartz gangue.——At the Red Elephant mine, operated under an option by Salt Lake City parties, Superintendent Page is taking out second-class ore from the 100 and 200-foot levels, while in the Crœsus 2 feet of galena, running high in silver, was cut at a depth of 700 feet in the shaft. Operations will be resumed at the Mayflower mine, owned by J. V. Farwell of Chicago, Ill., next month, while the mill at J. Q. Packard's Tipton will go into commission next week. The Minnie Moore continues to maintain its output, with 11 feet of galena showing underground.

Boise County.

A. M. Hager, superintendent of the Old Abe M. Co., has put men to work on the South Africa ledge, a mile north of Idaho City. There is a hoist on the ground.

Idaho County.

The Golden Crown mill at Newsome is in operation.——Mining and crushing ore at the Hogan mill at Oro Grande is in progress.——S. B. Baxter and L. Ewing are putting an arrastra on their Blind Pig claim on Relief creek, 8 miles from Elk City. It will have a capacity of one and one-half tons of ore daily. The motive power will be water and the wheel is so constructed that a second bed can be added later. The Blind Pig vein is opened up on two claims and much good ore is exposed. In the face of a 70-foot tunnel the ledge is 9 feet wide and is said to average $20 per ton. The tailings will be saved for future treatment.

Shoshone County.

Finch & Camphell, of Spokane, Wash., have bought the Granite mine, near Wallace, for $35,000. It is intended to increase the size of the plant and continue development work. Lessees have been working the property, and lead ores have been opened and shipped to the smelters.

Mining operations are reported improving on Nine Mile creek, near Wallace. Work is being resumed on the Granite mine under J. P. Keane, one of the principal owners. Formerly shipments were made by hauling the ore to the railroad at a point 1½ mile above Wallace in Canyon creek. Then it was loaded on the narrow gauge and shipped to the smelter by way of the lake. Later a concentrator was built at Granite station, near Gem, and the ore transported from the mine to the mill by a bucket tramway. The production of ore from the Granite was exclusively from the upper works, but meantime a tunnel was run at creek level to get under the ore body. This was accomplished when the shut down came about ten years ago. The mine is owned by J. P. Keane, J. Porteous, W. S. Norman and M. McAuley. The lower tunnel cut milling ore. As soon as air pipe is placed in the tunnel drifting on this ore will begin and a raise will be made to the upper works. This raise will be 418 feet in length. It is reported arrangements have been made to treat the Granite ore in the Sixteen-to-One mill.

Last month the California mine, on Nine Mile, shipped 230 tons of concentrates and is making a regular output of 200 tons a month. This property is operated under J. P. Keane. Twenty-five men are on the payroll.

O. Guay, part owner of the Hypotheek mine, near Kingston, says work is progressing. Bad air in the tunnel has made it necessary to put in a blower to be run by a small steam engine. The blower and engine are being set up.

KANSAS.

Cherokee County.

The Sunny Side mine at Baxter Springs has its crusher plant ready for work and will begin cleaning ore this week.——W. L. Carter and L. Ryan of Galena report mines south of Baxter improving.——Ford & Troupe at the Mission mine are running double shifts and are hoisting rich dirt to treat in the concentrating plant which is nearing completion.——D. B. Perkins of Joplin, Mo., says the shaft on his lease is 100 feet deep, and it is expected the ore penetrated by the drill will be opened up next week.

MICHIGAN.

Houghton County.

The annual report of the Isle Royale C. Co. for 1903, operating near Houghton, shows 3,134,601 pounds of refined copper produced. Receipts from copper sales averaged 13.12 cents per pound, or a total of $411,314. Expenses were:

		Cents Per Pound Copper Produced.
Mine expenses	$307,437	9.81
Smelting, freight, etc.	56,618	1.81
Exploration	7,259	0.23
Total	$371,314	11.85

Compared with 1902, the following figures are given by the report:

	1902.	1903.
Rock stamped, tons	203,672	199,493
Mineral saved, lb	5,219,305	4,408,615
Refined copper, lb	3,569,748	3,134,601
Fine copper in mineral, %	68.37	71.10
Fine copper per ton of rock stamped, lb	13 80	15 70
Cost of mining, per ton	$1 2556	$1.2516
Cost of stamping, per ton	0.2641	0.2884
Total costs	$1 5200	$1.5400

MISSOURI.

Jasper County.

At Webb City the Gussie K mine has its new shaft down into the ore and has begun mining the dirt. This is a different shoot of ore than the old workings and was driven over the line from the Stevison & Moore lease. R. and H. Gale et al. have leased the Mt. Ararat mine and are going into the old workings.——The Stevison & Moore mill, south of the Gussie K mine, started up last week and concentrates are ready for market. Stevison put down several drill holes near the mill and reports ore in all the holes. The company began sinking a shaft and moving the mill from its old location at same time. A second shaft is down into ore and shows 18 feet of pay dirt.——A lead prospect has been struck by a drill on the Center creek land.

The Stepp mill on the Guinn land, near Carterville, started up last week. This mine was formerly the Barrister.——The Oronogo mills have all been shut down on account of water flooding the ground from the heavy rains.——J. Wright & Co. have bought the Republic mill on the Plutocrat lease and will remove the mill to the Wright M. Co.'s six lots on the Missouri zinc fields ground where they have opened out a fine prospect.——A. M. Kennedy has started building a $10,000 mill on the Burgner land for a Cincinnati company.

At Galena, Gay & Co., on the Battlefield mine, made a turn-in of thirty-five tons of jack last week. A face of jack is being opened up at 110 feet. It is 40 feet wide and 100 feet long.——The Pittsburg M. Co. on the Windsor ground is preparing to mine on a larger scale, says Manager Matthews. The crusher is running and two shafts are producing. Two more shafts are being sunk. The pumps are handling the water. Three tramways will be built from the shafts to the crusher. The turn-in last week was seventeen tons of free ore and 10,000 pounds of lead.

MONTANA.

Beaverhead County.

By June 1 the Washoe copper smelter of the Amalgamated C. Co. at Anaconda will have an arsenic refinery in operation. The plant is said to be patterned after the German models, and is intended to save the arsenic, antimony and sulphur expelled through the stacks of the company's plants.

Fergus County.

There are four diamond drill outfits in Fergus county, three of which are being operated, says the Lewistown Argus. The Gold Reef Co. of Gilt Edge has two in operation and the Kendall at Kendall keeps one continually at work.

The Fergus M. C. has been incorporated at Great Falls by F. Longstaff, O. H. Perry, E. L. Williams, A. R. Mettler and O. F. Wadsworth of Great Falls and W. Ellis and J. E. Ferguson of Helena. The company has bought property on Sage creek, in the Belt mountains, and they are going to develop the claims during the summer.

Flathead County.

J. Ford of Libby, manager of the Illinois G. M. & M. Co., reports ore being opened up. The company has two claims, the Irish Boy and the Rambler, in West Fisher gold belt, on Lake creek, opposite the Illinois & Montana M. Co. mine. The vein is 2 feet wide and has a dip of 20°. The formation is slate. Cabinet is 3 miles from the mines. Since starting they have run 35 feet of tunnel, working three men.

NEVADA.

Churchill County.

As prospectors have located on tracts of land in Churchill county since the recent oil strike at Fallon, L. H. Taylor, district engineer in charge of the reclamation work being done by the Government in Nevada, has issued the following notice: "For the information of persons interested in prospecting for mineral oil in the Carson Sink valley, Churchill county, I desire to call attention to the fact that all of the public lands in this valley have been withdrawn from entry except under the homestead act, and are therefore not subject to location under the mineral land or mining laws of the United States.—Reno, May 24."

Esmeralda County.

D. Hudgens of Yerington, part owner of the Pine Grove mines at Pine Grove, says there are about 200,000 tons of tailings on the property and tests are being made to work them by cyaniding. Two-thirds of these were worked over some years ago, but it is thought that they may contain values sufficient to warrant working again. There are 60,000 tons of tailings lying mainly under the waste dumps, which have never been worked. Hudgens expects also to put men to work on the tunnel, this work to count as assessment work on the unpatented claims in the Pine Grove group.

The Jumbo & Vernal Extension M. Co. has been organized by K. Pittman and H. B. Lind for Martin, Jones & Higginson of Goldfield, H. B. Lind being secretary and manager. The mining claims owned by the company are the North Extension of the Jumbo mine, the North Extension of the St. Ives, a fraction of 137 feet which parallels the east side line of the Red Top mine; also a group of four claims, including Black Butte No. 1 and Three Friends, all at Goldfield.

Lincoln County.

At the Duplex mill, at Searchlight, the stamps will begin dropping again next week on ore from the Santa Fe group, says B. Macready of the Santa Fe M. Co. The present arrangement includes giving to the Santa Fe the use of the mill. It is thought that later, when the mine has been unwatered, the Duplex will resume operations. The Duplex has no use for the water until the lower workings are reached, and in the meantime the Santa Fe will be able to make tests of its ore. B. Macready is working the Santa Fe group under bond. He has also bought the adjoining Miess group of three claims and the Barney Reilly, an intervening fraction. Two shifts are sinking the main shaft to the 100-foot level. When reached, the vein will be drifted on both ways and east and west crosscuts run. Future operations will include opening up the lead by sinking two shafts, 200 feet apart, north of the present workings.

P. Thatcher has secured an option on the Dupont group at Camp Duncan, near Searchlight.——W. J. Kennedy and C. Crooks have relocated the W. Robbins claim as the Mohawk group. They have let a contract to sink 50 feet.

The system of settling tanks at the Quartette mine, at Searchlight, is reported successful. Ample water has been secured for all milling purposes and there is an overflow of waste. The management will put in two more hatteries this summer. The track is complete to the 700-foot level — twenty-five - pound rails were used and the gauge increased by 3 inches. Pumps have been received and will be set up. The vein is being drifted on the 700-foot level.

The sinking of the five independent shafts to depths averaging 50 feet each have shown the continuity of the ledge through the entire length of the Pioche-Nevada Con. Co. holdings at Pioche, says J. W. Burton of Salt Lake City, Utah, part owner, and the company will proceed with development. The central shaft, from which a recent shipment was made to the smelter and at the bottom of which 4 feet of high - grade ore are opened, will be sunk to the next level at 100 feet. The ore in the main shaft, says Burton, will average 50% lead, with at least an ounce of silver for each unit of lead, without reference to the gold and copper with which they are associated.

At Caliente, Superintendent Lloyd of the Chief group of mines, being developed by C. O. Whittemore et al. of Salt Lake City, Utah, says the ledge varies from 6 to 12 feet between walls. The ore, which averages $10 gold per ton, affords a cyaniding proposition. A mill will be provided.

C. Prisk has started work on the Pine Shade group of mines on east slope of Newberry mountain, near Searchlight.

Nye County.

J. M. Healy, of Tonopah, with Salt Lake City, Utah, men, has incorporated the Tonopah-Crown Point M. Co., which will operate the five claims of the Crown Point group on the Ray road, 6 miles north of Tonopah. These claims are said to show in an open cut a quartz ledge carrying values of $50 per ton in silver, lead and gold, the last-named metal averaging $25 per ton. The ore occurs in the northern lime belt. The claims are near the Cow Ranch wells, and within easy haul to the railroad.

F. Work, superintendent of the Hannapah M. Co. group, 18 miles east of Tonopah, says ruby silver has made its appearance in the face of the drift being advanced northeast to the dike.

NEW MEXICO.

Colfax County.

The Baldy Deep T. M. & M. Co. is increasing work on its group. A tunnel is being driven from the west side of Baldy

mountain to cut several ore bodies said to run through the mountain. The tunnel will gain depth of 2000 feet. The tunnel is in 1200 feet and when completed will be 3000 feet long.

Grant County.

F. Higgins has leased the plant of the Hanover M. & M. Co. at Hanover and is running it on ore from his mines as well as on custom ore.——President F. J. Herne, of the Colorado Fuel & Iron Co., after visiting and inspecting the iron properties of the company at Fierro, says operations will be resumed at Fierro by June 15.

Excavation work for the smelter owned by Johnson & Atkins, at Silver City, has been completed, the buildings are up and the machinery going in. The smelter will be blown in next week.

Superintendent Patterson, of the American Con. C. Co., near Lordsburg, is preparing to start work on the company's group. The American Con. C. Co. bas gold, silver and copper ore.

The Comanche M. & S. Co. intends to start work this week on a smelter on the site of the Silver City Reduction Works at Silver City. The plant will be larger than the one that burned down last July. It is intended not only to build a smelter but also to construct converters of sufficient size to handle its own matte and the matte of any other furnace.

Otero County.

Water has been struck in the Cuprite shaft on the Altamont C. Co.'s group at Jarilla and twelve barrels per day is capacity of the flow. This shaft is about 1 mile southeast of the Garnet group and near the placers. It is thought plenty of water can be obtained to work the placers.——The Excelsior M. Co. has men at work straightening up its shaft. The company is preparing to sink to depth of 500 feet. A vein of copper and silver ore has been opened in the Nashville No 1.

Prospecting is active around Tularosa. F. Clark has organized a company to work bis copper prospects.

San Miguel County.

The engine, boiler and pump have been set up on the Rising Sun mine on Copper mountain, near Rociada, and the workings unwatered. Development will be resumed.

Sierra County.

Preliminary work has been started on the Treasure mine near Hillsboro. A whim and other material are on the ground. —— Development work has been resumed on the Prosper mine. Drifting is being done on the 120-foot level.

J. Kasser has bought the Good Hope-Bonanza mines near Hillsboro. The working force on the Empire mine has been transferred to tbe Good Hope mines. A mill will be built. The mill will treat ore from both the Empire and tbe Good Hope mines. —— The Black Peak mines are producing ore.

Two companies in Hillsboro have plans for building milling and concentrating plants. They are the Sierra Con. G. M. Co., of which W. Miller is president, and the Good Hope & Bonanza G. M. Co., in which J. A. Holley and S. Stephenson of Charleston, W. Va., and J. Kasser are interested.

OREGON.

Baker County.

The '49 Jimmy mine, at Greenhorn, bas been sold to the Fortune M. & S. Co., of which R. M. Jackson of Spokane, Wash., is manager and P. A. Brady superintendent.

Manager Mueller of the Oregon S. & R. Co., with smelter at Sumpter, says ore buying will be resumed in Sumpter June 1st.

W. B. Dennis of Sumpter, principal owner and manager of the Black Butte quicksilver mine, Southern Oregon district, says he is preparing to put up reduction works. Development has been going on for three years. A drift has been made from the surface on the lode, and from it crosscuts driven to prove the entire lode, which is said to he 300 feet wide. Ore near the surface occurs in small lenses. The Black Butte will be equipped with a 300-ton plant.

At the Maxwell mine, in Rock Creek district, 18 miles northwest of Baker City, the 20-stamp mill which was wrecked by a snowslide in January will be rebuilt this summer. The snow is still deep at the mine, and it will be several weeks before construction can he started. Tbe new plant will he in a more protected spot. The bins were full of first-grade ore at the time of the accident, but remained in place.

Grant County.

(Special Correspondence).—The Badger M. Co., one of the Bunker Hill-Sullivan Co.'s properties, with offices at San Francisco, Cal., is working its mine and mill, near Susanville, to full capacity and has resumed the shipment of concentrates to the company's smelters.

Stevenson & Spaulding, who have a 30-ton mill to work over tailings of the Cooper claim, are making i provements in it to enable them to handle custom ore as well.——The owners of the Stockton mine, adjoining the Badger, have retimbered their shaft to a depth of 250 feet and expect to resume operations this summer.

The Blue Channel Gold Placer M. Co., which has bought 500 acres of placer ground on Big creek, is drifting at depth of 125 feet on an ancient river channel. Its gravel is dark blue in color. In addition to working by deep drifting, the management expect to put in a hydraulicking plant this summer, for which purpose they have 2000 feet of pipe and two giants on the ground.

Susanville, May 23.

A. A. Litsky of Boise, Idaho, is preparing to develop his quartz property, the Golden Eagle, near Prairie City. He has put men to work. Previous work at the Golden Eagle has shown a ledge 18 feet in width and carrying values in sylvanite.

Jackson County.

Foreman Garvin reports the Golden Spike tunnel of the Shorty-Hope M. & M. Co., near Ashland, is in 520 feet and the vein is carrying good ore. The management have ordered 400 feet of 8-inch galvanized steel pipe to run from the face of the drift back to the upraise to remove gases caused by the explosives. The dam at the ditch intake, injured by the high waters of Wagner creek, is being repaired.

Marion County.

J. J. Yackley of Portland, part owner, has put men to work on the Brightenbush mines, north of Quartzburg, in Marion county. He will develop tbe mine by tunnel and sbaft work. The property has smelting ore, and the ledges show an average of from 3 to 8 feet in width. A reduction plant will he put in on the mines.

SOUTH DAKOTA.

Custer County.

The Custer Chronicle says C. J. Sine and H. F. Ratte of Custer, and C. P. Doney aud C. B. Stevenson of Indianapolis, Ind., have bonded a group of six claims consisting of the Parish, Parish No. 2, Toledo, Springdale, Springdale No. 1, and another, in Camp Ivanhoe, 8 miles east from Custer, and joins the Ivanhoe M. Co.' property on the south and east. Development work has been done on some of the claims and ore has been taken from the surface workings.

Lawrence County.

The Penobscot M. Co., operating in Garden City district, near Deadwood, has been reorganized as the Alexander Maitland M. Co., A. Maitland of Negaunee, Mich., having taken over the interests of the company.

F. E. Little of Minneapolis, Minn., president and manager of the Minnesota M. Co., is arranging to start work on the company's property in the Garden City region, near Deadwood, adjoining the Penobscot mine. Little says he will start a two-compartment shaft, sinking to quartzite and exploring that horizon. The company has ore in both the horizontal and vertical systems. Attention for the present will be paid to the ore of the horizontal formations (the Cambrian).

The Gilt Edge-Maid M. Co. has excavated for its cyanide plant to be built on its mine near Galena. The company is owned by Minneapolis, Minn., men.

Operations are temporarily suspended at the Lucky Strike M. Co., near Deadwood, necessitated by installation of a steam hoist and other machinery. Delay has been encountered, the result of bad roads. An air compressor will also be set up at the workings and development work will be increased. The shaft has been sunk to depth of 175 feet and will be continued to 500 feet, when crosscutting will be started. The company expects to put up a mill, says Manager C. A. Allen.

The cyanide plants of the Black Hills are said to use yearly three and one-half carloads of cyanide of potassium, three and one-half carloads of zinc and about three carloads of sulphuric acid in the operation of tbe treatment of the gold and silver-bearing ore. Two-thirds of this amount is used by the Homstake company, and the balance by the dozen or more smaller cyanide plants operating throughout Lawrence county. The cyanide of potassium costs about 22½ cents a pound, the zinc about $8 per 100 pounds and the sulphuric acid $2.90 per 100 pounds. The zinc is shipped in the form of discs 12 inches in diameter and nine to the inch. They are placed on a lathe and made into shavings, which are used in the precipitation of the gold and silver from the cyanide solution. The sulphuric acid is shipped in iron tanks, weight 1600 pounds each.

UTAH.

Beaver County.

The Horn Silver mine at Frisco is preparing to increase output. Shipments during month of April reached 2800 tons. During the year 1903 the average monthly production of ore was 1450 tons, and the total receipts therefrom during the twelve months $126,000. The ores coming from the mine run well in copper and lead, while the silver values are low.

Box Elder County.

At Park Valley the Iona mine, of wbich P. W. Madsen of Salt Lake City is manager, will have a milling plant built this summer. The vein is 20 feet in width and is an extension of the Century vein. Madsen has put on more men.——At the Century the mill is handling fifty tons daily and is running on ore which will average $8 per ton. Superintendent Hardy is putting in a full set of new copper plates. The old ones are to be replated and placed in use again later.

Millard County.

Ore brought from the mines in Drum district, near Oasis, of the Oasis G. & C. Co., is said to show $40 in gold, silver and copper to the ton. Development work is being carried on under J. Clive.

Piute County.

The Copper Butte group of five claims in Gold Mountain district, near Marysvale, has been leased and bonded to W. Johnston of Richfield, who will begin development operations next week. The Copper Butte is near the B. W. & H. and the Butler Beck mines.

The Gold Dev. Co., P. A. H. Franklin president, operating near Marysvale, has made application to the State to appropriate the waters of Bullion canyon, amounting to 20 second-feet. It is intended to convert the water below the Dalton mill and apply same in operation of an electric power and lighting plant. The site selected for the proposed plant is above the Webster mill in same canyon. The water will be conveyed through a pipe 10,000 feet in length.

Salt Lake County.

With another set of rolls the Ohio C. Co. mill at Bingham is again in operation. The plant is reducing an average of 125 tons of ore daily, while 120 tons of ore, maintaining an average of 20% copper, has been forwarded to the valley smelters the present month, says Manager H. Caitro.

Summit County.

Work at the Mazeppa shaft at the Daly mine at Park City was discontinued last week, the reason given being that surface water has forced them to temporarily abandon the sbaft. It is thought development work will hereafter be carried on through the Federal tunnel. Manager Rood says it would take three months to connect with the Mazeppa ledge. If large ore bodies were opened up the product could easily be hauled through the tunnel and it would not be necessary to put a hoisting plant at the Mazeppa shaft.

Superintendent Moffat of the Ontario mill, near Park City, bas men at work sluicing dirt, taken from beneath the old mill, for its quicksilver values. Last spring and summer, before the mill was built, this process was worked with success, almost enough money to pay for the erection of the mill having been realized from it. When the mill was put up, a tunnel was run from the outside to the point under the old building that the product was taken from.

The new ore house at the Daly-West mine, at Park City, collapsed last week. The building was 130 feet long and fell in completely, entailing a loss of $10,000. The building was erected on an old dump, and it is thought the settling or moving of a large rock in the dump caused the disaster. The building contained sixteen bins, each of 100 tons capacity, there being about 1200 tons in the bins at the time of the accident. No lives were lost. Men were put to work clearing away the wreckage and building a temporary trestle, over which the ore will be hauled from the mine to the mill. The ore house will be rebuilt, but will be placed on piling to prevent its settling. The conveyor belt and electric motor were put out of commission by the accident.

Weber County.

Shipping of ore from the Southern Pacific mine in Sierra Madre district, north of Ogden, will start next month, says Manager Burnham, of Salt Lake City. He has put on more men. To get the ores down from the mine, Manager Burnham will build a road around the ridge of the mountain near the mine for ¾ mile. He has completed arrangements with the smelters and has the matter of freight rates up for consideration with the railroad companies.

Interests in whose favor a $60,000 option on the Castro group at Ogden having failed to comply with its terms, the property has reverted to its owner, N. Castro, who will resume work on the group the present season and extend the lower tunnel to the main ore bodies, while tbe placer will be operated under a lease.

WASHINGTON.

Ferry County.

(Special Correspondence). — Developments on the Belcher exceed one-half mile of tunnel and crosscuts. There is a body of ore 80 feet in width which has been followed 400 feet. The mine is to be equipped with a machine drilling plant.

The Copper Key, on the south slope of Belcher mountain, southeast of the Belcher mine, has been bonded to Spokane men. R. Angus is in charge.

The Oversight is to resume and the Old Hawkeye property is to start up. Work is also to be resumed on the Midnight, 6 miles east of Belcher mountain. It is reported that the Columbia mine will resume. It is a milling ratber than a smelting proposition.

Republic, May 21.

Lincoln County.

Preparations are being made to start work on a smelter at Crystal City and contracts will be let for the furnace, says Manager J. Gray of the Crystal mine in Cedar canyon, near Davenport. It will be of the type which has a method of consuming the fumes that ordinarily kill vegetation around a smelter. The furnace will be of 100 tons capacity and will make a base bullion containing copper, lead, gold and silver.

Thurston County.

H. G. Lougee of Spokane, president and manager of the Great Western Coal Dev. & M. Co. at Tenino, says the new washing plant, with a capacity of 400 tons per day, has been put in operation. The principal work is cleaning up some coal and sending it over a 3-inch screen. All the lump will go to the cars direct, while the rest will be washed and separated into pea, nut and egg coal. He says tbis product will return about 75% salable coal. They are putting in a new baulage system, which will facilitate handling the coal and do away with the mules. A 500-ton bunker will be added and a dynamo placed in the power house. The dynamo will be used to light the power house, the washer and other buildings. The company has 300 acres of land near Tenino, and has sunk a shaft and opened four veins. The first vein is the one being worked. Tbe next vein lies 35 feet under No. 1, and is 4½ feet thick. No. 3 is 70 feet below No. 1, and is 7 feet thick. No. 4, 240 feet under No. 1, is 11 feet tbick.

WYOMING.

Fremont County.

(Special Correspondence).—The Carisa M. Co., T. Ewing manager, is getting bids on a 500-ton stamp mill and cyanide plant which it expects to build during the summer.

South Pass City, May 22.

(Special Correspondence).—The Garfield M. Co. is making preparations to increase development work and to build a stamp mill during the summer.

Atlantic City, May 22.

Uinta County.

The American Con. Oil Co. reports a strike of oil in the Spring Valley field, east of Evanston. The second drill of the company, which was started near the first well a month ago, struck a heavy flow of oil at a depth of 800 feet. After penetrating the oil sand to a depth of 60 feet the drill was withdrawn and the well tested. The result is said to have shown a 200-barrel well.

FOREIGN.

AFRICA.

West Africa.

At Seckondi, on the west coast of Africa, J. H. S. Cox, of Denver, Colo., reports the mining industry developing. Ho says the negroes, who work under white foremen in the mines, are a difficult class to handle because of their natural love of outdoor life. While they are not lazy, yet it is difficult for them to devote their energies to one particular object.

AUSTRALIA.

South Australia.

The Northern Territories M. & S. Co., under date of May 5, reports the water-jacket smelter had been worked for twenty days satisfactorily. During that time a total quantity of 1160 tons of ore was treated, of average assay value of: Copper, 3½%; gold, 4 dwts. 7 grs.; silver, 10 ozs.; the total production being 120 tons of matte, containing: Copper, 40 tons; gold, 250 ozs.; silver, 12,200 ozs.; valued at £4570. Over one-third of the tonnage smelted consisted of slags from the reverberatory furnaces, which contained a small percentage of copper, gold, and silver, valued about 15s per ton. Tbe slag was useful in facilitating starting the water-jacket

smelter. Will start reverberatory furnaces roasting matte on the 8th inst.——At the Mount Ellison mine, 120-foot level was driven during month of April on lode 40 feet, total 252 feet; the level timbered throughout, and tramline laid. Grey ore is again making in face of lode, 4 feet wide; assaying 6% copper. They raised during the month 150 tons, of average value of 15% copper.——At the Iron Blow mine, the main shaft, 100-foot level, crosscut was driven 20 feet, total 72 feet; lode 20 feet wide; assay value copper, gold and silver, £6 5s per ton. Raised 960 tons of ore during the month. Sinking of main shaft has been resumed. On the tramways, earthworks have been completed for 7 miles 2 furlongs. Rails are laid for 6 miles 6 furlongs.

Queensland.

The gold returns of Queensland for month of April are reported as follows:

	Tons Crushed.	Yield in Ounces.
Charters Towers	24,500	25,500
Croydon	6,400	3,600
Gympie	16,900	9,100
Mount Morgan	18,500	10,400
Ravenswood	2,100	2,600
Other Fields	2,700	2,100
Alluvial	.....	800
Total yield		54,100

Western Australia.

Diamond drill boring is being carried on from the 1100-foot level of the Chaffer's mine, at Kalgoorlie.

The Great Boolder mine at Kalgoorlie is having two ball mills added to the sulphide plant, which will bring the treatment capacity of the crushing section up to that of the roasting section; also increase the tonnage handled by about 500 tons monthly.——At the Associated, two additional roasting furnaces have been put in, making fourteen in all. The completion of the 20-head mill, in course of erection for treatment of low-grade ore, was delayed pending delivery of concentrating tables.

BRITISH COLUMBIA.

Boundary District.

During the month of April 383 feet of development work was done at the Granby mines at Phœnix.

Work was resumed on the Trilby mine, near Greenwood, last week. The property is under bond to L. A. Smith and Gaunce & Wickwire. It is near the E. P. U.——Development on the Defiance has been resumed by W. Fowler. The steam plant of the Marguerite mine, in Deadwood camp, has been bought, including hoist, pump, drills, etc., and is being set up at the Defiance.——Superintendent Longley is starting development on the Carmi mine, up the West Fork. All repairs necessitated by a year's shut down have been made and drifting on the 150-foot level of the Carmi is starting.

East Kootenay District.

The number of men at work at the St. Eugene mine at Moyie has been increased. The concentrator is crushing steadily. The mill is being fed by ore from the Lake Shore workings. The aerial tram which connects with the upper workings is running. Ore is being shipped to the smelters.

Rossland District.

Next week it is expected operations will begin at the Rossland Power Co. concentrator, near Rossland. Each section will be started up and the machinery adjusted. The last consignment of cyanide machinery is being set up, also the electrical transformers for the West Kootenay P. & L. Co.'s transformer house at the works. The capacity of the plant is 200 tons daily.

Rossland reports say efforts are being made here through the Rossland Board of Trade to have the Canada Geological Survey make a structural map in detail of the camp, similar to the work done by the United States Geological Survey at Cripple Creek, Leadville and other points. E. B. Kirby, manager of the War Eagle-Center Star mines, says a structural survey would do much to stimulate mining.——In anticipation of the production of milling ores at Rossland on a large scale, further efforts will be made to secure the amendment of the 2% tax on the output of British Columbian mines. It is said to have been shown that on low-grade ores extracted for concentrating the tax takes from 12% to 22% of the profits, and remedial legislation is sought whereby the tax will bear less heavily on this class of product.

Vancouver Island.

President Atkinson of the Cascade M. Co. is preparing to start developing the company's property on Uchuchlesett harbor, near Alberni. The Southern Star mine on Uchuchlesett harbor continues to improve. The company is filling the hunkers ready for another shipment. The mining outlook for the district generally is reported good.

West Kootenay District.

In the Lardeau it is reported that the Great Northern Mines, Ltd., will put in ten more stamps in the Oyster mill, near Camborne. The fifth monthly cleanup of the Oyster mill was made last week, with satisfactory results.

It is stated that the Imperial Development Syndicate will take over the Eva mine, near Ferguson, from the Calumet & British Columbia Gold Mines, Ltd., on account of the latter company failing to make a third payment.

Yale District.

The plant of the Nickel Plate mine at Hedley is divided into three departments—the amalgamating, cyaniding and concentrating rooms—each operated independently of the other. The power used is water, taken from Twenty Mile creek. The overflow from this power is utilized to generate electricity, and the electricity, besides being used for lighting the mill, is held as a reserve power that may be used to run the mill in case of necessity. The tram from the mine to the mill was at first 4 miles long, but, because of the difficulty of working this length of cable, it has been cut into two sections, which facilitates handling the ore from mine to mill.

CANADA.

Ontario.

U. S. Consul H. S. Culver of London, Ontario, transmits the following statement, issued by the bureau of mines, showing the mineral production of the Province of Ontario during the year 1903. The total value of metallic minerals was $5,165,000 and non-metallic $7,632,644. The number of men engaged in production was: Metallic, 2936, earning in wages $1,583,361; non-metallic, 7652, earning $2,617,012. Following is the summary of metallic production:

Article.	Quantity.	Value.
Gold, ounces	10,383	$ 18,036
Silver, ounces	16,868	8,942
Copper, tons	4,731	641,726
Nickel, tons	6,998	2,499,068
Iron ore, tons	208,154	450 000
Pig iron, tons	87,004	1,491,696
Steel, tons	15,229	304,586
Zinc ore, tons	1,150	17,000

Total value, $5,601,154, less value Ontario ore smelted into pig iron and pig iron converted into steel, $436,154. Total value of metallic production, $5,165,000. Following is the summary of non-metallic production:

Article.	Quantity.	Value.
Asbestos, tons	550	$ 1,650
Arsenic, tons	257	20,046
Building and crushed stone	.....	845,000
Carbide of calcium, tons	2,509	144,000
Cement, barrels	784,808	1,282,118
Corundum, tons	1,119	87,600
Feldspar, tons	15,296	20,046
Graphite, tons	4,400	20,636
Gypsum, tons	4,520	7,910
Iron pyrites, tons	7,469	21,693
Lime, bushels	3,400,000	520,000
Mica, tons	948	102,205
Natural gas	.....	196,535
Peat, tons	1,100	3,300
Petroleum, imperial gallons	16,640,338	.....
Oil, refined, imperial gallons	9,710,386	.....
Benzine and naphtha, imperial gallons	832,153	.....
Gas and fuel oils and tar, imperial gallons	1,968,172	.....
Salt, tons	58 274	388,097
Talc, tons	920	2,625

Total non-metallic production, value, $7,632,644; add metallic production, $5,165,000. Total value, $12,797,644.

The commissioner of Crown lands reports the production of nickel in Ontario last year exceeded that of any previous year, the total being 6998 tons, valued at $2,499,698, writes J. E. Hamilton, United States Commercial Agent at Cornwall.

Yukon Territory.

A shipment of railroad rolling stock, to be used in the development of the Anderson concession on Hunker creek of Klondike district, near Dawson, is being taken in. The consignment consists of four 6-ton engines and twenty cars. The Detroit-Yukon G. M. Co. owns the concession. They are to be used on a railroad, about 3 miles in length, extending from the mines to water. The gravel will be loaded into the cars and from them dumped into the sluice boxes. The company's concession comprises a number of benches on Hunker creek.

MEXICO.

Chihuahua.

The United States M. Co., at Parral (formerly the Terrenates Con. M. Co.), is increasing development work on its mines and at same time is shipping a car of ore a day. Its steam-turbine, electric power plant is in satisfactory operation and three heavy pumps are on the ground to be set up, says Manager J. W. Marshall.

The Hidalgo Placer M. & M. Co. has been organized under Delaware laws by J. V. Dignowity et al to operate in the Colorado mountains, near the Conchos river, 65 miles from Parral. The officers are: M. C. Butler, T. S. Morehead, C. Hedges, Morehead being manager. The general officers are in Washington, D. C., with branch office in Parral. The company is said to own the Delfina, of eighteen pertenencias, the Florentina, of fifteen, and the Body, of ten perteuencias.

J. F. Johnson, B. Peterson and C. Crowell, of the latest bonanza at Santa Barbara, are striking ore in their Rayo mine, near the Adela mine, and they have contracted for the mill of the latter. The vein is said to be 16 feet in width, the ore carrying 150 grams gold per ton. The mine has been producing ore carrying 600 grams silver and some gold.

Durango.

The A. Payne and C. von Brandis mining interests at Velardena have been sold to the American & Mexico M. & Dev. Co. of Chicago, Ill. The properties transferred were the Roca Negra, the Alicia and Margarita, in one group. There were two other mines at Canelas, the properties in the El Torro group, which were sold to A. J. Scott of Chicago, Ill.

The San Lois Mining Co., L. Ross managing director, operating mines 30 miles from Durango, is putting in a pumping plant, boilers, hoists, etc., at the mines. The company is shipping 1000 tons of ore monthly and is treating 100 tons per day by the lixiviation process at the mine. It is building a 6-mile railroad to connect two of its mines with the mill. On the San Lucas mine a $25,000 pumping plant is being installed. The company has four mines in operation out of forty-three properties. The ores are silver, lead and copper.

The Arizona M., M. & Dev. Co. of Oklahoma City, O. Ty., is building a 20-stamp mill at its mine in the Canelas district, near Goanacevi. They report having a quantity of $15 milling ore.

Guanajuato.

H. Hine and L. E. Cortis, of Colorado Springs, Colo., with Eastern men have formed the Guanajuato R. & M. Co. to operate the Rul estate and other mines in Guanajuato. It is stated $2,500,000 is to be spent on the Rul mines and a 500-ton daily capacity mill is to be built.

Jalisco.

L. E. Oldham, E. Fitzpatrick and W. W. Dodd, of San Antonio de los Moran, have filed on a group of mineral holdings near the Falda mine and will begin development work.

Near Chapala, F. B. Martinez says he is preparing to develop a gold and silver group.——I. P. Martin will develop his mines near Hostotipaquillo.——Development work will be started at Tamazula by M. K. Taylor of Guadalajara.

Lower California.

C. W. French of San Diego, Cal., of the Pacific Steel Co., reports the company has taken over the W. E. Webb iron mines in Lower California, near San Quentin. Eight mines have been transferred, leaving twenty-one others to be transferred later.

Oaxaca.

It is reported La Purisima mine, at Penoles, had been bonded to J. Z. Mason, of Cleveland, O., for $1,000,000 Mexican money.

Puebla.

The Compania Minera de Mexico, Ltd., has bought a group of gold and silver mines, at Tetela de Ocampo, for $125,000 after an option, during which the company did development work. F. Brennan is manager. It is stated the company proposes acquiring electric power at Nexcaca, 65 miles distant for operation of its mines.

Sonora.

M. B. Romero at Mulatos reports shipping last week $35,000 in gold from the Rey del Oro Co.'s group, the result of three months' run of six Bryan mills. The Mulatos district is three and one-half days ride from Minaca, Chihuahua, and about six hours ride west of the Chihuahua line. Other properties in the Mulatos section being opened up are the Calera and Santa Eduviges mines, being developed by F. W. Garretson. These are silver and gold. The Trinidad silver mine is having extensive workings made by the owners who compose La Bufa Co. Richardson Bros. have charge of operations.——Near Mulatos the Cieneguita C. Co., of Nogales, Ariz., is operating its copper group. Development continues and it is stated the company is preparing to build a smelter at or near the mines. G. Beebe is manager.

The El Tigre copper mine, owned by B. F. Graham et al. of Bisbee, Ariz., is preparing for a reduction plant, says O. Hoffman, consulting engineer. C. Meyers of Albino, Durango, will be superintendent of the company's smelter.

Zacatecas.

Near Zacatecas, at the Magistral mine, D. H. Norris of New York City will put in additional machinery.

The Calera M. & M. Co., composed of Philadelphia, Pa., men, is arranging to build a 20-stamp mill at its mines, 12 miles east of Calera.

Personal.

C. K. COLVIN of Denver, Colo., has returned there from Idaho.

W. O. MANSON, a mine owner of Denver, Colo., is in San Francisco, Cal.

W. L. CARD of the Card concentrator, Denver, Colo., is visiting California.

J. H. NEALE, a mine owner and operator of Sonora, Cal., is in San Francisco, Cal.

L. HUMPHREY, Central City, Colo., is in Arizona for the Guggenheim Exploration Co.

W. E. GARVER is manager of the Little Lallie M. Co., operating near Central City, Colo.

W. H. HAMPTON goes from Grant's Pass, Or., as manager Jualpa Co., at Juneau, Alaska.

J. J. CHAMBERS of Rodding, Cal., a Shasta county mine owner, is in San Francisco, Cal.

B. PITTMAN, interested in Tonopah, Nev., mines, is in San Francisco, Cal., from Tonopah.

HOMER WILSON, a mine operator of San Francisco, Cal., has returned there from New York.

WM. SHARWOOD of Soulsbyville, Cal., interested in Tuolomne county mines, is in San Francisco, Cal.

T. DOUGLAS, operating mines at Bayoreca, Alamos district, Sonora, Mexico, is visiting in Wisconsin.

JOHN ROSS JR. of Sotter Creek, Cal., is in San Francisco, Cal., from mine oxaminations in Oregon.

A. H. PHELPS of Denver, Colo., manager of the Bonnie Girl mine, La Plata, Colo., is at the property.

O. A. HONNOLD, electrician of the Utah Power Co., has returned to Salt Lake City from a California visit.

W. H. BRAY of Nevada City, Cal., interested in Nevada county mines, is in San Francisco, Cal., on business.

G. F. DITZLER of Biggs, Cal., interested in Butte county mines, is in San Francisco, Cal., on business.

W. H. FORD, superintendent of the Francisco mine at Llano, Sonora, Mexico, is visiting in Morristown, N. J.

C. W. CLARK of Butte, Mont., manager of the United Verde C. Co. of Jerome, Ariz., is in San Francisco, Cal.

A. GURR of the Alder M. Co., near Virginia City, Mont., has resigned his position and gone to South Africa.

F. V. BODFISH is local manager at Cripple Creek, Colo., for the Moffat interests, including the Victor mine.

C. M. FUELLER, Denver, Colo., has returned there from a professional trip to the San Juan country, Colorado.

NORMAN MCGEE has been appointed to the chair of civil engineering of Colorado College, Colorado Springs, Colo.

C. A. ROSS, president of the Standard copper mines, near Clifton, Ariz., is in Boston, Mass., on a business trip.

A. E. SAYLES, representing the Mine & Smelter Supply Co., Denver, Colo., has returned thence from Sumpter, Or.

W. CONDRON, interested in mines in Mexico, with headquarters at Douglas, Ariz., is visiting in Spokane, Wash.

W. F. SNYDER of Salt Lake City, Utah, of the Western Exploration Co., is in San Francisco, Cal., on mining business.

W. E. THORNE has returned to Denver, Colo., from making mine examinations at Del Norte, Rio Grande county, Colo.

R. G. WILLIAMS of Denver, Colo., is in London, England, on business connected with his mining interests in Arizona.

F. M. DOWNER has been appointed superintendent and A. R. Hodges assayer at the United States Mint in Denver, Colo.

J. M. BIDWELL has been appointed assistant manager of the American S. & R. Co. in Utah, with offices at Salt Lake City, Utah.

M. L. REQUA, president of the Pacific Steel & Wire Co., and A. C. Lawson, professor of geology at the University of California, have gone to White Pine county, Nevada, to examine mines owned by the former.

J. H. LE NOIR of Chihuahua, Mexico, has gone to Victorino, Chihuahua, Mexico, to take charge of the Senorita mine of the Mines Corporation, Ltd., and the

San Vicente mine of the San Vicente & New England Co.

A. HARVEY has returned to Denver, Colo., from Santa Barbara, Chihuahua, Mexico, where he was on professional business.

H. M. DIFFENBACH of Chihuahua, Mexico, until recently with the American S. & R. Co., is manager of the Compania de Minerales y Metales.

E. D. PETERS has been appointed professor of metallurgy in Harvard University, Department of Mining and Metallurgy, at Cambridge, Mass.

M. H. LIPMAN, manager of the Lipman M. & T. Co., operating at Hailey, Blaine county, Idaho, is in Salt Lake City, Utah, from the company's mines.

J. A. BAYLOR of Clifton, Ariz., is manager of the International Development Co., operating a group of claims east of Hermosillo, Sonora, Mexico.

F. G. BAUM succeeds L. M. Hancock as general superintendent of the California Gas & Electric Corporation, with headquarters at San Francisco, Cal.

S. F. WILES of Los Angeles, Cal., superintendent and manager of the Mexico M., R. & E. Co., operating in Sonora, Mexico, has returned from a trip to the mines.

G. K. FISCHER of Salt Lake City, Utah, mechanical engineer for the United States smelter, near Bingham, Utah, has returned to Salt Lake City from San Francisco, Cal.

J. HENDERSON, president and manager of the El Porvenir de Sonora mines at Mina del Oro, 14 miles east of Poza station, Sonora, Mexico, has returned there from an Arizona trip.

F. P. RODDY, secretary of the Poker Flat M. Co. and the Lassiat M. Co., has returned to Downieville, Cal., from a three months' trip East on business connected with the Lassiat mine.

G. McM. ROSS, superintendent of the Andes and Mexican mines at Virginia City, Nev., has returned from a business trip to Boston, Mass., and New York, N. Y., and is in San Francisco, Cal.

F. FLETCHER of Parral, Chihuahua, Mexico, has been engaged as consulting engineer by the Avino Mines, Ltd., to put in a 400 H. P. gas system at that company's mines at Avino, Durango, Mexico.

MR. J. C. MCQUISTON, until recently secretary, has been appointed superintendent of the Westinghouse Co.'s publishing department, having charge of matters relating to the publicity of the products of the various Westinghouse interests in the United States and Canada.

G. A. ROBINSON of Salt Lake City, Utah, will go to British Columbia to take charge of the Britannia mines at Howe sound, Vancouver island. While retaining the management of the Tintic M. & D. Co.'s affairs of Eureka, Utah, he has resigned the management of the Yampa Smelting Co. of Bingham, Utah, in which he is succeeded by Walter Kelly of San Francisco, Cal.

Commercial Paragraphs.

THE Pioneer Roll Paper Co. of Los Angeles, Cal., manufacturers of Ready Rock roofing, report the sale to the Western Railroad of 1,170,000 square feet of their roofing.

FAIRBANKS, MORSE & CO. of Denver, Colo., report having closed an order with the Two Republics M. Co., Tejamen, Mexico, for a 100-ton concentrating mill, including two Elspass mills.

THE Lunkenheimer Co. have an exhibit in Machinery Hall, location 5-G, block 26, Louisiana Purchase Exposition, St. Louis, Mo., displaying the line of engineering specialties which they manufacture.

THE Colorado Iron Works Co., Denver, Colo., has recently shipped one 42x160-inch lead furnace, eight slag trucks and other material to Missouri. This is the largest furnace ever constructed by this company.

ALLIS-CHALMERS CO., through their Denver, Colo., office, have an order from the Atlantic M. & R. Co. for a 20-stamp wet crushing cyanide plant to be shipped to Atlantic City, Wyo., 90 miles north of Rock Springs.

C. M. FUELLER, 1752 California street, Denver, Colo., has recently placed orders for four plants of machinery for milling purposes. He recently drew plans for the Dexter Mining Co. of South Pass, Wyo., for a 100-ton mill. In addition to his regular work of making mill tests and designing mills for parties, he expects to take up special survey work.

FRANCIS SMITH & CO., 83 Fremont street, San Francisco, Cal., are installing an electric power plant for the Rock Creek Power & Transmission Co., near Baker City, Or. Power is to be furnished to mines in Sumpter district.

THE Pneumatic Engineering Co. of New York has an order for an air compressor to be used in connection with the water works of Sberman, Texas. The machine is a special Rand-Corliss compressor, with tangye frame, having air cylinders 20 & 12x20, steam cylinders 9 & 17x20, designed for 200 pounds per square inch air pressure.

A. M. ROCKWELL of the Kimplin Crusher & Pulverizer Co., Chicago, has just returned there from a successful trip through the West. On this trip Mr. Rockwell closed a contract for a plant equipped with Kimplin machinery near Phœnix, Ariz. Considerable interest was manifested in the crusher manufactured by this concern, and Mr. Rockwell was enabled to show the practical workings of the machine by means of a working model which he had with him.

JAMES W. LYONS, who has been for many years associated with the Allis-Chalmers Co. in the capacity of engine salesman, has been appointed manager of the newly created power department of the Allis-Chalmers Co., with headquarters in Chicago, the appointment taking effect Monday, May 16, 1904. This newly created power department will control the sales of: Reciprocating steam engines, steam turbines (entire unit including turbo-generators), condensers, gas engines, pumping engines, blowing engines, hoisting engines and air compressors. Mr. Lyons' well deserved promotion will gratify his many business friends throughout the country, for he is very well known, and it is an evidence that the management is determined to preserve the best traditions of the Allis-Chalmers Co.

Obituary.

N. JONES, a Gilpin county, Colo., mining man, died on the 19th inst. at Russell Gulch, after a protracted illness.

M. R. GLEESON, a mining man of Placer county, Cal., died in Sacramento, Cal., May 10th. Deceased was born at Wisconsin Hill, near Iowa Hill, Placer county, Cal., and was 42 years old.

C. J. BOGAN, foreman of the Dutch mine at Quartz, Tuolumne county, Cal., was killed on the 14th inst., being buried by falling rock in one of the stopes of the mine. Deceased was a native of Tuolumne county, aged 41 years.

H. R. CROCKER of Crocker's station, on the Big Oak Flat and Yosemite road, a Tuolumne county pioneer miner, died in Lodi, Cal., on the 22nd inst. Deceased was born at Waquoit, East Falmouth, Mass., March 20th, 1827.

P. H. SCOTT, a mining engineer of Denver, Colo., 70 years of age, died on the 24th inst. at Denver. Deceased was born in Canada. He was a pioneer on the Comstock, in Nevada, and was in business with J. W. Mackay and W. O'Brien. For fifteen years he was master mechanic of a Comstock mine.

Trade Treatises.

Bulletin No. 302 of the Holtzer-Cahot Electric Co., Boston (Brookline), Mass., gives detailed data of dynamotors and motor generators.

The Salt Lake Hardware Co., Salt Lake City, Utah, produce an illustrated catalogue and price list of the Keller assay balance, which they supply.

"Annealing, Tempering and Case Hardening" is the title of a booklet on the portable forge and tempering furnace from F. W. Braun & Co., Los Angeles, Cal., containing some helpful hints thereon.

"Pumping Machinery," from Fairbanks, Morse & Co., Chicago, San Francisco and Denver, edition C., No. 48, gives in its 88 pages some salient points of interest to pump users, and will be sent on request to any address.

"Compressed Air Haulage" is tersely treated in a brochure from the H. K. Porter Co., Pittsburg, Pa., builders of light locomotives, steam and compressed air. Of standard size—6x9 in.—the book is a fine example of a trade treatise and deserves a place in the engineer's library.

Latest Market Reports.

SAN FRANCISCO, May 27, 1904.

METALS.

SILVER.—Per oz., Troy: London, 25⅜d (standard ounce, 925 fine); New York, bar silver, 55½c, refined (1000 fine); San Francisco, 55½c; Mexican dollars, 45½c San Francisco, 44½c New York.

COPPER. — New York: Standard, $13.12½; Lake, 1 to 3 casks, $13.00@13.12½; Electrolytic, 1 to 3 casks, $12.75; Casting, 1 to 3 casks, $12.50; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £56 7s 6d spot per ton.

Following are the figures of German consumption of foreign copper for the months January-March, 1904, compared with the same period of time in 1903-1902:

	1904.	1903.	1902.
Imports, tons.....	29,624	19,590	17,427
Exports, "	901	2,242	2,298
Consumption, tons..	28,723	16,648	15,129

Copper is slightly lower than last week, but there is a feeling of somewhat better prices in the near future, as consumers must soon stock up for the season.

LEAD. — New York, $4.50; Salt Lake City, $3.50; St. Louis, $4.25 San Francisco, $4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, $4.85. London: £11 13s 9d ₱ long ton.

SPELTER.—New York, $5.30; St. Louis, $5.00; London, £22 ₱ ton; San Francisco, ton lots, 6¾c; 100-lb. lots, 7c.

TIN.—New York, pig, $27.00@27.75; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 30½c; bar tin, ₱ lb., 32½@35c. London, £124 2s 6d spot.

PLATINUM. — San Francisco, crude, $18.50 ₱ oz.; New York, ingot, $19.00 ₱ Troy oz. Platinum ware, 75@82c ₱ gram.

QUICKSILVER. — New York, $44.50@45.50, large lots; London, £8 2s 6d; San Francisco, local, $43@43.50 ₱ flask of 76½ lbs.; Denver, $46.00. Export, $43.00@43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER. — Half-and-half, 100-lb. lots, 19.00c; San Francisco, Plumbers', 100-lb. lots, 16.50c.

ZINC.—Metallic, chemically pure, ₱ lb., 50c; dust, ₱ lb., 10c; sulphate, ₱ lb., .04c.

NICKEL.—New York, 40@47c ₱ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $13.60@13.75; gray forge, $12.75; San Francisco, bar, 3c ₱ lb., 3½c in small quantities.

STEEL. — Bessemer billets, Pittsburg, $23.00@23.00; open hearth billets, $23.00@23.00; San Francisco, bar, 7c to 12c ₱ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½c ₱ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In hhls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER. — (Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4 and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $1.25 country, $1.25 city ₱ hhl.

CEMENT.—Imported, $2.15@2.65 ₱ hhl.; California carload lots, $2.10 f. o. b. at works; small lots, $2.45 ₱ hhl. in sacks, 4 sacks to hhl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY. — New York, Cookson's, 7¾c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8¼c; 100-lb. lots, 10¼c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ₱ set; 14 oz., 40s., 10c.

CHEMICALS. — Cyanide of potassium, 98%-99%, jobbing, 23@24c ₱ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ₱ 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ₱ lb.; Cal. s. soda, hhls., $1.20@1.40 ₱ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, hhls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3¼@3½c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ₱ lb.; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ₱ lb.; nitric acid, carboys, 8c ₱ lb.

COAL. — San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.00; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Antbracite, $13.00; Rock Springs, $11.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $11.50, long ton.

BONE ASH.—Extra No. 1, 5@6c ₱ lb. No. 1, 4@5c.

OILS.—Linseed, boiled, hhl., 49c; cs., 54c; raw, hhl., 47c; cs., 52c; Lucol oil boiled, hhl., 44c; cs., 49c; raw, bbl., 42c; cs., 47c. Kerosene—Pearl, per gal., 20½c; Astral, 20½c; Star, 20½c; Extra Star, 24½c; Eocene, 23½c; Elaine, 26½c; Water White, in bulk, 14c; Mineral Seal, iron bbls., 19c; wooden bbls., 21½c; cs., 25c; Mineral Sperm, cs., 26½c.; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E W. S., hhl., 75c; cs., 80c; Neats-foot Oil, pure, hhl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 70c; Bleached, do., 80c; Whale Oil, cs., 52@57c.

RED LEAD.—500 lbs. and over at one purchase, ₱ lb., 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ₱ lb.

BORAX.—Concentrated, 6@7c ₱ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANCANESE.—Pure, ₱ lb., 60c.

SODIUM.—Metal, ₱ lb., 50c.

BISMUTH.—Subnitrate, ₱ lb., $2.10.

MERCURY.—Bichloride, ₱ lb., 77c.

MOLYBDENUM.—Best, $2.00 ₱ lb.

CHROMIUM.—90% and over, ₱ lb., $1.00.

PHOSPHORUS.—American, ₱ lb., 70c.

SILVER.—Chloride, ₱ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ₱ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittshurg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittshurg.

URANIUM.—Oxide, ₱ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FISHING TOOLS FOR SUCKER RODS, OR THE LIKE.—No. 759,454. May 10, 1904. O. A. Mann and W. J. Evans, Oil Center, Cal. This invention relates to improvements in means for recovering and removing broken sucker rods or other and similar obstructions from oil wells. The object of the invention has been to design a simple, durable device which may be lowered into the well, slipped over the end of the broken rod, and engaged with a coupling or like protuberant part of the rod and the latter, with its bucket, drawn upward to the surface.

HOLDER FOR BOILING HAMS.—No. 759,451. May 10, 1904. H. A. Kurlinks, San Francisco, Cal. This invention relates to a device which is designed for holding hams during the process of boiling. It consists of a foraminous cylinder the meeting edges of which are free to move upon each other and within which cylinder the prepared ham is placed, a mechanism by which the cylinder may be contracted so as to compress the ham within it, and means for retaining the cylinder in its contracted position during the boiling of the ham. This device retains the juices of the ham and prevents its being unduly dried during the process of boiling.

PORTABLE BUILDING APPARATUS.—No. 760,178. May 17, 1904. H. Brand, Oakland, Cal. This invention relates to an apparatus which is designed for the purpose of preparing finished building material ready for immediate use from substantially rough lumber and in a means for placing the apparatus in close proximity with each building from which the lumber is to be used. It consists of a portable structure mounted upon wheels containing all the machines and apparatus necessary for the work permanently set up and maintained in line and in readiness for instant operation and a motor from which power is derived for the operation of the machines, wheels upon which the structure is mounted, and an independent connection between the motor and the wheels whereby the power of the motor may be directed to the transportation of the apparatus from point to point where necessary.

TOILET PAPER HOLDER.—No. 760,113. May 17, 1904. R. B. Friend, Oakland, Cal. This invention is designed to provide a means for conveniently holding and delivering toilet paper. It consists of a containing box or case, with means for securing or attaching it with the edges of the paper presented, so as to be extracted at will, and in other details of construction.

MINING AND SCIENTIFIC PRESS.

Whole No. 2289.—VOLUME LXXXVIII. Number 23. SAN FRANCISCO, CAL., SATURDAY, JUNE 4, 1904. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Proposed Copper Combine.

It is reported that a new movement is being made in New York and Boston with a view to forming a greater copper syndicate with larger capital and more far-reaching effect than that wielded by the Amalgamated Copper Company. This new consolidation of interests, it is said, contemplates the union of all the greater copper producers of the Lake Superior region (excepting Calumet & Hecla,) those of Arizona, California and Mexico, as well as those of the Butte, Mont., region not already in the control of the Amalgamated Company. The combined capital is stated to be $300,000,000. The plan, as outlined in the published reports of this proposed merger, is to buy the Heintze interests in Butte for $16,000,000; the Lake Superior properties for $50,000,000, and the Southwestern mines for $40,000,000. This latter item is supposed to include the Clark, Phelps-Dodge and Green interests in Arizona and Mexico, beside such others as may be considered necessary or desirable. It is then the intention of the Amalgamated Company, so it is reported, to increase its capital to $300,000,000 and to absorb the several subsidiary companies.

The scheme of controlling the copper output has been attempted before, but up to the present time has not met with unalloyed success Any move on the part of the large operators to raise the price of copper is at once followed with increased output by mines great and small not directly connected with the large interests. Increased price stimulates production, and it also has the effect of opening and equipping new mines all over the mining regions. Should copper go to 16 cents and remain there a year, the copper output would probably be increased at least 20%, and this largely by mines unable to produce copper profitably below 14 to 15 cents, and there are mines of this class in great number, while those more fortunate would at once take advantage of higher price to increase their reduction capacity and to output a greater amount of the metal to take advantage of the opportunities afforded by a high selling price.

It is unlikely that the several amounts mentioned above would buy the mines referred to, though it might possibly go a long way toward securing control of them. That the copper mines embracing the United Verde, Equator, Copper Queen, Shannon, and the others of Clifton, Globe and Morenci, together with the Cananea group of Mexico, are not held at more than $40,000,000, no one familiar with them believes. As to what may be accomplished in Butte or in the Lake Superior region with $56,000,000, as suggested, is a matter difficult of determination. When the Amalgamated consolidation was first talked of in 1899, about five years ago, the reported capital was $75,000,000, and it was then pointed out that the amount was insufficient to accomplish the purpose. The necessary sum was placed at $450,000,000 at that time, and it will probably require more than that amount now to secure control. When looking to such gigantic combinations of industrial interests, it is necessary that all actual competitors, or those likely to become such, must be included in the scheme of consolidation, or the plan may fail. In addition to the noted mines above mentioned, there are many others of present or future great value ; beside which there are indications that in China, in Alaska, and even in the heart of Central Africa, and in numerous other places are copper deposits of great prospective value which only require the stimulating effect of high price, whether created by increased demand for copper or by control of the market by a powerful syndicate, to spring into active life and become large producers and competitors. The proposition has not come to a realization as yet, but the syndicate formed to control, which does not actually control, soon becomes a burden in the hands of those creating it.

Head Frame of Globe and Phœnix Mine, Rhodesia, S. A.

A New Style Head Frame.– (See Page 380.)

Mining in Rhodesia.

Although Rhodesia is one of the most recently developed gold fields of the world, the mining equipment and methods there are for most part after modern ideas and practice. The Globe and Phœnix mine, near Bulawayo, is said to be one of the good properties of that section. It has been opened by a shaft on the dip of the vein to a depth of 1000 feet, and is said to make a favorable showing in the bottom. The accompanying illustration is that of the steel head frame at this shaft—a structure designed on modern lines, and especially to suit the conditions of the surroundings, in which topography is important. The shaft is sunk on a hill sloping toward the foot wall, which makes construction of a head frame somewhat more complicated than when situated on level ground. In Rhodesia timber is scarce and the imported timber is expensive, and in view of this steel frames are not generally more expensive than similar structures made of wood which would meet the requirements of the situation. In such places steel head frames are preferable to wood frames, because of their freedom from the danger of fire. Where steel frames have been introduced they have been found satisfactory and they are growing in popularity. In many instances a less elaborate frame is permissible. An instance is shown in the larger engraving on this page.

Latest Problem on the Rand.

The importation of Chinese laborers from China to South Africa has actually begun and the result of their introduction into the mines of the Rand will be watched with much interest by the mining world. A recent press dispatch states that a mutiny among the Coolies, which occurred iu the pen in which they were confined before shipping, had to be quelled by troops. This indicates that the Coolies are not going voluntarily to their period of serfdom in the gold mines, and also that careful organization and prompt measures to suppress rioting or uprising of any kind will be necessary. If these men were going voluntarily there might be less to fear of insubordinatiou, but a mutiny and rioting before they leave their native land makes it appear that some difficulties might be anticipated in their control when they actually reach the mines. If they are dissatisfied with the conditions under which they enter the service it would probably be the part of wisdom to select only those who are willing to accept the conditions voluntarily. In past years thousands of native Africans have been successfully haudled in the mines of South Africa, both on the Raud and in the diamond mines, and it has only been rarely that harsh measures were necessary. These natives were fed and lodged in compounds—large enclosures from which there was no escape—and the terms of their service were not uulike those under which the Chinese are engaged, and no serious difficulty arose, but it may be that the native Kaffirs are more tractable than the Chiuese Coolies. In auy event the present condition of the gold mining iudustry on the Rand demands a large number of cheap laborers, and the Chinese have come to be cousidered as the only material available to meet the requirements. It will be a largc problem to hold these men in check while getting valuable work out of them, but the mine managers of the Rand are accustomed to difficult problems, and doubtless, with the aid of the Government, will find a solution to this their latest difficulty.

Where Knowledge Is Power.

There is something required of the mining engineer in many instances when making an examination of a mine, beside the mere takiug of samples, measuring the width of the vein, etc. These are simply mechanical operations which may be performed by any miuer after a short course of instruction by an energetic and painstaking instructor. The blocks of ore may be measured and carefully sampled, and by a strictly mathematical process the averages may be found and the value of the mine determined as to ore in sight. In a well developed mine the mechanical labors of the mining engineer are multiplied — the greater the area of ore exposed the larger the number of samples that must be taken, but, on the other hand, this condition robs the proposition of much of the risk involved, and if the work of sampling, measuring and plotting be carefully and thoroughly done, the actual value of the mine is readily ascertained. But there is another element in the determination of the value of a mine, and this is the conclusions based on the observed facts. It is not always the good fortune of the engineer to find a carefully developed mine. Often he finds a very badly developed one. Sometimes the rich ore has been stoped and the low grade rock left standing with only the owner's statement as to the value removed—a factor which experience has taught to be regarded with much caution. The backs of the stopes may be inaccessible, requiring the construction of scaffolding to reach the ore. Uuder such conditions "instances have been reported" where the backs claimed to be rich were worthless. Caved workings, strange appearing aud apparently unnecessary bulkheads are sometimes found which require investigation. An instauce was recently related to the writer of a reported 30 feet of valuable ore opened iu a crosscut from the main line drift. This proved on investigation to be a mere "scab of ore" left along a branching fissure, which a few shots stripped completely, showing barren rock just back of it. This crosscut was left as a "show place," evidently in the hope that it would be mistaken for a solid face of ore. This supposition is strengthened by the fact that iu the face of the crosscut a bulkhcad had been erected which, upon being removed, showed that the crosscut had been turned to the right and backward, and all in barreu rock, proving that the former operators knew that the 30 feet of good ore was only "skin" deep. In another mine examined not long since two drifts were found running ou either side of an ore body 40 feet wide, a stope connecting the two drifts—one of the drifts on the foot wall, the other on the hanging. No ore appeared in the crosscut from which these drifts were run, except a stringer 12 inches wide, though 30 feet south of the crosscut the ore body was actually 40 feet wide. The back was 30 feet above the floor, several hundred tons having been removed and no timbers put in the stope. At the face of the foot wall drift was found probably twenty tons of ore broken down lying on the floor of the drift and filling the space entirely up to the back of the drift. The other drift on the hanging wall was still in ore. The broken rock was cleaned up in the foot wall drift, and a short distance beyond the pile of broken rock and partly covered by it was an east crosscut toward the hanging wall, altogether in barren rock, and not 15 feet south of the 40-foot stope, where the face was all in ore. The mining engiueer demands proof that men are honest. He dares not assume it. If he does it may result in his undoing. He must be a judge not only of mines, but of men. In miue examination a knowledge of geology — particularly of that branch known as mining geology—is imperative as a means of self-protection and an end to the success of himself aud that of his clients, and he who lacks this knowledge is as unsuited to pass upon the value of a mine beyond what can be absolutely seen and determined as the novice at the business.

An Important Decision.

The United States Circuit Court of Appeals for the uinth circuit has rendered an important decision in the case of the Last Chance Mining Co., appellants, vs. the Bunker Hill & Sullivan Mining & Concentrating Co., appellee. These properties are in the Cœur d'Alene district of Shoshone county, Idaho, and the mines concerned cover one of the most important lead-silver deposits in the world. In its decision the court has determined for the first time some points in law, which heretofore have been merely presumed to exist, and has affirmed others. The case was tried before Judges Gilbert, Ross and Morrow, and the opinion was written by Judge Ross, being concurred in by the other members of the bench unanimously. In the Circuit Court below the appellee was plaintiff and the appellants defendants. The complainant claimed to own the Bunker Hill claim, and that the apex of the vein claimed is within the boundaries of the claim. This apex on its course crosses the claim diagonally, making what was originally intended to be the side lines, in fact, the end lines, aud the extralateral right is therefore in the direction of the actual end lines. In its opinion the court states that the locator must consider the outcrop or apex of the vein to indicate its direction. The prospector is not presumed to be an engiueer, who can make a trigonometrical calculation of the true strike along a hillside.

"The extralateral right to a vein or lode outcropping at the surface, where it exists," said the court, "is fixed by the course of the vein or lode at the surface, and not by its course on the level. We do not mean to say that a vein must necessarily crop out upon the surface, in order that locations may be properly laid upon it." Said the Supreme Court, in Mining Co. v. Tarbet: "If it lies entirely beneath the surface, and the course of its apex can be learned by sinking shafts at different points, such shafts may be adopted as indicating the course of the vein, and locations may properly be made on the surface above it, so as to secure a right to the veiu beneath. But where the vein does crop out along the surface, or is so slightly covered by foreign matter that its course can be ascertained by ordinary surface exploration, we think that the Act of Congress requires that this course should be substantially followed by laying claims and locations upon it. * * * * The most practicable rule is to regard the course of the vein as that which is indicated by surface outcrop, or surface explorations and workings. It is on this line that claims will naturally be laid, whatever be the character of the surface, whether level or inclined."

Another important point made by the court is as follows: "The mining right is an integral one. It is secured by a single location. The title to it is conveyed by one patent. It is a separate and distinct thing from every other claim. The fact that one individual, company, or corporation locates or acquires many such claims is wholly unimportant. Congress has never yet seen fit to put a limit on the number of such claims that one individual, company or corporation may locate or acquire. Whether, in view of its well-known policy to encourage the development of the mineral wealth of the country it shall ever deem it wise to do so, rests with Congress, and it is a matter with which the courts have nothing to do. The rights which a valid location of such a claim secures to such a locator and his grantees and successors are clearly defined by law, and are wholly unaffected by any subsequent conflicting location. Iu all such matters the first in time is the first in right."

Another point was made in the fact that although the Bunker Hill claim was located prior to the Last Chance, one of the claims in conflict, the location of the former was not recorded within fifteen days, as required by the Idaho State law, while the latter was recorded seven days after location, but as the State law fixed no penalty for failure to comply with the law it was of no force and in no matter affected the title of the Bunker Hill claim.

The opinion is of interest throughout, and decides a number of important points in mining law which have heretofore been somewhat in doubt by reason of lack of high judicial decision, which is considered essential in all legal points wherein the laws are at all ambiguous or silent entirely in the matter.

CONCENTRATES.

THE relative cost of water gas and fuel oil depends almost wholly on the situation and cost of raw materials at the point where the gas or oil is to be used.

✤✤✤✤

THE forward tilting of screens in the stamp battery facilitates the discharge of the crushed pulp, and consequently has a tendency to reduce sliming of the ore.

✤✤✤✤

IT is only rarely that concentration of ores yields the mineral sought directly. The concentration of metallic copper from the Lake Superior ores is a notable exception.

✤✤✤✤

GYPSUM is used for the manufacture of plaster of Paris, and also to a great extent as a fertilizer. It is worth from $2 to $2.50 per ton where mined. The supply is abundant.

✤✤✤✤

BY employing a greater volume of water in the battery, or adding it to the pulp coming from the mortar at the head of the amalgamating plate, the plate may be given a decreased grade.

✤✤✤✤

IT is probably owing to the fact that solutions of gold —the chlorides, iodides, bromides, etc., may vary more or less in their state of dilution that no specific gravity is assigned by text books to these solutions.

✤✤✤✤

ATACAMITE is a double chloride and hydrate of copper, first found at Atacama in northern Chile. Its color is green, of various shades, with apple-green streak; transparent to translucent. Hardness is 3 to 3.5; specific gravity 3.75; luster, adamantine to vitreous.

✤✤✤✤

THE coarser the rock to be crushed the larger should be the rolls employed to crush it. Rolls of small dimensions will not satisfactorily crush coarse rock. It may be stated as a general proposition that the wider the face of a set of rolls the greater their capacity.

✤✤✤✤

THERE is no limit placed by the law upon the number of claims an individual may acquire by location, but the law requires that not less than $100 worth of work shall be performed, or improvements made for each claim, annually, until patent is secured. The prior location is also first in right in case of conflicting interests.

✤✤✤✤

THE loss of quicksilver in mills varies greatly with the method of treatment, the character of the ore and to no small extent upon the millman. Pan mills generally lose much more quicksilver per ton of ore treated than plate amalgamation mills. This is partly due to the flouring of "quick" by grinding in the pans and failure to re-collect the finely divided quicksilver.

✤✤✤✤

A TIMBER-FRAMING machine at a mine will save much time and labor, and consequently money. It can be operated by any motive power, as water, steam, air or electricity. It frames accurately and quickly. It finds its greatest usefulness in framing timbers for square sets. The circular saw is also useful, as it may be used to work up lumber and waste into many things necessary for use about the mine.

✤✤✤✤

GENERALLY speaking, jigs are of two types—shaking screens, where the separation is affected by the rapid up-and-down motion of the screen in water, and the pulsation jig, where the concentration of mineral results from the reciprocal motion of a plunger in water in a compartment adjoining that in which the screen is situated, the pulsations of the plunger being communicated by means of the water to the screen.

✤✤✤✤

FOR the purpose of carrying running ropes, grooved wheels are in every way superior to cylinders. The latter almost invariably cut, and also injure the rope. Where the distance between the head frame sheave and the reel of the hoisting engine is so great as to seem to require a support, erect a light and substantially braced frame and place in it a grooved wheel on a running shaft, that the wheel may follow the cable in its side motion as the rope winds from one side of the drum to the other.

✤✤✤✤

USUALLY rusty gold ores in which the metallic gold is covered with a film of iron oxide silica, calcium carbonate, or some other substance which renders the gold impossible or difficult to amalgamate, may be successfully treated by crushing in grinding mills. The arrastra is considered one of the best gold-saving devices in use, for the reason that it brightens the particles of gold, making them readily subject to the action of quicksilver. The modern grinding mills are somewhat like the simple Mexican arrastra, in that they crush by grinding instead of stamping.

✤✤✤✤

SPECIFIC GRAVITY of a mineral is the ratio of its density—a comparison of its density as compared with some standard, usually the weight of the body divided by the weight of an equal volume of pure water. It is sometimes convenient in the determination of specific gravity, and also in separating fragments of mineral of different density, to employ a liquid of high gravity or density. For this purpose the Thoulot solution is used. This consists of a solution of mercuric iodide in potassium iodide, which has a maximum density of about 3.2, which may be diluted to any desired density.

✤✤✤✤

THERE is no way by which the trend of an ore shoot may be determined without exploration. In one part of the vein the trend may be to the right and in another portion to the left, and as often the shoot may descend normal to the strike. In most mines, however, the shoots generally trend with more or less persistence in a common direction. There is no law or rule by which to be guided. The theory that, "when standing and looking in the direction of the hanging wall, the shoot will dip to the right," is without foundation. There are many instances to support this idea, but there are as many disproving it.

✤✤✤✤

WHERE assessment work is done on one of a group of claims for the benefit of all the claims of the group, it is necessary that an amount of work be done equal to $100 for each claim of the group, and if the amount of work performed falls short of the necessary amount, it is likely that the courts would decide that the work performed should apply only on the claim upon which the work had actually been performed. "Concentrates" knows of no precedent to decide this case, but the evident intent and meaning of the law is plain, and clearly the performance of $1100 worth of work to represent fifteen claims is not strict compliance with the law.

✤✤✤✤

WHEN considering the likelihood of an ore to slime, it should be remembered that the amount of slimes which an ore will produce depends more upon the character of the ore itself than upon the method adopted to crush or pulverize it. Should an ore contain talc, clay, chlorite, lime or other soft minerals, or should the sulphides or other metallic contents be soft, like galena and tellurium, the disposition to slime is much greater than in the case of brittle and harder mineral. The finer the screens used the finer the crushing, and, consequently, the greater the amount of slimes. The proportion of slimes in wet crushing is generally greater than in dry crushing through a screen of the same mesh.

✤✤✤✤

THE lixiviation process for treating silver ores consists in roasting the ores with salt to convert the silver into chloride, if it is not already in that form, and subsequently dissolving the chloride of silver with a solution of hyposulphite of soda, and precipitating the silver from the solution in the form of sulphide by means of sodium sulphide or calcium sulphide. The precipitate is collected and smelted in a crucible. The process, though seemingly simple, often involves complicated chemical reactions, difficult to understand, and the results are often unsatisfactory with no apparent cause. The refining of the precipitates is also a matter often giving much trouble. When such processes are contemplated the services of an expert chemist, one having had practical experience with the process, should be engaged. It may save much unnecessary expense and trouble.

✤✤✤✤

SILVER is the most important substance of a foreign nature occurring in lead ores, although lead ores do not always contain silver in an amount to make the silver commercially valuable. Silver has a favorable effect on smelting operations, and most other foreign substances are detrimental to the process. Of these, zinc is the most injurious and unwelcome, as it renders the ore more difficult to fuse, and promotes the formation of slags containing sulphur and more or less of the precious metals. Arsenic and antimony are very volatile, and in most cases carry away precious metal values in the fumes. In lead smelting the presence of large percentages of either iron or copper sulphides is undesirable. In addition to these substances there are various earthy minerals present in the ore, such as silica, calcium carbonate, magnesium carbonate, aluminous minerals, etc. The presence or absence of these minerals determines the fluxes that must be added. The most commonly employed are limestone, oxide iron ores and silica.

✤✤✤✤

PANDERMITE is a variety of white, earthy calcium-borate, which occurs in nodules, the result of efflorescence, usually found on the floor of dry lakes in desert regions. It is doubtful if a borate mineral containing no more than 6% boric acid could successfully compete with mines producing colemanite which contains when pure about 50% boric acid. An ore running 20% might be made to yield a profit. The companies manufacturing borax and borax minerals have large and expensive plants, and small operators on low-grade ores could scarcely hope to successfully compete with them. The calcium-borate bearing mud of Calico, San Bernardino county, Cal., is being worked, it is said, successfully. This rock does not contain the characteristic colemanite, but is an indurated mud from a Tertiary lake bed, saturated, as it were, with calcium-borate. The percentage of boric acid in that ore is not known to "Concentrates." This mineral is reduced at large works at Daggett, 6 miles from the mines, by the employment of sulphurous acid.

✤✤✤✤

WHERE an ore is crushed in two separate batteries, one having a 600 screen and the other an 800 screen, all other conditions being equal, it is unlikely there would be no difference in the tailings after amalgamation with an ordinary gold ore. The only condition likely to produce such an unusual result would probably be found due to the fact that the gold in the ore was in an extremely fine state of division, and that it was disseminated throughout the mass with remarkable regularity. Instances of this kind have been observed. It is unlikely that the gold would be what is known as free milling. In some ores the values are largely in the fines, as in the case with some Cripple Creek, Colo., ores. In such cases the ores are washed and screened as they come from the mine, the fines only being milled, the coarse dumped out as waste. In other instances, the fines represent low-grade material, and these may be screened and rejected. A series of screening tests, followed by assays of the several grades, will usually show where the values are, and the result will suggest the proper method of treatment. There is usually found a point beyond which it is unnecessary to go for economic reasons, and that is the place to stop.

✤✤✤✤

IN the issue of the 14th ult., the statement was made in "Concentrates" that at Cripple Creek, Colo., ores containing not more than $10 per ton were not profitable. This statement has produced a number of inquiries from various parts of the country where gold ore containing $10 is valuable and produces a handsome profit. Cripple Creek ores are peculiar to that district, and are not as easily treated as free-milling ores, or as cheaply as telluride ores of the Black Hills of South Dakota. The charge for transportation and treatment of Cripple Creek ores, assaying one-half ounce gold, is $5.75. The cost of mining may vary from 75 cents to $3, according to the character and size of the vein. In many mines, while the mass of ore stoped from the vein may be placed in the ore bin at the surface for from $2 to $3 per ton (counting all costs), only a comparatively small amount —the fines—may contain the values. This raises the cost of mining the valuable ore very materially. The result of extraction will not average above 92%, which represents in $10 ore a loss of 80 cents per ton. Taking the average cost of mining at $3, the loss in treatment at 80 cents, and the smelter charge and transportation at $5.75, the total cost would be $9.55, leaving a margin of 45 cents for possible profit, and this the average miner does not view with favor, as the margin for success is small, and a small change in values to a point below $10 would mean loss.

✤✤✤✤

THE Coolgardie, West Australia, water scheme was taken up and built by the Government. A bill was introduced in the Parliament in July, 1896, and it finally passed the house in September, 1896. The work was completed on January 26, 1903, and cost £2,670,000, or only £170,000 more than the original estimate, which is a close result as public enterprises generally go. The scheme was designed to pump water from the Helena river, near Mundaring, to the summit of Mount Burges, near Coolgardie, a distance of 358 miles, the capacity to be 5,000,000 gallons each twenty-four hours. Those included in the so-called "trust" purchase water at a cost of 5 shillings per 1000 gallons. The particulars of the scheme are: Quantity of water to be pumped per day of twenty-four hours; length of pipe line from storage reservoir to Mount Burgos, 358 miles; diameter of steel pipes, 30 inches; velocity of water per second, 1.54 feet. The pipe line has a cubic capacity of about 70,000,000 gallons, so that water started from the reservoir does not reach Coolgardie until the fourteenth day; maximum lift from storage reservoir to main distributing reservoir, 1290 feet; weight of water pumped daily, 20,862 tons; net effective horse power required, 3129; horse power of engines in reserve, 2475. Total horse power, 6187. There are twenty stations and sixty-five pumping engines on the line. From the Mount Burges reservoir the water flows by gravity to the mines of the district.

✤✤✤✤

WHERE zinc shavings swell up and rise above the solution in the precipitation boxes, if a two-pound weight is insufficient to hold them down, try twenty pounds. If that is insufficient, add more weight. A good way to arrange this is by making a lattice screen of wooden laths and placing it on top of the zinc shavings, and upon the lattice place a boulder or rock of sufficient size and weight to hold the zinc in place—this to be determined by experiment. The foaming of solution in zinc boxes is due to excessive alkalinity of the solution, owing to the presence of too great an amount of lime or other alkali. If lime is being used, reduce the amount until foaming ceases. The zinc shavings should be shifted daily, according to F. L. Bosqui, and during this operation the solution should be turned off and the flow through the boxes stopped until the precipitate has had time to settle before turning the solution on again. Some operators prefer the downward flow of the solution through the zinc to the upward flow, the latter being the common practice. Those favoring the former method claim that by the downward flow the result of precipitation can be more carefully watched, and that the disposition of the fine zinc to sift through and clog up the bottom screen is reduced. It is said that dipping the zinc shavings in a solution of lead acetate before placing in the boxes facilitates precipitation. Also that zinc shavings containing a small percentage of lead effect a better precipitation than those made from pure zinc. When renewing zinc at the head boxes, it is considered good practice to take zinc from the lowest box of the series and add it to the head box, as it is known that zinc upon which a small amount of gold has been precipitated will act more effectively than new shavings.

Some of the Ore Deposits of Colorado.

Written for the MINING AND SCIENTIFIC PRESS by ARTHUR LAKES.

In Colorado are some very peculiar mines and ore deposits, some that can hardly be classed under any conventional type. These anomalous mines are mostly in highly volcanic regions, in fact, some of them occupy the vents or throats of ancient volcanoes. A district remarkable for its peculiar mines is that around Rosita and Silver Cliff, 30 miles south of Cripple Creek. It is a region of intense vulcanity of no very ancient date. The rocks covering the granite have all been poured or ejected from volcanic vents in the vicinity. Some of these eruptions were highly explosive, as indicated by the quantities of volcanic ash and fragments of rocks blowu from vents and now consolidated into stratified tuffs and breccias. Alternating with these explosive manifestations were quieter eruptions in which molten lavas welled up in the throats of volcauoes, or in fissures, and poured in lava flows over the country. Besides tbe different modes of eruption there were many different kinds of volcanic rocks erupted; among them rhyolites, trachytes and several varieties of andesite.

Three or four miles north of the Bassick mine, Custer Co., is a peculiar mine called the Bull Domingo. It also has its ore deposits in an oval well; the ore occurs in this in thin coatings of silver-bearing galena, enveloping and encrusting granite boulders. The dump on which these granite boulders and shells have been thrown reminds one of a battle field, with massive round shot of grauite lying here and there and pieces of broken bombshells of glittering galena instead of iron. One of the main differences between the ore occurrences of the Bull Domingo and the Bassick is that the boulders are all of country rock, granite or syenite, while those of the Bassick are of volcanic lavas, such as andesite. "The Bull Domingo ore channel," says Emmons, "was not so much that formed by a crater of explosion by the complicated intersection of a number of fracture planes producing a zone of country rock, in which the included fragments were rounded by attrition, but more by the action of percolating solutions. At the same time explosive eruptions of igneous rock were taking place in the adjoining regions, and, by force of such explosions, heated gases or waters may have been injected through the fissures of the surrounding country rocks, and passing through this broken zone rendered more complete—partly by attrition and partly by solvent action — the rounding of the rock fragments in this zone and may have ejected some of them from near, the then, existing surface." A narrow dike of red syenite cuts the granite close to the ore deposits. West of the Bull Domingo is Silver Cliff. This area is underlaid by beds of stratified tuff containing large round, bomb-like masses of pitchstone.

The Cliff, which gave rise to the name of the locality and was the first discovery, is a low, rusty bench of volcanic rhyolite breccia, seamed and stained; and in the seams, when first discovered, were quantities of horn silver. The deposit was worked by a large open quarry. Adjoining the Cliff is the Geyser mine. This mine has gone down over 2000 feet on a very uarrow, but rich vein, carrying galena, zincblende, copper pyrite, argentite, gray copper, ruby silver and polybasite. The shaft was driven down through the stratified tuff, in which it encountered fossil impressions of leaves and fragments of wood, showing that the comminuted material was hurled into the air from some neighboring explosive vent and fell into a lake on the site of Silver Cliff and was stratified by its waters.

Cripple Creek's mines, also situated in a highly volcanic area, are somewhat similar. The ore deposits may be grouped into ordinary fissure veins, ore deposits in shear zones and fractured zones, fissure veins following the lines of volcanic dikes, or at contact between dikes and breccia, or decomposed honey-combed granite, or dikes so impregnated with ore as to constitute veins. Seeing that these veins and ore deposits are located within the seat of a wide volcanic crater, we might naturally look about for peculiar volcanic manifestations such as fumaroles and the like. One of the most remarkable of these is at the Annie Lee mine. The ore deposit here is a body of cylindrical form, 12 to 15 feet diameter, dipping steeply and almost vertically from the surface to the bottom of the mine. The ore body occurs in the course of a dike 2 to 4 feet thick, which at the surface appears cutting right across the middle of the deposit. The deposit on either side of the dike consists of a friable puddingstone composed of small pebbles or pellets of phonolite and breccia surrounded on the edges by kaolin, which together with telluride ore constitutes the cement. The rock may run as much as 300 ouuces in gold, although no ore is visible to the naked eye. The ore body represents the neck of a hot spring or fumarole, such as abounded in the district after the subsidence of volcanic activity. Ascending hot water kaolinized the feldspathic constituents of the rock and deposited the other metallic minerals.

The difficulty of developing this oval, well-like ore body resulted in a fatal accident. The shaft, timbered by square sets, descended into the deposit through the center. The ore beiug very rich was robbed from around the shaft, leaviug it partially unsupported. A big rock fell in from the side and crushed the shaft like jack-straws, killing eleven men who were ascending in the cage.

At Leadville there is nothing very peculiar unless it be the fact that the horizon known as the "lead-silver belt" changed to a gold belt at the southern end of the camp, the change being probably due to a preponderance of siliceous and pyritic porphyry at that end. Another region of queer mines is that of the Sau Juan, composed of enormous accumulations of andesitic breccia and other volcanic rocks. Most of the veins are fissures.

The mining town of Ouray is situated in a deep, pit-like depression, in the San Juan plateau, surrounded by steep cliffs of sedimentary rock capped by an enormous thickness of volcanic breccia. Hot springs abound, and the upper part of the town is located on the Travertine deposits of ancient extinct

hot springs. The cliffs are riveu by dikes. The succession of strata from below up is, first, Carbouiferous limestone, then a great thickness of massive red Triassic sandstone, followed above by thinner beds of Jurassic shales, marls, limestones and sandstones, capped by a thick bed of quartzite belonging to the Dakota Cretaceous. It is this quartzite bed that contains the peculiar deposits of the American Nettie. Above the quartzite are beds of Cretaceous shale traversed by a sheet of porphyrite, and the top of the hill is capped by andesitic breccia worn by erosion into fantastic spires and pinnacles. Dikes of porphyrite and breccia cut all the formations from the base to the volcanic cap.

The ore deposits of the American Nettie were discovered in a zone of holes and caverns occupied principally by mountain rat's nests, so that it was said that at first they shipped mountain rat's nests and gravel rich in free gold. The cavities occur in the vertical jointing planes and at their crossiug of the bedding plaues of the quartzite. An adit tunnel enters the zone of cavities and follows down the gentle inward dip of the strata into the mouutain. There are upwards of 5 miles of intricate workings ramifying through these quartzite beds into the heart of the mountain.

On either side of the tunnel we observe cavities and vugh, or "bug" holes, as the miners call them, from a few inches in diameter to others large enough for a man to crawl into. The cavities are usually elliptical in shape. Some are smooth inside as if water worn, others are lined with quartz crystals or with a coating of gouge. Sometimes part of the cavity is filled with oxidized ore, in part with sulphides, and part with quartz crystals. Some cavities are completely lined with quartz crystals alone and are destitute of ore. In some the ore is brown oxide, in others solid sulphide. In most the ore is loose and friable and is carefully scooped out with a long scraper, the walls brushed clean and a light inserted to see if all the ore is taken out. Sometimes the ore occurs as veins along cracks. Narrow dikes of volcanic breccia at times make ore at contact with the quartzite, though themselves barren.

Above the quartzite lies the black impervious shale forming the roof. Ore rarely occurs at the contact except when there is a bulge or roll of the shale in the roof. When the quartzite is locally less metamorphosed or in the condition of an unaltered sandstone, ore is scarce, but increases when the rock becomes more quartzitic. Ore also is found at contact with a large porphyrite dike which cuts the quartzite.

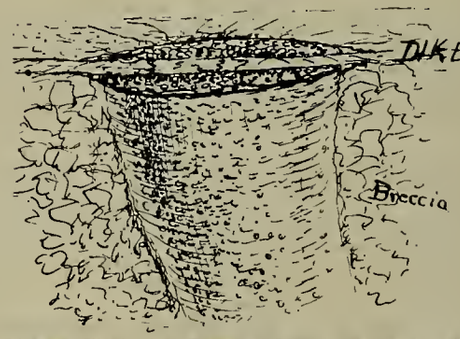

Diagram Illustrating Fumerole Deposit, Annie Lee Mine, Cripple Creek, Colo.

American Nettie Mine.

The ore zone, or gold belt, as it is locally called, is traceable for several miles, and numerous mines are located along it. Sometimes there is a mineralized seam connecting the cavities, again there may be no visible connection at all. Zones of crushed rock occur, due to local faulting, barren of ore.

The Nettie mine is remarkable for the great variety of ores found in it. There are copper pyrites, peacock copper, iron pyrites, silver-bearing galena, zincblende, gray copper, native copper and carbonate of copper. Tellurides also occur, together with bismuth. Green and blue sulphate of iron, or copperas, is common, resulting from secondary alteration of iron pyrites.

The ore may ruu from 2 ounces to 105 ounces gold. Pockets of moderate size have yielded $30,000 to $40,000. Part of the ore is concentrating, part smelting and part free milling.

The remote origiu of the ore deposits seems to be connected with the dikes and intrusions of eruptive rock. Heated waters or vapors ascending with the eruptiou of the dikes circulated among the joints and interstices of the sandstone, metamorphosing the rock into quartzite and eating out soft places, filled the cavity so formed with sulphide ores, which sub-

sequently became oxidized and broke up into friable matter, containing more or less free gold.

The cavities appear to have been first hollowed out and then filled with ore and vein matter, as there is often a lining of quartz crystals, and when the ore is removed the cavity shows a round, smooth face, with no gradual fading of the ore into the country rock, as there would have been had the ore been deposited by metasomatic replacement.

Crystallization of Copper Sulphate at the United States Mint.*

Written by HAROLD FRENCH.

In the United States Mint at San Francisco, Cal., the refining of gold bullion is almost exclusively confined to the sulphuric acid process. The crude gold, having been melted with 2½ parts by weight of fine silver, is poured into the form of thin, rectangular slabs, averaging in thickness ¼ of an inch. These slabs, which are commonly called "granulations," are then conveyed to the refining department, where two cast iron kettles are each charged with 600 pounds of the alloy.

PROCESS OF REFINING THE "GRANULATED" METAL.—Into each kettle the contents of a drum of concentrated sulphuric acid (66° B.) is siphoned and beneath each a coal fire is maintained for nearly twenty-four hours. At the expiration of this time, the silver is nearly all dissolved and the almost saturated solution of silver sulphate is siphoned from the kettles into a silver precipitation tank. The refined gold is then transferred to four smaller finishing kettles, where final boiling with concentrated H_2SO_4 reduces the gold to the fineness requisite for coining purposes. The silver sulphate solutions drawn down from each kettle contain nearly 900 pounds of the metal, which is reduced to fine silver by copper in the form of slabs placed along the sides and bottom of the tank. The precipitation of the silver is facilitated by diluting the solution down to 21° B, and keeping it at the boiling temperature by means of live steam forced through an open jet.

TREATMENT OF THE COPPER SULPHATE SOLUTIONS.—After about twenty-four hours the silver is entirely reduced, and, no trace of silver being detected upon the solution with salt brine, the copper sulphate solution is then siphoned down into the yard, situated in the interior of the mint. There it is received in one of two lead-lined boiling tanks, in which are coils of steam pipe which effect the necessary evaporation. The copper sulphate solution, as received, averages 26° B, and, according to the average of certain assays, is of the following composition:

	Pounds.	Per Cent.
Copper	300	3.16
H_2SO_4	3000	31.58
Water	6200	65.26
Totals	9500	100.00

The above proportions vary slightly with inconsequential percentages or traces of the sulphates of base metals derived from the boiling of the "granulations." The principal impurity is in the form of ferrous sulphate, the amount of iron dissolved in each tank averaging 3 pounds, or .000316 of the entire volume.

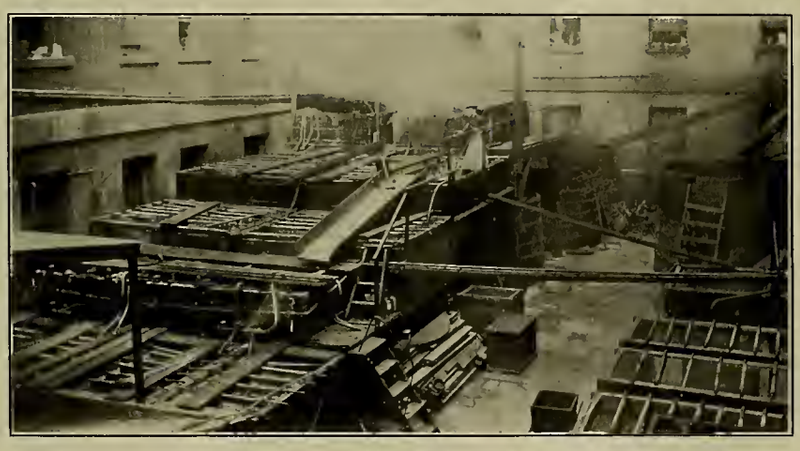
Each tank is boiled from six to seven hours when the solution is concentrated to 33° gravity—about 2700 pounds of coal being required to effect this much evaporation. The solution is then allowed to remain on the hot coils over night, when it is found to have gained from 5° to 6° in density, thereby saving fuel. It is then warmed, allowed to settle for an hour to eliminate any particles of metallic silver which may have been mechanically carried down by the siphon. At a specific gravity of from 38° to 40°, it is drawn down into one of the eight lead-lined crystallization tanks.

This density insures an abundant crop of crude crystals of "bluestone," but is not sufficiently concentrated to allow the formation of crystal sulphates to any noticeable extent. The boiling tanks are covered with a sloping roof, from 2 to 6 feet above the solutions, which prevents their dilution by the accumulation of rain water, while its height is sufficient to prevent condensation. The solutions are allowed to remain in the crystallization tanks from six to ten days, according to the speed with which refining operations are being conducted.

Five points are essential to good results in crystallization; namely, (1) the solution must be concentrated to nearly 40° gravity; (2) the density must remain constant during the first few days, crystallization being retarded by the addition of water or of fresh solution in any appreciable quantity, and the solution must be undisturbed; (3) the tanks must be clean, since dirt checks the molecular attraction through which the crystals form; (4) over 225 square feet of lead surface must gather the crystals which form on the sides, bottom and on the aprons of lead suspended from bars placed across the tank; (5) sufficient time must be given for the production of bluestone, all other factors being observed; this varies directly with the time allowed for crystallization.

Upon discharging the tanks the supernatant liquor is siphoned below into tanks where the remaining 60 or 70 pounds of copper still in solution are recovered by precipitation with scrap iron. The remaining crystals of crude copper sulphate, averaging 1000 pounds to a tank, are chopped from the surfaces to which they cling, with a tenacity increasing with their age. These crystals are shoveled into a dissolving tank where they are dissolved in hot water until a density of from 30° to 32° is reached. At this point the solution is drawn into one of seven final crystallization tanks, each having a capacity of 115 cubic feet. At this density only the pure sulphate of copper forms, all impurities from the crude crystals remaining in solution. In the second crystallization the solution stands from eight to ten days, and then the mother liquid is pumped back into the dissolving tank by means of a steam injector, and is used again to dissolve the crude crystals.

The pure "bluestone" is shoveled upon a drain board, where the crystals are washed carefully and the drainings, containing from 20 to 25 pounds of copper in solution, are saved in small tanks where the copper is precipitated with iron filings.



Copper Sulphate Plant, United States Mint, San Francisco, Cal.

The crystals are finally spread out in a drying house on a floor of sheet lead, under which steam pipes maintain a heat sufficient to dry the crystals thoroughly, care being taken to avoid the formation of the white, anhydrous copper sulphate by overheating. The bluestone is then barreled and sold to the wholesale dealers, this article being used by orchardists, wheat growers, electrical concerns, etc.

RECOVERY OF METALLIC COPPER.—The mother liquid solutions which are drawn into the cement-copper tanks beneath the series of crystallization vats contain from 60 to 70 pounds of copper. This metallic content is recovered by precipitating with scrap sheet iron and tin. Galvanized sheet iron is a splendid precipitant. The decomposition of the iron is hastened by warming the solution by means of a perforated steam pipe, the copper being thrown down in a spongy state comparatively free from iron. This copper is digested with warm acid solutions which free it of most of the remaining iron—leaving but a small percentage which can be readily slagged off by the melters. The copper is "sweetened" and dried previously to melting. By the use of a hammock-like sieve of copper wire, the scrap iron may be suspended in the solution, the fine copper falling through the meshes to the bottom of the tank, and, upon cleaning out the precipitation tank, the remaining pieces of iron are readily lifted out in one compact bundle.

The accompanying engraving illustrates the copper sulphate plant at the mint in San Francisco, Cal.

The Copper Deposits of the Kaibab Plateau, Arizona.*

Written by E. P. JENNINGS.

These copper deposits occur on the top of the Kaibab plateau in Coconino county, Arizona, and extend from the northern edge of the Grand Canyon of the Colorado river to near the Utah State line. The best developed deposits are near Jacobs lake, 30 miles south of the Utah line, where they are 16 feet thick, of unknown width, and are more or less continuous for 5 miles.†

From Jacobs lake to the edge of the Grand Canyon, a distance of 40 miles, outcrops of ore have been found, but no explorations have been made except those of wandering cowboys and hunters.

The Kaibab plateau, the highest of the Colorado river plateaus, is a great uplift, about 90 miles long from north to south, and from 10 to 20 miles wide from east to west. Its southern face is the Grand Canyon; its western boundary, a N.-S. fault plane, which separates it from the Kanab plateau, lying 1500 feet below. Its eastern edge is a monocline which brings the horizontal beds of the high plateau to the level of the plateau country of eastern Utah.

The elevation of the plateau near the Colorado river is over 8000 feet, and about 6000 feet at the Utah line. Its structure, as shown by the western fault, consists of about 500 feet of Aubrey limestones underlaid by 1000 feet of red sandstones. The limestone is the upper member of the Carboniferous, and is overlaid by the marls and shales of the Permian, 25 miles to the north on the Kanab plateau. At the town of Kanab, near the Utah line, the Permian strata pass under the magnificent red sandstone cliffs of the Triassic, that rise to heights of 1000 feet above the desert. The Grand Canyon exposes a section a mile deep at the southern end of the plateau, showing all the formations from the Archæan to the top of the Carboniferous.

The mountain mass, cut by two sections, the canyon and the western fault, shows no mineral veins or mineralization, above the Pre-Cambrian, near the bottom of the canyon. These ancient metamorphic strata contain a few copper-bearing dikes, with the usual contact impregnation of copper ore and copper-stained rock. All the Paleozoic strata are barren, both in the canyon and along the western fault, until the copper beds are reached at the top of the plateau.

I have described the formation of the plateau, for the purpose of showing that the possibilities of any connection between the copper veins and dikes of the Pre-Cambrian, and the horizontal copper beds of the Carboniferous limestones are, to say the least, very remote.

The ore beds are white chert, impregnated with malachite and azurite; small amounts of earthly cuprite, copper glance and chalcopyrite have been observed. Silver and gold are present in very minute quantities. The ores range from 2% to 40% in copper, and average 7%. They are too siliceous for smelting, but are good leaching ores.

Some leaching experiments have been made in a small way, but no copper has been produced commercially. The ore is covered by a few inches of soil and often outcrops. The upper portion of some of the beds have been leached, leaving a mass of honeycombed iron-stained rock. The beds are intersected by many small faults; the ore near these faults has been crushed and recemented by silica and copper, showing that the period of deposition was long. The quantity of ore cannot be accurately estimated from the small amount of development work done, but it is believed that 1,000,000 tons of 7% ore can be put in sight at the Jacobs lake beds alone.

I am not aware that any theory has been advanced to explain the occurrence of these ores. Evidently, they are replacements of the limestone by silica and copper. The ore-bearing solution was a descending carbonated alkaline water, which dissolved both silica and copper from the Permian and Mesozoic measures, that, in former time, covered the Carboniferous. This theory is rendered more probable from the fact that the Triassic sandstones to the north and east are copper bearing, and sufficiently so to be mined at a profit. There are no known eruptives that could furnish the copper, except the dikes of the Pre-Cambrian, a mile below the present copper horizon. I consider it a case of solution from a great mass of superimposed rock, and the precipitation by chemical means at one horizon, the Aubrey limestone being the precipitant.

The deposits can be considered as horizontal bedded veins, from which the hanging wall or roof, and also much of the ore, has been removed by erosion. The beds are similar in physical characteristics to the iron deposits of the Mesabi; the taconite or iron chert of the latter corresponding to the copper chert of the Kaibab. The chemistry of the formation of the two may be alike, but the Kaibab ores lack the subsequent enrichment the iron ores have received.

*Abstract Trans. Am. Inst. Min. Engs.

†Similar deposits occur on the south side of the Grand Canyon, presumably due to similar causes, and in all probability are older than the canyon, which has simply cut a drainage way through the strata, separating the two districts.—ED.

Acid Making From Pyrrhotite.*

NUMBER II—CONCLUDED.

By E. A. SJOSTEDT.

This roaster is shown in Figs. 1 and 2. Fig. 1 presents a battery of four furnaces in horizontal cross section on broken lines, 1——1, 1′——1′ and 2——2 on Fig. 2 showing the combustion chambers a^5, the lower and upper heatiug chambers a^4 and a^1, and the lower or discharging hearth A 5. Fig. 2 shows a sectional elevation of the battery on lines 3——3, on Fig. 1, through the ceutral columns of the furnaces, one side shown with the rabbles and one without. A1—A5 are five straight arched hearths, and a^1, a^4 and a^5 the combustion and heating chambers. The flow of the fuel gas and combustibles is indicated by arrows. The gas or oil, entering from main F3, through branch F3 and a suitable burner into the combustion chamber at F and F1, strikes the hot baffle walls and is readily ignited, passes through the chamber and reaches the flue D, which leads to the heating chamber a4 over the lower roasting hearth. This chamber also being provided with a baffle wall E, which extends to and surrounds center shaft 1, separating the gas inlet from its outlet; the combustibles are compelled to make a full turn here before passing out and up through the upper section of chimney flue D to heating chamber a1. Here it makes a similar circuit before finally passing out through the last section of D and flue D1, to stack K, which is in common to the whole battery of four

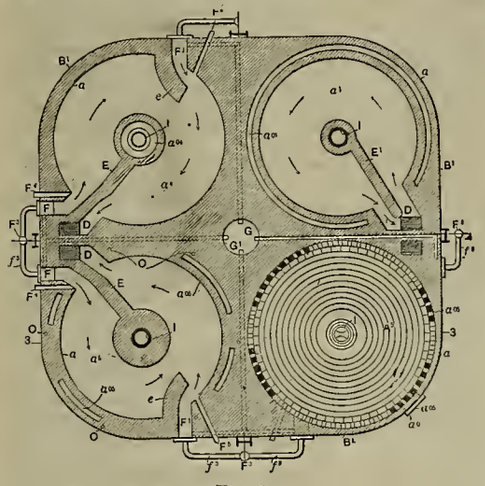

FIG. 1.

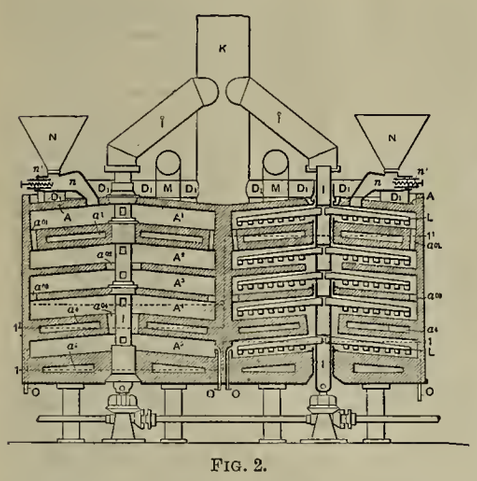

FIG. 2.

roasters. F4 and F5 are peep holes, for inspecting the heat and the combustion iu the heating chambers. G is an air receiver ("hot blast") in the center of the battery into which the air of combustiou is introduced under pressure and heated from the brick walls with which it is surrounded, and thence carried through blast pipes B2 to burner at F. The ore finely crushed is introduced through au opening in the top of roof A of the upper roasting chamber to the hearth A1, by feed tube n, provided with an automatic screw charging device n1. Owing to the bottom heat furnished by the heating chamber aL, the ore is soon dried and is moved towards the circumference by the teeth of arms L, fastened to the revolving center shaft I, and finally drops down on hearth A2 through rim discharges a o 1. The arms of this hearth, having their teeth placed in opposite directions to those in hearth a1, now cause the ore to move towards the center, and discharges it through center openings ao2 on hearth a3, and the ore is thereupon moved toward the circumference, drops through ao3, on the shelf a4, and is then moved towards the center and discharged on shelf a5, and finally through ao5 and spout ao6 in the ore conveyor. O are pipes admitting and controlling the air supply for the roasting of the ore, and M is a cast-iron pipe leading from the top of arch A of each roaster and through which the sulphurous gases pass out from the roaster to the main gas flue.

Four of these batteries of kilns—16 units—have been built with a total capacity of treating forty tons of ore per day; also a crushing plant has been installed, consisting of one 24x15-inch jaw crusher, two 36-inch rolls and two revolving screens of No. 16 mesh with a capacity of pulverizing about eighty tons of ore per shift of ten hours; also two water-gas generators, each having a capacity of producing 20,000 cubic feet of water gas per hour, or with a total capacity of about 800,000 cubic feet per day; also an electric installation of three 95 H. P. motors for supplying the required power.

THE ROASTING GAS.—At first water gas was used as an axiliary fuel, but by gradually improving the details of the roasters and gaining in experience we finally succeeded in doing without it, and since then have roasted our pyrrhotite without any extraneous fuel (even at times when the sulphur in the ore averaged but 20% to 25%, producing a gas of sufficient strength 6.10% SO_2), for making bisulphite liquor and liquid SO_2; also a fairly well roasted ore, running as low as 20% to 75% S when admitting a liberal amount of air and obtaining a weak gas, but generally from 1% to 3% S when producing a good gas.

A glance at the chemical reactions taking place in burning sulphur and in roasting iron sulphides will assist in forming an intelligent idea of the maximum strength of gas obtainable, as well as of the efficiency and significance of a 10% SO_2 gas from pyrrhotite.

When burning sulphur: $S + 2O = SO_2$, i. e., all the O combines with the S to form SO_2. When burning pyrite: $2FeS_2 + 11O = Fe_2O_3 + 4SO_2$, i. e., 8 parts of O out of 11 unite with S to form SO_2. When burning pyrrhotite: $Fe_6S_7 + 23O = 3Fe_2O_3 + 7SO_2$; i. e., 14 parts of O out of 23 unite with S to form SO_2. When burning pyrrhotite: $2FeS + 7O = Fe_2O_3 + 2SO_2$; i. e., 4 parts of O out of 7 unite with S to form SO_2. The roasting being accomplished by means of air instead of undiluted oxygen (containing 21% O, by volume), we readily find that the highest theoretical percentages of SO_2 obtainable are the following: When burning sulphur, S: $21 \times 2 \div 2 = 21\%$ SO_2 max. When burning pyrite, FeS_2: $21 \times 8 \div 11 = 15.27\%$ SO_2 max; when burning pyrrhotite, Fe_6S_7: $21 \times 14 \div 23 = 12.78\%$ SO_2 max; when burning pyrrhotite, FeS: $21 \times 4 \div 7 = 12\%$ SO_2 max.

The annexed tables from our daily records of two weeks run in February last, during which time we used pyrrhotite only (and that of an inferior grade), will furnish exact data of results obtained under such circumstances.

Composition of ore used, average sample taken from each 40-ton lot:

	a	b	c	d	e	Average.
Insol.	24.74	29.20	24.95	21.63	16.10	22.50
Sulphur	26.30	23.81	24.67	27.60	29.90	24.46

Roasting results (average of tests made each hour):

February.	11-12	13-14	15-16	17-18	19-20	21-22	23-24
Strength of gas, % SO_2	8.60	8.30	7.90	7.90	7.40	7.60	7.70
Roasted fines, % S.	1.66	1.86	2.04	2.54	1.78	0.95	1.86

During these two weeks we treated 210 tons of pyrrhotite, containing 111,112 pounds of sulphur, and recovered 191,917 pounds SO_2, thus obtaining an efficiency of 86%. The average working cost, exclusive of heating and lighting the building, amounted to $1.86 per ton of ore treated, distributed as follows:

Labor	$1 12	Crushing	50
Power	24	Roasting	75
Repairs and sundries	50	Sup. repairs and sundries	61
	$1 86		$1 86

If to this amount we add depreciation of plant (say, 14 cents per ton), the cost of the raw ore (say, $5 per ton) and the cost of briquetting the fines (say, 75 cents per ton), and then subtract the value of the briquetted ferro-nickel ore—which we will assume to be equal to that of the unroasted ore, or $5 per ton—we obtain a total of $2.75 as the cost of 914 pounds SO_2, equal to a rate of $6 per ton of SO_2 gas recovered, corresponding to $12 per net ton, or $13.44 per gross ton, sulphur.

It may be well to state here that at first no other raw material than pyrrhotite was used for the acid making; but some valuable deposits of pyrite having been discovered in close proximity to the company's iron mine, it was decided to use some of it at times when treating a low-grade pyrrhotite, or when an extra supply of gas would be required. During the last half year's run a few hundred tons of brimstone were also used, on account of shortage of both pyrrhotite and pyrites from the mines, caused by the company's financial condition at that time. Altogether 10,000 tons of pyrrhotite and 3000 tons of pyrite have been roasted in these kilns and 375 tons of brimstone used as raw material at our acid plant up to the present time.

*Abstract Trans. Can. Min. Inst.

Mica and Its Applications.

Mica is a substance that is now so very common, that to conjecture as to what would have been the influence on electrical industry had the substance not been a commercial article would be difficult; indeed, as regards electrical progress, mica has always beeu, as it were, ready at hand to aid any discovery or improvement, says a writer in the Electrical Engineer of London. On the discovery of the principles of the self-excited dynamo, which marked the advent of both a scientific and commercial evolution, it seems a most fortunate coincidence that such a material should have been to hand, and one that so successfully filled in, so to speak, the interstices of modern progress. Just before this time some practical use to which mica could be applied was being diligently sought after; now, however, what is required are new sources of supply to cope with the multifarious demands for the material. The substance has become now as essential to every branch of electrical engineering as electricity itself seems to be to human progress.

From a geological point, mica, slate and gneiss are the oldest stratified rocks that we are acquainted with. That it was known in past ages is evident from the many marks of ancient operations to be found in mines, and in so many places, for the material was employed for windows, mirrors and ornaments in the early days. In some form or other mica exists all over the earth; it may be found in granite and associated with quartz, tourmaline, feldspar, lepidolite, and many other minerals. It varies in color from white through green, yellowish and brownish shades to black, and its color is greatly influenced by the mineralogical peculiarities of the rock in which it occurs or has been associated, and its commercial value varies also with these circumstances.

One of the most important properties of mica, and one on which its value depends, is the remarkable property of lamination, its structure being so perfect that it is possible to divide it by cleavage into leaves $\frac{1}{250000}$ part of an inch. In consequence of its powerful insulating property, and also the very great advance made in electrical industries, the demand for mica at the present day in almost every country is so great that the supply is almost inadequate. It is not only the superior insulating property of the mineral that gives it such an advantage, but its characteristic and peculiar structure which makes it so adaptable as an insulator requiring very little machining or shaping; for instance, it is a substance which could not be well replaced as an insulator of commutator segments, for it is not only the best, but au efficient insulator under every condition. In the case of the commutator its hardness makes it invaluable, for it wears away under the friction of the brushes nearly at the same rate as the hard drawn copper of the commutator itself.

Further, the fact that heat has no injurious effect on either its physical structure or insulating property makes it almost indispensable in armature construction, safety appliances, and a multitude of industrial applications, such as lamp chimneys, smoke radiators or preventers, and all purposes where transparency, infusibility and toughness are required. As is the case with the incandescent burner chimneys, it is also taking the place of glass in many respects, especially on board ship, where its combined transparency and tenacity enable it to withstand the wear and tear and the concussion of heavy firing. The qualities of elasticity and toughness are properties in which it is not excelled by anything natural or artificial. These properties are taken advautage of in its employment as an absorbent of nitro-glycerine, and when so used explosions by percussion are rendered less liable, while at the same time nothing is taken from the nitro-glycerine; and for such purposes the pulmose mica is used, or that kind in which the scales are arranged in a feathery form.

The unalterable nature of the substance and its resistance to the corrosive action of acids, smoke and dust, make it also invaluable as a decorative material. The French silver mouldings are made with ground mica, which is accomplished by passing the prismatic or foliated material through a mill, which process increases the bulk forming a mass of translucent and beautiful bean-like scales. Mica is also being used extensively as a lubricant, and for such purposes it has no superior, except plumbago; it is likewise employed for boiler covering, as roofing material, and as fireproofing for safes, etc. As a reflector of light it has many applications, for it can be readily stamped into any desired shape. At the present time such reflectors are on the market in very many varieties, being admirably adapted to electric incandescent lamps.

Probably the most interesting and beautiful properties of mica are its optical, which, in connection with polarization of light, are both edifying and instructive. Mica under such conditions is what is called a biaxial crystal, which cleaves perpendicular to the bisector of the angle between the optic axis. Its properties in this respect are used for instructive demonstrations of the property of thin films.

There are so many ways of utilizing scrap and cut-

tings of this material in the manufacture of other insulating substances, such as micanite, etc., that it is almost impossible to find any real mica that may be pronounced useless.

The Park City Mining District, Utah.*

Written by J. M. Boutwell.

In August, 1902, the detailed study of the economic geology of the Park City, Utah, district was undertaken by J. D. Irving and the writer.

Sedimentary Rocks.—The sedimentary rocks of the Park City district include quartzites, sandstones, shales, and limestones. They constitute, according to their lithologic character and paleontologic contents, five distinct geologic formations. These are, from older to younger, (1) a massive quartzite, approximately 1500 to 2000 feet in thickness; (2) a calcareous series made up of normal limestones, considerable sandstone, and some shale, varying several hundred feet in thickness, from 600 feet upward; (3) a red shale with intercalated thin, argillaceous limestone and varicolored shales, ranging in thickness from 1000 to several hundred feet less; (4) a calcareous sandstone, normal sandstone, and varicolored shales, approximately 1200 feet in thickness, and (5) red shale with intercalated thin, fossiliferous limestones and calcareous sandstones, capped by coarse, conglomeritic, quartzitic sandstone, approximately 1000 feet in thickness. This group of five formations lies above a series of intercalated limestones, quartzites, and massive fossiliferous limestones of lower Carboniferous age several thousand feet in thickness and it lies below an immense thickness of red shale of Mesozoic (probably Triassic) age. Accordingly the geologic formations which outcrop within the Park City district are intermediate in age between lower Carboniferous and Triassic.

The geologic ages of individual formations in this Park City group are determined by means of distinctive faunas which characterize each of the two limestone formations. Thus the lower of these limestone formations, lying upon the massive quartzite and beneath the lower red shale, contain several members which carry faunas indicative of the upper Carboniferous. The underlying quartzite formation (known locally for many years as the "Outario quartzite," after the Outario silver mine in this formation) has thus far proved unfossiliferous. Its age may be closely limited, however, as it underlies the upper Carboniferous limestone, and carries intercalated in its basal portion fossiliferous limestones of lower Carboniferous (Mississippian) age. The upper of the two limestone formations bears a limited but distinctive fauna, which is unlike any described typical fauna. For the present it seems advisable to follow the usage instituted by the King survey, and to denominate these beds Permo-Carboniferous."

The lower red shale lying beneath this limestone formation and on the upper Carboniferous limestone has thus far yielded no remains of life and might be assigned to the age of either of the inclosing limestone formations. Inasmuch as its lithologic aspects are more characteristic of the overlying formations, however, it may reasonably be considered, for the present, to be "Permo-Carboniferous." The upper of these two red shale formations, although showing a dearth of organic life, presents a normal paleontologic and lithologic transition from the underlying "Permo-Carboniferous" (Paleozoic) limestone into the overlying Triassic (Mesozoic) sediments.

Igneous Rocks.—Although the field work of the last season has disclosed significant information regarding the igneous rocks of this area, it has failed to yield conclusive evidence on the relations between the three recognized types previously described as a fine-grained dioritic type, a coarser porphyritic type, and a poorly defined, variable, andesitic type. Facts observed both underground and on the surface tend to suggest, however, that these are three closely related facies. In case further study should show that they were derived from the same magma and were contemporaneous or approximately so, it is not improbable that the fine-grained, granular facies (dioritic type) may represent the present mass which, on breaking into the overlying sediments as restricted dikes, cooled in the porphyritic facies (porphyritic andesite), or breaking upward to the surface flowed out, blanketing the topography, and cooled as andesitic breccia (hornblende andesite). Final judgment in this case must be suspended until these rocks have been thoroughly studied microscopically and chemically. It now seems clear, however, that at least one, and probably two periods of intrusion preceded the above igneous activity. That an intimate relationship exists between these intrusions and the ore bodies which have been studied thus far seems indisputable. The determination of the nature of this relationship, however, is most difficult. Accordingly these problems assume immense practical significance, and their solution may reasonably be expected to throw light on the problems of the date, origin, and occurrence of the ore deposits.

Metamorphic Rocks.—The entire sedimentary section, embracing all of the clastic formations represented in this area, has been traversed by an extensive mass of the dioritic rock and penetrated by dikes of andesitic porphyry. Adjacent to the main intrusive body, and to some of the minor intrusions, the sediments have been intensely metamorphosed. Numerous contact-metamorphic minerals, such as garnet, epidote, magnetite, specularite, serpentine, spinel, secondary mica, and others have been developed, and the lithologic character of the sediments has been thoroughly changed. The determination of the precise nature of the metamorphism by tracing strata continuously from their unaltered phases through transitions into their altered representatives is attended with much uncertainty, owing to the obliteration of fossil remains by metamorphism and to the presence of complex and extensive faulting in the transition zone between the altered and unaltered sediments. The equivalency of certain marbles, quartzites, and argillites to certain limestones, sandstones, and shales has been recognized. Furthermore, metamorphosed sediments have been noted in localities which, though relatively remote from visible intrusive masses, are in the neighborhood of strong dynamic movement.

Geologic Structure. — The sedimentary formations of this region dip in general toward the northwest about 30° to 40°, and are traversed by many fissures, faults and intrusions. Normally the oldest formation therefore outcrops in the southeastern portion of the area, while younger formations outcrop successively toward the northwest. This general structure, however, suffers several important and many minor modifications through folding and faulting. In the vicinity of Park City proper, the general northwesterly dip of the formations gradually changes to a northerly and northeasterly dip, until, in the northeastern portion of the district, the dip is toward the east. In short, the general northwesterly dip gives way locally to a broad arch along a NNE. axis, which pitches northerly. The economic significance of this fact is that the two limestone formations, which in certain portions of this camp include valuable ore bodies, are thus preserved for some distance from burial beneath igneous intrusives to the north, and are brought into accessible positions immediately north and northeast of the city. This arch appears to have been faulted along a general NNE. zone of fracture at the east side of Deer Valley Meadow, with the net result that the eastern side has moved relatively a considerable distance to the south. To the south and within this general zone of deformation several hundred feet of sediments have been overriden and buried by strong overthrust faulting. McHenry canyon, the scene of some of the earliest mining of this region, follows for a considerable portion of its extent a great fault along which the displacement was not less than 2 miles.

The principal mineralized fissure zone, passing in a northeast-southwest direction through the center of the district, has been the seat of much faulting. On one of the fissures in this zone the northern side has dropped several hundred feet, and on another the south side has dropped considerably.

Pronounced faulting of direct importance to mining has occurred in the western portion of the district. In Empire canyon a fault truncates the "Permo-Carboniferous" limestones and throws their northern continuation westward for approximately a mile. A few hundred feet to the north of this fault in Empire canyon a northwest-southeast fault displaces the contact between the upper Carboniferous limestones and the Ontario quartzite, so that the north side is offset westward for several hundred feet.

Evidence, mainly of paleontological character, tends to show that the strata which form the ridges inclosing Thaynes canyon and White Pine canyon all belong to the "Permo-Carboniferous," and these ridges are duplications due to faulting along northeast-southwest planes. Other significant instances similar to those above described have been worked out, and many cases of folding and faulting have been observed.

In general there was fissuring in a northeast-southwest direction before the deposition of ore, and in northeast-southwest and northwest-southeast directions subsequent to both igneous intrusion and ore deposition.

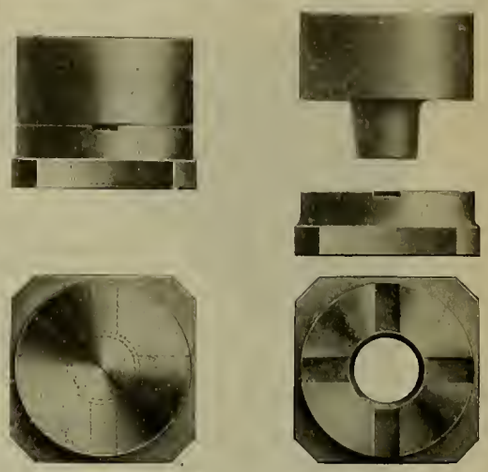
Glacial Features.—Evidences of local glaciation abound in the upper portions of the canyons which head on the higher divides and peaks. Although the exact succession of events during the period of ice invasion in this region cannot be stated here, the occurrence of typical features may be cited. These include characteristically polished and striated bedrock surfaces, rounded profiles of canyons, irregular kame-like deposits of mixed debris, erratics perched high on the sides of canyons, bowlder belts, lateral and terminal moraines, and other glacial features. Many of these are well developed in Lavigneur canyon, at the northwest fork of Snake creek, on Bonanza flat, in Empire canyon, Walker, Webster, and Woodside gulches, and Thaynes and White Pine canyons. About the head of Bonanza flat certain rock knobs and walls exhibit excellent polishing and striation. A limit of advance of each stream of ice appears to be indicated on the valley bottoms by heavy deposits of mixed unsorted soil and rock debris, which terminate abruptly downstream. The numerous bowlder belts typically displayed on Bonanza flat probably mark different positions occupied by the ice front. The Lady Morgan lakes, two small ponds just west of the Daly West shaft, are dammed back by a moraine. Collections of large, disordered masses of coarse rock debris simulating cirques at the extreme heads of valleys are best shown east of Clayton peak and Scott hill. Furthermore, glacial material composing the divide at the head of Woodside gulch; the flat-topped lobe between Walker and Webster gulches and Empire canyon; the narrow, attenuated spur between Woodside gulch and Empire canyon, and the straight, narrow, level ridge east of lower Thaynes canyon, indicate striking changes in topography and drainage produced by glaciation.

(to be continued).

* Abstract Bulletin No. 225 U. S. Geological Survey.

A Sectional Die.

One of the innovations in stamp mill forgings is in the sectional steel die made by the Chrome Steel Works of Chrome, N. J., and Brooklyn, N. Y. The die is illustrated by the accompanying engravings.



Sectional Die.

It consists of two portions—the base of cast chrome steel and the upper section or die of "adamantine" hydraulic-pressed chrome steel—which, it is claimed by the manufacturers, is the most economical material of which a die can be made, owing to its hardness and density. It is claimed that by the use of this die from 35% to 40% of the weight of the castings are saved, as the base is permanent and may be reused for years. When worn down, the remaining portion of the upper section is removed by driving a wedge in at the line joining the two sections at the point shown in the engraving. G. W. Myers, Hayward Bldg., San Francisco, Cal., is Pacific coast representative of the Chrome Steel Works.

New Style of Head Gear.*

To the Editor:—Some years ago the writer found it necessary to take the needed time to design a single-sheave wooden head gear that would give the maximum strength and durability with minimum timber and cost of construction. The result is the head frame shown in the engraving on the front page, which gives a clear idea of its construction.

The 32-foot head has 24 feet clear bucket way. The braces are made of ordinary iron pipe and can be placed lower or higher on any side so as to give any desired room for dumping the bucket. With 24-foot heads no braces are required. If it is desired to dump very high, it can be done by dumping over the brace.

The hoist is placed sufficiently near the head to allow the resultant line of force to come inside the feet. A Roebling sheave was used with ordinary horizontal boxes. It might be better to use a suitable angle box or cut the timbers to a square shoulder seat. However, several of these in use for several years have not given one particle of trouble.

By making the brace, which stays the rod and dumping chain, of the necessary length, and placing the frame brace at the proper elevation, the bucket can be dumped anywhere. The hoist man soon gets expert in dumping into cars or at a given place.

The advantages found in this sort of a head gear are its extreme simplicity and cheapness of construction. A 32-foot head, all complete, costs us here $145.05. Its great rigidity, strength and safety and its entire accessibility recommend it. There is nothing to interfere with general work around the shaft. It is practically working around a shaft without a head gear.

The iron caps at the upper ends of the legs are not necessary with good yellow pine, Oregon pine or similar wood. It is necessary with a head block

* See illustration on front page.

made of white pine, or a wood that would split easily, although not absolutely necessary with that.

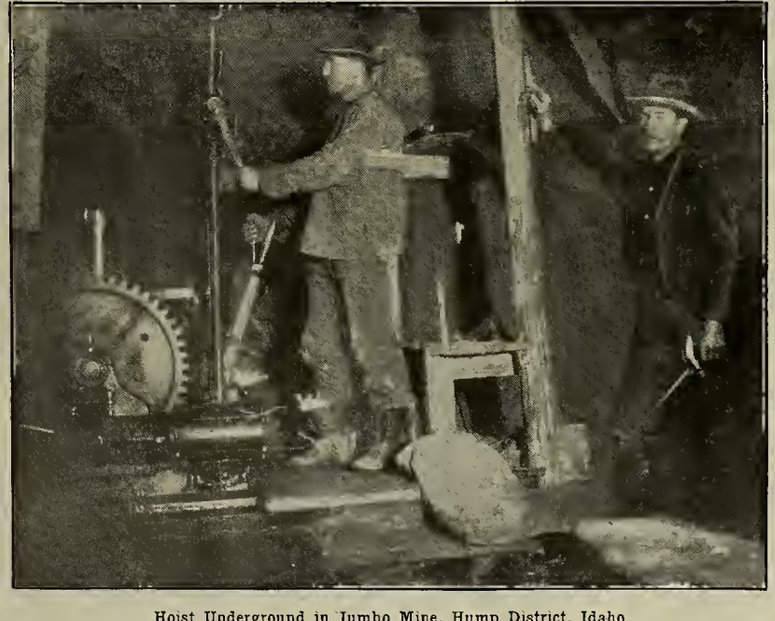
One of the heads of this description is on a working shaft over 600 feet deep. It has had incessant work for three years. It has not needed nor had a cent's worth of repairs and is as good as when erected. We expect to use it to at least 2000 feet depth. It is, of course, kept painted. The only things necessary are to keep the sheave greased and the bolts tight. The design is a departure from the ordinary, rather cumbersome, in-the-way sort, and experience indicates it to be an improvement over many in a practical way. F. L. STOCUM.

Concord, N. C., May 14.

Buffalo Hump District, Idaho.

One of the attractive sections of western Idaho is the new district known as the Buffalo Hump. It was discovered about four years ago, but owing to its inaccessibility, and the heavy snows of the winter, and the short seasons, the development of the region has been slow, attention having been directed to other districts more easy of access. The ore deposits are large, but of a grade which will insure satisfactory results when the region is made accessible by the construction of suitable roads, that the necessary machinery may be taken into the district to treat the ores. Up to the present time all supplies and machinery have been packed in. Among the latter is the Jumbo mill of twenty-four stamps, illustrated in the accompanying engraving, also the hoisting plant shown in another of the illustrations, which we are permitted to use through the courtesy of Alford Bros. & Stalutou of the Lewiston, Idaho, Tribune. The mines of the camp will be developed more extensively this year than in the past years, and it is hoped the State road, which has been building into the Hump section, will be completed this season. This will render the camp accessible and will also give an impetus to the development and equipment of the mines, which could not be possible without this necessary means of transportation. The mines are being systematically developed, however, and long tunnels are now being driven and others projected to reach the ore bodies in depth, the owners properly believing that this is the best way to advance their interests and to increase the value of their property, for, as they evidently think, with abundance of ore developed, railroads will build into the Hump camp to secure the assured business and to incidentally increase it—a result oft proven in mountain mining regions elsewhere. Other mines have ordered machinery, among them the Cracker Jack. Cyanide plants are among the latest additions to the metallurgical plants of the district.

Jumbo Mill, Hump District, Idaho.



Hoist Underground in Jumbo Mine, Hump District, Idaho.

Lake Superior Copper Mines.*

Written by HORACE J. STEVENS.

The old order changes, and a critical observer, well acquainted with the past history of Lake Superior copper mining, can note the great change that is now being made in the production of the district. With rare exceptions, the old mines are marking time, or going backwards, while the younger and more vigorous properties are gaining ground. That this should be so is not surprising, for the richest mine has its bottom, but it comes as something like a shock to the old residents, accustomed for a generation or more to consider the great mines as immortal. It should not be inferred, however, from the preceding statement that the old and large mines of the district are in danger of immediate extinction, or that their managements have grown senile. Such fine old mines as the Calumet & Hecla and Quincy will last for another generation at least, and discoveries of parallel cupriferous beds may prolong their life indefinitely. In the case of the Calumet & Hecla, such prolongation, due to the opening of new mines, is reasonably well assured, and the Quincy has several copper-bearing amygdaloids paralleling the great Pewabic lode, on which the mine is developed, although it was originally opened and worked for some years, in a small way and with indifferent results, on the Quincy amygdaloid. The improvement in methods and machinery has been marked during the past decade and every item of rock manipulation has been materially reduced. For this reason it is possible to mine and mill much lower grade rock than ever before, and some of the copper-bearing amygdaloid and conglomerate beds, pronounced worthless after exhaustive tests made many years ago, will eventually be worked at a profit. It is this possibility of developing parallel mines that gives hope for the remote future for the great old mines of the district.

The ore reserves of the Calumet & Hecla are variously estimated at ten to thirty years. The former figure is much too low, as the mine has ground opened ahead of the stoping parties for nearly that length of time, while the higher figure is based upon desires and hopes, rather than on tangible measurements and estimates. By virtue of lowered costs in mining and milling, the Calumet & Hecla can now work lower grade rock than ever before, and the limit has not yet been reached in this regard. The mine, however, has physical limitations, and while its territory west of the Tamarack undoubtedly carries the underlay of the Calumet conglomerate reef, the disappointingly low returns of copper given by all four of the deep vertical shafts sunk on the underlay of the conglomerate—three by the Tamarack and one by the Calumet & Hecla—renders it reasonably certain that at still greater depths the reef would prove still leaner, hence there is little likelihood that the Calumet & Hecla management will ever attempt to sink a 2-mile shaft to reach the conglomerate west of the Tamarack.

The objections to such a shaft, which has been given tentative consideration, are many and serious. As to time, not less than ten years would be required for sinking, and a longer period might be needed. The cost of sinking the shaft and equipping it with adequate hoisting machinery, compressors and rock houses would be not less than $5,000,000, and perhaps nearly twice as much. The heat of the mine openings at a depth of 2 miles would preclude work, except by the aid of artificial ventilation on a very extensive scale, and it might be necessary to reinforce this by artificial refrigeration. Last, but by no means least, the conglomerate might be found pinched to unworkable dimensions, or, possibly, cut out entirely, though the latter contingency is a possibility rather than a probability, and the copper contents of the rock would in all likelihood be very low.

The percentage of copper secured per ton of rock crushed is steadily decreasing at all of the old mines of the district. This is true of the Calumet & Hecla, Tamarack and Quincy, and the Atlantic is the only old property affording the proverbial exception needed to prove the rule. The Atlantic has always been of notoriously low grade, and its best stopes at the bottom of the mine show small change from those of the upper levels. It is evident, however, in the case of the Atlantic, as of the other extensively developed mines of the district, that the copper makes in courses or gigantic chutes that extend from surface to great depth, usually running somewhat diagonally to the dip of the copper-bearing bed.

Fortunately for the Lake copper district as a whole, mining and milling practice are as advanced here as in any part of the world, and the progress made enables the old mines to offset decreasing richness of rock at depth with greatly increased tonnages and greatly lowered costs per ton in every department of production. Among the important changes of the past decade have been the adoption of much heavier hoisting plants, high-pressure boilers, compounded engines, steam economizers, feed water heaters, automatic stokers, automatic hydraulic ash dischargers, electric underground haulage, improved crushers, heavier stamps, round mortars, hydraulic classifiers and discharges, coarse screens, improved jigs and slime tables and the introduction of several highly efficient forms of patented concentrating tables for the saving of fine copper formerly lost. In the smelters the reverberatory furnaces are several times as large as ten years ago. Water-tube boilers are heated by waste gases from the furnaces, dipping and casting are done with the aid of trolley lines, and one man does as much work as two did ten years ago about a smelter. All these improvements have united to greatly reduce cost, and have saved the day for the old mines of the district, but they have also set a new pace for the developing mines. Twenty-five years ago the experienced men of the district said that half a million dollars was needed to properly open and equip a new mine. Ten years ago the figure had been raised to a

* London Mining Journal.

million; but the experience of the new mines developed in the district during the past eight years show that this sum was an underestimate. At the present day an average of about $2,000,000 is needed to properly develop and equip an important new mine, allowing an average cost of $500,000 for the lands and promotion. In no other copper-bearing district of the world is the cost of making a mine so great as here; but there has been a proportionate increase in outlay required in all other districts. The principal reason why Lake mines are costliest to open and equip is found in the low grade of the rock, which necessitates miles of openings to feed the big mill that is needed to allow the mine to secure a considerable production and earn profits. The cost of opening the mines is usually less in other districts, as the ore is richer and the country rock less refractory as a rule. Timbering is frequently costlier. Power plants are usually much less extensive, and, consequently, far cheaper, as the Lake mines are the deepest in the world. The concentrators of the copper ore mines are far cheaper than the stamp mills of the Lake district. The cost of a Lake mill averages about $75,000 per stamp, and a modern 3-stamp or 4-stamp mill, which is the size commonly built for new mines, requires about eighteen months to build and costs a respectable fortune. In the item of smelting the Lake mines have a great advantage over any other district, as the raw charges fed to the furnace average 60% to 80% copper, and the gangue is merely adhering trap, conglomerate or amygdaloid rock; hence the only flux needed is a small charge of limestone. The big smelters and the intricate metallurgical processes common in many copper-bearing fields are unknown in the Lake Superior fields.

The sole disadvantage of the Lake district, as a whole, is the exceedingly low grade of its ore. This is a serious matter, and, were the district not so firmly entrenched, would prevent its development, with far richer ores abundant at a score of points on the world's surface. The advantages of the district are low labor and fuel costs, the best of rail and water transportation, ample capital, long experience and the best mining and milling equipment found in any mining field.

The Prospector.

During the past year a large number of mineral specimens (rocks, ores and minerals) have been received for determination, and the replies to this class of inquiry have heretofore been made in "Concentrates," but information of this character does not properly belong to that department of this publication, and it has been thought advisable to segregate the mineralogical and lithological features to a separate portion of this paper, and as the greater number of inquiries of this kiud come from prospectors, and miners engaged in actual mining, it seems proper to place this matter under the general and seemingly appropriate head of "The Prospector," where it will hereafter be found. It is not the intention to assay ores or to make analyses of any kiud, but to merely identify minerals, rocks and ores sent for that purpose that may be determined by simple means and by their physical appearance.

It is very necessary that an explanatory letter be sent with all specimens, either with the package or separately, at the same time, and it is also necessary that the sender place his name and address on each package, similar to that in the descriptive letter, as well as the location from which the specimens came. Following are the results of some recent investigations in this department:

The minerals from Manvel, Cal., are: 1. Limonite (pseudomorph after pyrite). 2. Same as No. 1. 3. Zinc blende in quartz. 4. Tourmaline in fine needles. The cassiterite at the Cajalco mine on the San Jacinto estate, Riverside county, Cal., occurs in a matrix of this black tourmaline. 5. Bismuth. 6. Pectolite. 7. Mica.

The specimens from Quartzsite, Ariz., are: 1. Orthoclase granite, in which the mica is much altered. 2. Aplite dike. 3. Metamorphic siliceous rock.

The specimens from Bishops, Cal., are: 1. Garnet, with a little copper carbonate. 2. Same as No. 1.

Specimens from Washington, presumably from Tacoma, are as follows: 2. Chalcopyrite in a gangue of dark siliceous rock. 2. Marcasite (white iron pyrite) and chalcopyrite (yellow copper sulphide) in quartz. 3. Chalcopyrite in quartz and altered greenstone.

Specimens from Winnemucca, Nev., are: 1. Clastic rock—fine-grained conglomerate. 2. Probably diorite (much decayed). 3. Diabase. 4. Granite.

The specimens from Rye Patch, Nev., having a metallic luster are pyrolusite (black oxide of manganese).

The rock from Battle Mountain, Nev., is hematite and is evidently of eruptive origin, being a much altered rock, in which hematite constitutes a large percentage

The two rock specimens from Shasta, Cal., are so much altered as to make their identification difficult. The minerals clearly seen are quartz and kaolinized feldspar. A dark-colored, dirty, greenish-brown mineral is evidently greatly altered hornblende. This is evidently diorite, or possibly grano-diorite. There is little difference between the two, one containing a little more quartz than the other, and is, in consequence, somewhat harder. Both rocks are stained with brown iron oxide.

The specimens from Canyon Creek, Mont., are: 1. Chalcopyrite in gangue. 2. Marcasite. 3. Altered country rock. 4. Diabase. 5. Malachite (green copper carbonate). 6. Altered greenstone.

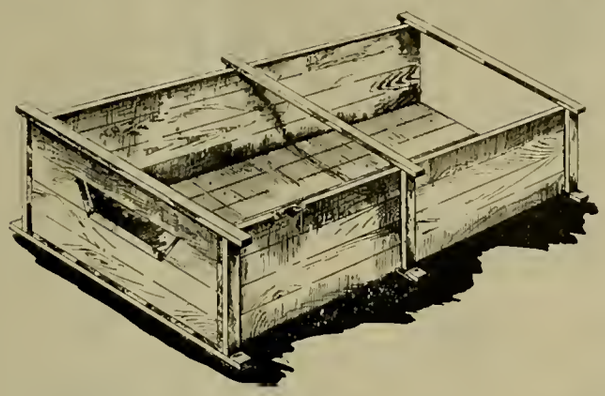
The rocks from Challis, Idaho, are: 1. Hornblende andesite. 2. Quartz diorite, much decayed. 3. Breccia. 4. Quartz, with antimony oxide.

The rocks from Bisbee, Ariz., are: 1. An eruptive rock, probably calcareous diorite, with abundant small crystals of magnetite, to which the dark color of the rock is largely due. The rock contains considerable disseminated copper sulphide, which might be concentrated to advantage. The values would probably be largely in the slimes. 2. Feldspathic rock containing much quartz and rhodonite (manganese silicate). 3. Greenstone (diorite).

A BILL has been introduced by Sir William Lyne in the Australian House of Representatives to provide bounties for the encouragement of the iron and steel industries in Australia. Should this bill pass and become law, as it probably will in a modified form, the imports of iron and steel from the United States will be largely affected. It provides a bounty of $2.48 per ton on iron and 10% on value of manufactures of iron and steel.

How to Measure Water.

One of the best and simplest devices for measuring water is the so-called Cipoletti weir. It consists of a rectangular box placed in the ditch, and through which the water flows. In the front of the box is a trapezoidal opening, over the base of which, known as the crest of the weir, the water flows. The accompanying sketch illustrates the weir.



Trapezoidal Weir.

Scale to be Secured to Side of Weir to Measure Volume of Water Passing Weir

Numerous tests have resulted in the construction of elaborate tables, by means of which, if the depth of the water flowing over the crest of the weir is known, the volume of water flowing through the ditch at any time may be determined.

Since tables are awkward to handle in the field, various devices have been made to allow those interested to determine, without measurement or table, the water flowing over the weir. The simplest of these devices is a scale, invented by T. P. Page of River ou, Utah, which may be screwed on the side of the weir. An illustration of this scale is also shown.

By the expenditure of a few dollars and a little labor, any one may construct such weirs as may be needed.

Dredge Buckets.

Herewith is illustrated a consignment of dredge bucket bottoms as they appeared in the shipping yard of the Taylor Iron & Steel Co., High Bridge, New Jersey. The sixty dredge buckets shown therein weigh 1700 pounds each. Part of them were for the new gold dredges being put in by Manager Hanford at Folsom, Cal.; the remainder are for the El Oro dredge, Oroville, Cal.

Dredge Bucket Bottoms.

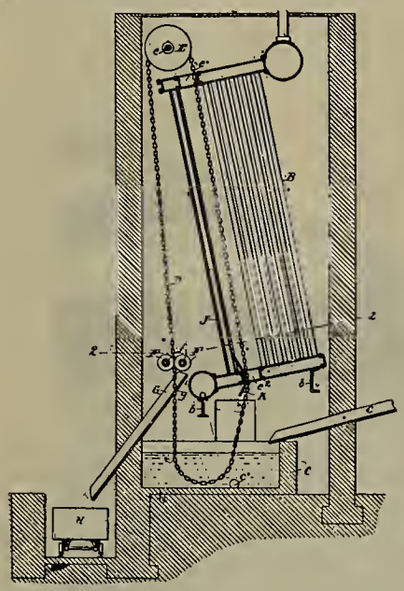
THE Mount Margaret gold fields of Western Australia, though only about six years have elapsed since their discovery, now ranks second in gold production in that region, according to the official reports. Originally a part of the North Coolgardie gold fields, it now comprises the three districts—Mount Malcolm, Mount Morgans and Mount Margaret.

Mining and Metallurgical Patents.

PATENTS ISSUED MAY 24, 1904.

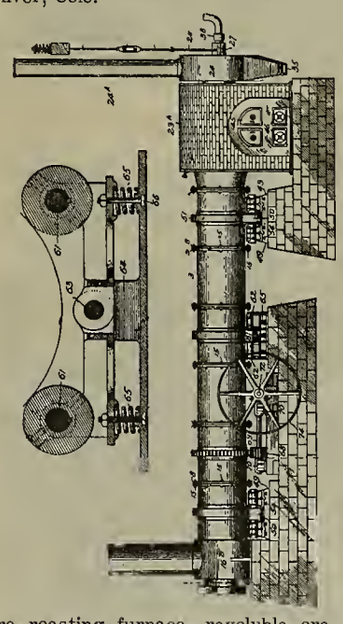
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

SLAG FURNACE.—No. 760,172; R. Baggaley, Pittsburg, Pa., and O. S. Garretson, Buffalo, N. Y.



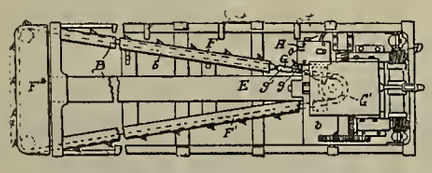
Combination of steam boiler, having upright heating passage, receptacle for molten slag arranged below heating passage, endless traveling slag carrier suspended in form of loop which dips with its lower portion into slag receptacle, elevating slag therefrom and passing with ascending portion, coated with molten slag, through heating passage for imparting heat to boiler, and mechanism acting upon carrier after it has passed through heating passage for detaching congealed slag from carrier.

ORE TREATING FURNACE.—No. 760,941; C. C. Wilson, Denver, Colo.



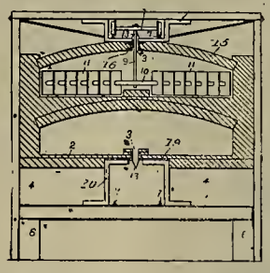
In ore roasting furnace, revoluble ore roasting chamber, and longitudinal shelves projecting from walls of chamber, shelves constructed to cause ore to drop from shelf to shelf and to move inwardly and outwardly on opposite sides of each shelf.

MINING MACHINE.—No. 760,575; F. L. Sessions and G. B. Norris, Columbus, Ohio.



In mining machine, combination with carriage, bed, and cutter carrying chain mounted upon carriage, of lubricant receptacle, valve, controlling flow of oil therefrom, means for guiding oil to chain, and automatically actuated tripping devices for intermittingly opening valve as carriage moves along bed to permit limited flow of oil.

ORE ROASTING FURNACE.—No. 761,049; W. H. Smyth, Berkeley, Cal.

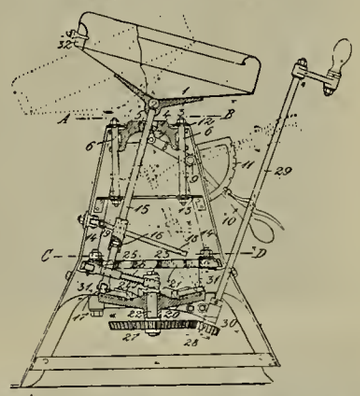


Slotted hearth furnace with rabble actuating devices projecting through slot, and laterally swinging plates or gates adapted to close slot, ends of which swing transversely across slot.

PROSPECTOR'S PAN.—No. 760,691; B. P. Herndon, Florence, Ariz.

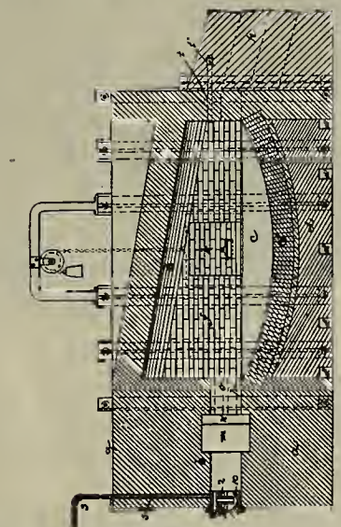
Portable prospector's pan having bottom and side walls, side walls being curved transversely or laterally in relation to bottom and pan being of substantial lune shape in general contour.

GOLD WASHING MACHINE.—No. 760,664; C. C. van der Valk, Voorburg, near The Hague, Netherlands.



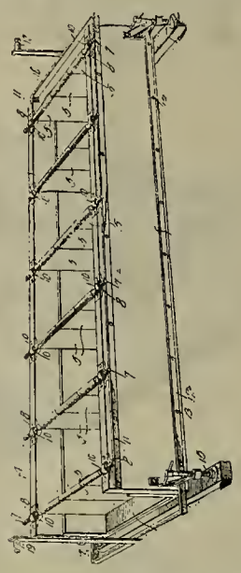
Gold washing machine comprising receptacle, bottom of which runs downwardly toward center, nonrotating support for receptacle, support being provided with recess, and receptacle having opening communicating with recess, means for simultaneously giving receptacle constantly changing inclination and up and down motion, whereby specifically heavier bodies contained in charge in receptacle are caused to advance toward recess.

FURNACE FOR MELTING METALS.—No. 760,495; J. Southern, Belleville, N. J.



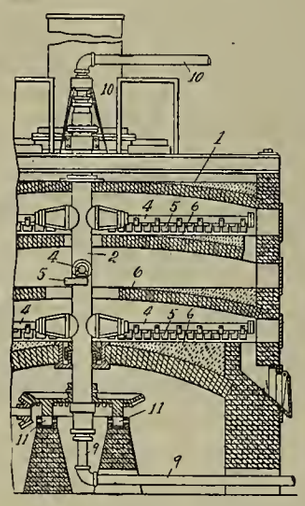
Melting furnace having wall a, melting chamber beyond wall, plurality of combustion chambers formed in wall and branching at ends next melting chamber to provide increased number of discharge openings to discharge heat into melting chamber, and means for supplying heat.

PROCESS OF RECOVERING METALS FROM ORES OR SANDS.—No. 760,539; W. J. Jory and J. H. Jory, San Francisco, Cal.



Process of extracting noble metals from ores, comprising simultaneous pulverization of ores and treatment with reagents adapted to combine with less valuable constituents of ores to form solvent for noble metals.

ROASTING FURNACE.—No: 760,510; L. T. Wright, Keswick, Cal.



In apparatus of character described, combination, with floor, of central hollow shaft, hollow arm communicating therewith and carried thereby over floor, pipe in hollow shaft, conduit connected with pipe and discharging into hollow arm, feed pipe leading up to, and connected with, bottom of inner pipe and discharge pipe connected with top of hollow shaft.

Gold Adhering to Retort.

TO THE EDITOR:—In the issue of the MINING AND SCIENTIFIC PRESS of April 16th last, under the head of "Concentrates", is given a method of recovering gold adhering to the bottom of an old iron retort. I would suggest that the following method might be used—it will require less chemical apparatus than the other: Melt the pieces of the retort with adhering gold in a graphite crucible, with excess of sulphur, at high temperature. The iron and sulphur will combine, forming a matte, and most of the gold will collect in a button in the bottom of the crucible. After the melt has been poured and has cooled, the matte may be crushed up fine, and panned with quicksilver, to amalgamate any gold that may be mechanically retained in the matte. A more complete recovery of gold held (mechanically or chemically) by the matte may be obtained by fluxing the crushed matte with litharge, silica (pulverized glass or quartz) and bicarbonate of soda in a fireclay crucible, and then cupel the resulting lead button.

WALTER W. BRADLEY.

San Francisco, Cal., May 31.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ALASKA.

The Davies mill and assay office at Juneau has been leased to T. D. Drew, who will keep the works open for custom work, with W. R. Bentley as assayer in charge. The 3-stamp mill has water power for its operation. There is a Blake crusher, from which the ore is hoisted to the automatic feeder, and to the stamp. Amalgamating plates save the free gold, and a Frue belt machine and a table concentrator separate the sulphides.

L. H. French and W. J. Scanlon of New York have gone to Nome with sixty head of horses, six cows and several hundred tons of mining machinery. They are engaged in mining operations, owning 14 miles of claims on both sides of Solomon river, near Nome City. Manager French says, employing 100 men at $5 a day and board, they will build a ditch to take water from Solomon river. They have heretofore tried steam shovels, conveyors and other devices.

ARIZONA.

Cochise County.

(Special Correspondence).—J. M. Burke of Boise, Idaho, has Riggs Bros. King of Lead claims under lease and bond. Brown, Murphy & Wright, lessees, have six cars of $70 ore out, which they are packing 1½ miles on burros, then by wagon freight to Rodeo station, N. M.—distance of 14 miles—$3 per ton wagon freight. The ores are silver-bearing galena. The concentrating ore is 20 feet wide; average $15 total value.——Four air compressors are being set up for the Knowles-Coles groups—Calumet & Arizona Co. The company has thirty-two claims. Two railroads are talked of, one from San Simon, 23 miles north on the S. P.; the other from Rodeo on the El P. & S. W. The telegraph line will be completed this week.

H. Summers has fifteen claims near the King of Lead, showing a 30-foot vein. It is 12 miles from Rodeo, New Mexico, station on the Bisbee R. R. in southeast Arizona. There is plenty of wood and water. Till lately this was only a wood and saw mill region for Bisbee and Tombstone. Paradise is on a line drawn from Cananea to Clifton, via Bisbee, and is in the same belt as Santa Rita and Carlisle. This is in the Chiricauhua forest reservation, altitude 4500 feet.

Paradise, May 30.

The Junction M. Co., near Bishee, has started its diamond drill on new ground on its claims adjoining the property of the Saginaw Dev. Co. The machine is set up several hundred feet to the left of the road leading to Naco and Don Luis. ——Work on the churn drill on the Junction property, near Bakerville, is completed and boring for water will be started this week. It is expected a large quantity of water will he secured through exploration to be done hy the churn drill, and the Calumet & Arizona C. Co. are building a concentration plant in which the water is to be used.

Gila County.

R. M. Foree of Santa Fe, N. M., manager of the Arizona-Colorado C. B. & G. M. & M. Co., says the company owns twenty-one claims in a body, embracing an area of 420 acres of mineral land 3 miles north of Globe, in the copper belt. The company has set up a 100 H. P. boiler, a double-geared steam hoist, has a shaft house and blacksmith shop and is sinking a double-compartment shaft.

Graham County.

(Special Correspondence).—The Home C. Co. is operating 2 miles southwest of Morenci. The Home is owned by Morenci men. Superintendent Molder has prospected the ground and reports the principal ore bodies are approachable from a tunnel site, giving 600 feet depth and starting on ore. The surface shows several ledges. The Home has a group of twenty-three copper claims, carrying large bodies of low-grade ore in porphyry dikes. Stringers of copper glance, carrying values in gold and silver, are also found in the ledges that have been opened. A mile north of its coppor claims the company holds twelve gold claims. Development work has shown the presence of bodies of free milling ore of low grade. High-grade ore taken from small stringers has been shipped from the property. The main ledge has been drifted on and crosscut a width of 75 feet.

Morenci, May 28.

Maricopa County.

(Special Correspondence).—W. Channell and R. F. Doll report finding gold-bearing ore in their group near the Phœnix mine, in Cave Creek district.

Phœnix, May 29.

Mohave County.

W. S. McCornick and O. P. Posey of the Gold Road M. & Ex. Co., operating near Acme, report the matter of betterments for the property have been taken up, and it is expected the mines and mill will he operated hy electric plants on the river or at Kingman. The mill will be converted into a wet crusher and its capacity will be increased to keep pace with dovelopments.

The Moss mine will be worked, having been taken over on bond by Manager Slocum of the Mossback mines. Contracts will be let for development work. The Moss mine is in San Francisco district, 6 miles west of the Gold Roads mines, near Acme, and within 7 miles of the Colorado river.

J. Denair of Needles, Cal., with A. Gosuell and P. Kleinfelter, are reported proparing to increase work on the Maguiro mines, south of Kingman. The mines have been under hond to A. J. Pickeril for two years past. The Bi Metal, one of the group, shows an outcrop of free-milling gold ore, and it is on this that the principal work has been done. It is expected a reduction plant will he built.

Pinal County.

(Special Correspondence).—The Copper Butte M. Co. is working sixteen men on its group, 7 miles from Kelvin.——A body of sulphide ore has been struck in the McSherry tunnel, heing oporated by an Omaha, Neb., company.

Dovelopment work is in progress at Troy. A road is heing huilt from the mouth of the Alice tunnel to the Gila river.

Kelvin, May 24.

(Special Correspondence). — The Lake Superior & Arizona M. Co. is developing its property with twonty men. The same company has let a contract for developing a load property 3 miles from its copper group.

A group of claims owned by the Ray M. Co. is heing worked hy lessees. High-grade copper ore is being taken out for shipment to the smelters.

J. L. Harn, operating the Fortuna mine, near Silver King, is taking out silver-lead ore. Soveral shipments have been made to the smelter.——J. Elder reports making a find of gold quartz on one of his claims near Kelvin.

Silver King, May 30.

Yavapai County.

The group of mines owned by the Burlington G. M. Co., 2½ miles from McCahe, is temporarily closed down pending putting in a hoist, compressor, etc. About July 1st they will again start up and will put in use several air drills.

The Rincon M. Co. is increasing work on its group near Martinez. Water tanks and pipe lines are heing put in and arrangements made for the 1-stamp test mill. There are twenty-five men at the camp.

CALIFORNIA.

Calaveras County.

Work will be started this week on the Zeigler mine, near Angels, which has been honded to the Etna King M. Co., who have also secured the Nellie group of mines. A shaft will be sunk on the Nellie mine to a depth of 1000 feet.

Work is again under way at the Oriole mine near Angels.——Machinery is heing put in at the Metropolitan mine.

El Dorado County.

Superintendent L. H. Wilkins of the Darling mine, near Georgetown, says men are at work grading for an electric plant, which will he put in at the mine this summer.——Work has heen resumed at the Eureka quartz mine at Georgetown by El Dorado C. M. Co. Superintendent Everson has men at work cleaning up about the shaft and cut preparatory to unwatering the shaft and making a survey of the underground works. A larger boiler will be put in at the hoisting works, after which development work will be increased.

L. H. Wilkins of Placerville, manager of The Darling mine, is preparing to put in an electrical plant at the mine. J. Toman is superintendent. The new three-compartment shaft is down 130 feet. It will be sunk to a depth of 1200 feet and will be equipped with heavy machinery. A dam, to he 250x300 feet, is in course of construction to impound water for supplying power to the dynamo.

At the Gopher-Boulder mine, near Kelsey, men are getting out rock from the Gopher ledge. The mill has been repaired. W. A. Bell is owner and J. Sipp superintendent.

Kern County.

The Amity M. & M. Co. expects to begin operations in the Slate range, northeast of Randsburg, next month. It has bought twenty claims from J. B. and A. Earley.

Mariposa County.

At the Virginia mine, near Coulterville, the mill is running steadily. The work is heing done under D. O'Toole and thirty-five men are on the payroll.

Nevada County.

At the Brunswick mine, near Grass Valley, the pumps are working satisfactorily and they have cleared tho mine of the water. There has been uncoverod at the 1250-foot level a hody of ore that shows payahle values.

Last week the Kenosha mine (Soven-Thirty), near Grass Valley, started up with electric power, says Manager Root. With the pump, hoist and compressor at work, sinking will be done.

Plumas County.

The Gold Run mino at Emigrant Hill, near Quincy, owned by the Gold Run M. Co., having received a permit to operate thoir hydraulic mine, hogan piping last week.

In Indian valley, at the Peter mine, near Genessee, dovelopment work continues steadily. A tunnel is heing run and it is expected to reach the vein in a distance of 400 feet. An air shaft will also he put down. The company has a mill on the property, hut it has not yet heon set up.

The mining camps of Granite Basin and Bucks ranch, near the Quincy and Oroville stage road, are being developed. The See & Jolly quartz property in Granite Basin, and the P. Malloy quartz mine on Buck creek, with the Huse quartz claim near the Malloy, have been bought by tho Idaho-Thunder Mountain G. M. Co. W. Vandenhoff is president and manager, W. W. Sweet is superintendent. At the See & Jolly ore is heing taken out in readiness for crushing when the mill starts next month. At the Malloy and Huse claims Superintendent Sweet has miners running tunnels on the ledges which aro said to he showing payahle ore. These properties are so situated with reference to each other that the ore from each can he conveyed through a common chute to a 10-stamp mill, to he built as soon as lumher may be ohtained for its erection.

San Bernardino County.

At the Fletcher camp, west of Needles, the development work is said to be showing bodies of payable copper ore. It is expected the smelter will he completed hy August 1. Fletcher has lead mines in Mohave county, Ariz., the ore of which he will ship to Needles for reduction.

Santa Clara County.

W. D. Holloway of Brookline, Mass., J. Joyce, J. R. Powders, E. Stone and M. Woodman are directors of the San Juan Quicksilver M. Co., which has heen incorporated to work a tract of mineral land near San Jose. They are taking out quicksilver ore.

Shasta County.

G. R. Du Bois of Battle Creek, Mich., secretary of the Huron Suhmarine G. M. Construction Co., says the company's gold dredger is in steady operation in the Sacramento river, near Redding. A second boat will he built.

Furnace No. 1 of the Mountain C. Co.'s Keswick smelter blew up on the 30th ult. making a complete wreck of the furnace, damaging the west end of the smelter building hadly, and fatally injuring five men, three of whom have died. The furnace had just been drawn off, so that repairs could be made to the pipe fittings of the water jackets. Left in the bottom of the furnace was a cake of matte. This is usually allowed to cool so that lahorers can get inside and pick and har it out. To hasten the cooling of the matte some one turned a hose on the mass. The water struck some of the molten metal that had not been drawn off, causing the explosion. The five men injured were hoth hurned hy the red-hot metal and struck hy iron fragments.

Sierra County.

P. H. Mason, superintendent and manager of the Golden Scepter M. Co., at Downieville, has begun operations at the mine.

Trinity County.

The Trinity Gold Dredging Co., operating near Lowden's Ranch, on the Trinity river, has begun operations. They have built a ferryboat and a cable footbridge and are clearing a place for the dredger. The company expects to have the plant in operation by Oct. 1.

F. C. Meckel, H. L. Knowles and W. B. Wilson have bonded the Schwartz group of mines on Rattlesnake creek, near Weaverville. They will begin development work this week. There are 100 tons of ore on the dump which will be crushed in the Bob's Farm Co.'s mill adjoining.

Tuolumne County.

(Special Correspondence).—The 50-ton cyanide plant at the Rawhide mine, near Jamestown, has resumed operations, treating the tailings impounded in the canyon from earlier operations of the mines. Heretofore the tailings were handled by scraping into bins and tramming to the vats. The tailings are now conveyed through 200 feet of V-shaped sluice to the leaching tanks. The tailings water from the mill is employed, after roughly separating the sand, in a spitzkasten. This water is run into the tailings dam and washes out the packed sand, carrying it to the sluice. The sluice enters the dam through a 12-foot tunnel in the rock wall. One Chinaman is employed to direct the water against the tailings hy means of short hoards set on edgo. This method does away with expense of six laborers and the scraping team formerly used. J. T. Terry, Jr., is in charge.

Jamestown, June 2.

At the Mohican mine, near Groveland, work continues and Superintendent Chappellett has thirty men employed. Sinking is going ahead, the shaft having reached a depth of 300 feet helow the station in the tunnel. Ore is being taken out and the mill is running.

W. Heath, manager of the Horseshoe Bend mino, near Columbia, with C. G. Grim, will operate the Mount Lily mine. He has also an option on the Littlo Queen group of mines in the Five Mile Creek section.

The interests of C. A. Holland et al. in the New Era group of mines (the Hunter group), near Carters, including tho water rights on Hunter creek, have heen sold to T. F. McAvoy of the Hard Tack G. M. Co.

Yuba County.

Near Hansonville, H. H. Wehb and C. Fife of Santa Monica, who have an option on a quartz mine on the Pauline land, have been doing development work on the lode and are putting in hoisting machinery to go deeper. It is named the Ora Leva mine and the lode is 4 feet in width. They will put the incline down at least 300 feet before starting work on a mill. —— In the Seahourg & Davis quartz mine, near Hansonville (now the Gold Bar mine), owned by J. M. Beck & Co. of Pasadena, Cal., the shaft is down 150 feet, and they have a ledge of quartz. They have put in a pumping plant. —— The Mexican mine, near Rackerby, is being worked by a company which has a tunnel in 300 feet, and when completed it will drain the lode. —— The King Bird quartz mino is on the C. F. Adam's land hought by J. M. Beck & Co. of Pasadena. The shaft is down 100 feet and well timbered.

COLORADO.

(Special Correspondence).—Reports received from several districts show placer mining is active. At Breckenridge, Summit county, all the placers are busy and work is being increased. Alma and Fairplay in Park county and Dillon in Summit county are also active. Near Telluride, in San Miguel county, considerable work is going on along this line.—— Lead mining seems to be improving. The strike situation is subsiding and in a short time it is expected everything will be running as hefore the strike. —— One of the State School of Mines building at Golden was damaged by fire on the 29th, doing ahout $8000 damages. The fire started in the basement of the main huilding, where the chemicals were stored.

Denver, May 30.

Boulder County.

(Special Correspondence).—The Boulder County M. Co. is cutting a tunnel through its property. This company has put in an 8-drill compressor. The tunnel is in 1200 feet. C. F. Lake, of Boulder, is superintendent.

Nedorlands, May 29.

(Special Correspondence).—Surveys are heing made through Eldora section for branch railroads, which will improve transportation facilities.

The Enterprise M. & R. Co. is operating its mine on Spencer mountain. It is stated the company will huild an aerial tramway from the mine to the mill. The mine is equipped with an 8x10 hoist and 60 H. P. hoiler. The shaft is 400 feet deep and from the 100-foot level they have drifted 280 feet east and 100 feet west. On the 200-foot level considerable work has been done—also at the 300-foot level. They are taking out fifteen tons of ore per day, but will double the amount. The 50-ton chlorination mill of the company has received added improvements.

They are roasting the ore by the use of oil burners instead of wood. Oil is brought from Boulder. A. M. Selfridge is superintendent of the mine and mill. He says they are making cyanide tests on the ore and, if satisfactory, will put in a cyanide plant.

It is expected the Mogul tunnel will start operations under direction of J. A. Gilfillan, manager, this week. The tunnel is 10x12 feet, with double track.

Eldora, May 30.

The Enterprise M. & R. Co., near Eldora, is increasing work at the mine and mill. Two shifts of twelve men each are employed at the mine and ore is being broken down. A 60 H. P. boiler has been set up at the mine and new cable put in

and the 35 H. P. boiler formerly at the mine has been put in the mill to furnish power for the oil blower. Two tanks, with a capacity of ten barrels each, have been put on trucks and are used in hauling oil from the Boulder refinery, which has the contract for furnishing the crude oil and residuum which is being used as fuel for the roaster. Two storage tanks for the oil used in the furnaces have been built outside the mill.

The Black Rose mine at the head of Gillespie gulch, near Jamestown, has been unwatered by Superintendent T. E. Irvine, and the work of sinking begun. A 3-inch seam is said to carry values in gold, with a large body of mill ore that runs $10 per ton. J. D. Mersereau of Pasadena, Cal., is owner of the property.

Chaffee County.

A plant of machinery is being put in for the Oklahoma mine at Harrington, 10 miles north of Salida, and development work will begin next week. President R. F. Grow, of the Oklahoma G. M. Co., of Lexington, Okla., is superintending operations. The shaft is down 80 feet, with small veins of ore reported in sight that run $12 in gold and a small per cent in copper. Owing to lack of sufficient water the company will use gasoline power until the water level is reached. The present plant is capable of sinking the shaft to a depth of 1000 feet. The Oklahoma mine is 1 mile from the Denver & Rio Grande railroad and 2 miles south of Turret.

The Granite G. M. & T. Co. has been incorporated by Colorado Springs and Eastern men, the object being similar to that of the deep drainage project of Cripple Creek. A 3000-foot tunnel will be started this month to drain the property of the Granite district at a depth of approximatcly 300 feet. G. Swan of Pittsburg, Kans., is president, with E. J. Eaton, J. T. Estill and C. L. Zobrist as directors. The Washington & California group will be the first drained.

Clear Creek County.

The McClellan Mountain G. & S. M. & M. Co. has been incorporated under Arizona laws to operate a group of claims in the Gold Belt district, upper Clear Creek county. The officers are: G. Albertson, president and manager; P. Garrettson, A. B. Kessler and E. W. Garrettson, with offices at Denver. The company owns the Double Header group on McClellan mountain, near Silver Plume.

The Republic Con. M. Co., near Georgetown, says F. H. Collins, manager, has been reorganized and all matters of difference settled. Development work in the crosscut tunnel, as well as opening up the claims on Douglas mountain, will be resumed.

Operations on the Clift group, on Democrat mountain, near Georgetown, are being carried on. says Manager D. W. Shepard. It is intended to drive the lower level to cut under the point where rich values were formerly obtained.

Work has started on the Ramsdale group of claims in Lincoln district, near Georgetown. A crosscut tunnel has been driven 150 feet and high-grade ore is exposed, some of which carries values in gold. A shaft has been sunk to a depth of 60 feet.

Custer County.

The Humboldt mine at Rosita is being reopened by a company of New York men. It is expected production will be increased. The silver ores carry also gold, copper and lead. —— The Bull-Domingo mine, in same district, will resume also. —— The Elematah mine has started up anew in charge of the Little Jim M. Co. and the shaft is down 400 feet, with ore bodies uncovered from the 100-foot level. Operations will be resumed by the Hessite G. M. Co. at the Eleventh Extension.——The Little Bernice mine reports opening up a body of ore, resembling the Bassick formations. The Toledo is increasing development work. The American Flag has opened a large vein of ore. A body of galena is reported in the Theresa mine.

Fremont County.

It is reported the tailings dumps of the National mill at Florence have been leased to L. R. Findley et al. The tailings will be worked over for the gold contents.

Gilpin County.

(Special Correspondence).—Everything in northern Gilpin county is waiting the advent of the Moffat road. This road, which has reached Rollinsville, will be receiving and discharging freight next week, when it is expected mining operations will be increased.

About 2½ miles northwest from Rollinsville is the Blue Grass M. Co. group in the Phœnix mining district. This company owns and controls ninety acres and has been operating and developing its property the past six years. On the Champion the shaft is down 265 feet, with 900 foet of drifts and crosscuts. The Decoration, which is 300 feet south of the Champion, has a large vein, but little development work has been done on it. A crosscut is within 75 feet of the Decoration from the Champion. The Lone Star is down 225 feet and operating from the 150-foot level. This shaft is equipped with an 8x10 hoist, 60 H. P. boiler. They are hoisting ten tons per day, but will double this output. Work has also been done on the Tenderfoot. The company has built a 10-stamp amalgamating and concentrating mill, which has been in operation three months. Concentrates are being stored at the mill until the railroad is ready to receive freight. K. C. Parrish is consulting engineer and R. L. Alexander superintendent.

Josephson Bros. have a lease on the Beaver placer on Beaver creek. They started operations in April and have handled 10,000 yards of dirt. They report the dirt pans well so far as opened up. The first cleanup will be made June 15th. The gravel averages 11 to 13 feet to bedrock.

Rollinsville, May 29.

(Special Correspondence). — The Gold Dirt M. Co. will sink another shaft and put in an air compressor and drills. A mill will also be put up on the property in Gamble gulch. The company will sink the old shaft 100 feet deeper. It is down 600 feet. A 100 H. P. boiler is being set up. W. H. Knowles is manager and A. L. Williams superintendent.

Perigo, May 29.

(Special Correspondence).—The Perigo mines, owned and operated by Potter & Lightbourn of Central City, are making light production at present, but it is expected they will increase the capacity. They propose to drive another tunnel, starting farther down the gulch to gain greater depth. The 100-ton concentrating mill will be started this week.

Perigo, May 30.

(Special Correspondence).—F. P. Dovey has started work on the Copper King mine and will put in a hoisting plant.

Gilpin, May 30.

(Special Correspondence). — O. B. Thompson, who has charge of the consolidation formerly owned by the Cook-Fisk-Gregory-Bobtail Co. and others, is putting the plants and mill in shape to produce. One of the compressors has been disabled and is being repaired. The mill is an 80-stamp, rapid-drop, with twenty-six concentrators.

Black Hawk, May 29.

(Special Correspondence). — Considerable development work is going on in Russell Gulch section. The Old Town Con. M. Co., with headquarters in Idaho Springs, has put in additional machinery, including compressor and drills, 75 H. P. motor, 100 H. P. engine and a 1250-gallon per minute (under 1000-foot head) pump. The shaft is down 1500 feet. No work has been done below the 1100-foot level. Ore is coming from the second, ninth, tenth and eleventh levels. Other levels above the 600 are under lease to outside parties. They will begin this week to produce 100 tons of ore per day. The ore is being treated at the Jackson concentrator at Idaho Springs. They have $750,000 in ore blocked out at the mine, says G. K. Kimball, manager of the company. The company owns fourteen patented claims in one body. L. Hanchett is president. The company has built a heavier gallows frame and ore bins. The ore can be dumped into the bins or direct into the tramway cars. Ore is hauled by tramway to Black Hawk, and the portion for Idaho Springs is transferred to the Colorado & Southern for shipment to that point. The compressor is run by electricity furnished by the power company at Georgetown.

F. A. Scheuber of Livingston, Mont., and G. K. Kimball have a lease on the Lutz group, east of the Old Town mine, and are unwatering the shaft. The property has not been worked for the past ten years. Its end line is within 700 feet of the Newhouse tunnel.——The shaft on the Lilian mine is down 375 feet, and is under lease to W. Slater & Co., who are drifting toward the winze, which was sunk to a depth of 175 feet. They expect to open up ore in the winze.

R. I. Hughes has a lease on the Federal mine, which adjoins the Old Town on the west. He is doing development work and taking out ore. The Baker Shop group adjoins the Federal. also under lease to the same party.——E. A. Came, G. S. Crilly and H. W. Snell have a lease and bond on the Hall mine, and report taking out ore that runs $90 per ton.

Russell Gulch, May 30.

Sinking operations have been started at the Running Lode mine, near Black Hawk, with double shifts, the shaft to be sunk 100 feet, giving it total of 1050 feet. The mine is operated by the Gower M. Syndicate, Ltd. Developments are kept well ahead of production. T. Dunstone of Black Hawk is superintendent, and has fifty men on the payroll.——Sinking operations have been started at the Cui Bono group in Lake district, near Central City, which is owned by D. Bourk of Nevadaville. The shaft is down 110 feet and the owners intend to sink it at least 50 feet deeper.

The Black Hills & Denver G. M. Co. has been incorporated by S. H. Blakeslee, W. T. Skelton, J. M. Blakeslee, R. C. Hayes, M. H. French and W. T. Graham to operate in Gilpin county, with offices in Denver and Deadwood, S. D.

Gunnison County.

The Bowerman Independent mine at Bowerman has been sold to the J. C. Bowerman M., M. & Dev. Co. The Independent group and the Gold Belt group, the latter near the Raymond mine, are now owned by this company, and all operations will be conducted in future under supervision of J. C. Bowerman, president of the new company.

Hinsdale County.

R. M. Collins of Lake City, manager of the Monte Queen mine, reports that he has subleased the mill at Crooke's Falls to Vinton & Palmer under conditions that will give Monte Queen ore right of way. They will put in a Frue vanner and a canvas plant at the mill, increasing its capacity.

Lake County.

The Alps M. Co. has been incorporated to operate in South Evans gulch at Leadville. The directors of the company are: B. F. Stickley of Leadville, C. S. Burlingame, F. Prentice, J. F. Hume and M. J. Friedman of New York City. The company's properties include the Alps No. 1, Alps No. 2, the Helvetia and other claims on eastern end of Ball mountain and saddling both slopes of the mountain, extending down into both South Evans and Iowa gulches. These properties have been operated under leases.

Larimer County.

The National M. & M. Co. is preparing to put in two 115-ton copper matte furnaces for its reduction plant to be built at Pearl this year. The company will build two short tramways to take ore from neighboring mines, and is planning to take water from Big Creek lake, 7 miles distant, to supply power for the smelter and electrical plant. Matte from the Pearl smelter will be shipped to Grand Encampment, Wyo., and converted into blister copper.

Mineral County.

E. T. Elliott of Del Norte has an option on the Creedemoor mining property, consisting of six patented claims and a concentrating mill; also on the Mexico, Hiram and St. Peter's claims, near Creede, for $80,000. These properties are producers of lead and zinc ore. The concentrating mill has a capacity of sixty tons per day.

Ouray County.

The Smuggler Meteor G. M. & R. Co. has been organized, with F. Nelson of Topeka, Kan., as president, and is preparing to operate on its group in the gold belt north of Ouray. The Smuggler Meteor group comprises six claims covering the upper and lower quartzite. The company will drive the 400-foot tunnel ahead, where two veins will be cut—one within 75 feet and another in 100 feet more.

San Juan County.

The Silver Ledge mine, near Chattanooga, near Silverton, has thirty men at work in mine and mill. An addition is being built on the mill for electric zinc separators and twenty tables. The mill when complete will contain two Chilean mills, twenty large and small tables and the zinc separators. The number of men will be increased. Bodies of ore containing zinc exist in the section up Mineral creek, South Mineral and at the head of Animas Forks, says Manager Warner of the Silver Ledge.

The Hercules Con. M. Co., near Silverton, is getting ready to increase operations. The 75 H. P. compressor, sixteen machines capacity, has been put in operation and is supplying 9000 feet of tunnels, raises, etc., with air, while fifteen men are catching up bad ground.

San Miguel County

L. L. Nunn, manager of the Gold King Con. M. Co., owning the Gold King group, near Telluride, is reported to have a lease and option on the Summit mine, adjoining the Gold King side line and higher up the mountain. When last operated, seven years ago, connection was made between the Summit and Gold King workings. The product will be handled through the Gold King.

W. A. Berglund has men working in the Gold King and Gold King No. 2 mines the past winter, and there are twenty-three men on his payroll. These properties adjoin and Berglund has a lease on a portion of them. It is reported he has enough ore on the dump and cut out in the mines to keep twenty stamps of the Gold King 40-stamp mill running the rest of the year and that these stamps will be started dropping this week. The ore is free milling, the values being saved on the mill plates.

Summit County.

The Gold Pan placer at Breckenridge is in full operation, the present rush of water being utilized to full advantage. In the pit three elevators, three giants and two cranes are operated. and on the surface the cableway and belt conveyor are working.

Near Kokomo, the Union Con. group on Gold hill has placed an electric drill on the tunnel which is being run. They expect to drive 800 feet to reach the ore shoots opened in the upper working. M. Gagan is manager.

Teller County.

Five blocks of the Bull hill property of the Stratton estate at Cripple Creek were leased last week. The property leased comprises three blocks on the Longfellow No. 1 and two on the Longfellow No. 2. Ore has been shipped from both properties. Block 171 is leased to Stewart & Co., who have put in a plant of machinery and started to unwater. As soon as the water is out two shifts of men will he put to work and machine drills will be used. Heffron & Schoen have the lease on block 172. They intend putting in machinery. Block 170 has been leased to Heffron & Weaver. This block constitutes the east end of the claim, and it, too, will he equipped with machinery. H. M. Gilbert & Co. have a lease on blocks 176 and 177. They have unwatered the shaft.

The Mary McKinney M. Co. at Cripple Creek is having a larger compressor set up, one with a capacity of sixteen drills. The previous capacity was twelve drills.

It is reported that Lessees Harrison & Seaver, who last winter made a strike on the W. P. H. claim on Ironclad hill, Cripple Creek, have opened up another body of ore in their lower workings at a depth of 380 feet, and nearly under the rich shoot found above. It is stated the vein measures 10 feet in width and that streaks traverse the vein that show gold besides sylvanite. The returns received from shipments are running 4 to 7 ounces gold per ton. The lease is shipping out a broad-gauge car of ore daily, returning $75,000 a month.

W. Erickson, manager of the Hawkeye M. & L. Co., composed of Iowa men, who have a two-year lease on the Julia E. claim of the Jennie Sample company, near the Doctor-Jack Pot mine on Raven hill, Cripple Creek, is putting in a plant of machinery and has started to sink the shaft for depth of 200 feet. The lessees will not attempt any development work or shipments from that property until that point is reached. The lessees have opened up a body of ore, 15 feet below the 100-foot level.——The plant of machinery on the Victor mine is again in operation. The company has the levels from the twelfth to the surface cleaned out. The water has risen to a point a few feet below the top of the station 1000 feet from surface. However, this will not hinder the company for the present, as they intend to confine the work between surface and the 1000-foot point.

G. Jordan, who has a lease on the tailings of the Summit mill near Gillett, and worked a cyanide mill with a capacity of twenty tons daily all last summer, will start up again next week. The tailings averaged $6 per ton.

A cyanide mill will be built on the property of the Moon Anchor M. Co. of Colorado Springs, on Gold Hill at Cripple Creek.

The Beacon Hill Ajax and the Zenobia mines near Cripple Creek are closed down on account of pending litigation and are not expected to resume operations until the matter is settled. Both mines were under lease to J. Wright.

E. S. Johnson, president of the Blue Bird M. Co., operating on Bull hill, Cripple Creek, says construction work is in progress for the installation of a heavier plant of machinery. A new gallows-frame has been completed. The plant will be placed over the shaft, which was made by a raise from the 400-foot level of the inclined shaft, making the shaft vertical for a depth of 1367 feet. This mine has produced gray copper ore and free gold associated with it.

There are more lessees at work in the Cripple Creek district than there has been before during the past five years, says the Cripple Creek Times. A large percentage of the lessees are getting ore. The Cripple Creek district owes much to the leasing system. At present leases are in greater demand than for several years. Many properties are being worked by lessees which have been idle and closed down for a number of years.

IDAHO.

Blaine County.

J. Gorman, owner of the Young America group of mining claims in Smoky district, near Hailey, says operations will be increased. Two ledges were opened up

last fall, the larger one, 5 feet between walls, having been drifted on for 30 feet at a depth of 100 feet. In the face of this drift there is exposed 5 feet of ore, 2 feet of which is free milling.

Idaho County.

The cyanide plant on the Jumbo mine at Hump will be enlarged this summer to three times its present capacity, says F. Brown, manager. The plant will be made large enough to handle the entire output from the twenty-four stamps in the mill. They are working full capacity and what ore is not treated in the cyanido plant is being piled up on the dump. He is working forty men, and tunnel No. 4 is going in at the rate of 10 feet a day and by July 1st is expected to be in the main ore body. Ore is being taken from tunnel No. 3, but when tunnel No. 4. is finished, all mining will be done in that.——Seven men have been put to work on the Diamond Hitch group, which F. Brown has bought. The property is half way between Elk City and the Hump, 2 miles from the Hogan group. He has a group of seven claims, with three veins from 3 to 4 feet wide, carrying values in gold. A tunnel is in 100 feet, but will go in 1000 feet.——They are working twenty-one men on the Crackerjack in tunnel No. 2, and are getting under what was the main ledge in tunnel No. 1.

In the Big Creek district, J. W. Killinger et al. of Lowiston have incorporated the Hillside group, on Big creek, 10 miles southwest of Oro Grande and 6 miles southeast from the Jumbo mine of Buffalo Hump. This group consists of the Hillside, Hilltop, Lowland, Kansas City, St. Joseph and the Junction placer. About 1000 feet of development work has been done in two tunnels with two crosscuts, a shaft and open cuts and test pits.

The Dollar Bill M. & M. Co. has been organized in Lewiston, with mining properties in the Buffalo Hump mining district. The following are directors: G. W. Thompson, S. Heitfeld, J. Steele, J. M. Molloy and J. W. Briugolf. The company owns the Old Bill group of mining claims near Hump, 2000 feet north of the Jumbo mine. One of the claims is an extension of the Dewey. The property has been opened in several places and shows a ledge averaging 4 feet between walls, assaying $20. The Old Bill claim has one 30-foot and one 15-foot shaft. The company will start development as soon as the snow is off, and will prepare this summer to work through next winter. A small developing mill will be built.

The Fidelity placer mines, near Elk City, have been leased by C. H. Williams and C. Kogler from the Fidelity Co., and work has been started. Two giants were set up and a bedrock flume dug for a distance of 700 feet. The lessees are using two pipe heads of water and are washing out gravel. While the top dirt is being worked the men report removing about 200 yards of gravel per day.

Lemhi County.

E. Edwards of Gibbonsville, with Montana men, has formed a company and taken over the property of the American D. & M. Co. at Gibbonsville. The incorporators are F. W. Volger, F. M. Shaw, E. E. Edwards, J. Shineberger and E. Benedict. F. M. Shaw is manager.

Owyhee County.

F. T. and L. F. Clemons of Denver, Colo., will begin developing the Standard claim on South mountain, 23 miles southwest of Silver City. A shaft 20 feet deep has been sunk, but from this ore assaying 40% lead, 50 ounces silver and $10 in gold is reported opened up. After taking a bond on the property six other claims were located. These will all be developed during the summer. The Standard claim was bonded for $10,000 by T. F. Walsh of Denver, Colo., who, with others, organized the American Standard M. & M. Co., with F. T. Clemons as manager. It is intended to start work sinking a shaft, and as soon as it is down 100 feet a level will be started for exploration.

F. T. Clemmons, manager of the Standard M. Co. of Denver, Colo., owning properties at South Mountain, near Silver City, says he is preparing to do development work this summer.

Shoshone County.

W. J. McConnell, president of the company operating the True Fissure mining property in the Clearwater country, in the southeast corner of Shoshone county, near Lolo Hot Springs, Mont., says they have nine claims all carrying values in gold. They are in the Bitter Root mountains, 70 miles from railroad transportation. They have to pack supplies in over a trail 40 miles from Lolo Hot Springs. A new trail will be cut to reduce the distance to 20 miles by going by way of Granite creek. A 3½-foot Huntington mill will he put in this summer. At first they will mill only the ore taken out in development work. Water power from Cayuse creek will operate the mill. McConnell says he is working ten men on the property of the Greyhound M. & M. Co., in Custer county, a silver and lead group, and intends to put in mining machinery this summer. The mine is in the Sea Foam district. The ore is said to carry values in silver and lead, with gold enough to pay for treatment. It is 100 miles from railroad transportation.

At Delta the dredgers of the Mascot G. M. Co. are reported successfully working on Trail creek. Bedrock there is from 24 to 28 feet, and the machines work a breast of 6 or 8 feet across a pit 300 feet wide. The dredger is under supervision of H. P. Gilligan. It requires 50 H. P. to operate it and about three cords of wood daily, with nine men to run it continuously — three shifts of eight hours each.

It is thought the Northern Pacific Railroad will build a spur 1000 feet long from Burke up the gulch toward the Hercules mine this summer, says H. L. Day, manager of the Hercules. If the line is built it will have to cross the Shoo Fly No. 2. The Hercules Co. will then put in an aerial tramway from the mine down to the road, a distance of 7000 or 8000 feet. They will also put in a compressor plant. The output of the mine, which is now about 1000 tons a month, will he doubled. The electric plant is working.

Reports from the properties of the Little North Fork M. Co., near Wardner, say there are 8 feet of copper ore in the lower tunnel, with values also in gold. The tunnel has been driven 500 feet. The company is owned by Wardner men, and the group consists of several claims on the Little North Fork of the Cœur d'Alene river, 7 miles from Kingston. An upper tunnel was also run, showing a 4-foot ore body, giving an average assay of 15% in copper.

G. Gruhe, R. Paden, F. Magnus and A. L. Mogan of Orofino, who relocated the Mascot mine January 1st last, report having completed the necessary work and are about to apply for a patent to the ground. Since relocation they have taken out considerable rich ore and expect to make a mill run in June. The Mascot mine, formerly owned by the Gold Creek Con. M. Co., is a developed property, with a 7-stamp mill and a hoist. In the latter part of 1902 work was stopped and was never resumed by the company.

Manager Fitzgerald of the Cascade Power Co., which owns the water power at Orofino falls, near Orofino, reports making arrangements for putting on men to further develop the coal prospects on Orofino creek, 15 miles above Orofino. The power company has the mining prospects there under bond. The deepest shaft is 50 feet. In this a 6-foot seam of lignite has been uncovered. Strikes of lignite have been made on the Lolo Fork, Ford's creek and above Kamiah.

Washington County.

The Ford-Salzer M. Co., operating at Black Lake, near Council, E. D. Ford manager, will start the sawmill this week and cut lumber to rebuild the cyanide mill destroyed by fire last fall. The new mill will be practically the same as the former in design and capacity.

S. Dorsey of Nebraska and J. C. Rogers and W. Hayward of Weiser have a bond and lease on the Blue Jacket group of mines in the Seven Devils mining district, near Weiser, for $250,000. This is a copper property and has been opened up to a depth of 250 feet. J. C. Rogers is manager.

MICHIGAN.

Houghton County.

The report of the Copper Range Con. C. Co., operating the Baltic, Champion and Trimountain mines, in the South Range district, near Painesdale, has been issued for the year 1903, and includes the following results:

	Baltic.	Champion.	Trimountain.
Rock stamped, tons	490,237	398,082	507,377
Fine copper, lbs.	10,580,997	10,564,147	9,237,051
Copper per ton, %	1.08	1.36	0.91
Cost per ton stamped.	$1.538	$2.066	$1.970
Cost per lb. copper, c.	7.12	7.61	10.82
Development, ft.	5,669	8,342	6,647

MONTANA.

Deer Lodge County.

Fitzpatrick & Todd, who have a lease and bond on the Oro Fino mine, adjoining the Southern Cross group, near Anaconda, have begun operations. Men were put to work last week, sinking a new shaft, and at suitable deptb a tunnel will be driven. The old shaft was found unfit for use. They will drift under the old workings.

Flathead County.

J. F. Collins of Spokane, Wash., manager of the Spokane & Montana M. & M. Co., is operating on Fourth of July creek, in the West Fisher mining district, near Libby. They are driving a tunnel and will have 150 feet of work done next week. The tunnel is to tap three veins that crop from 50 to 100 feet above the tunnel. The ledges are stripped for several hundred feet, and vary from 1 to 3 feet wide. They show free gold. The company has, in addition to seven quartz claims, eighty-six acres of placer ground, a millsite, water right and timber. The Brick & Brannagan M. Co., which has a 10-stamp mill, will put in ten more stamps and a cyanide plant. The Libby company property has a 2-stamp mill, and is in 3 feet of ore.

Missoula County.

Work has been resumed on the Bullion group, 3½ miles south of Borax. A ledge 16 feet in width carries values in copper. In the upper tunnel a drift was run 200 feet on the ledge. A shaft was also sunk and a 50-foot crosscut run.

Silver Bow County.

A find of copper ore is reported made north of Walkerville, and a large number of locations have been made. The principal showing is said to have been made on the Bull Run claims. For years this district has been prospected for gold and silver and little attention paid to copper.

NEVADA.

Elko County.

The Dexter M. Co. of Salt Lake City, Utah, is preparing to start work at its mine at Tuscarora. In the past the company has experienced difficulty with slimes, and to overcome this, it is intended to put in a new process of treatment. During greater portion of past year the mine has been operated almost entirely by lessees.

Esmeralda County.

Superintendent Nelson of the Consolidated Esmeralda M. Co., near Hawthorne, last week shipped a gold bar, the result of a cleanup from Pamlico ore. He reports work progressing satisfactorily in the mines, although the mill is not running full time, owing to scarcity of water. The company is preparing to increase the supply, either from Whisky Flat or by running the pipe up Cottonwood canyon.

Eureka County.

W. Whalen has men at work in the mines of the United States G. & S. Co. at Alpha, and Manager C. Lay has men at work on the Whalen C. Co.'s properties at the same place. Work is reported progressing.

B. Smitb of Eureka, manager of the Rocco-Homestake mines, says shipments for the season have been resumed, the ores maintaining the usual percentages in lead and silver. The shaft has reached a depth of 150 feet, with the first level, established at 90 feet, extending north and south in ore, while in the incline is another exposure of galena.

Humboldt County.

E. W. Griffith of Salt Lake City, Utah, says he has bonded a group of seven claims in the Trinity range of mountains, 20 miles west of Humboldt station, on the Southern Pacific. The ores carry values principally in gold, lead and copper.

Winnemucca reports say the properties of the Golden Eagle M. Co. has been taken by O. Stalman and J. Farren on a lease and bond. Equipment will he put in, including a mill.

Lyon County.

The 5-stamp mill at Nordyke, owned by E. H. Whitacre, started up last week on ore from the Pierce & Sherry claim in Smith valley. The mill has been overhauled and repaired.

The Hanson & Fielding iron mine, 18 miles northeast from Virginia City, has been sold to Merritt & Smith of Minnesota for $24,000. The property consists of three locations near the Storey county line, 3 miles southwest of Siegel district and 17 miles from Wadsworth, the nearest point of connection with the Central Pacific Railroad. The ledge is 1200 feet wide and carries 66% of iron. Development work is in progress, with H. M. Hanson of Wadsworth as manager. The land on which the property is located is on that part of the public domain withdrawn from entry after the national irrigation Act became a law. There is an abundance of wood for fuel 3 miles from the property and spring water at hand. They will ship ore to some point in California, where they propose to put up a smelting plant, says Manager Hanson.

Nye County.

The Crown Point group of mines, 6 miles north of Tonopah, has been bought by Salt Lake City, Utah, men. J. M. Healy has put men to work. The group consists of five locations along the strike of the vein. The vein, which bas been opened up at intervals, reveals width of 10 feet, with the main workings exposing a breast of ore.

H. C. Park of San Francisco, Cal., has bought the Spokane group at Diamondfield, near Tonopah, south of the Daisy and Vernal.——C. L. & L. G. Wheeler have bought the Golden Chest and Golden Circle claims, 7 miles north of Tonopah, which will be incorporated under title of the Milwaukee-Tonopah M. Co.——F. Williams has bought twelve claims, north and east of the King Tonopah, which will be incorporated as the Tonopah-Mother Lode M. Co.

At the Leasers' mill at Tonopah, the new grinders having been put in position, the ten stamps are crushing from thirty-five to forty tons per day from the Douglass lease with satisfactory results. The Boss grinders are supplementary to the Huntington mills, which crush the ore to an 80 mesh, the grinders reducing it to the fineness of flour. Two more grinders will be added. W. J. Douglass is superintendent, with F. Gallagher as fureman.

Storey County.

Superintendent Roote of the Keyes-Graesler mine, near Virginia City, is preparing to put the mine in shape for development work. Power pumps will be set up and the shaft sunk deeper.

NEW MEXICO.

Grant County.

W. S. Cox and R. P. Thompson have bought a half interest in the Montoya lease at Santa Rita. There is said to be a 23-foot vein carrying native copper.

Machinery is on the ground for the Burro Mountain C. Co. plant in the Burro mountains, near Silver City, says Manager T. Carter. The consignment consists of two pumps, with a capacity of 100,000 gallons daily, an electric light plant with a capacity of seventy-five lights, steel rails for the mine and other machinery. The building for the concentrator is completed and machinery being placed. It is expected to have the plant running by July 1st. The management has added concentrating tables.

The Cupadero M. Co. has been incorporated by C. F. Blackington, R. M. Blackington and W. T. Harris of Socorro, with headquarters at Socorro.

Socorro County.

A strike is reported made in the Cooney mine at Cooney. The strike was made at depth of 400 feet in the level running eastward, says Manager Wetherby, of the Mongollon G. & C. Co.

Taos County.

Considerable placer prospecting is being done around Red River.——M. Parker has organized a company and will work the Little Gem and other mines on Bitter creek, near Red River.——E. Westoby and A. Hedges are developing the Willard mine in upper Red River mining district. In a week's run $40 in gold was cleared by the arrastra.

The Jayhawk G. M. & M. Co., at Red River, is working two shifts of four men each. The ore carries values in gold.——Two shifts are being worked on the tunnel of the Copper King group at Red River. The tunnel is in 1250 feet and the first vein has been cut through. It is 200 feet thick. The ore is a copper sulphide and also carries lead and zinc.

T. A. Melson reports finding a lead of gold ore on the Klondyke, at Red River. Melson & Logan are owners. The ore carries free gold.——The Jayhawk G. M. & M. Co. lead has been cut at a depth of 55 feet. It is 6 feet wide and carries gold and silver in equal values. The company will put in a hoist and will sink another 50 feet before putting up a new mill. In the meanwhile the old mill will be started.

Work has begun on a mill at South Fork, near Rio Hondo. It will be a 10-stamp mill, for purpose of crushing. Cyaniding vats will be put in. Water will be used for power and 2000 feet of pipe are being laid. A body of low-grade ore has been opened up.

OREGON.

Baker County.

Machinery for the Alpine mill, near Sumpter, is being put in place under direction of Superintendent R. Addoms. The plant is of 20-stamp capacity and is equipped with concentrating tables.

J. P. Smith of Sumpter has bonded the Mormon Boy group in Cable Cove district. A shaft has been sunk 40 feet.

Manager W. Techow of the Mountain View mine, near Sumpter, is preparing to build a milling plant. The equipment will include rock breaker, Chilean mill, plates, concentrating tables, percolating tanks for sands and an agitation process for slimes, adapted to Cracker creek basin ores. Gasoline power will be used, and an additional 25 H. P. engine will be put in, which, with the one at the mine, will give a total of 50 H. P. The plant is to have capacity of 30 tons daily.

M. H. Clark, manager of the Buckeye mine, 16 miles northeast of Baker City, has sent out supplies and men to resume operations. The mine will be further developed and tests made before a mode of treating the ore is decided upon. It is intended to make shipments of the highest grade ore to the smelter. This will be followed up by making a run of 150 tons through the stamp mill at Tellocasset and the concentrates shipped to the smelter. The Buckeye has a body of ore carrying

copper, gold and silver, and the working shaft is down 200 feet.

W. Cable of Baker City says he has an option on the Bunker Hill group, near the Annalulu mine. It is owned by a Canadian company. Cable says he will put men to work as soon as the snow is out of the way. The property has not been operated for several years. A compressor plant is on the ground and will be set up.

Bishop Bros. of Baker City, owners of the Climax mine in Cracker Creek district, near Sumpter, say work will be started there next week.

SOUTH DAKOTA.

Lawrence County.

Preparations by the Reliance M. Co., on west side of Terry's peak, near Terry, for work on erection of its 300-ton mill are under way. The mill will be built on Annie creek. The winter's work has resulted in opening up ore bodies on the east end of the ground and in the center, giving returns of $8 a ton. The ore is said to be a cyaniding proposition. Ore has been uncovered on four levels. Three hundred feet from the east side line of the property a tunnel has been driven for 50 feet, which has cut three shoots of ore.

The lateral work from the 500-foot level of the main shaft at the Columbus mine, near Deadwood, has opened up a body of free-milling quartz.

Work will start on a tract of 120 acres of ground between the Penohscot and Dizzy mine in Garden City district, near Deadwood, by the Omaha G. M. & M. Co., with headquarters at Omaha, Neb. W. Schmoller of Omaha is president. On the adjoining property of the Dizzy Co. a diamond drill has been sunk 115 feet, cutting the lower quartzite level. H. Rheinhold of Omaha is manager.

UTAH.

Beaver County.

Grading, building and the moving of supplies and materials for the equipment of the Cactus group, near Frisco, are under way. Meanwhile development operations continue.

The Estella mine, south of Milford in the Star district, will be equipped with stamp mill this season, says Manager Tarbet. The plans call for five 850-pound stamps. A 25 H. P. engine will be required to operate the machinery. It is expected concentrating tables or a cyanide plant for the tailings will be added later, this depending on the percentage of saving effected by the plates. The water supply will be secured by pumping. Manager Tarbet reports satisfactory conditions underground. Payable ore has been opened up in six places. This is an iron ore, carrying free gold to extent of $7.50 per ton.

Davis County.

At a depth of 700 feet the Union Gas & Pipe Line Co. last week struck a flow of gas in its well near Centerville, says Manager Bigger. This was after thirty days drilling. It is expected to get oil this month.

Salt Lake County.

Manager E. McCarrick of the Red Wing Extension mine, near Bingham, reports that the company will sink deeper and will build a concentrator in Freeman gulch as soon as a permanent water supply is developed.

The first of an additional battery of roasters to be installed at the Yampa smelter in Bingham canyon, near Bingham, was put in operation last week.

The American S. & R. Co. smelter at Murray treated a total of 630,000 tons of ore during the year ending April 30, 1904, according to Manager C. W. Whitley, in his annual report. The company has found it necessary to build additional furnaces to handle the output of the mines.

The Columbus Con. C. Co. of Bingham has bought the Tesora mill at Tintic. The plant will be moved to Alta and will be made a part of the big mill with which the Columbus Con. is to be equipped. The removal of the machinery of the Weber-Kearns mill at Park City, which was bought by same company, was begun last week.

Sevier County.

Near Monroe, 4 miles out on the D. & R. G. Railway from Elsinore, a gold strike is reported made.

Tooele County.

To simplify the method and reduce the cost of supplying its plant with water, the Stockton G. M. Co. at Stockton is preparing to put in 3 miles of 4-inch pipe that will be laid from a spring owned by the company to its shaft house. Hitherto the management has pumped its supply of water from the West Argent mine. As at the Honerine, the Stockton with a steady supply of water is expected to equip for the reduction of its second class ores.

The Galena King mine at Stockton has begun production again. It is producing two grades of ore, one which goes direct to the smelter assaying 25% lead and from sixteen to thirty ounces in silver, while the other, which goes to the Honerine mill to be concentrated, averages eight ounces in silver and 16% lead. The management expects to maintain a daily output of fifty tons.

WASHINGTON.

Ferry County.

The Huntington crushing mills at the Mountain Lion mine at Republic have been put in operation, and work has resumed in the mine.——The Knob Hill G. M. Co. expects to contract for the disposal of ore at the Hall mines smelter, at Nelson, B. C., and to begin shipping ore this week. The ore hin at the Knob Hill mine is full, and there are 150 tons on the dump. Stoping has been discontinued until the ore ready for shipment can be sent to the smelter.——B. Campbell has men at work on the Surprise tunnel on the Faithful - Surprise group of claims, near Danville.

S. L. Boyer, superintendent of the Minnehaha M. Co., operating at Danville, near Republic, reports the shaft at the Minnehaha mine down 250 feet. He has nine men on two shifts, crosscutting from the hottom of the shaft. A. McKinley, who has a contract for driving a tunnel across the Minnehaha group, is working and has driven the tunnel 260 feet. It is expected to cut the vein at 400 feet in.

Okanogan County.

The mill and the cyanide plant on the Bodie mine at Bodie will be ready to start next week, says C. M. Fassett of Spokane, president of the company. More development work will be done. They expect to work fifteen men, as it will take six men to run the mill. The ore carries gold and silver, and the milling ore averages $15 a ton. Bodie camp is 29 miles northwest of Republic. The mine is developed hy four tunnels to a depth of 400 feet.

Stevens County.

At Northport a small lead smelter will be built, says L. P. Larson of Spokane, owning the Last Chance mine, to handle the lead carhonates produced at the mine. Such a plant would produce pig lead ready for marketing. The silver values in the Last Chance ore are low, hut, says Larson, the ore is practically self-fluxing. They are putting in two trams and expect to carry coke up the hill on one side of the tram while ore goes down on the other side. The galena will he shipped as before. They are working thirty-five men. The furnace would employ twenty-five.

WYOMING.

Carbon County.

The Doane-Rambler mine, near Encampment, reports a strike made in crosscutting south from the new shaft. A crosscut was started to tap a vein previously located, but came into a body of sulphide ore at a point not anticipated. The strike is said to show 10 feet in widtb, with copper values of 8%. Considerable surface water is running and another pump will be put in.

At Grand Encampment the North American C. Co. concentrating mill is in full operation. It has been running since May 2 and is piling up concentrates to feed the smelter furnaces, which will start up this month. High-grade bornite ore is also heing brought from the mine over the tramway, and regular shipments of this grade of ore will follow.

FOREIGN.

AFRICA.

Transvaal.

The Transvaal Chamber of Mines at Johannesburg reports the gold output of the mines on the Witwatersrand for month of April amounted to 297,470 ounces, and 8476 ounces for outside districts, being a total of 305,946 ounces. This compares with the previous three months of 1904 as follows:

	Rand. Ounces.	Outside. Ounces.	Total. Ounces.
January	278,867	9,957	288,824
February	282,436	7,066	289,502
March	299,625	8,617	308,242
April	297,470	8,476	305,946
Totals	1,158,398	34,116	1,192,514

The following production of some of the principal mines on the Witwatersrand is reported for the month of April: Angelo Gold, ninety stamps crushed 12,533 tons for 4759 ozs. gold; 10,422 tons treated hy cyanide for 3012 ozs. —— Langlaagte Deep, 115 stamps working twenty-nine days and nine hours, crushed 18,147 tons, yield 3723 ozs.; 13,746 tons of sands and concentrates treated hy cyanide, yield 2030 ozs.; 4274 tons of slimes treated, yield 248 ozs. Total yield, 6001 ozs. fine gold. ——Langlaagte E. & G., 150 stamps running twenty-nine days, crushed 21,206 tons for 5048 ozs.; concentrates: cyanide process treated 564 tons for 910 ozs; tailings: cyanide process treated 17,600 tons for 2317 ozs.——Crown Deep, 155 stamps working twenty-nine days five hours, crushed 20,390 tons for 5232 ozs.; 13,600 tons of sands and concentrates treated by cyanide for 2562 ozs.; 5589 tons of slimes treated for 547 ounces. —— Crown Reef Gold, yield from mill, 7646 ozs; from cyanide works, 3256 ozs.; from slimes works, 271 ozs. Total, 11,173 ozs. fine gold: 120 stamps worked twenty-seven days fifteen hours, milled 18,261 tons. To mining, transport, milling, cyanide, treatment of slimes, general charges, maintenance, and mine development, £26,901. Revenue per ton crushed, £2 11s 11.74d; cost per ton crushed, £1 9s 5.55d.——Driefontein Con., 110 stamps crushed 14,983 tons for 4410 ozs.; 10,821 tons treated hv cvanide for 3081 ozs. ——Nourse Deep, 95 stamps working twenty-eight days twenty-three hours, crushed 12,570 tons for 3302 ounces; 9070 tons of sands and concentrates treated by cyanide for 1674 ounces; 3540 tons of slimes treated for 277 ounces.——Robinson Deep Gold, 180 stamps working twenty-eight days, crushed 24,790 tons for 8985 ounces; 3941 ounces from tailings by cyanide and 621 ounces from slimes. ——Rohinson Gold, 155 stamps crushed 19,867 tons, yield from mill, 8889 ounces; from tailings (by cyanide), 3379 ounces; from concentrates (hy chlorination), 965 ounces; from slimes, 779 ounces; total from company's ore, 14,012 ounces; yield from purchased concentrates, 552 ounces.—— Robinson Randfontein Gold, 95 stamps, twenty-seven days eight hours, crushed 12,137 tons for 3658 ounces; concentrates by cyanide process, 919 tons, for 359 ounces; tailings by cyanide process, 6720 tons for 1341 ounces; slimes, 4459 tons, for 306 ounces.——Glen Deep, 100 stamps, working twenty-six days eighteen hours, crushed 13,300 tons for 2699 ounces; 9240 tons of sands and concentrates treated by cyanide for 2691 ounces; 4143 tons of slimes, for 371 ounces.—— Rose Deep, 155 stamps, working twenty-nine days seventeen hours, crushed 22,174 tons for 5116 ounces; 14,525 tons of sand and concentrates by cyanide for 2801 ounces; 7379 tons of slimes for 643 ounces. ——Simmer & Jack Proprietary, 190 stamps, working twenty-nine days, crushed 28,500 tons for 5968 ounces; 4470 ounces from tailings hy cyanide, and 462 ounces from slimes.——South Randfontein Gold, 100 stamps, running twenty-seven days twelve hours, crushed 12,877 tons for 3470 ounces; concentrates by cyanide, 840 tons, for 295 ounces; tailings by cyanide, 7995 tons, for 1307 ounces; slimes, 3848 tons, for 391 ounces.——Jumpers Deep, 100 stamps, in twenty-eight days sixteen hours, crushed 15,827 tons for 3875 ounces; 10,735 tons of sand and concentrates hy cyanide for 2050 ounces; 5027 tons of slimes for 309 ounces.——Ferreira Gold, 120 stamps, in 28.58 days, crushed 17,439 tons for 8058 ounces; concentrates, 1400 tons, for 697 ounces; sand, 11,760 tons, for 2248 ounces; slimes, 4695 tons, for 487 ounces.——Geldenhuis Deep, 185 stamps, in twenty-nine days five hours, crushed 23,030 tons for 6939 ounces; 16,090 tons of sand and concentrates hy cyanide for 2900 ounces; 7044 tons of slimes for 698 ounces.——Knights Deep, 105 stamps ran twenty-eight days, crushing 15,550 tons for 7229 ounces fine gold, inclusive of 2102 ounces from cyanide.

AUSTRALIA.

Western Australia.

The Great Fingall Con. M. Co., at Kalgoorlie, reports its output as follows for month of April: Tons of ore treated hy 80-stamp mill, 13,300; ounces gold recovered, 10,634; tons of tailings treated hy cyanide, 13,010; ounces recovered, 1617; tons of concentrates treated, 149; ounces recovered, 843; total fine gold recovered, 13,094 ounces. The managers report the sands treatment is in course of transfer from the old to the new mill, and, consequently, that the tailings from the new mill have not heen treated, and that 960 ounces remain to he recovered. An additional ten stamps were started on April 28 and another five stamps on May 7, making ninety-five stamps running. April working expenses were £8875, distributed over 13,300 short tons, equal to 13s 4d per ton, divided as follows: Mining (including pumping), 4s 6d; treatment (including milling, cyaniding and concentrating), 8s; realization of hullion, 10d. (General expenses are included in the ahove.) Total development expenditure, £3583; total other capital expenditure (machinery, plant, etc.), £7070.

The Ivanhoe G. Co., at Kalgoorlie, reports April returns at: 14,080 short tons of ore crushed, yielding 3170 ounces gold (100-stamp mill running 29 days 6 hours); 7190 tons of sands treated for 2685 ounces; 6080 tons of slimes treated for 3133 ounces; 820 tons of concentrates treated yielded 1730 ounces; 330 tons of telluride ore treated yielded 330 ounces gold; total, 11,048 ounces fine gold recovered. Working expenses (equal 21s 7d per ton), £15,600; mine development, £3700; machinery and plant, £200; West Australian dividend duty (estimated), £1000.

The output figures for month of April for the Lake View Consols mine at Kalgoorlie show: 9102 tons (of 2000 pounds) of ore treated yielded 4218 ounces fine gold. Costs: Ore extraction, 12s 9d per ton; ore reduction, 13s 6d per ton; realization of bullion, 4d per ton; total working expenses, £1 6s 7d per ton; equals £12,118. Expenditure on machinery and plant, £217; expenditure on mine development, £2456.

Kalgoorlie reports to the Record say during 1903 the mines of Western Australia produced hullion to the value of $43,800,000 from the treatment of 2,160,656 long tons of ore. There were 16,987 men employed, also 4055 stamps, 165 other mills, 1309 leaching vats and 140 filter pressos. The dividends paid amounted to $10,120,000. The total production of Western Australia from 1886 to 1904 is $232,000,000 from the treatment of 9,682,932 long tons; the dividends for that period amounting to $47,500,000. Kalgoorlie's contribution to these totals is as follows: In 1903 the fifteen principal mines treated 893,668 tons for a yield of $21,200,000. The dividends for the period were $7,000,000. On this part of the field 6077 men were employed, also 570 stamps, 92 other mills, 318 leaching vats and 105 filter presses. The total production of Kalgoorlie since 1894 approximates $116,000,000. Dividends total $37,900,000. Individual outputs of main Kalgoorlie mines during 1903:

	Long Tons.	Value.
Golden Horseshoe	152,183	$3,750,000
Perseverance	132,593	3,700,000
Boulder Proprietary	109,844	2,850,000
Ivanhoe	149,131	2,750,000
Oroya-Brown Hill	52,259	2,100,000
Associated	58,008	1,400,000
Lake View Consols	92,497	1,200,000
Kalgurli	48,160	850,000
Brown Hill Extended	12,3.5	600,000
Associated Northern	5,963	550,000

The consumption of water from the government water scheme is increasing. It now totals 1,500,000 gallons daily, the mines taking 600,000 gallons daily. Water is pumped 383 miles through a 30-inch pipe to the gold fields. The pipe line and pumping plants have a capacity of 6,000,000 gallons daily and were constructed at a cost of $15,000,000.

BRITISH COLUMBIA.

The annual report of the Minister of Mines for British Columhia has been issued and includes the following statistics relating to mineral products for the year 1903:

	Quantity.	Value.
Gold, placer, ozs.	53,021	$1,060,420
Gold, lode, ozs.	232,831	4,812,616
Silver, ozs.	2,996,204	1,521,472
Copper, lbs.	34,359,921	4,547,535
Lead, lbs.	18,089,283	689,744
Coal, tons (2240 lbs)	1,168,194	3,504,582
Coke, tons (2240 lbs)	165,543	827,715
Other materials		531,870
Total		$17,495,954

Compared with 1902, gold, silver, lead and coal show a decrease, lead having the greatest loss (4,500,000 pounds). Copper, coke and miscellaneous made an increased output over 1902. The total production for 1902 was $17,486,550 in value. The production for 1903 hy divisions and districts was as follows:

Name.	Divisions.	Districts.
Cariboo District		$475,200
Cariboo Mining Division	$314,400	
Quesnel " "	132,000	
Omineca " "	28,800	
Cassiar District		480,368
Kootenay, East, District		1,951,128
Kootenay, West, District		6,603,981
Ainsworth Division	219,818	
Nelson "	653,457	
Slocan "	1,126,986	
Trail Creek "	4,308,458	
Other parts	295,262	
Lillooet District		31,283
Yale District		3,714,422
Osoyoos, Grand Forks & Kettle River Divisions	3,654,234	
Similkameen Division	2,000	
Yale "	58,188	
Coast Districts (Nanaimo, Alberni, W. Coast V. I., Victoria)		4,239,572
		$17,495,954

The principal placer gold producers were Cariboo and Cassiar districts; of lode gold, Trail Creek (Rossland division), Slocan and Yale; of silver, the Slocan; of copper, Yale (Boundary division) and Rossland; of lead, the Slocan.

Boundary District.

J. C. Haas has an option on the group of claims formerly owned hy the Boundary Creek M. & M. Co., near Phœnix. There are twelve claims in the group, including the D. A.——Connections have been made in the No. 4 tunnel of the Granby mines, work on which has been under way since last fall. It will make the portal of this tunnel 1500 feet from the No. 2 shaft of the Old Ironsides mine, the grade heing ahout 5%. The tunnel will be widened and improved. The Great Northern survey reaches the mouth of this tunnel.

A diamond drill has been put in operation on the Rathmullen group in Summit camp, near Phœnix.

It is reported G. A. McLeod of Grand

Forks has a working bond on the McKinley, a rich gold-copper proposition in Franklin camp.

Development work was started last week on the Lottie F. group, up the main Kettle river, near Phoenix, owned by G. W. Rumberger, J. Marshall, J. B. McCaulay and W. Fernie.

J. H. Peet, of Spokane, Wash., a director of the Providence mine, near Greenwood, reports work is improving. The shaft is down 325 feet and they are drifting and have struck ore. The vein has widened to 2 feet, and they have let a contract to sink 100 feet more, and also propose putting in electric drills. They have electric air fans, and the mine is lighted with electricity.

Cassiar District.

In Atlin section the power plant of the British American Dredging Co. at Pine Falls is reported working satisfactorily. This plant supplies power to the dredge built last season on Gold Run, 6 miles up Pine creek. The dredger has been put in full operation.——Hydraulic operations have begun on Otter creek. Water is two weeks earlier than last year.

On Boulder creek, near Atlin, good pay is reported as being exposed on the ground of the Societe Minieres de Columbie Britannique, and they are ready to start hydraulicking. Black & Grant, operating above the Societe's ground, are taking out gold in drifting.——The McKee Creek Con. and the Atlin M. Co., Ltd., (working under one management) have started piping. They will operate two lines this season.——On Spruce creek the Spruce Power Co. has completed its plant and piping will start this week. Prospecting on Ferguson & Walker's claims and adjacent ground has developed pay to open up on.

East Kootenay District.

It is expected the Canadian Pacific Railway will build a road 28 miles long from Michel to the properties of the Imperial Coal & Coke Co. this summer, says O. G. Laberee of Spokane, Wash., a director of the company. Superintendent J. Brown will put men to work developing and preparing to ship. Buildings will also go up during the summer. As soon as the road is built the company will put in coke ovens. Ultimately they intend to have 1000 coke ovens on the property and the output will be 10,000 tons of coal a day, a part of which will be made into coke. The property is north of the Crow's Nest coal fields. W. H. Evans of Montreal, Canada, is president. The company is said to have 96 square miles of coal lands in southeast Kootenay.

The John Bull group of claims on the St. Mary's river, in southeastern Kootenay, has been sold to C. A. Jarnigan of Spokane, Wash., J. M. Ely and W. F. Rickets of Pullman, Wash. Development work will be started this month. It is a copper mine.

J. Brown of Spokane, Wash., of the Imperial Coal & Coke Co., has made preparations to survey and exploit the company's claims in the coal areas of Fording river, near Fort Steele.

Rossland District.

Machinery for a 25-ton experimental concentrating plant will be put in for the Velvet-Portland mines on Sophie mountain, near Rossland, by W. Thompson of Rossland, consulting engineer. Water concentration will be used on gold and copper ores. Two steam stamps, with a capacity of twenty-five tons a day, will be used to reduce the ore to 10 or 20 mesh. It will be separated on tables. The concentrates will be shipped. The company expects to put in a small smelting plant this fall to reduce ores not amenable to water concentration.

Work is under way on the White Bear Con. M. Co. 100-ton concentrator at Rossland. The plant is expected to be completed in September, and at that time Rossland will have three concentrators in operation—Le Roi Two, Rossland Power Co. and White Bear—handling the low-grade output of at least four mines, Josie, War Eagle, Center Star and White Bear.

Vancouver Island.

Property of the Western Fuel Co. at Nanaimo, valued at $80,000, was destroyed by fire on the 30th ult., that started in the shaft house of Pit No. 1. All the men in the coal mine were saved. The blaze was started by a spark from a passing locomotive, which fell upon a timber of the pit head. The timber was dry, and everywhere coal dust was lying to a depth of several inches. The mine has another entrance from Protection Island, across the harbor, and from this point the men were warned. They brought out with them a large number of horses and mules, which were stabled at the bottom of the shaft.

CANADA.

Yukon Territory.

It is reported the placer mining regulations in the Yukon have been amended to give latitude to the Yukon commissioner, who may, in his discretion, cause the mining property of any deceased or insane person to be worked, as the necessity of the case may demand. He may also cause the public administrator of the territory to take possession of the property until it is administered by him, or until such mining property has been taken possession of under letters of administration granted by the proper court in that behalf. The charges and expenses incurred will be the first charge against the property.

CHILE.

The report of the Association Salitrera de Propaganda for last quarter of 1903 contains the following figures relating to the nitrate industry: The production for the year 1903 amounted to 1,614,434 tons, as compared with 1,419,483 tons in 1902. Exportations in 1903 amounted to 1,584,142 tons, as compared with 1,504,472 tons in 1902. The deliveries for consumption in 1903 amounted to 1,641,374 tons, as compared with 1,420,041 tons in 1902. If the consumption in February, March and April of the current year should be equal to that in the corresponding months of last year, the consumption in the "nitrate year" 1903-4 will be 1,650,013 tons.——The total of the quotas assigned to the several works to January 31, 1904, amounts to 2,249,500 tons, and there are eight new works in course of construction, the product of which will equal 405,000 tons, making total for the next nitrate year of 2,654,500 tons.——It is noted that the majority of the operators of the new nitrate works and "officinas" being established in the "pampa" are Germans.

MEXICO.

Chihuahua.

The iron mines northeast of Jimonez, on the Mexican Central railway, have been bought by H. Ginther for a French, Belgian and Dutch company, which will operate the property. It is proposed to build a railway from Jimenez to the mines.

The Compania Minera Sensitiva de Naica has been incorporated at Chihuahua to exploit a mining property in Naica district, and on which work was started last week. The officers are R. F. & M. L. Lujan, J. G. Acosta, G. Kraft, V. A. Cabrero.

Durango.

E. F. White reports that he has a concession to build reduction works at Mapimi.

Jalisco.

H. S. Church, manager of the Mascote M. Co., has arranged for building a smelter with a capacity of 100 tons on the mines of the company, north of Mascote. The ore from the company's mine is said to contain 22% of zinc, with copper, lead, silver and gold.

Nuevo Leon.

The Monterey News says E. Ludlow, manager of the Mexican Coal & Coke Co., is preparing to build a railroad from Las Esperansas through Musquiz to the company's coal fields at Nogalitos. Extensive development work is anticipated as soon as the road is built, and it is expected coal shipments will start by January 1st next. Shipments from Las Esperansas are at present thirty cars of coal per day. The town has a population of 10,000 and 3000 men are employed in the mines. Most of the coal is shipped to Monterey's industrial plants. The branch railroad which will develop the lands will be 30 kilometers long and will extend from the International Railroad.

Oaxaca.

I. Z. Mason of Cleveland, O., has an option on the La Purissima mine and a group of five other claims in Penoles district, which he will develop.

San Luis Potosi.

At San Luis Potosi the municipality has granted a concession to a company to take up the low-grade ore that was used in paving the streets, and to fill in plazas. The company agrees to replace the ore used by a better pavement. The company is composed of San Luis Potosi men, says the Enterprise.

Sinaloa.

L. Warfield, at Mazatlan, proposes to build a reduction plant of 100 tons daily capacity.

Sonora.

President W. C. Greene of the Cananea Con. C. Co., operating at Cananea, in his monthly letter to the stockholders says the product of the company during April was valued at $750,000. The company produced 370,000 pounds more of copper in April than in March. Developments at Cananea are exposing more ore of a high grade. The statement of the treasurer shows that the company has on hand cash and copper to the value of $1,229,086.19.

The Mines Company of America of Colorado Springs, Colo., owning and operating the Creston-Colorado mine, near Torres, and also owning an interest in the Dolores mine, in Chihuahua, is building a cyanide plant at a cost of $75,000 at the Creston-Colorado. The company employs 300 men at the property and the production amounts to about 6000 tons of ore a month.

Sahuaripa reports say W. O'Neill and L. Coombs will take over the Montoroy group of mines at Sahuaripa for $20,000. They will start development work next week.

The International Dev. Co. has been formed in Clifton, Ariz., to acquire and develop mining property in Sonora. The company has an option on forty pertenencias, near the Yaqui river, east of Hermosillo, on which it will start work next month. The workings will be cleaned out and opened up. The lode is 6 feet in width and carries gold and copper values. J. A. Baylor is manager.

The Dewey mine, near Hermosillo, has resumed shipment of graphite and is sending out several carloads each week. Superintendent T. Bentley says in the mine there has been opened a body of high-grade material. Besides graphite there is in the Dewey a copper ledge, carrying also gold and silver.

Personal.

W. J. DOUGLASS is superintendent of the Leasers' mill at Tonopah, Nev.

C. GEGNOR is superintendent of the Victor mine at Cripple Creek, Colo.

S. F. PARRISH has resigned as manager of the Le Roi mine at Rossland, B. C.

O. B. STEEN of Santa Monica, Cal., is in San Francisco, Cal., on mining business.

L. B. DE LA MORA, a mine owner of Guadalajara, Mexico, is in San Francisco, Cal.

W. J. NELSON of San Andreas, Cal., is in San Francisco, Cal., on mining business.

J. A. GILFILLAN is manager of the Mogul tunnel project at Eldora, Boulder Co., Colo.

H. J. BARTON of Yreka, Cal., interested in Siskiyou county mines, is in San Francisco, Cal.

T. F. SINGISER, president of the American Flag mine at Park City, Utah, is in Sioux City, Iowa.

W. F. GRIDER is superintendent of the Sugar Pine mine near Murphys, Calaveras county, Cal.

F. H. COLLINS is manager of the Republic Con. M. Co., operating near Georgetown, Colo.

J. SIPP is superintendent of the Gopher-Boulder group of mines near Kelsey, El Dorado Co., Cal.

C. F. BREED of Chicago, Ill., is in northern Gilpin county, Colo., looking after mining interests.

W. G. SCOTT, superintendent of the Black Oak mine, near Soulshyville, Cal., is in San Francisco, Cal.

E. L. WHITE, commissioner of mines for Colorado, has returned to Denver, Colo., from St. Louis, Mo.

J. B. COPLEN is superintendent of the Clipper group of mines of the Pacific M. & M. Co., near Globe, Ariz.

A. H. ELFTMAN of Minneapolis, Minn., has returned there from a trip through the West on mining business.

P. A. BRADY has resigned as superintendent of the Belcher group in the Greenhorns, near Granite, Or.

F. DAINES is superintendent of the Belcher group of mines, near Granite, Or., vice P. A. Brady, resigned.

G. RECKHART of El Paso, Texas, is manager of the Aberdeen C. Co., operating copper mines near Lordsburg, N. M.

R. KNOX, manager of the Revenue mines and mill at Norris, Mont., has returned to camp from Salt Lake City, Utah.

G. B. ADAMS, manager of the Hermosa M. Co., has returned to the mines of his company, near Nogales, Ariz., from Oklahoma.

J. T. TERRY of San Francisco, Cal., is in charge of the cyanide plant at the Rawhide mine, near Jamestown, Tuolumne county, Cal.

G. W. DRYDEN of Boston, Mass., manager of the Pelican M. & M. Co., is in Lake City, Colo., in the interests of the Pelican properties.

T. W. DAVIDSON, of the Eastern Oregon Dev. Co., returned to Sumpter, Or., last week after a trip East in the interest of the Morning mine.

A. F. DOWNS of Davenport, Iowa, president of the Spar M. Co., has returned from the company's mines at White Pine, Gunnison county, Colo.

L. H. WILKINS, superintendent of the Darling mine, near Georgetown, El Dorado county, Cal., has gone to London, Eng., on company business.

F. CLARK is superintendent of the Trade Dollar Extension M. Co., operating near Silver City, Owyhee county, Idaho, vice A. F. Stevens, resigned.

G. R. DUBOIS of Battle Creek, Mich., secretary of the Huron Sub-Marine G. M. Con. Co., operating gold dredger near Redding, Cal., is in California.

T. F. TURNER of Canton, Ohio, president of the Mexican-American M. & Dev. Co., owning the San Ricardo mine, east of Poza, Sonora, Mexico, is at the mine.

J. R. SPEER of Pittsburg, Pa., and F. E. Himrod of New York City attended the annual meeting of the Old Town Con. M. Co. in Idaho Springs, Colo., recently.

M. A. REPLOGLE of Akron, Ohio, having perfected his "differential" water wheel governor, has been retained by the Replogle Governor Works as chief engineer.

DANIEL A. JONES, formerly with the Buffalo, Rochester & Pittsburg Railway, in charge of construction work, is on his way to Nome, Alaska, to open an engineering office.

J. F. COLLINS, manager of the Spokane & Montana M. & M. Co., returned last week to Spokane, Wash., after an extended visit to the company's mines, near Libby, Mont.

A. F. STEVENS has resigned as superintendent of the Trade Dollar Extension M. Co., near Silver City, Idaho, to devote his time to management of the Addie C. property in same section.

G. W. MYERS of the Chrome Steel Works of New York has returned to San Francisco, Cal., from a business trip in Siskiyou, Calaveras and Tuolumne counties, Cal., and leaves next week for Alaska.

HENRY VENTRESS, assayer at the Centennial-Eureka mine at Eureka, Utah, for the past five years, has resigned and has gone to Bingham Junction, Salt Lake county, Utah, as assayer at the smelter of the United States M. Co.

S. W. TRAYLOR, mechanical and metallurgical engineer, whose headquarters are at 116 Liberty street, New York, has returned East from Nevada and Colorado camps which he visited in the interests of mining companies of Boston and New York.

F. A. GOODALE of the Colorado School of Mines at Golden, Colo., has been appointed to go to St. Louis, Mo., to assist in installation and operation of the chemical and assay departments which are to be exhibited by the Colorado School of Mines.

PROF. A. MARSTON, who has been in charge of the civil engineering department of the Iowa State College, at Ames, Iowa, for the last twelve years, was recently elected dean of the engineering division. Prof. G. W. Bissell has charge of the department of mechanical engineering, Prof. L. B. Spinney of the electrical engineering, and Prof. S. W. Beyer of the mining engineering.

J. W. LIEB, JR., of New York City, N. Y., vice-president and associate general manager of the New York Edison Co., has been elected president of the American Institute of Electrical Engineers. The following officers were also elected at the same meeting of the Institute: Vice-presidents, W. E. Goldsborough, J. J. Carty, S. Reber; managers, H. G. Scott, L. A. Ferguson, J. G. White, S. S. Wheeler; treasurer, G. A. Hamilton; secretary, R. W. Pope.

Books Received.

"Encyclopedia of Mexican Mining Law," being a digest of the Mexican mining code, by Richard E. Chism, Ph. D. This little volume, well known to all mining men in Mexico, has just been issued, bringing the work up to the present year, 1904. In addition to the mining laws of Mexico, which every operator, prospector and owner of Mexican mines should understand, the work contains a carefully compiled glossary of mining terms in Spanish, and the weights and measures in use in Mexico.

Commercial Paragraphs.

C. R. HEWITT has accepted a position as salesman with the Rand Drill Co. of New York, and will be connected directly with the selling of the Imperial tools.

THE Chrome Steel Works of Brooklyn, N. Y., and Chrome, N. J., have an exhibit of stamp mill parts, etc., at section 73 of the Mines and Metallurgy Building at St. Louis, Mo., in charge of H. Hussa.

THE C. O. Bartlett & Snow Co. of Cleveland, Ohio, report an order from the United States Geological Survey for one of their No. 3 style "C" four-compartment direct heat rotary dryers to be used in the plant located within the Exposition grounds of the Exposition at St. Louis for testing the coals and lignites of the United States.

THE Colorado Iron Works Co., from its New York office, 116 Liberty street, reports closing contracts for several mills to be erected in Idaho. One of these, in the Big Creek district, is for the Wordenhoff M. & M. Co., and consists of a complete 30-stamp amalgamation mill, with cyanide plant. This mill is to have both water and steam power plant, that it may be operated by either, as the case requires. Also a complete 15-stamp amalgamation mill for the Thunder Mountain Climax G. M. Co. and the Thunder Mountain H. Y. G. M. Co., together with the necessary power. Also a contract for the Idabo Gold Coin M. Co. for a dry crushing cyanide mill, with 36x16-inch improved standard rolls. In addition to this the firm reports shipping to the St. Joe Lead Co., near St. Louis, Mo., one of the largest modern lead smelting furnaces installed in that district.

Obituary.

J. BAXTER, a mining engineer of Boise, Idaho, died at Boise, May 19th.

G. RENNICK, a California mining man, died at Marysville, Yuba Co., Cal., on the 1st inst. Deceased was 38 years of age.

J. CLAWSON, assistant superintendent of the O. K. mine at Dale, San Bernardino Co., Cal., died May 25th. It appears he had started down the ladder leading into the shaft, when either his foot slipped or the timbers gave way, dropping bim a distance of 200 feet.

DAVID R. FRASER, one of the founders of the Fraser & Chalmers Co. of Cbicago, Ill. (now the Allis-Chalmers Co.), and identified with the concern until 1893, died May 31st of apoplexy. Deceased was 80 years old. Fraser was the inventor of machinery used in the mining industry.

P. H. SCOTT, consulting engineer in the Denver, Colo., office of the Power & Mining Machinery Co. of Milwaukee, Wis., died in Denver, Colo., May 24, 1904, aged 73 years. Deceased was born in Napanee, Upper Canada, and while a young man went to California during the early gold rush. He worked on the Comstock at Virginia City, Nev., as constructing engineer, and later on the Bassick mine at Querida, Colo. At one time he was associated with H. C. Holthoff and R. J. Cory as erecting engineers and contractors for mining and metallurgical plants. He bad charge of construction of the Dahlonega 120-stamp mill at Dahlonega, Ga., and also built the two chlorination plants at Colorado City, Colo.

Trade Treatises.

The Rand Drill Co. of 128 Broadway, New York City, N. Y., has issued a neat little pamphlet on air and gas compressors which it describes briefly, giving the facts and figures which those wishing to buy machinery of tbe kind referred to want to know.

"Sawmill and Woodworking Machinery" is the latest catalogue from the Eby Machinery Co. of San Francisco, Cal., and Seattle, Wash., handsomely illustrated with cuts of plants in operation, and of the varied machines for handling such materials, from the rough log to the finished mill product.

Dividends.

The Bunker Hill & Sullivan M. & Con. Co. on the 4th inst. paid dividend No. 80 of $75,000, a total since Jan. 1, 1904, of $288,000, and total to date, $1,821,000.

Latest Market Reports.

SAN FRANCISCO, June 3, 1904.

METALS.

SILVER.—Per oz., Troy: London, 25⅜d (standard ounce, 925 fine); New York, bar silver, 55c, refined (1000 fine); San Francisco, 55c; Mexican dollars, 45½c San Francisco, 44¼c New York.

COPPER. — New York: Standard, $13.12½; Lake, 1 to 3 casks, $13.00@13.12½; Electrolytic, 1 to 3 casks, $12.75; Casting, 1 to 3 casks, $12.50; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £56 5s 6d spot per ton.

LEAD. — New York, $4.40; Salt Lake City, $3.50; St. Louis, $4.25 San Francisco, $4.50, carload lots; 1¼c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, $4.85. London: £11 13s 9d ℔ long ton.

SPELTER.—New York, $5.30; St. Louis, $5.00; London, £26 ℔ ton; San Francisco, ton lots, 6¾c; 100-lb. lots, 7c.

TIN.—New York, pig, $27.00@27.20; San Francisco, ton lots, 29c; 500 lbs., 29½c; 200 lbs., 30c; less, 30¼c; bar tin, ℔ lb., 32¼@35c. London, £126 2s 6d spot.

PLATINUM. — San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $19.00 ℔ Troy oz. Platinum ware, 75@82c ℔ gram.

QUICKSILVER. — New York, $44.50@45.50, large lots; London, £8 2s 6d; San Francisco, local, $43@43.50 ℔ flask of 76½ lbs.; Denver, $46.00. Export, $43.00@43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c: No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER. — Half-and-half, 100-lb. lots, 19.00c; San Francisco, Plumbers', 100-lb. lots, 16.50c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb., .04c.

NICKEL.—New York, 40@47c ℔ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $13.60@13.75; gray forge, $12.75; San Francisco, bar, 3c ℔ lb., 3½c in small quantities.

STEEL. — Bessemer billets, Pittsburg, $23.00@23.00; open hearth billets, $23.00@23.00; San Francisco, bar, 7c to 12c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less tban 500 lbs., per lb., 7c; in 25-lb. tin pails, ¼c ℔ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER. — (Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4 and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $1.25 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $2.15@2.65 ℔ bbl.; California carload lots, $2.10 f. o. b. at works; small lots, $2.45 ℔ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY. — New York, Cookson's, 7¾c; Hallett's, 6⅝c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less tban one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE. —Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ℔ set; 14 oz., 40s., 10c.

CHEMICALS. — Cyanide of potassium, 98%–99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.20@1.40 ℔ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5½@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

COAL. — San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.00; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $11.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $11.50, long ton.

BONE ASH.—Extra No. 1, 5@6c ℔ lb. No. 1, 4@5c.

OILS.—Linseed, boiled, bbl., 49c; cs., 54c; raw, bbl., 47c; cs., 52c; Lucol oil boiled, bbl., 44c; cs., 49c; raw, bbl., 42c; cs., 47c. Kerosene—Pearl, per gal., 20½c; Astral, 20½c; Star, 20½c; Extra Star, 24½c; Eocene, 23½c; Elaine, 26½c; Water White, in bulk, 14c; Mineral Seal, iron bbls., 19c; wooden bbls., 21½c; cs., 25c; Mineral Sperm, cs., 26½c.; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 70c; Bleacbed, do., 80c; Whale Oil, cs., 52@57c.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb., 7c; less than 500 lbs., 7½c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ℔ lb.

BORAX.—Concentrated, 6@7c ℔ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ℔ lb., 60c.

SODIUM.—Metal, ℔ lb., 50c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.00 ℔ lb.

CHROMIUM.—90% and over, ℔ lb., $1.00.

PHOSPHORUS.—American, ℔ lb., 70c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ℔ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HYDROCARBON OIL BURNER.—No. 760 818. May 24, 1904. L. J. Strait, San Francisco, Cal. This invention consists of an oil reservoir or chamber, means for automatically keeping up a supply of oil within it, pipes connecting the steam space of a boiler with the space above the oil in the chamber, and means for automatically regulating the pressure, pipes leading from the oil space and the steam above it to a common burner, through which they discharge, and means for automatically regulating the supply of fuel to correspond with the steam requirements of the boiler, said means being controlled by the increase or decrease of steam pressure within the boiler.

GRAIN CLEANER. — No. 760,832. May 24, 1904. Wm. Williamson, San Francisco, Cal: one-half assigned to C. J. Williamson and H. E Williamson of same place. This invention consists in the combination, with loosely suspended, superposed and connected shoes containing suitable screens, of a fan by which a blast of air may be discharged, two pairs of eccentrics upon said fan shaft, one pair being connected with the upper and the other with the lower shoe, substantially at right angles with each other, and a means for adjusting the second pair of eccentrics to increase, diminish or reverse the stroke and to make a reciprocation with any desired relation to the first pair of eccentrics. In conjunction with this device is a superposed hopper and a means for directing a blast through the space between the hoppers, and thus separating out the larger chaff and straw before the grain reaches the screen-carrying shoe.

COMPRESSIBLE PISTON PACKING.—No. 760,632. May 24, 1904. J. C. Kitton, San Francisco. Cal. This invention consists in forming the piston with a reduced portion or chamber between itself and the inner sides of the cylinder in which it operates and in the employment of a sleeve inclosing the piston rod and passing with it out through the gland or stuffing box, said sleeve being movable with relation to the piston rod and having its upper end forming one portion of the piston chamber. Within this chamber a suitable compressible packing is placed, and this can be moved or adjusted from the outside without opening the cylinder.

OIL BURNER.—No. 760,826. May 24, 1904. G. B. Von Boden, Sacramento, Cal., and E. F. Ingles, San Francisco, Cal. This invention relates to an atomizer or burner for use in the utilization of petroleum o · other liquid or pulverized fuel to produce steam or generate heat for any purposes; but it is designed particularly to generate steam for locomotive, stationary and marine boilers. The particular feature of the device consists in combining the fuel and vapor on or above a lip or plane having a smooth or irregular surface projecting in front of the oil and steam discharge and slightly below the latter for the purpose of more thoroughly mixing the discharge or controlling its movement before passing into the fire.

New Patents.

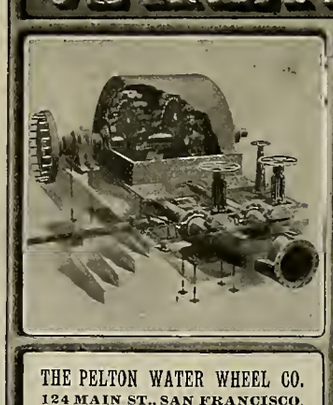
DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING MAY 24, 1901.

761,029.—ELECTRIC BELT—F. H. Brown, Los Angeles, Cal.
760,608.—MANIFOLDING TABLET — H. P. Brown, S. F.
760,609.—MANIFOLDING BLANK — H. P. Brown, S. F.
760,610.—SHINGLE MACHINE—F. W. Burpee, Fairhaven, Wash.
760,729.—OIL BURNER—J. G. Camp, Sacramento, Cal.
760,730.—ACCORDION—R. Carbonari, S. F.
760,777.—DISH WASHER—C. S. Chamberlain, Emeryville, Cal.
760,780.—DOOR OPENER—J. F. Connell, Los Angeles, Cal.
760,530.—MANGLE—J. W. Durr, Portland, Or.
760,982.—MITER BOX—W. H. Gordon, Portland, Or.
760,691.—PROSPECTOR'S PAN—B. P. Herndon, Florence, Ariz.
760,996.—CAR STEP—E. Howe, Everett, Wash.
760,539.—TREATMENT OF ORES—W. J. & J. H. Jory, S. F.
760,632.—PISTON PACKING—J. C. Kitton, S. F.
760,910.—COPY HOLDER—M. L. McAloney, Seattle, Wash.
760,472.—LACED SHOE—G, T. McGuinness. S. F.
760,798.—CIRCUIT BREAKER—A. C. Miller, Corona, Cal.
760,641.—TROLLEY POLE—A. W. Morgan, Long Beach, Cal.
760,552.—SPRING BED—L. P. Norton, Los Angeles, Cal.
760 553.—TABLE—D. F. Oliver, S. F.
760,753.—POT COVER—C. H. Pickett, Eugene, Or.
760,703.—OIL BURNER—A. C. Rush, Los Angeles, Cal.
761,049.—ORE FURNACE—W. H. Smyth, Berkeley, Cal.
761,050.—ORE FURNACE—W. H. Smyth, Berkeley, Cal.
760,496.—BOTTLE—S. N. Sparks, Everett, Wash.
760,818.—OIL BURNER—L. J. Strait, S. F.
760,819.—CORD ADJUSTER—H. E. E. Strunk, Upland, Cal
760,826.—OIL BURNER—Von Boden & Ingles, S. F.
760,678.—VAPORIZER—White & Duryea, Los Angeles, Cal.
760,596.—PUMP HEAD—W. & H. M. Williams, Lordsburg, Cal.
760,832.—GRAIN CLEANER—W. Williamson, S. F.
760,510.—ROASTING FURNACE—L. T. Wright, Keswick, Cal.

THE CALIFORNIA DEBRIS COMMISSION having received application to mine by hydraulic process from Geo. E. Waggoner and David Upton, in Telegraph Mine, at Indian Diggings, El Dorado County, Cal., draining into Indian Diggings Creek which reaches Cosumnes River, gives notice that meeting will be held at Room 96 Flood Building, San Francisco, Cal., June 20, 1904, at 1:30 P. M.

PELTON WATER WHEELS



THE PELTON WATER WHEEL CO.
124 MAIN ST., SAN FRANCISCO.
147 LIBERTY ST., NEW YORK.

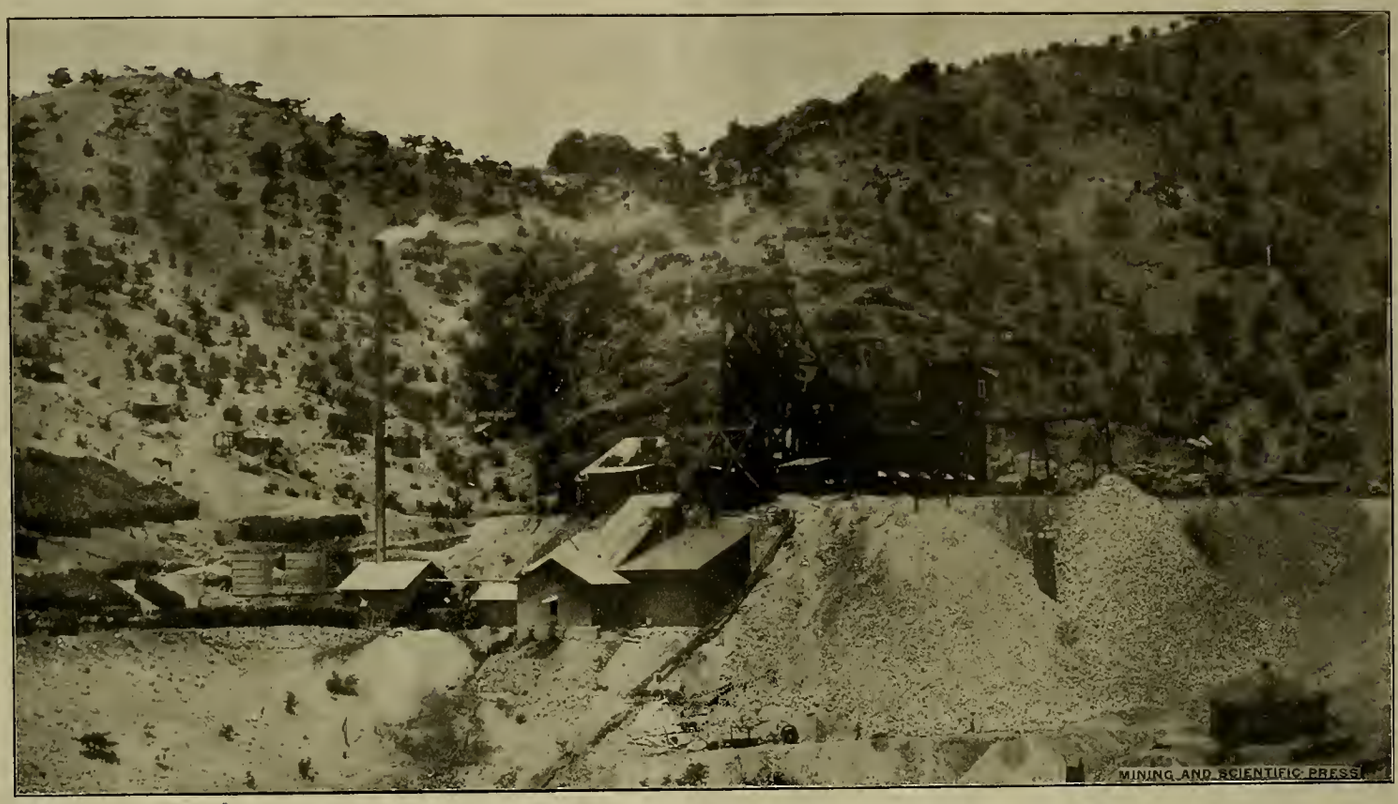
THE Pelton Water Wheel Company has just been awarded a contract from the Washington & Oregon Power Co., Walla Walla, Washington, covering three multiple Pelton units, each having a maximum capacity of 1000 h.p. operating under a head of 360 ft.—direct-connected to electric generators, running at a speed of 600 r.p.m. Also two exciter units similarly driven. The power is to be transmitted electrically and used for general industrial purposes throughout Southeastern Washington and Northeastern Oregon.

MINING AND SCIENTIFIC PRESS.

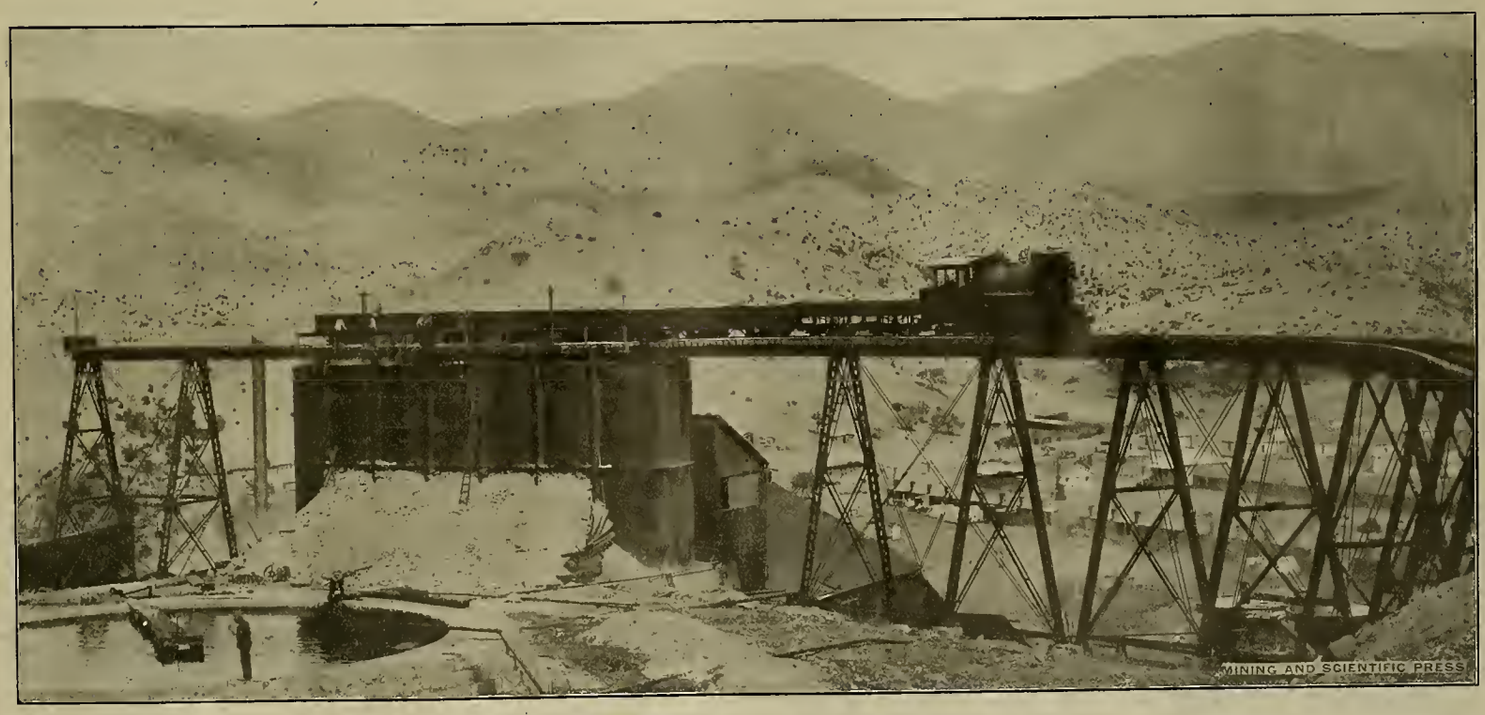
Whole No. 2290.—VOLUME LXXXVIII. Number 24. SAN FRANCISCO, CAL., SATURDAY, JUNE 11, 1904. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Mining Enterprise in Mexico.

Mexico is rapidly taking a place among the important mining countries of the world. The mineral resources of that Republic have long been known, but it is only within recent years that they have attracted marked attention from capital. There is much about Mexican mines attractive to capital, but without doubt one of the foremost incentives for monied men to undertake the development of Mexican mines is the absence of labor trouble of any sort. Mexico is not a good country for the walking delegate to attempt to exercise his autocratic sway, and knowing this he studiously avoids taking any such risks as the pursuit of his peculiar calling involves. The class of mines which attract the greatest attention and those most sought are large gold-bearing veins. The native Mexicans understand silver milling, and extract by their primitive, but effective patio process, a large percentage of the white metal, but for some reason they have given less attention to gold mining. In modern Mexico the mines having the greatest attractiveness are the antiguas—old mines abandoned many years since—and those in which mining was discontinued on account of carrying operations below the drainage level, may be looked upon with some favor, but the idle dry mines should be approached with caution, as when the Mexicans failed to make a mine pay it may be assumed that the elements of success are of doubtful character.



Main Shaft, Moctezuma Copper Co., Dos Pilares Mine, near Nacozari, Mexico.—See Page 393.



Ore Bins and Mill, Moctezuma Copper Co., Nacozari, Mexico.—See Page 393.

Mistakes in Cyaniding.

In view of the fact that the manipulation of the cyanide process requires more than an ordinary knowledge of chemistry to understand the complicated reactions that take place, it is a matter of surprise to note how many there are who without this very necessary fundameutal knowledge undertake to operate cyanide plants. Mistakes are of more than common occurrence—they are abundant, due to lack of knowledge. Not only is this true of the chemistry of the process, but iu the mechanical department as well, and these mistakes are by no means limited to the small operators. As an instance may be mentioned one where a retaining wall was built and the rock removed in grading the hillside for the plant was dumped into the space between the wall and the hillside. On this insecure pile were placed large tanks, which were set directly upon the "made" ground, no sills being first laid. The natural result followed. The first time the tanks were filled to overflowing—something likely to occur in any similar works where particular mechanical means are uot provided to prevent it—the solution saturated the loose ground, and in a few hours the tanks were badly out of level, necessitating much expense in reconstruction and adjustment, all of which might have been avoided had a competent engineer beeu employed at the outstart. Since those high in the profession continue to disagree about certain more or less important chemical reactions, and the methods to be employed, it seems a waste of time for those wholly unfamiliar with the process and its iutricate details to attempt it, but many do nevertheless, and often with a meed of success scarcely to be anticipated. The cyanide process is always an experiment. No one can say that any particular ore cannot be successfully treated until the test is made. Apparently similar ores often give widely differing results under the same treatment. Raw sulphides yield up their gold more readily to the process on the Rand in South Africa than anywhere else where this has been attempted thus far, and that with relatively coarse crushing. Elsewhere very fine grinding or roasting have been found essential to success in treating pyritic ores. Flinty ores containing extremely fine gold or gold associated with tellurium seem particularly adapted to it, but the results obtained are not always by the same methods, nor at anything like a similar cost. Ores in South Dakota are mined and profitably treated at a cost below that of treatment alone in the Cripple Creek district of Colorado, which makes the low grade ores of Dakota—carrying $4.50 to $5.00 per ton—valuable, while those of Cripple Creek containing an assay value of double this amount are worth nothing at present, though in time changes in the process and additional knowledge may make this class of ores available—at least, the history of the process in the past leads to that conclusion.

Reaping the Whirlwind.

Within the week the entire civilized world has been startled and horrified by the dastardly murder of eleven men at Independence, Colo., whose only "crime" was in the fact that they were engaged in giving an honest day's work for a reasonable—and to them satisfactory—day's pay, and that they preferred to live, act and work independently, refusing to ally themselves with the miuers' union of that district. Ever since the organization of the association known as the Western Federation of Miners in the mining regions of the West, there has been a state of unrest where they have become strong, and clashes between the members of the Federation and mine operators have beeu frequent and bitter. Just what the teachings and tenets of the Western Federation are, thosc outside of that organization cannot reasonably claim to know, but the world judges what they must be by the acts of violence committed at times wheu this organization has had difficulties with miue operators.

Years ago in Pennsylvania there grew up a stroug secret organization of miners, known as the "Molly McGuires." This name soon became a synonym of all that was brutal, fiendish and lawless. Those who refused to yield to the dictates of this organized band of cutthroats were ruthlessly murdered. At great cost of money and sacrifice of human life this organization was finally broken up, and those of its leaders who were not hanged scattered throughout the mining regions of the West. The first indication that a similar organization had grown into power in the West was in Shoshone county, Idaho, where they ruled for a time with an iron hand. Finally they became so autocratic and uureasonable in their demands that the mine operators of the Cœur d'Alene refused longer to submit. Then followed a reign of terror. Men were waylaid and beaten, and others were shot when in the peaceful pursuit of their business. Still others were warned to leave the country. The trouble finally culminated in 1899 in the complete destruction by dynamite of the Bunker Hill and Sullivan mill at Wardner. Troops were sent into the country and the Westeru Federation men were driven out. They scattered into other Western States and into British Columbia, and extended and strengthened their organizatiou, and as a result in many camps, where peace and prosperity only had been known for years, followed strikes, bloodshed and the destruction of property. Intimidation was the weapon usually employed, and threats backed up by their activc execution drove many men into the ranks who preferred to remain outside of them.

Colorado particularly became the scene of frequent strikes, followed by violence. In almost every mining State the mine owners and operators were driven to organize protective associations to resist by organization the intolerant demands and threats of the Federation. In San Miguel county the long drawn contest between union miners and mine operators resulted in the assassination of A. L. Collius, superintendent of the Smuggler-Union mine, on November 19, 1902. This so incensed the law abiding element of that section, that with the assistance of the military many union miners were driven out, and for months the district was under martial law. Other troubles have since occurred throughout Colorado, and among them was the blowing up of the Sun and Moon electric plant at Idaho Springs by union miners or their sympathizers last fall. Closely following this on November 21, 1903, the superintendent and foreman of the Viudicator mine at Cripple Creek, while descending the shaft of that mine, were instantly killed by an infernal machine placed at a disused station. The individual perpetrator of this crime has never been discovered. Since then the agitators have been more quiet than before and the labor condition in Cripple Creek district was considered very much improved, as nearly all the mines were operating, though the majority of men employed were not members of the union, or were those who had resigned from the union in order to secure employment.

Between 2 and 3 o'clock A. M. of the 6th inst. the most dastardly of the long series of crimes, committed in aid of the cause of uniouism, was perpetuated when eleven non-union miners were blown into eternity and many more seriously injured by an infernal machine similar to that employed in the Vindicator outrage. This is supposed to have consisted of a large amount of dynamite which, having been placed beneath the depot at Independence, was discharged as the men collected on thc platform to take a train for their homes, after coming off shifts from the neighboring mines. It is believed, from evidence found, that the explosiou was effected by the discharge of a revolver secured to the platform timbers, the trigger being pulled by means of a wire which had been laid nearly 300 feet to the shaft house of the Delmonico, a neighboring mine. Can anyone conceive a plot more fiendish, morc cold blooded, and revengeful? It was not done in the heat of passion, but was the result of cold and remorseless calculation. These honest toilers werc hurled into eternity without an instant's warning, simply because they preferred to work rather than lie idly about for months waiting for the mine owners to submit to unreasonable dictation.

No one believes that the rank and file of the Western Federation approves of such murderous methods of obtaining the success of their aims, but without doubt the inflammatory speeches by their leaders and such disreputable characters as "Mother" Jones and others—who live at the expense of these misguided men—are responsible for crimes such as are above described.

Here is an example of "sowing the wind and reaping the whirlwind." Every Westeru Federation miner in Colorado is considered by the law-abiding people of that commonwealth as in a measure culpable for this—the climax of a long list of atrocities—and the leaders as directly responsible, and the people of the Cripple Creek district, aided by civil and military authorities, have started in to purge the county of Teller of an element dangerous to its existence. It has become evident that neither life nor property are safe as long as this element remains, and the mine and property owners are determined it must go. Union men are being deported from the district in large numbers and warned never to return. How far-reaching the reactionary effect of this crime will be it is difficult to say at this time, but it is bound to have a salutary effect—though at what a terrible cost!

THE recent completion of the Poland tunnel through the northern Bradshaw mountains, near the head of Lynx creek, in Yavapai county, Ariz., should mark a new era in the prosperity of the mining industry of that sectiou. Iu that vicinity are a great many mines in various stages of development. As a class they are not among what are generally considered free-milling mines, the ores being for most part sulphides of the base metals. Heretofore these mines have found the topographical situatiou a serious drawback to their development and operation; but the completion of the tunnel, through which a railroad is constructed, will render many of these properties easily accessible, so that the orcs may be shipped at a profit, or machinery may be set up at the miues to treat the ores, whichever seems the better course from an economic standpoint. The values are largely in the gold and silver contents of the ores; but in most cases, as by-products of greater or less importance, are also copper, lead and zinc. The separation of the sulphides of the several base metals is now comparatively easy iu the light of modern knowledge and methods, and ores which only a short time ago were commercially without value are now brought within the range of profitable reduction.

CONCENTRATES.

A SUITABLE GRADE for tracks in mines is 5 inches in 100 feet. A grade greatly in excess of this is too heavy for tramming empty cars up grade.

✣✣✣✣

ANY arsenic in ores being treated hy cyanido process tho arsenic will bo precipitated in the zinc precipitation boxes. Precipitates from such boxes must be refined with much care, as the arsenurated hydrogen evolved is a deadly poison.

✣✣✣✣

SLIMY ORES are estimated to average about 30 cuhic feet to tho ton. Dry sand will pack whon dampened and occupy loss space than before. Whon figuring on tho contents of a tailings pile tho calculations should be mado en a hasis of dry sand.

✣✣✣✣

IT has hoen decided by the Supreme Courts of several States that a tunnel cannot be driven threugh the prepcrty of another to reach ground beyond. If A starts a cresscut tunnel on his own ground, and undertakes to reach a claim located beyond B's claim, B may stop A, if he is so disposed.

✣✣✣✣

THE only instance known to "Concentrates" whero a drain tunnel is utilized as a means of transportation by water underground is at the mines of Clausthal, Germany, whero a large tunnel was employed as a "navigablo stream" to float ore laden boats, which conveyed the ore from the loading chutes to tho cencentration works.

✣✣✣✣

TALCOSE gold-bearing ores have been successfully worked by the cyanido process in Montana, by the decantatiou method. The gold usually occurs in talc, in extremely thin sheets—tbinner, if possible, than geld foil. It disselves readily, but the difficulties encountered are in classifying the solution and removing what remains of it frem the slimy sludge after decantation.

✣✣✣✣

AT many of the Butte, Mont., mines the water pumped or hoisted from the mines is run into tanks containing scrap iron, upon which the copper contained in the water, probably as sulphate, is precipitated in the metallic form. These waters are acid and rapidly corrode ropes and iron work in the shafts and about the surface works that they may reach.

✣✣✣✣

WHEN designing a stamp mill in which concentrating machines are to be operated, provision should be made for a separate means of power for the concentrators, to insure steady running. Concentrators operated by the same power—water wheel, steam engine or other motive power—are usually affected when the heavier machinery starts or steps. Particularly is this noticeable with the intermittent working of the rock breakers.

✣✣✣✣

VALVES on water pipes should he closed slewly or the "water hammer" incident to the sudden closing of a tap or valve may cause the pipe line to burst at any point between the valve and the reservoir or pressure box. This is due to the sudden stoppage of the water in motion, and the danger increases with the increasing size of the valve. For this reasen large valves or gates are so made that they can only he closed slowly with a screw.

✣✣✣✣

THERE are conditions under which stoping may be carried on with little or no timber. Such conditions, however, do not always exist. Some mines occurring in limestone, and in massive formations of tuff in dry regions, are among these that it is pessible to work extensively without timber. Methods of stoping with a minimum of timber were described in the MINING AND SCIENTIFIC PRESS, in the issues of February 13 te March 12, inclusive.

✣✣✣✣

THERE may appear to be some error in the statement that tailings after concentration contain a higher percentage of lead sulphide than was found in the original ore. This is due to differential separation of the sulphides. Where zinc sulphide is also present in considerable quantity, if it is removed by any process of concentration te a greater extent than the lead sulphide, the latter may appear in the tailings to contain a higher percentage of lead sulphide than the original ore.

✣✣✣✣

WHAT is known as the "rhombohedral theory" in relation to vein formation was intreduced by Louis Janin in the case of the Pennsylvania Mining Co. vs. the Grass Valley Exploration Co. of Grass Valley, Cal., and conceives that certain vein formation in those claims was due to the jointing planes of the rocks breaking the rock masses inte rhembohedral blecks, or forms approaching a figure of that description, and that the veins, or certain parts of them, were formed along these jointing planes.

✣✣✣✣

FAILURE te perform the necessary amount of assessment work on an unpatented claim will result in the forfeiture of the claim should it be taken up by another. Where there is more than one partner, the fact that one partner performs his share of the work will not save the claim. The Government requires not less than $100 worth of work, and this must be performed by some one of the owners, if not by all concerned. The only recourse of the one doing the work, in the event of failure of the co-owners to do their share, is to advertise the delinquent non-contributors out, as required by law. As perfect a title may be secured in this manner as in any other.

✣✣✣✣

THE depth to which mining may be carried has never been determined, except locally. In some instances it has been determined by economic conditions; in others by physical conditions, such as large floods of hot water, or high temperature of the air and surrounding rocks. Is is holieved that from a mechanical standpoint equipment may be provided which will enable the sinking of shafts and the operation of mines to a depth approximating 10,000 feet. At present, about 5000 feet is the limit. It is probable that the only inducement required to carry mining oporations to a dopth of 2 miles is rock sufficiently rich to pay a profit on the operation.

✣✣✣✣

WHERE the tailings in a gold mill are worth $2.50 te $3 after amalgamation and cencentration on a machine, it is probable that a large percentage of theso values may bo saved by sending the pulp to a spitzkasten or some form of hydraulic sizer, which will produce a separation of coarse and fine particles, then sending the coarse material discharged from the bettom of the box to a shaking table, and the fine slimes overflowing to a belt machine. If these operations are carefully carried out hy a competent, experienced operator, there will prebably be a very noticable lowering of values in the tailings—in some instances, no doubt, making an accessory cyanide plant unnecessary.

✣✣✣✣

WHERE a placer location, whether in a modern stream or an ancient river channel like those of California, is properly made, and is in valid existence, no outsider may enter the placer for the purpose of prospecting for a vein or lead, no matter hew strong the belief may be that a voin exists there, owing to surrounding geological conditions. A quartz claim cannot be located without a discovery and as a discovery under the alluvial and gravel of a placer claim, or beneath a lava-capped ancient river channel is impossible without sinking a shaft or driving a tunnel, such discevery cannot be made hy the stranger, as he may not enter within the boundaries of the placer claim for the purpose of prespecting, as he is a trespasser.

✣✣✣✣

IF there is any suspicion that the fuse being used is defective, make actual tests of pieces from several coils. Cut the pieces 3 feet or more from each coil and light one end of all the pieces simultaneously and notice if there is a material difference in the time of burning through to the opposite ends. In case such discrepancy in time is very noticeable, the fuse is unreliable. It is net expected that a second or two on a short piece of fuse should condemn it; but half a minute or mere on a 3-foot piece is an indication that the fuse is irregular, and further tests should he made, and, if the results seem to justify it, the fuse should he condemned as dangerous. Tripple tape fuse should he used in wet holes, and it is also the safest to use under any circumstances.

✣✣✣✣

THE law requires that the end lines of mining locations shall be parallel, but it is not essential that these end lines cross the vein or lede at right angles. As the end lines projected in the direction of the dip determines the extralateral right, and the end lines may he so placed as to give this right in a direction not at right angles to the strike, so that the extralateral right may be taken somewhat more along the strike than along the dip. Ore shoots usually have a trend to the right or left of a line normal to the strike, and if this direction of trend of an ere shoot can be ascertained before finally marking the boundaries of a claim, this knowledge may be taken advantage of and the extralateral right may then conform more completely to the downward extension of the ore bodies than if the end lines were laid at right angles across the vein.

✣✣✣✣

WHERE the pressure gauge at the entrance of a hydraulic giant shows a pressure of sixty pounds per square inch, the pressure at the nozzle will be slightly less than that at the point ef entrance to the giant. Troutwine gives the following fermula for determining the pressure at any point in a pipe line: "The pressure head of running water upon any point in a pipe between the orifice and the reservoir is equal to the total head on that point minus (the head due to the velocity at that point + the entry head + the head consumed in overcoming resistances in the pipe between the reserveir and the point). The static pressure at any peint in a pipe line is determined by the head above that point, but when the water is in motion the pressure may be determined by the above formula. The velocity is much greater at the nozzle than at the entrance to the giant, but as abeve stated the pressure is lewer."

✣✣✣✣

THE federal statute requires the discovery of "mineral hearing rock in place" before a valid location can be made, though many mining claims are located without having a discovery of prefitable ore. In some States a period of time—from 30 to 60 days—is allewed for prospecting purposes. The law does not say or require that the mineral discovered shall he of a commercially profitable character, or that it shall contain a stated amount of metal or mineral of any particular kind. It has been frequently said, says "Lindley on Mines" that a valid location may be made whenever the prospector has discovered such indications of mineral that he is willing to spend his time and money in following it, in expectation of finding ore, and such location may be made of a ledge deep in the ground and appearing at the surface, not in the shape of ore, but as vein matter only. Doubtless a discovery made by means of a diamond drill, er even a churn drill, would form a sufficient basis upon which to base a mining claim, whero flat or nearly flat ore bodies eccur beneath sedimentary formations or sheets of perphyry, as at Leadville, Colo., or in the Terry peak region of South Dakota.

✣✣✣✣

IT is ofteu difficult to ascertain the hardness of a mineral, owing to the condition in which it occurs. A hard mineral which is in a granular and friable condition may seem much softer than a compact mineral of inferior hardness. The artificial mineral carborundum is an example. It has a hardness equal te or exceeding cerundum, being 9 in the scale of hardness, yet owing to the fact that it eccurs as a greup of small incoherent crystals it seems much softer than massive quartz, which is 7 in hardness. Carhorundum, as it comes from the electric furnace, can usually be disintegrated with the fingers, but a small crystal will give an idea of its hardness by scratching the face of a quartz crystal. Some minerals are harder on one crystal face than on anether. The mineral cyanite, also called disthene, is an example of this peculiar property. The hardness ranges from 5 on one face to 7.75 on another.

✣✣✣✣

THERE is not the same relation between the lead and silver in slags from lead furnaces as between the copper, silver and gold in slags from copper furnaces. When lead furnace slags are low in lead and silver there must be a definite and constant ratio between the iron, lime and silica forming the principal constituents of the slag. In cepper smelting no such ratio seems necessary, as a slag may vary widely in its silica content, and still the slags be almost free frem copper, silver and gold. The cepper smelter, in considering the formation of new slags, is guided to a great extent rather hy commercial than by chemical or technical considerations. Skill in furnace manipulation and proper equipment may result in making a slag nearly free from valuahle metallic constituents, yet it is considered easier and better to make a mere siliceeus slag on this without additienal fuel. Where the copper centent in the ore is low a siliceons slag is considered by some of the most successful smelters as ahsolutely necessary to success.

✣✣✣✣

IN theory one ounce of zinc decompesed by a gold-bearing cyanide solution should precipitate six ounces of gold, but in practice it is found that a much larger quantity of zinc is required per ounce of gold recovered. This is thought to he due to the fact that an excess of cyanide in the solution decompeses the greater amount of zinc. It is a fact, however, that the preeipitatien of gold from cyanide solutions is more rapid and perfect from stronger than from weak solutions. To hring this about, the solution is strengthened by adding strong solution constantly from a barrel or tank centaining it, and placed at the head of the precipitation boxes. The strong solutien is allowed to drip steadily into the weak gold-bearing solution while precipitation is in progress. Where copper precipitates on zinc shavings in the cyanide precess, the precipitatien of this metal may be checked by strengthening the solution as abeve suggested, as it has been found that copper precipitates much more readily from a weak than a strong solution. It is claimed hy Park that generally where the zinc shavings are first dipped into a 10% selution of lead acetate until cevered with a coating of the lead the gold will he precipitated more rapidly, and that no copper will be precipitated, even from the weakest selutions. Where the lead acetate fails to give satisfactory results, better success resulted frem dipping the zinc shavings inte a weak solution of mercuric chloride until coated with a film of mercury. The gold precipitates readily and the mercury is recovered, and dees not pass into the bullion, as does the lead by the previous method.

✣✣✣✣

MECHANICAL ENGINEERS are net agreed upon the relative merit or value in heisting from great depths of plants located wholly at the surface or partly on the surface and partly below ground. Stage winding has generally come to be leoked upon as necessary or advisable in depths exceeding 5000 feet; but some think that stage winding may be best accomplished by placing the hoisting plant on the surface, sinking a vertical shaft directly to the depth required—6000 feet or more—and dispensing with any offset in the shaft, such as would be necessary in the case where the machinery for the lower lift is placed under ground. Where the winding plant is placed en the surface in a relay lift, the principal advantage for such an arrangement would be in the fact that the winding reels or drums would only be required to wind about 3000 feet of cable instead of 6000 feet. The rope operating the lower skip would be placed beneath the upper skip. At a 6000-foot shaft, when the upper skip was at the surface the lower skip would be at the relay station 3000 feet below, where it would dump automatically. The two skips would then descend—the lower one te the 6000 level to be reloaded and the upper one to the 3000 level, where it would automatically take the load deposited in the ore pocket hy the lower skip on the last trip. This system admits of only operating a single level, but is designed to work in a vertical shaft which has been sunk to exploit a flat or low-lying vein, such as the Lake Superior copper deposits or the conglomerate beds of the Rand in South Africa.

The Nacozari District of Mexico.*

Nacozari, Sonora, Mexico, is 78 miles south of Douglas, Arizona, and has recently been connected with the latter city by railroad. The Nacozari road has been building for three years past and for a year has had its terminus at Cos, 22 miles north of Nacozari, necessitating freighting of copper out and fuel and supplies in, and the discomforts of stage travel for passengers.

Phelps-Dodge Co. own the principal interests at Nacozari, under the name of the Moctezuma Copper Co., and it is their capital which has constructed the railroad. They have a smelter and concentrator there for the reduction of ores of their Dos Pilares copper mine, situated 6 miles southeast of the plant and connected with it by a narrow gauge railroad. The operation of the mine and works has always been carried on under difficulties due to lack of transportation facilities. Fortunately the mine required little timber, there being stopes (the largest 150x125 and 80 feet high) without a stick of timber in them. Gas engines supply the motive power of the plant.

Simultaneously with the building of the road has been the erection of the Copper Queen smelter at Douglas and the constructing of a mile-long tunnel through the mountain connecting with the Pilares shaft at the 600 level. This last piece of work is now almost completed and will facilitate the production and transportation of ore, for instead of hoisting by a shaft and dropping by a tramway to the railroad level, it will now be dumped down shoots to bins in the tunnel and drawn off directly into the cars.

This mile of tunnel cut a total of 600 feet of ore in different places which previously had been unknown and which will now be developed. The Dos Pilares ore is chalcopyrite and while of low grade is good concentrating ore. The concentrator has at present a capacity of about 300 tons per day. It is likely that the smelter will be discontinued and the concentrates sent to the Copper Queen smelter at Douglas when transportation runs smoothly, but this is not likely to be done for six months.

The company has a number of private houses for its employes, beside a general boarding-house, and a hotel is now being erected.

The company operates two stores, one at the mine and one at Nacozari, where it also has an ice plant and a hospital. Apart from the town on a neighboring slope are the residences of Manager Jas. Douglas, Superintendent Williams and the company physician.

The greater part of labor employed is Mexican, which is largely depended upon in this country.

Northeast of Nacozari a distance of 6 miles is Huacal gold district, with El Globo on the eastern extremity, San Jose midway and Churinibabi on the north. All of these properties, while now idle for various causes, have been extensively developed. El Globo is owned by the Romadkas of Milwaukee, the San Jose by a French company, with M. Clere in charge, and Churinibabi by the Moctezuma Copper Co.

Scattered along this strip are many prospects of more or less merit. Among them is the New York, owned by W. L. York and M. Bridgeman, which has been shipping sixty tons per month from development work, very little stoping having been done. There are now 800 feet of work done, which is said to have been more than paid for by the ore taken out. It is a gold and silver ore. The property, consisting of twenty-six pertenencias, occupies the west spur of Huacal mountain. El Globo is on the east of the same mountain.

Another property is the Providencia, which is developing under the direction of F. P. Thomas.

Edward E. Miller and Henry Eisenhart also own property in the neighborhood, while Spencer Shaw and H. G. McCulloch are doing development work on the Monterey. The Sonora Land & Mines Co., F. M. Watts, manager, owns thousands of acres of land in the vicinity, they, with the Moctezuma Copper Co., being the most important land owners in Moctezuma mining district.

At present it is not proposed to extend the railroad to Moctezuma and Cumpas, 40 miles south of Nacozari, but when this is eventually done it will open up one of the most promising districts of Sonora.

Ysabel station, on the Nacozari road, is the shipping point of El Tigre mine, which has come into prominence during the past two years and is now a steady producer of high-grade gold ore. It is 30 miles east of the railroad on the Yaqui river. At present it is shipping five tons per day, which it is said averages about $250 per ton. The original purchase was 311 acres, which comprises their most important holding, though the property has since been increased to 600 acres. The ledge is from 4 to 20 feet in width and is cut by canyons in four places. From these it is worked by tunnel and upraise. The pay ore blocked out averages about 10 feet wide and $30 per ton. Though some bodies of it are of higher grade.

Present plans of the company, of which B. F. Graham of Douglas is president, are to put a 100-ton mill on the river connected by a 12-mile narrow gauge road with the mine, and concentrate the low-grade ore while continuing to sort and ship the high grade. A branch road from Ysabel is among the possibilities, as there are other producing properties in the neighborhood, among them the Ray and the Cinco de Mayo.

A short distance south of Ysabal is Turichachi, shipping point of El Picacho mine, 35 miles west in Bacoachi district on the Sonora river. This is a Phelps-Dodge gold property and has been undergoing development for about three years. For the past two years it has been a shipper of high-grade ore.

In the Ceniza mountains, about 16 miles southeast of Douglas, the most important mine is the Santa Rosa. The district has been taken up by locations and there are several good prospects being developed.

The Copper Queen smelter is responsible for much activity throughout this section. It has four furnaces in operation and a fifth almost ready to be blown in. The probability is that the Bisbee, Globe and Nacozari ores will be brought here for treatment in the course of time. Custom ores are bought to furnish proper combinations for fluxes.

The Calumet & Arizona smelter is operating two furnaces and turning out their customary amount of copper.

* See illustrations on front page.

Hook to Prevent Overwinding.

TO THE EDITOR:—Noticing that the problem of preventing overwinding has engaged the attention of many since the accident at the Independence mine at Cripple Creek, I wish to offer my quota to the literature on the subject.

The disengaging hook here shown is intended to avoid accidents in overwinding by releasing the rope

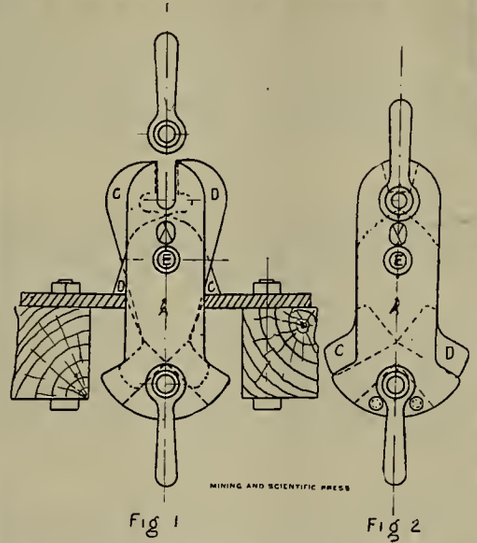

Fig 1 Fig 2

from the cage and at the same time suspending the cage. The action of the hook will be readily understood by comparison of the figures 1 and 2.

The thimble or collar plate is secured close under the pithead sheave and will support the cage when the rope is released. The hook is made up of four leaves, the outer two riveted together with a packing piece between at the bottom. The inner two leaves are held to place by the through bolt "E," about which they are free to revolve through a small arc, sufficient to open the slot for the release of the hook above, which is, of course, attached firmly to the winding rope. A small copper rivet "A," insures the hook against release, unless in actual cases of overwinding. This copper rivet is easily sheared by the action of the thimble against the inner leaves. The letters "C, C, C" refer to one inner leaf, the letters "D, D, D" to the other.

A modification of this hook is one which does not suspend the cage, in which case reliance is placed upon the usual safety catches. Either one of these devices is a sure thing, and may be applied to vertical or incline shafts with no alterations to existing arrangements, and will satisfy the most exacting Government regulation.

A recent contrivance on a winding engine to prevent overwinding consists in an automatic brake which is firmly set when the cage passes a given mark. This is not always applicable, as there are cases where not over 2 feet of overwinding room is to be had above the required station, and the automatic brake would not have time to work, in the 2 feet, or it would be set too quickly and so interfere with the regular work.

We have heard recommended a great catapult so set that it should be released by overwinding and strike the engine driver such a blow as would send him to kingdom come, there to give his excuses. This is hardly worthy of this, the engineering age, but illustrates the feeling most of us have in the matter, who entrust our lives to these contrivances.

D. E. BIGELOW.

Boulder, Western Australia, April 30.

A Dome of Lepidolite.

One of the striking features of the California exhibit at the St. Louis Exposition will be a dome of lepidolite, surmounted by a shaft and ball of the same material, as shown in the accompanying illustration. Lepidolite is a variety of lithia mica, of

Dome and Shaft of Lepidolite, California Exhibit, St. Louis Exposition.

colors ranging from white through shades of silvery gray, and varied shades of violet. The mineral is bright and glistening and much of it contains radiated groups of the pink tourmaline—rubellite. This mineral is obtained at several localities in San Diego county, Cal., notably at Pala, and near Mesa Grande. The structure is 25 feet in height, the dome being 9 feet above the floor and 12 feet in diameter. The interior of the dome is formed into a grotto, which is lighted by electricity. It will form one of the most conspicuous and attractive of the mining exhibits. Beyond the dome and column is an arch, shown in the illustration, which is now completed. It is made up of various mineral exhibits and is also an attractive exhibit. These structures have been erected under the direction of L. E. Aubury, State Mineralogist of California.

Gold Mining in Nova Scotia.

A large plate glass model of the Canadian Geological Survey, to illustrate the forty-nine gold mining districts of Nova Scotia, has been prepared for exhibition at the St. Louis Exposition. The model was prepared by E. R. Fairbault of the Canadian Geological Survey, and is considered an improvement on the one exhibited at the Paris Exposition. The section represented, 1 mile long by 2000 feet wide and 2000 feet deep, shows by lines of different colors the veins at the surface and in the working to a depth of 475 feet, the probable succession of deeper veins, their richest portions on the north and south dips, and the direction that should be followed in deep mining.

On the model are given the following explanatory notes: The gold-bearing rocks of Nova Scotia cover an area of some 5000 square miles along the Atlantic coast. Their total thickness is about 27,000 feet and they are probably of the Lower Cambrian age. Siuce their deposition on a sea floor they have been folded into a series of anticlines and synclines, roughly parallel with the coast line, the folds having an average distance of 3 miles apart. This folding was accompanied by a fissuring of the strata along the planes of sedimentation at the summits of the anticlines and gave rise to a succession of superposed saddle-shaped auriferous veins.

Mining operations have so far been confiued to the veins outcropping at the surface and have not reached a greater depth than 600 feet, and although often conducted in a very unskillful manner they have been remunerative. The recent study of this region by the Geological Survey has proved conclusively, however, that the auriferous saddle veins recur one below the other on the anticlinal domes, like the "saddle reefs" of Bendigo, Australia, which are mined extensively to depths reaching 4000 feet. This succession of saddle veins presents a most important field of operation for deep and permanent mining.

The El Paso Mine, Cripple Creek, Colo.

The Cripple Creek district of Colorado is keeping up the production and new strikes are reported frequently. On this page is an engraving illustrating the El Paso Con. G. M. Co.'s property on the western slope of Beacon hill. This company owns sixty acres of ground. The engraving shows the El Paso buildings in the center and the C. K. & N. in the extreme right, and near it is the Old Gold (not shown). Both of these latter properties are good producers. The El Paso are sinking their shaft from the 600-foot to the 800-foot level, and may continue to the 1000-foot level later. They have encountered the Tillery vein in the bottom of the shaft, just below the 700-foot level. This vein is from 2 to 3 feet wide and carries large quantities of sylvanite. But a small amount of water has been encountered in this shaft so far. The company is aiming to make a production each month of $75,000 to $95,000 gross, which means $40,000 to $55,000 per month net, out of which they are paying $24,500 per month in dividends and the remainder is being added to the reserve. The production for April was closed on the 27th of that month, owing to the fact that the company did not care to produce any more than they had during that month. The production for May was closed on the 20th of the month for the same reason as above. S. S. Bernard is president, J. M. Jordan secretary and treasurer, W. M. Bainbridge superintendent.

No. 2 Shaft of Vindicator Mine, Cripple Creek, Colo.

The El Paso shaft has come into considerable prominence through its connection with the drainage tunnel, a large portion of which was cut in headings driven both ways on its course from the El Paso shaft. The tunnel reaches the shaft at about 580 feet from the surface. Since the tunnel has drained the ground the El Paso shaft makes less water than previously, and the pumps are only required to raise it to the tunnel level, a comparatively short distance, consequently they should be able to control the water for some time to come. With such mines as the El Paso, C. K. & N., Old Gold, W. P. H., Elkton, Portland, Strong, Independence, Granite, Golden Cycle, Vindicator, Gold Coin and others producing regularly the camp has a long period of prosperity before it, which would, no doubt, be prolonged indefinitely by the driving of a deeper drainage tunnel.

There are more operating leases in the Cripple Creek district than ever before, and to this class of operators is much of the success of the district due. The fact that the leasing system as applied to the mines of the district is superior to any other method thus far tried is evidenced by the fact that a number of the larger corporate companies have adopted the system for the more extensive development and operation of its mines. Some of the most important and extensively developed mines of the district are operated largely under a system of leases. The leasing system is one involving the least expense in mine operation. The men interested in the lease are generally practical mining men who work, either actively in the mine or have charge of some branch of the business in an executive position. Expensive management is, to a great extent, dispensed with, and office expenses are reduced to a minimum. The work is done under the personal supervision of those interested or by contract, with proper restrictions and limitations of a practical and business-like character. The result is that there are to-day working in the district more men than at any time in its history, and the output is being maintained in a satisfactory manner.

The El Paso Gold Mine, Cripple Creek, Colo.

THE PROSPECTOR.

The three mineral specimens from Glendale, Or., are: 1. A small amount of chalcopyrite (copper sulphide) in a gangue of quartz and earthy material. 2. Pyrrhotite in quartz, with a little copper sulphide. It is not uncommon for pyrrhotite (a magnetic subsulphide of iron) to contain nickel and sometimes cobalt to the extent of several per cent; a careful sampling of the ore should be made. 3. A small amount of copper sulphide with iron sulphide in gangue.

The samples from Grizzly Flat, Cal., are: 1. Quartz rock, evidently metamorphic. 2. Iron sulphide. 3. Iron and lead sulphide, with a little disseminated granular quartz; the ores are probably both gold and silver bearing.

The rock specimens from J. J. B., Manvel, Cal., are quartz, stained with iron oxide; the light yellow crystals are wulfenite (molybdate of lead); it may also contain gold or silver, probably both; the wulfenite may be mistaken for gold in panning. Wulfenite is decomposed by hydrochloric acid with formation of lead chloride and molybdic oxide, which, on moistening with water and adding metallic zinc, produces an intense blue color, which does not fade on dilution of the liquid.

The specimens from Pearce, Ariz., are: 1. Liparite (a variety of rhyolite). 2. Fragmental rock, composed of pieces of chert, quartz and feldspars, with a feldspathic cement. 3. Trachyte; the latter very much altered, giving reaction for calcium carbonate, due to decomposition of feldspars.

The specimens from Springhill, Mont., are: 1. The black mineral magnetite (magnetic iron oxide); the green mineral serpentine. 2. Mica schist, with green iron silicate, resembling glauconite. 3. Very siliceous aplite, a variety of micaless granite occurring in dikes and bosses. 4. Much altered semi-schistose rock, containing abundant scales of black mica (biotite). 5. Coarse granite, the variety known as pegmatite. 6. Quartz with mica, possibly gold bearing. 7. Quartz and feldspar, with a little chalcopyrite.

The black rock from Argenta, Mont., is graywhacke, a variety of metamorphic sand rock, compact and hard.

The specimen from Sumpter, Or., is quartz—the variety known as chert. The bluish mineral on the side marked with ink is chalcedony (silica).

The three samples from Big Bug, Ariz., are: 1. Diorite, the hornblende largely altered to epidote. 2. Diorite, with a little disseminated pyrite. 3. Chlo-

rite schist, probably the result of alteration of diorite.

The samples from Baker, Idaho, are: 1. Missing. 2. Chalcopyrite, with small crystals of magnetite. 3. Quartz with chlorite and pyrite. 4. Schistose diorite. 5. Siliceous greenstone schist.

The green and blue colors in the rock specimen from Fletcher, Nev., are due to the carbonates of copper, which has resulted from the decomposition of copper sulphide, which occurs in small amount in the ore.

Important Legal Decision.

Among the recent legal decisions affecting the mining industry is that rendered by the United States Circuit Court of Appeals for the ninth circuit in the case of Last Chance Mining Co. et al., appellants, vs. Bunker Hill & Sullivan Mining & Concentrating Co., appellee, a brief allusion to which was made in the issue of June 4. In consideration of the importance of the case and the fact that a high court has enunciated legal principles which had previously been uncertain, the decision is published in full, together with the engraving necessary to a more comprehensive understanding of the facts of the case, and the legal problems involved:

IN THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE NINTH CIRCUIT.

LAST CHANCE MINING COMPANY, ET AL., Appellants, vs. BUNKER HILL AND SULLIVAN MINING AND CONCENTRATING COMPANY, Appellee. } No. 985.

Appeal from the United States Circuit Court for the District of Idaho, Northern Division.

W. B. Heyburn, and John P. Gray, attorneys for appellants.

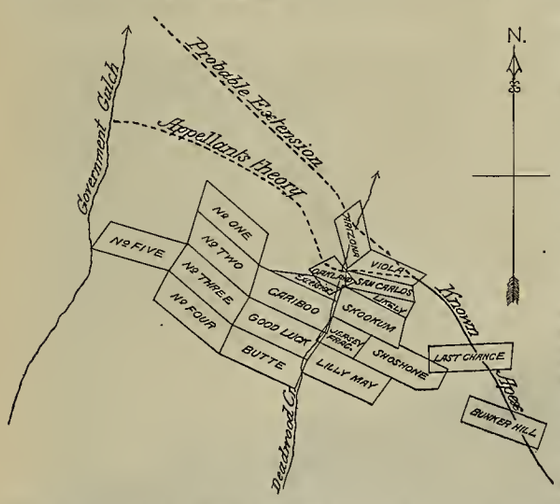
Curtis H. Lindley, Henry Eickhoff, and M. A. Folsom, attorneys for appellee.

Before Gilbert, Ross, and Morrow, Circuit Judges.

Ross, Circuit Judge, delivered the opinion of the court.

In the court below the appellee was complainant, and the appellants, defendants. For convenience of reference, the complainant Bunker Hill and Sullivan Mining and Concentrating Company will he referred to as the Bunker Hill Company; the defendant Last Chance Mining Company as the Last Chance Company; the defendant Shoshone Mining Company as the Shoshone Company; and the defendant Empire State - Idaho Mining and Development Company as the Empire Company.

The bill of complaint alleges the Bunker Hill Company to he the owner in fee, in possession, and entitled to the possession, of that certain mine and lode mining claim situated in Yreka mining district, Shoshone county, Idaho, known as the Bunker Hill lode mining claim, and specifically described in the bill; that within that claim there is a vein or lode of rock in place carrying silver, lead, and other valuable minerals, the general course or strike of the top or apex of which, at the surface within the claim, is northerly and southerly, on which course the top or apex of the vein crosses the southerly end line thereof at a point 300 feet westerly from its corner No. 3, and, continuing on its northerly course, the top or apex of the vein passes through the claim and crosses the northerly end line thereof at a point about 700 feet westerly of corner No. 2 of the claim, and that the said vein or lode on its downward course westerly passes out of and extends indefinitely beyond a vertical plane drawn through the westerly boundary thereof; that this vein or lode is the only vein or lode having its top or apex within the limits of the Bunker Hill claim, and is the vein or lode originally discovered on the 10th day of September, 1885, hy the grantors of the Bunker Hill Company. Attached to and made a part of the hill is a diagram which shows that the claim was located across the top or apex of the vein, instead of along it. It is not shown or suggested that this was knowingly or purposely done; on the contrary, it appears in this and other records in this court that at the time the Bunker Hill claim, and others within the immediate vicinity, were located, it was supposed hy the locators thereof that the vein or lode outcropping thereon ran in an easterly and westerly direction. That fact is referred to by counsel for the present appellants in his brief on behalf of the Empire Company in cause numbered 950, where, in speaking of a dispute between the owners of the Stemwinder and Emma claims in December, 1885, he said: "The Stemwinder at that time lay in an easterly and westerly direction; it was supposed that the ledges ran easterly and westerly; and that the ledges of the Stemwinder and Emma were separate and parallel ledges." What were intended as side lines of the Bunker Hill claim, therefore, actually became its end lines, under the familiar doctrine hereinafter referred to.



The hill further alleges that the Bunker Hill Company is, and for many years has been, the owner in fee and in the actual and exclusive possession of the Bunker Hill claim, and of the apex of the Bunker Hill lode within the claim, and of such part of the said vein or lode throughout its entire depth as lies westerly from, outside of, and beyond a vertical plane drawn downward through the westerly side line of the claim, and between vertical planes drawn downward through the end lines thereof extended indefinitely in their own direction westwardly; that neither of the defendants to the suit is, or ever has been, in possession of any part of the Bunker Hill claim, or of the Bunker Hill lode as thus described, and that each of them claims an estate or interest therein adverse to the Bunker Hill Company, which the latter alleges to be false and groundless and without any right whatever, and a cloud upon its title; that the value of that part of the Bunker Hill lode situated westerly of its side line, and between vertical planes drawn downward through its end lines, exceeds the sum of $500,000, exclusive of interest and costs. The prayer of the bill is, among other things, that the defendants, and each of them, he required to set forth the nature of their respective claims, and for a decree adjudging the alleged title of tho complainant to he good and valid, and that the defendants have no interest in or to the Bunker Hill claim or lode as described in the hill.

The defendants interposed a demurrer to the hill on the ground that it did not make or state such a case as doth or ought to entitle the complainant to any such discovery or relief as is thereby sought or prayed for. The demurrer being overruled, each of the defendants filed a separate and similar answer, and also a cross-bill, differing only in that each alleged ownership in the respective defendants of separate and distinct mining claims. Each of the answers admits that the complainant owns the surface of the Bunker Hill claim, and tho vein or lode within its boundaries, hut denies that the course of the vein is northerly and southerly, or that it crosses the alleged side line thereof, or that in its downward course it passes westerly beyond a vertical plane drawn through the west side line of the Bunker Hill claim, or that the complainant company is the owner of any part of the lode situated west of its alleged west side line.

The cross-hills alleged ownership, respectively, in the Last Chance Company of the Last Chance mining claim; in the Shoshone Company of the Shoshone and Summit mining claims; and in the Empire Company of sixteen other mining claims, specifically named and described, all of which, with the outcrop of the vein or lode therein, its course and dip, and its conflict with the extralateral right claimed by the Bunker Hill Company, are described in the respective cross-hills. They also allege that the vein or lode described in the Bunker Hill claim does not cross its end lines as now claimed, hut crosses its original end lines, and that the Bunker Hill Company's right to follow its vein or lode downward is between the parallel vertical planes drawn through its located end lines; that the course of the vein or lode, instead of being northerly and southerly, is north about 51° west, and that to follow it westerly, as complainant claims the right to do, would he following it more along its course or strike than upon its true dip. The prayer of the cross-hill was to the effect that the Bunker Hill Company be required to set forth any and every adverse interest, claim, or demand which it had to the claims, veins, or lodes described in the cross-bills, whether the same be claimed hy the Bunker Hill Company hy virtue of its ownership of the Bunker Hill claim and of the lode apexing therein, or hy virtue of its ownership of any other claim, vein, or lode, and that such adverse claim, interest, or demand be decreed null and void as against the cross-complainants, and that their respective titles thereto he quieted.

To each of the cross hills the Bunker Hill Company demurred on the ground that it presented mere matter of defense, and that the mining claims therein described were not included in or embraced by the original hill of complaint. The demurrers to the cross hills were sustained hy the court below.

We think the ruling of the court helow upon all of the demurrers was right. Two objections are made to the hill. One is that it contains no allegation concerning the general course of the vein beyond the limits of the Bunker Hill claim; and the other, that the bill does not show that the complainant is the legal owner and in the exclusive possession of the ore hodies in controversy.

In respect to the first objection, it is not perceived that there is any necessity for an averment in such a hill concerning the general course of the vein beyond the limits of the claim. The statute authorizes citizens of the United States and those who have declared their intention to become such, who find a vein or lode upon the public land, carrying any valuable deposit, to locate and claim the same, not exceeding 1500 feet along its length, and not exceeding 300 feet on each side of its middle at the surface, making the end lines of the claim parallel. R. S., Sec. 2320. The right of location is in no respect made dependent upon the course of the vein beyond the limits so fixed. A location so made, and marked and claimed as further provided by statute, or by the local rules and regulations of the particular mining district, when not inconsistent with statutory regulations, confers upon the locator, and his assigns and successors, the rights defined and specified by Section 2322 of the Revised Statutes, to wit: "The exclusive right of possession and enjoyment of all the surface included within the lines of their locations, and of all veins, lodes and ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically, although such veins, lodes or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of such surface locations. But their right of possession to such outside parts of such veins or ledges shall he confined to such portions thereof as lie hetween vertical planes drawn downward, as above described, through the end lines of their locations, so continued in their own direction that such planes will intersect such exterior parts of such veins or ledges." Whether the lines of the Bunker Hill claim were so laid with respect to the vein or lode outcropping within them, as entitles the complainant to the extralateral right there defined and here claimed, depends upon the prohative facts of the case.

In respect to the second objection urged to the hill, it is enough to say that it has heretofore been held by this court that the ownership and possession of a vein at the surface carries with it the ownership and possession of all that pertains to the location. "The mining right," as said by us in Empire State-Idaho M. & D. Co. v. Bunker Hill & Sullivan M. & C. Co., 58 C. C. A., 315, "is an integral one. It is secured by a single location. The title to it is conveyed by one patent." It is a separate and distinct thing from any and every other claim. The fact that one individual, company, or corporation locates or acquires many such claims is wholly unimportant. Congress has never yet seen proper to put a limit on the number of such claims that one individual, company or corporation may locate or acquire. Whether, in view of its well-known policy to encourage the development of the mineral wealth of the country, it shall ever deem it wise to do so rests with Congress, and is a matter with which the courts have nothing to do. The rights which a valid location of such a claim secures to the locator and his grantees or successors are clearly defined hy law, and are wholly unaffected by any subsequent conflicting location. In all such matters the first in time is the first in right. Therefore, it heing conceded by the defendant's answers in the present suit that there is a vein or lode outcropping within the surface boundaries of the Bunker Hill claim, and that the complainant is the owner of the surface of that claim and of the vein or lode within its boundaries, it follows, as a matter of law, that if the vein or lode so crosses the lines of the claim as to entitle its owner to extralateral rights at all, the complainant has, as against any and every other claim not founded on a prior location, precisely the same right, hy virtue of Section 2322 of the Revised Statutes, to such parts of all veins, lodes and ledges throughout their entire depth, the tops or apexes of which lie inside of its surface lines, as lie between vertical planes drawn downward vertically through the end lines of the location extended indefinitely in their own direction.

A stipulation of the parties is to the effect that every one of the claims here in question, except the Last Chance, is subsequent in point of time to the Bunker Hill. Priority is asserted for the Last Chance only upon the fact that it was located, marked, and the notice of location recorded, hefore the location notice of the Bunker Hill was recorded.

A statute of the State in which the claims are situate requires that such notice be recorded within fifteen days after the making of the location, in the office of the Recorder of the county, or with the Recorder of the district designated hy the resident miners, as provided hy Section 3103 of the Revised Statutes of Idaho. The statute, however, prescribes no penalty for a failure to record such notice.

The master found as facts that the Bunker Hill claim was located September 10, 1885, hy one O'Rourke, who possessed the necessary qualifications and who had theretofore discovered within its limits a vein of rock in place carrying silver and lead; that on the day named O'Rourke posted "a discovery notice of location," containing the name of the location and claim, the date of its location, a description of the claim hy reference to such natural objects and permanent monuments as identified it, and reciting "such other matters as were then required hy the laws of the United States and the Territory of Idaho;" that at the same time O'Rourke marked the boundaries of the claim on the ground so that they could be readily traced, and then entered into the actual possession of the claim and commenced working it, which possession has ever since been maintained hy him and his successors in interest; that on September 29, 1885, O'Rourke caused a notice of location of the claim, duly verified, to be recorded in the office of the Recorder of the county in which it is situate; that prior to March 21, 1902, the complainant duly acquired through mesne conveyances from O'Rourke the title to the claim, and on the day last mentioned made application to the United States for patent therefor, which application recited the facts just stated, and upon which application a patent was issued hy the Government to the complainant on the 17th day of November, 1903; that the Last Chance claim was duly located September 17, 1885, and the location notice thereof recorded on the 22d day of the same month; that prior to the discovery and location of the Last Chance its discoverers and locators "had actual knowledge of the discovery and location of the Bunker Hill claim; they had visited the discovery, read the notice posted thereon, saw the discovery stake, the east end stakes, and knew that the locator was in the actual possession of the claim and was then engaged in development work thereon."

The record shows that during the proceedings before the master, the following stipulation was entered into hy and between counsel for the respective parties:

"Mr. Heyburn. It is stipulated that the discovery of the Bunker Hill lode claim was on the 10th of September, 1885; that the acts of location, except as to recording, were performed at or prior to that time, and that the recording of the claim was on the 29th day of September.

"Mr. Lindley. In other words, it will he admitted hy all the parties to this action, that all the acts establishing a perfected location were completed prior to the acquisition of any rights asserted hy respondents, or any

of them, in this action, respondents reserving, however, such legal objection as they may hereafter desire to make with regard to the application of the doctrine of relation, for the failure to record the Bunker Hill location prior to the 29th day of September.

"Mr. Heyburn. No objection is raised to the sufficiency of the location of any of our claims.

"Mr. Lindley. I must make a reservation in there in reference to the Shoshone and Summit. That is the only reservation that I make.

"Mr. Heyburn. I think we will have to stipulate all or none, Judge. As to the Shoshone and Summit, we will only be required to make proofs of the acts of location, and the admission goes to the effect that whatever title the locators got is vested in the Shoshone Mining Company.

"Mr. Lindley. If any title goes by that location, it is vested in you by mesne conveyances."

The record further shows that at a subsequent stage in the proceedings the following stipulation between the counsel was read in evidence:

"Mr. Heyburn. I offer in evidence a stipulation entered into this day, signed in open court by the counsel for the respective parties to this suit, as follows: 'It is hereby stipulated in the above entitled cause, that if Philip O'Rourke, the locator of the Bunker Hill lode claim, were present as a witness in this case, he would testify that the west end stakes of the Bunker Hill lode claim were not put up, nor was the west end of said claim marked upon the ground by the locators, until after the location and recording of the Last Chance and Emma lode claims.' That stipulation is signed by counsel for the respective parties in this suit. I offer it in evidence, in order that it may be here in the record.

"Mr. Lindley. We will reserve a formal objection to the materiality and admissibility of it.

"(Overruled. Exception.)"

We do not think it necessary to decide whether a stipulation to the effect that a certain witness would, if present, testify in contradiction of one or more of the facts already agreed to by counsel; could be properly held to modify such prior stipulation, for the reason that upon the facts expressly conceded, found, and in no wise contested, the Last Chance was located after the Bunker Hill, and while the latter was a valid, subsisting claim. At the time of the location of the Last Chance claim the time prescribed by the Idaho statute within which the Bunker Hill location should be recorded, had not expired. The Last Chance locators had actual notice of the Bunker Hill location, had read the description of it, and the locator of the Bunker Hill was in actual possession of that claim and actually engaged in working it. No part of the claim, therefore, whether above or underground, was then open to location by any other person. Belk v. Meagher, 104 U. S. 279; Book v. Justice Mining Co., 58 Fed. 106; Meydenbauer v. Stevens, 78 Fed. 787; Jerdan v. Duke, 53 Pac. 197.

It is conceded by the counsel for the appellants that the locators of the Last Chance could not then have entered upon the surface of the Bunker Hill claim and acquired any right as against it; but he insists that it is different in respect to such portions of its veins or lodes as lie outside of the vertical boundaries of that claim. The mistake of the learned counsel is in supposing, as he does througout his argument, that there is a radical difference in the nature of the right by which the locator of a valid lode claim holds the veins or lodes embraced by the surface lines extended vertically downward, and such of the veins or lodes belonging to the claim as extend in their downward course outside of the side lines; and that as to the latter, adverse rights may be acquired which could not be acquired in respect to the former. As has been already said herein, there is no such distinction. The mining right is an integral one, and is precisely the same to all that belongs to the location—its surface, and all veins or lodes apexing within it, and all not apexing elsewhere, found within the surface lines extending vertically downward, as well as the extralateral right defined by Section 2322 of the Revised Statutes of the United States. The St. Louis Mining and Milling Company of Montana et al. v. the Montana Mining Company, Limited, U. S. Supreme Court, decided May 2, 1904.

That the failure of the locator of the Bunker Hill claim to record his notice of location within the time prescribed by the Idaho statute did not work a forfeiture of the claim, there being no such penalty affixed by the statute, is well settled. Jupiter Mining Co. v. Bodie Con. Min. Co., 11 Fed. 666; Bell v. Bedrock T. & M. Co., 36 Cal. 214; McGarrity v. Byington, 12 Cal. 426; Johnson et al. v. McLaughlin et al., 4 Pac. 130; Emerson v. McWhirter, 65 Pac. 1036; Rush v. French, 25 Pac. 816. Besides, the issuance by the government of its patent for the claim is conclusive evidence of the sufficiency of the steps taken by the complainant. Davis v. Weibold, 139 U. S. 507; United States v. Idaho & S. M. Co., 128 U. S. 673; Montana Cent. Ry. Co. v. Migeon, 68 Fed. 811.

Whether the surface lines of the Bunker Hill claim were so laid as to entitle its owner to any extralateral right at all; whether, if it exists, it should be bounded by vertical planes drawn downward through what were originally located as the end lines of the claim or through those originally located as its side lines; and whether the extralateral rigbt claimed by the complainant and awarded it by the court below is to permit the complainant to follow the vein along its length and not on its downward course as prescribed by the statute, were matters of defonse open to all of the defendants in the court below, and upon which much evidence was given by the respective parties.

The master, to wbom the cause was referred to take the proofs and report to the court his findings of fact and conclusions of law, found, among other things, the following to be facts: That within the Bunker Hill claim there is a vein or lode of rock in place carrying silver and lead, commonly known in the district as the Bunker Hill lode, the apex of which is indicated by the outcrop of the foot wall which traverses the claim in a general northwesterly course from where it cuts the south boundary; that the foot wall is the well defined and persistent feature of this vein, and enters the Bunker Hill claim at a point on its south line about 300 feet from the southeast corner, and, exteuding along its course at tho surface northwesterly, passes out of the north line of the claim about 726 from the northeast corner of the claim; that the Bunker Hill lodo has no physical hanging wall, no marked line complement to the feot wall, in defining the limit of the fissure; that for its underlying boundary it has a well-defined, continuous bed of barren quartzite, but for its overlying boundary it bas only an irregular and vague outline of the limit of mineralization, from which fact, and the peculiar geological formation of tho lode, it is very difficult to define this limit with any degree of certainty, for which reason much confusion and some contradictiou appears in the testimony upon this point; that the weight of the testimony shows, however, that the mineralization of this lede or ledge extending from the foot wall into the hanging wall country, gradually fades in value until a point is reached 350 or 400 feet out, where the rock is practically barren; that the lode er veiu in passing through the Bunker Hill claim takes a northwesterly and southeasterly direction, and so intersects the north and south lines of the claim, wbich lines, while originally located as side lines, are in fact its end lines, and the original end lines became its side lines; that there is within the surface boundaries of the Bunker Hill claim the entire apex of the vein for a length of 676 feet, measured en the line of the foot wall at the surface, and that a segment ef part of that vein departs from tbe perpendicular in its downward course, and extends in a westerly direction under the outside of the westerly side of the claim, the same having been originally located as the westerly end line, and between vertical planes drawn downward through the end lines of the claim as above designated, so continued in their own westerly direction indefinitely; that tho vein, or segment thereof, having its apex within the surface boundaries of the Bunker Hill claim on its downward course between the extended end line planes thereof, extended in their own direction, passes underneath respective portions of the surface of the following lode claims owned by the Empire State-Idaho Mining and Developing Cempany, namely: The Lily May, Butte, Good Luck and Number 4; all of which are junior in point of time to the location of the Bunker Hill claim.

And as conclusions of law, the master found:

"1. That the surface lines of the Bunker Hill claim, originally located as side lines, are in law the end lines of the claim, and its extralateral right is defined by vertical planes drawn downward through these lines extended in their own direction westerly indefinitely.

"2. That the complainant is the owner and entitled to the possession of the sogment of said Bunker Hill lode and the ore bodies thereef in controversy herein, as against the respendents, Last Chance Mining Company, the Shoshone Mining Company, the Empire State-Idaho Mining and Developing Company; and that complainant is entitled to a decree against said respondents, and each of them, in accordance with these findings and conclusions, and agreeable to the practice of this court."

Certain exceptiens were filed by the defendants to the master's report, but none calling in question any ruling of his in admitting or rejecting evidence. Findings of fact made without any evidence to support them may, and should, as a matter of course and of law, be disregarded, but findings made by a master in pursuance of an order to take the preefs and report the facts and conclusions of law to the court, that depend upon conflicting testimony, or upen the credibility of witnesses, especially where, as in the present case, they are approved by the trial ceurt, will not be disturbed. Davis v. Schwartz, 155 U. S. 631; Warren v. Keep, id. 265; Crawford v. Neal, 144 U. S. 585; The Irequois, — U. S. — (May 2, 1904); The S. B. Wheeler, 20 Wall. 385; The Lady Pike, 21 Wall. 1, 8; The Richmond, 103 U. S. 540; Towson v. Moore, 173 U. S. 17; Smith v. Burnett, 173 U. S. 430, 436; Singleton v. Felton, 101 Fed. 526; The Columbian, 100 Fed. 991; North American Exploration Co. v. Adams, 104 Fed. 404; Fidelity & Casualty Co. v. St. Mathews Sav. Bank, 104 Fed. 858; Western Unien Tel. Co. v. American Bell Tel. Co., 105 Fed. 684; National Hollow B. B. Co. v. Interchangeable B. B. Co., 106 Fed. 693; Chauncey v. Dyke Bros., 119 Fed. 1; Thallman v. Thomas, 111 Fed. 277.

The Appellants do not, and, in view of the record, could not contend that there is no evidence to support the findings; but they urge that the weight of the evidence is to the effect that the true course of the vein or lode in question runs easterly and westerly instead of northwesterly and southeasterly through the Bunker Hill claim, and crosses the lines originally located as the end lines of that claim, and even if its course through the Bunker Hill claim he as found by the master, its width is far greater than found by him and in fact extends outside of and beyond the westerly boundary of that claim, originally located as one of its end lines and now treated as its westerly side line.

The conclusive answer to all of this is that above indicated, viz: that the findings by the master, made, in tbis instance, upon evidence that is decidedly conflicting, and approved by the court below, are against the appellants upon these points. But it may be added, that even if the vein or lode be as extensive in width upon the surface as contended by the appellants, the priority of the Bunker Hill claim over those here in controversy being here established, the extralateral right of the appellee would remain as fixed and determined by the decree of the court below. Empire State-Idaho M. & D. Co. v. Bunker Hill & Sullivan M. & C. Co., 114 Fed. 417; St. Louis M. & M. Co. v. Montana Min. Co., 104 Fed. 664, and like cases there cited.

The case showing that the lines originally located as the side lines of the claim are parallel, and it appearing from the findings that the apex of the vein or lode in question crosses those lines, they become in law the real end lines of the claim, under the well-settled doctrine upon that subject. Flagstaff M. Co. v. Tarbet, 98 U. S. 463; Argentine M. Co. v. Terrible M. Co, 122 U. S. 478; Del Monte M. & M. Co. v. Last Chance M. Co., 171 U. S. 55; Tyler Min. Co. v. Last Chance M. Co., 71 Fed. 849; Tyler v. Sweeney, 79 Fed. 277; Last Chance M. Co. v. Tyler Min. Co., 157 U. S. 683; Empire M. & M. Co. v. Tombstone M. & M. Co., 100 Fed. 910; Cosmopolitan M. Co. v. Foote, 101 Fed. 518; Bunker Hill & Sullivan M. & C. Co. v. Empire State-Idaho M. & D. Co., 109 Fed. 538a.

It is further and strenuously urged on behalf of the appellants, that the appellee, in following the vein underground between vertical planes drawn downward through its adjudicated end lines, decs so more upen its strike than upon its dip; and this, it is insisted, is not permissible under the law. In respect to this matter the master made no findings, holding it immaterial, as did the court below, and confining his finding in that regard to the fact that the course of the vein was downward between the end line planes fixed by him.

The extralateral right to a vein or lode outcropping at the surface, where it exists, is fixed by the course of the vein or lodo at the surfacc, and not by its course on a level. "We do not mean te say that a vein must necessarily crop out upon the surface, in order that locations may be properly laid upen it," said the Supreme Court in Mining Co. vs. Tarbet, 98 U. S. 469. "If it lies entirely heneath the surface, and the course of its apex can he ascertained by sinking shafts at different points, such shafts may be adopted as indicating the position and course of tho vein; and locations may be properly made on the surface above it, so as to secure a right to the vein heneath. But where the vein does crop out along the surface, or is so slightly covered hy foreign matter that the course of its apex can be ascertained by erdinary surface exploration, we think that the Act of Congress requires that this course should he substantially fellowed in laying claims and locations upon it. Perhaps the law is net so perfect in this regard as it might be; perhaps the true course of a vein should correspond with its strike, or the line of a level run through it; but this can rarely be ascertained until considerable work has heen done, and after claims and locations have become fixed. The most practical rule is te regard the course ef the vein as that which is indicated hy surface outcrop, or surface explorations and workings. It is on this line that claims will naturally be laid, whatever be the character of the surface, whether level or inclined."

In the subsequent case of Iron Silver Mining Co. vs. Elgin Mining Co., 118 U. S. 196, 206, the same court, after queting Section 2322 of the Revised Statutes, said: "This section appears sufficiently clear on its face. There is no patent or latent ambiguity in it. The locators have the exclusive right of possession and enjoyment of 'all the surface included within the lines of their locations,' and the location by another section, must be distinctly marked on the ground so that its boundaries can he readily traced. Rev. Stat. Sec. 2324. They have also the exclusive right of possession and enjoyment 'of all veins, lodes and ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended dewnward vertically, although such veins, lodes, or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of said surface locatiens.' The surface side lines extended downward vertically determine the extent of the claim, except when in its descent the vein passes outside of them, and the outside portions are to lie between vertical planes drawn downward through the end lines. This means the end lines ef the surface location, for all locations are measured on the surface.

"The difficulty arising from the sectien grows out of its application to claims where the course ef the vein is so variant from a straight line that the end lines of the surface location are not parallel, or, if so, are not at a right angle to the course of the vein. This difficulty must often occur where the lines of the surface location are made to control the direction of the vertical planes. The remedy must be found, until the statute is changed, in carefully making the location, and in pestponing the marking of its boundaries until explorations can he made to ascertain, as near as possible, the course and directien of the vein. In Colerade the statute allows for this purpose sixty days after notice of the discovery of the lode. Then the location must be distinctly marked en the ground, and thirty days thereafter are given for the preparation of the proper certificate to be recorded. Erhard v. Boaro, 113 U. S., 527, 533. Even then, with all the care possible, the end lines marked on the surface will often vary greatly from a right angle to the true course of the vein. But whatever inconvenience or hardship may thus happen, it is better that the boundary planes should be definitely determined by the lines of the surface location, than that they should be subject to perpetual readjustment according to subterranean developments made by mine workings. Such readjustment at every discovery of a change in the course of the vein would create great uncertainty in titles to mining claims. This rule, whatever hardship it may work in particular cases, should be settled, and thus prevent, as far as practicable, such uncertainty. * * * *

"The provision of the statute that the locator is entitled throughout their entire depth to all the veins, lodes, or ledges, the top or apex of which lies inside of the surface lines of his location, tends strongly to show that the end lines marked on the ground must control. It often happens that the top or apex of more than one vein lies within such surface lines, and the veins may have different courses and dips, yet his right to follow them outside of the side lines of the location must be bound by planes drawn vertically through the same end lines. The planes of the end lines cannot be drawn at a right angle to the courses of all the veins if they are not identical."

While the statute requires parallelism of the end linos, and the courts have held that they may not be laid so divergent as to include more in length upon the dip of the vein than is allowed in length upon the surface, neither the statute nor any decision to which our attention has heen called, defines auy particular angle at which the end lines shall cross the general course of the vein in order that the extralateral right given by the statute may exist. And as said by the Supreme Court in the case last cited, where more than one vein apexes within the surface lines, it would be a physical impossibility for the end lines to be drawn at a right angle to the course of all such veins. And that tbe extralateral right conferred by the statute may and does exist without regard to the angle at which the end lines cross the general course of the vein has been held both hy the Supreme court and by this court. Last Chance Min. Co. v. Tyler Min. Co., 157 U. S., 683; Empire State-Idaho M. & D. Co. v. Bunker Hill & Sullivan M. & C. Co., 114

Fed., 417, in which last-named case the court awarded the appellant Empire State-Idaho M. & D. Co. the right to follow the vein outcropping within the surface boundaries of its San Carlos location between planes drawn down through its end lines, at almost if not quite as much an angle to the general course of the outcrop of the vein within its surface boundaries as is the angle at which the appellee herein was permitted by the court below to pursue the segment of the vein here in question.

The judgment is affirmed.

(Endorsed): Opinion. Filed May 31, 1904. F. D. Monckton, clerk.

The Park City Mining District, Utah.*

NUMBER II.—CONCLUDED.

Written by J. M. BOUTWELL.

DEVELOPMENT.—The opinion is current among miners that the ore bodies of this district lie deep aud do not crop out. The means and determination to explore widely and at depth have resulted in very extensive development. Twenty-two shafts, now accessible, have reached a depth of at least 500 feet, ten a depth of at least 1000 feet, six a depth of 1300 feet, and one a depth of 2000 feet. Lateral development has been proportionately extensive. According in position with that of the great fissure zone, and of the ore-bearing limestone formations, the underground workings of the main properties lie in two parallel northeast-southwest belts. In addition to the shafts on individual properties, the northern belt is entered by two loug tunnels, the Hanauer and the Alliance, and the southern by three, the Ontario drain, the main Ontario-Daly-Daly West work, and the Daly-Judge drain tunnels. The adjoining mines in each belt have been connected, so that it is possible to pass continuously underground from one end of each belt to its opposite end. Thus in the southeast belt there is continuous underground connection in a northeast-southwest direction for a distance of over 5 miles. Furthermore, a crosscut only 450 feet in length would connect these two belts and afford continuous underground connection between all the great mines of the district.

CHARACTER OF ORES.—The ores mined in this district are essentially argentiferous lead ores, with accessory gold and copper and a siliceous gangue. The values in the sulphide ore lie in galena (lead sulphide), tetrahedrite (gray copper) and pyrite (iron sulphide); and in the oxidized ore in cerussite (lead carbonate), angelsite (lead sulphate), azurite (blue copper carbonate), malachite (green copper carbonate), and complex oxidation products. Silver is obtained from the iron, lead and zinc approximately as follows: 3 ounces to each per cent of iron, 1 ounce to each per cent of lead, and $\frac{5}{10}$ ounce to each per cent of zinc, which statement is based upon results secured from a large number of precise tests by F. W. Sherman, superintendent of the Daly West and Daly-Judge mills. Silver has also been found in its native state. Zinc is a common associate in fissure ore, and appears to increase in depth and toward the great intrusive mass at the southwest. Barite and fluorite occur sparingly. Oxidized ores are still mined to a limited depth, but the bulk of the shipments of both crude ore and concentrates is composed of sulphides.

Although values as a whole run rather high, a noticeable difference in value exists between ores from different parts of the district.

An average high-grade ore carries about 60 ounces silver, 40% lead, 0.25 ounce gold and 2.5% copper. Ordinary crude ore carries 50 to 55 ounces silver, 20% lead, 0.04 to 0.05 ounce gold, 1.5% copper and 10% to 18% zinc. Just as the values vary in different parts of the camp, so the degree of concentration required in milling ores varies. Some ores are concentrated four times, others five. It may be stated that in general the degree of concentration ranges from four to six into one. A good concentrate of sulphide ore carries approximately 55 ounces silver, 30% to 40% lead, 0.05 ounce gold and 15% zinc. The above figures are based on published and reported average values of ores extracted at the present time. Bonanzas have been and are encountered, and excessively high assays of silver, lead and gold are occasionally reported.

OCCURRENCE OF ORES.—The principal ore bodies which have been opened in this district occur either (1) in lodes or fissures or (2) in limestone beds. Although in early days the high-grade silver ore was from fissure veins, at present the bulk of the shipments of crude ore is from bedded ore bodies in limestone. Fissures occur abundantly throughout the district. Those fissures which have been found to carry the largest and richest ore bodies lie in the northeast-southwest zone in the center of the camp and dip (with rare exceptions) steeply towards the northwest. They are branching systems, in which individual members may be single, narrow fissures or broad, breccia zones. Thus ore is found in narrow paystreaks frozen to the walls and in groups of paystreaks included iu lodes which are 2 to 35 feet wide.

The ore bodies in limestone have replaced portions of certain members in both the upper Carboniferous and "Permo-Carboniferous" limestone formations, and they lie between siliceous members as walls. Those occurring in the upper Carboniferous formation which have been studied thus far have replaced a limestone bed that overlies a brown sandy or quartzitic member at a distance varying from 50 to 100 feet above the Ontario quartzite. Occasionally the calcareous bed underlying this sandy member is found replaced by ore, and the sandstone, normally the foot wall, is left barren between these two productive horizons. Ore in the Carboniferous limestones has been observed to have replaced certain metamorphosed calcareous members, and also to have been deposited in a quartzose breccia adjacent to a dike.

Both the lodes and the replacement bodies occur in frequent and intimate association with porphyry. Fissures occupied by ore bodies cut indiscriminately across porphyry and all other formations. Among the numerous cases observed in which ore-bearing limestone has suffered intrusion by porphyry, several have been noted in which the ore is in immediate contact with porphyry. The evidence now at hand tends to show that a period of igneous activity preceded the period of ore deposition.

EXPLOITATION.—In underground exploration, in mining, in milling, and in shipping ore, the economies afforded by perfect mine and mill equipment are practiced. Air drills are used in development work. Stoping is done by the overhand process. Timbering is done on the square set system when the size of chambers admit, in narrow fissures by props, and in low, flat stopes by props and cribs. Mine ventilation is good. Drainage, the lack of which has been for many years a serious obstacle in the development of the mines of the district, is now adequately effected through the long Ontario, Daly-Judge and Alliance drain tunnels. Three properties, which apparently lie outside of the ground drained by these deep tunnels, are now encountering considerable water in sinking to explore virgin ground.

For the treatment of low-grade ores four large and four smaller concentrating mills have been erected by individual companies on their properties, and another large mill is expected to go into commission in the near future. These large mills effect an unusually high saving. Two of the large properties ship directly to the smelters in the Salt Lake valley. The output of all the other mines passes to a local custom sampler en route to the valley smelters. One of the large mines transports its ore from the mine to the railroad by aerial tramway, the others by trams drawn by horse power through long work tunnels. Labor is well paid and employes may procure good board and lodging, if desired, from the companies at their mines.

RECENT INDUSTRIAL PROGRESS.—During the last year the mining industry in Park City advanced to the highest stage ever reached. More men were employed and more work in surface improvements, in underground development, and in perfecting methods of mining and milling was accomplished than during any previous year in the history of the camp. In spite of two serious declines in the price of silver, no properties were closed down. At date of writing, however, one of the most extensive properties has closed its mill, to conduct experiments on treating its ores, and has reduced its activity to exploration of virgin ground. The large paying mines have increased their plants and extended exploitation. Thus the Silver King Co. has added to its mill; the Daly West Co. is deepening its main shaft and erecting a tailings mill; the Ontario Co. has sunk its main shaft to a depth of 2000 feet, extensively explored its great lode at depth, and remodeled its amalgamation mill into a modern concentration mill; the Daly-Judge Co. has entirely refitted its draiu and work tunnel with heavier rails and equipment preparatory to utilizing it for regular shipping by power, has conducted extensive underground developments, and extensively expanded and remodeled its concentration mill; the Kearns-Keith Co. has continued mining through the Hanauer and Alliance tunnels, erected a concentration mill, and begun regular shipments. In the other working properties the year has witnessed extensive underground operations. Following the unusual activity in the fall of 1902 in the incorporation of mining companies, resulting from the recent discovery of valuable ore bodies, exploration was undertaken which is still being vigorously prosecuted. One of these new companies has sunk a shaft 600 feet, explored its ground on the 400-foot level, and is uow drifting on the 600; another sunk 800 feet to catch a vein previously developed above; another is down 400 feet and has explored at the 200, 300 and 400-foot levels; another, after sinking 600 feet and extensively exploring the ground at that level, has put its shaft down to a total depth of 800 feet, and is now drifting on that level; another, guided by considerable previous development, has sunk 900 feet and drifted at the 700-foot level. Four of the older properties of intermediate size have carried on considerable prospecting and made some shipments.

As a net result of these operations, some slightly mineralized ground has been opened up, a small amount of ore has been discovered, and in the ground which was more wisely located the indications are good. So far as observed, however, no ore bodies of any considerable value have yet been uncovered. Although this exploratory work has been conducted with great vigor and persistence, if definite prospect of adequate returns is not soon disclosed it is inevitable that the work must be abandoned.

RECENT PRODUCTION.—It might have been expected from the generally increased activity of last year that the output would also increase. On the contrary, the output fell from a total shipment, including crude ore and concentrates, in 1902 of 330,662,628 pounds to 292,588,365 pounds in 1903, a decrease in the shipments of last year amounting to 38,064,263 pounds. Notwithstanding this small decrease, the mines of Park City were the prime factors in making Utah the leading silver producing State in the country in 1903. The decrease is not as unpropitious as might appear, for it is due to the fact that the Ontario Co., on deciding to erect a concentrating mill, greatly reduced its shipments. Neglecting the Ontario shipments during these two years, the total output from the camp increased in 1903 approximately 17,500,000 pounds. Each of the great mines contributed an individual increase to this total, but the larger portion of the increase was supplied by the Silver King mine. The two great producing mines alone paid dividends last year amounting to a total of $2,704,000. With regard to the future, the outcome of exploration and of experimentation on zinciferous ores by one of the great properties, the results of development by the several young properties, and the proof of the capability of the mines and the new mills of two important properties, are awaited with deep interest. On these factors and the continuance of good prices for lead and silver the future expansion of the camp depends. As to the immediate future, it is assured that, if the lead and silver market holds its present strength, the productive mines—even without continuing their current rate of increase—equal their shipments of last year, and the Ontario and Kearns-Keith mines ship regularly, the total output of the mines of the Park City district in 1904 will considerably exceed that of any previous year.

* Abstract Bulletin No. 225 U. S. Geological Survey.

Pan Amalgamation at Rosario, Mexico.*

Written by A. E. DRUCKER.

The Tajo mines are situated on the west coast of Mexico, near the Rosario river, 60 miles southeast from Mazatlan. These mines are one of the oldest, largest and most extensively worked properties in Mexico. About 700 men are employed and over 80 miles of tunneling have been done, while the mine has only reached a depth of 650 feet. The vein has an average width of 300 feet and dips at a low angle of about 24°.

Tajo ore is made up mainly of quartz and calcite, but contains 10% to 12% sulphides, such as galena, chalcopyrite, zincblende and iron pyrites. Silver occurs metallic in the wire form, as argentite (Ag_2S), and as cerargyrite (AgCl). Gold occurs free, except for some that may be in chemical combination with the pyrites. The ore iu these mines occurs in bunches, ore shoots and pockets. The greater part of the 300-foot vein is barren.

The pan amalgamation plant, situated on the Rosario river about ½ mile from the mines, consists of a 60-stamp mill, thirty-six amalgamating pans, eighteen settlers, four concentrators, two agitators, blanket sluices, retort and melting rooms aud assay and chemical laboratories.

During the time the writer acted as assayer and chemist for this company and later as mill superintendent, experimenting on a large scale with pan amalgamation was carried on and a number of valuable points in regard to the preventing and saving of "floured" quicksilver gained.

In the past too little attention has been paid to the mechanical side of the process, and it is this side which is largely instrumental in reducing the quicksilver loss. Formerly at this plant everything had been regulated for an almost free-milling and oxidized ore, and as the mine got deeper, and the ore more base and rebellious, the loss of quicksilver through flouring became greater. Besides the large loss of mercury, there was the gold and silver contained within the floured quicksilver, which amounts to considerable within a month. The principal loss of mercury is due to flouring in the pans. Each little particle of floured mercury, so small that it will float on water, without detection by the eye, contains a high percentage of gold and silver and floats off when it reaches the settler and is lost with the tailings.

All the pans here are made of iron and are 5 feet in diameter and 3 feet high, holding about one ton of ore each. Each pan has a false bottom, dies, shoes, muller, pan ring to protect sides, cone, and a screw to raise or lower the muller.

ORE TREATMENT.—The ore as it comes from the battery is stamped to a 30-mesh and run into settling tanks, where the slimes are allowed to flow off into other slime tanks and saved. All slimes that go over seven ounces of silver per ton are mixed with sands and worked in the pans. The two main chemicals used are bluestone ($CuSO_4$) and salt (NaCl), while the

* Abstract Cal. Jour. Tech.

caustic soda is used to cut grease and prevent it from coating the quicksilver particles. As the coarse sands from the first settling tank are charged into the pans, bluestone and salt are also added and the muller lowered so as to grind. At the end of 1½ hour grinding, caustic soda is also added to destroy any grease that may have gotten into the pans, and the grinding is coutinued for half an hour more. Next two quarts of quicksilver are added, the muller raised and the amalgamation of the gold and silver continued for two hours more. After the amalgamation is finished the ore is discharged into a settler, the pan washed out, the muller lowered and new ore charged with bluestone and salt, ready for another run.

Reactions.—Important reactions take place in a pan, causing a reduction of the sulphide and chloride of silver. Native silver, as well as the sulphide and chloride, but not that chemically combined in the galena, are the values saved by pan amalgamation. Salt and bluestone form cupric chloride, which acts on the silver sulphide in the ore and changes it to the chloride, cuprous chloride being also formed.

(1) $CuSO_4 + NaCl = CuCl_2 + Na_2SO_4$.

(2) $2CuCl_2 + Ag_2S = 2AgCl + Cu_2Cl_2 + S$. Cuprous chloride acts on any unchanged Ag_2S and converts it into the chloride.

(3) $Cu_2Cl_2 + Ag_2S = 2AgCl + Cu_2S$. Metallic silver is acted upon by cupric chloride, silver chloride and cuprous chloride being formed.

(4) $2Ag + 2CuCl_2 = Cu_2Cl_2 + 2AgCl$.

The following reaction may take place, but it is not probable, on account of the cupric chloride being changed over to the cuprous form in a very short time:

$$Ag_2S + CuCl_2 = 2AgCl + CuS.$$

The reaction of Hg, Cu, Fe and $FeSO_4$ on $CuCl_2$ reduces it to Cu_2Cl_2.

$2CuCl_2 + 2Hg = Cu_2Cl_2 + 2HgCl$.
$CuCl_2 + Cu = Cu_2Cl_2$.
$2CuCl_2 + Fe = Cu_2Cl_2 + FeCl_2$.
$2CuCl_2 + 3FeSO_4 = Cu_2Cl_2 + FeCl_2\ Fe_2(SO_4)_3$.

The main reaction towards reducing or changing Ag_2S to AgCl is equation No. 3.

Silver chloride is very easily reduced to metallic silver by the small particles of iron caused by the wearing of shocs upou the dies. This is amalgamated by the quicksilver.

$$2AgCl + Fe = FeCl_2 + Ag.$$

Also AgCl is soluble to a certain extent in the strong solution of salt and is reduced by Hg to metallic silver.

$$2AgCl + 2Hg = 2HgCl + 2Ag.$$

The silver is then amalgamated. Large excesses of $CuCl_2$ cause a reduction to copper aud may change metallic Ag into its chloride.

$CuCl_2 + 2Ag = 2AgCl + Cu$.
$CuCl_2 + Fe = FeCl_2 + Cu$.
$CuCl_2 + Zn = ZnCl_2 + Cu$.

Such reduced copper will bc amalgamated and give base bullion. It must be remembered that salt and bluestone are only needed when silver sulphide is present in the ore so as to change it into chloride, in which form it can be readily reduced and amalgamated. They are harmful to the amalgamation of free gold.

Action of $CuCl_2$ and Cu_2Cl_2 on Quicksilver.—An excess of cupric and cuprous chlorides causes a flouring of the quicksilver, coating it with a film of chloride of mercury, thus preventing finely divided quicksilver from uniting. This may plainly be seen by trying an experiment in a bottle with mercury, bluestone, salt and water, shaking well. Notice the finely divided mercury with a dull gray coating, and even floured quicksilver. It will be impossible to have the floured join with the larger globules of mercury, but if a very small piece of zinc amalgam be added you will at once see all combine. The same thing will be seen after mercury has been charged into the pans upon panning several charges after running for some time. The quicksilver will be finely divided and have a dark coating, and even some floured will be seen at times. By panning along the row of pans we are able to tell just how amalgamation is proceeding and to judge the loss of quicksilver.

A large loss of mercury is caused by the forming of the chloride of mercury film which coats the quicksilver particles. This chloride was found with the Comstock tailings, and, after cyaniding, considerable mercury was saved. The chloride could be saved by cyaniding, but the floured Hg could not.

Excesses of bluestone are to be avoided, since large losses in quicksilver through flouring and the forming of the chloride are caused by it. The amount of bluestone needed in the pans from day to day is told by a simple test on the amalgam obtained. Take an average sample of the amalgam (1 gram) and dissolve in 3 c.c. of strong nitric acid. Add ammonia until a blue color is shown, and, by a comparison of colors, the percentage of copper is estimated. Regulate the bluestone so as to have always a faint blue color. By doing so we obtained very pure bullion along with a high extraction. Some went as high as 920 fine in silver and 65 in gold, a total fineness of 985. The remaining 15 was principally copper, with traces of zinc, lead and iron. The total fineness would seldom fall below 950. The amount of bluestone necessary for each pan varied from ten to sixteen ounces, according to the richness of the ore. Rich sulphide of silver ore required more bluestone.

Iron reduces $CuCl_2$ and Cu_2Cl_2, forming metallic copper, which is amalgamated by quicksilver. For this reason but slight excess of bluestone should be used in the pans over that necessary to convert the sulphide of silver into its chloride. Large excesses will only result in very base bullion aud low extraction. I have proved this point on a large scale. Mercury charged with copper readily becomes coated by iron particles, and in the pulp it is readily coated by irou pyrites, lead and slimes. Any substance coating the mercury and keeping it dirty will interfere with amalgamation and increase the loss of mercury. The mercury particles should be bright to give best results.

Both chlorides of copper decompose galena and zincblende to a certain extent. $CuSO_4$ (bluestone) expels lead to a certain extent from quicksilver, copper being amalgamated and lead sulphide formed. Some say the copper amalgam formed by the presence of bluestone with the mercury aets on silver sulphide and decomposes it and helps to put it into a form to amalgamate.

The Action of Caustic Soda.—The amount of NaOH necessary for each pan depends upon the amount of bluestone added. If an excess of bluestone be used, then enough NaOH must be added to counteract that excess and also to destroy the grease. The action of NaOH on the excess of Cu_2Cl_2 is:

$$CuCl_2 + 2NaOH = Cu(OH)_2 + 2NaCl.$$

The use of caustic soda hinders amalgamation to a certain extent, and large excesses are very harmful. I saw this clearly while experimenting with the pans. Every other week caustic soda was used, and when it was not used a noticeable increase in the extractions was shown. There was no need of oil getting into the pans after we had taken proper precautions against it, and so NaOH was dispensed with. While caustic soda was detrimental to amalgamation, especially when in large excess, it was also helpful in one respect, as it changed the copper chlorides to the hydroxide, thus preventing the chloride film (HgCl) being formed.

Lime was found to take the place of NaOH in that respect, as:—

$CaO + H_2O = Ca(OH)_2$ (lime).
$CuCl_2 + Ca(OH)_2 = Cu(OH)_2 + CaCl_2$.

One pound of lime was added to each pan fifteen minutes before the quicksilver was charged, causing the excess of copper chloride to be changed to the harmless $Cu(OH)_2$. After the mercury had been in the pans for some time, it was found to be bright and free from the grayish black film that had formerly been noticed. Its use did not affect the extractions of silver or gold. The addition of lime always thickens the charge, so that water must be added to have the pulp of the proper consistency.

(To be continued.)

Provincial Mining Association of British Columbia.

The executive committee of the Provincial Mining Association of British Columbia recently held a meeting at Nelson, West Kootenay district, to consider several matters connected with the mining industry of the province. The most important business transacted was the passing of two resolutions, which were discussed at length during the two days' session. One of these endorsed the application of the silver-lead miners for the extension of the benefits of the lead bounty act so as to permit, for a period of one year, of the bounty being paid on lead mined in the province and shipped abroad for smelting, the capacity of the home smelting not yet being sufficiently large to admit of all the lead ore produced in the province being treated at home. The other involves an application to the provincial legislature to so amend the statutes relating to the location of placer claims as to prevent such locations being made on ground already covered by lode mining claims, also asking that the surface rights be granted to mineral claim owners. The necessity for the amended legislation asked for has lately been made evident by the location of a placer claim over the Lucky Jack mineral claim at Poplar creek, and the decision of the supreme court that the applicant for the placer claim was entitled to have his location recorded, the local gold commissioner having previously given instructions not to record same.

An unusual accident occurred at the smelters of the Mountain Copper Co. at Keswick, Cal., recently, in which several workmen lost their lives. From all that can be learned at this time it had become neeessary to make repairs in one of the water-jacketed furuaccs, and to hasten the operation of cooliug after "blowing out" the furnace a stream of water from a hose was directed into the interior of the furnace, but it appears that there still remained considerable molten matte and metal in the crucible of the furnaco, and an explosion immediately followed the introduction of the water, the great volume of steam destroying the stack, scattering debris and molten metal over the workmen standing about. Whether this is the usual practice in cooling furnaces at Keswick is not known, but as a similar accident has not been previously reported from there it is probable that some one erred in his judgmeut as to a safe time to turn the hose into the furnace. Hereafter it is not unlikely that this branch of the work will bo conducted under the immediate personal supervision of a competent foreman.

The First Hurdy Wheel.

To the Editor:—I notice you state that Hamilton Smith used onc of the first hurdy gurdy wheels, which was introduced about 1875. Thos. Pattison, now deceased, made and operated on a derrick in 1858 the first hurdy wheel in Nevada couuty. At Liberty Hill he used wooden buckets between rims. His derricks were afterwards put up in Dutch Flat and all over the hydraulic mining section. Mr. Pattison was a resident of Little York, Nevada couuty. He hoisted with his wooden buckets as large rocks as are hoisted with modern wheels, as his old rock piles, still in evidence, show to bear out the statement. The wheel was operated with pipe aud hose, the pipe having been made by Chas. Macy of Iowa Hill.

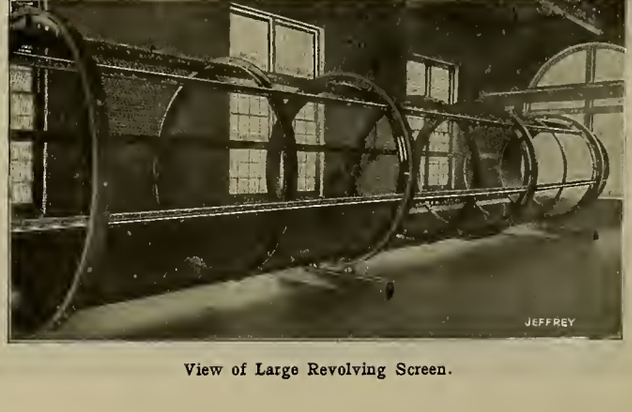
Dutch Flat, June 1.

A Giant Trommel.

The accompanying side and end view illustrations show a large revolving screen built by the Jeffrey Manufacturing Co. of Columbus, Ohio. It is 7 feet in diameter and 54 feet long, mounted on friction rollers. This screen is for separating coal into a number of sizes and was built for one of the large coal companies in Virginia. As will be seen from the illustration, the screen has no central shaft but is supported on friction rollers.

Cross Section of Revolving Screen.

When installed at the mine the screen will be supported on heavy friction rollers, carried on shafts extending the full length of the screen, the rotation of which causes motion to be imparted to the screen by the friction rollers on the shafts bearing against the friction rings attached to the outside of the screen. The coal is fed into the screen by means of a special bucket elevator at the rate of about 250 to 275 tons per hour. This type of screen is also suitable and used in mills for screening shavings in large quantities.



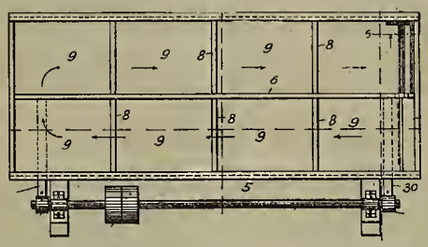
View of Large Revolving Screen.

Mining and Metallurgical Patents.

PATENTS ISSUED MAY 31, 1904.

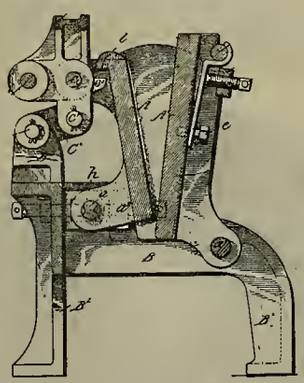
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

SLIME SAVING APPARATUS.—No. 761,615; J. J. Smith, Denver, Colo.



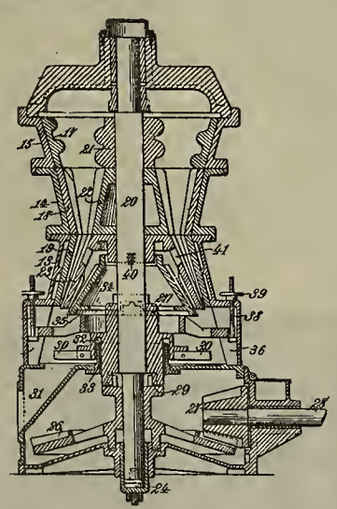
Horizontally arranged slime saving table having vibratory movement transverse to travel of pulp thereon, table being provided with feed compartment having gate controlled openings for admitting pulp to body of table, and discharge opening for gangue or tailings, discharge opening being remote from feed box or compartment, table being also provided with gate pivotally mounted near discharge opening, normally occupying horizontal position below opening and capable of adjustment on hinge or pivot to maintain suitable predetermined depth of water or pulp above slime bed as it accumulates on table.

PROSPECTOR ORE BREAKER.—No. 761,579; A. C. Calkins, Los Angeles, Cal.



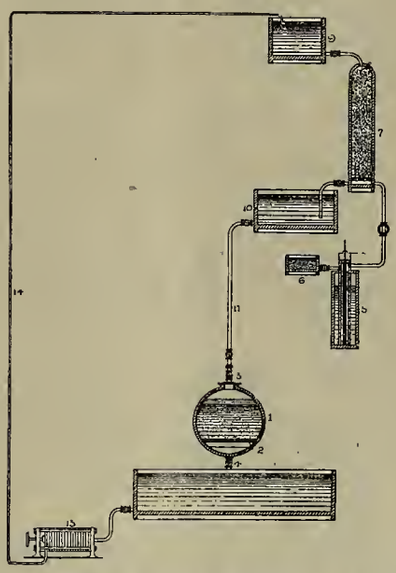
Ore breaker comprising rigid framework, two jaws formed at lower ends with perforated lugs offset outwardly from face of jaws, and two axes for jaws passing through outer ends of lugs and arranged at different elevations, and means for causing jaws to approach and recede from each other at top and to turn about axes.

VERTICAL CRUSHING AND GRINDING MILL.—No. 761,334; T. L. Sturtevant, Quincy, and T. J. Sturtevant, Wellesley, Mass.



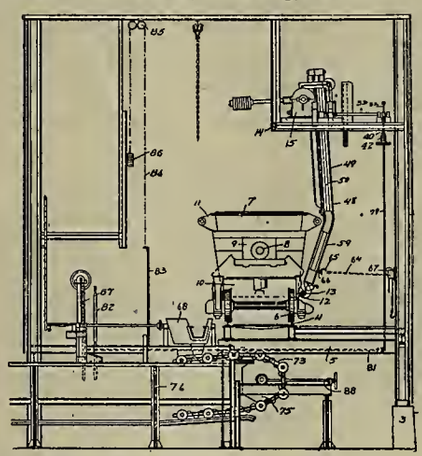
In vertical crushing mill, combination with central vertical driving shaft 20, provided near its lower end with driving gear 26, of vertically adjustable support in which lower end of shaft is stepped, outer and inner stationary shells or cones, as 19 and 34, and intermediate shell or cone 23 hung to shaft to rotate and to be vertically adjustable therewith and provided with openings to admit material into inner chamber formed by three shells or cones.

PROCESS OF EXTRACTING METALS FROM ORES.—No. 761,164; W. E. Greenawalt, Denver, Colo.



Process of extracting metals from ores, comprising electrolyzing sodium chloride for purpose of generating chlorine, absorbing chlorine so generated in aqueous solution, charging solution and ore to be treated into closed vessel, agitating it for some time, then introducing fresh solution under pressure thereby displacing first solution, again agitating contents of vessel, then filtering solution from ore and precipitating desired metals.

LADLE-TILTING DEVICE.—No. 761,319; W. J. Patterson and A. M. Acklin, Pittsburg, Pa.

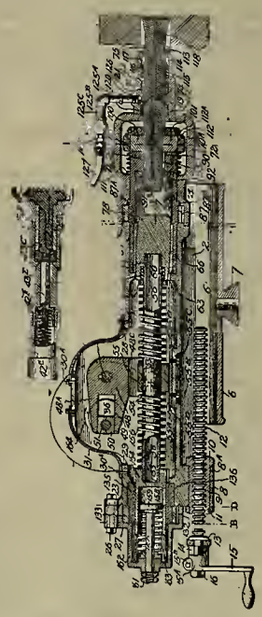


In ladle-tilting device, combination with tilting ladle, of shaft, swinging frame mounted thereon, pinion on shaft, beam adapted to engage ladle and having rack adapted to engage pinion, worm wheel on shaft, worm shaft, gear wheel on worm shaft, pinion meshing with gear wheel, friction wheel on last-named pinion shaft, oppositely driven friction wheels mounted on adjustable shafts on each side of first-mentioned friction wheel, and mechanism for throwing oppositely driven friction wheels alternately into engagement with friction wheel.

CORE DRILL.—No. 761,332; F. Stone, Spokane, Wash.

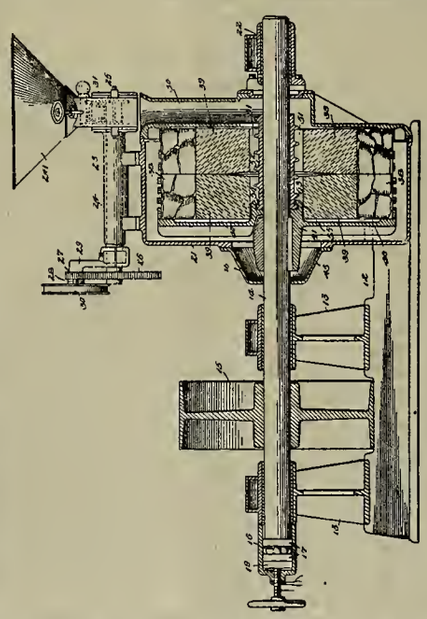
In drill of character described, combination with rotatable hollow rod and shell rigid therewith; concentric inner core barrel, means for delivering water into core barrel from rod and means for discharging water from top of core barrel exterior to rod.

ROCK DRILLING ENGINE.—No. 761,153; L. Durkee, Denver, Colo.



In rock drilling engine, combination with casing and its screw feed sliding supporting base, of piston hammer reciprocally mounted in casing, hammer having spirally grooved peripheral surface at one end, spirally fluted nut rotatably mounted on hammer, sleeve secured to nut, rock cutting drill bit operatively and removably secured to sleeve in relatively fixed position to piston hammer, means including coiled springs operatively mounted on piston hammer for reciprocating piston hammer against drill bit, straight fluted portion on rear end of piston, straight fluted nut rotatably mounted in casing having its fluted portion in operative mesh with straight flutes on piston hammer, ratchet toothed ring on nut and spring controlled pawls arranged in operative relation to ratchet teeth and provided with resilient buffer support.

GRINDING MILL.—No. 761,333; T. L. Sturtevant, Quincy, and T. J. Sturtevant, Newton Center, Mass.



In grinding mill, combination with mill shaft and bed and runner stones, of runner head to which runner stone is attached and which is provided with hub having undercut recess, and feed screw mounted on shaft and provided at one end with one or more peripheral lugs by which it is operatively connected with undercut recess of hub so as to rotate with runner head and be held against longitudinal movement.

BOTH amalgamation and cyaniding of gold ores have been successfully accomplished by the use of salt water. A large cyanide plant is operated in Bolivia, S. A., where the only water available is that of the Pacific ocean. The salt water of the mines of Western Australia has been used to amalgamate ores. There appears to be nothing detrimental in the salt to either process.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ALASKA.

H. H. Hildreth, U. S. Commissioner at Seward, reports a strike on the Shushitna river made by R. C. Richardson and C. A. Peterson of Sunrise. They spent the wintor opening up claims. The spring clean-up gave results of 30 cents to 50 cents per pan. Tho diggings are shallow. This strike was made on Gold creek, a tributary of the Shushitna river. 100 miles from its mouth and below the falls of the river. From Seward and Cook inlet miners are going to the new diggings. The routo is via Tyoonic, and thence in small boats, a journey of ten days.

The Little Basin M. Co. property of Windham Bay has been honded to A. Gfeller, ot al., of Scattle, Wash. The bond extends for fivo years, the terms of which are that the parties honding the mine guarantee a dividend annually and to turn over 10% of the gross output of the minc. They will build a 20-stamp mill.

Tho English Oil Co. at Kayak is reportod to have struck another gusher. The flow of oil was capped, as are the othor three wells of the company. It is estimated the output of the three wells will be 6000 barrels per day. Pipe lines are heing laid from the wolls to the harbor, a distance of 5 miles, and it is expected they will bo shipping oil by fall. Considerable oil drilling machinery is on the docks and being set up, preparatory to beginning development.——The White & Abornethy Co., the Ivey Co., the Spokane (Wash.) Co., of which G. Turner is president, tho English Co. and the Lippy Co. are all making preparations to develop their coal holdings this summer.

ARIZONA.

Cochise County.

Diamond drill operations have been suspended at the Marquette and Arizona group near Bisbee.

The Dutchoven group, incorporated as the Bisbee Dev. Co., which consists of sixteen claims, 1 mile northwest from the center of Bisbee, is reported improving. In the 100-foot shaft copper ore was found, several tons having been taken from the dump and shipped. Cowan, Clawson, Hicks, Mitchell and Seymour are principal owners.

Gila County.

The Pacific M. & M. Co. has made a payment of $70,000 in cash ($10,000 having been previously made) for the Clipper group of mines, says the Globe Silver Belt. The Clipper group comprises twelve claims, 8 miles west of Globe. J. D. Coplen, manager of the Pacific M. & M. Co., says work will be started this month under the direction of J. B. Coplen as superintendent. The company also has three other claims adjacent to the Clipper group under bond.

Graham County.

President C. A. Ross of the Standard Con. C. Co., near Morenci, says he has bought control of the Copper Center group, which consists of eight patented claims adjoining the holdings of the Standard mines on the east. Considerable development work has been done on these claims, showing ore of the same general character as that in the Standard mines. The group lies along the crest of the mountains east of the Standard, and will be opened through Standard workings at depth. The veins of the Copper Center run parallel with the Standard mines. This gives the Standard Con. twenty-three claims in one group (besides the twenty-nine Coronado claims). Since starting work on the San Jose claim, Manager Rosecrans has opened up a 2-foot vein of glanee which averages 22% copper. This vein will be cut by lower workings, and will be stoped later and brought to the railroad over the Standard tramway.

The Polaris M. & M. Co. has bought the Russian Bear and sixteen other claims in Greenlee district, ncar Clifton, for $20,000.

Maricopa County.

The Grijalva M. Co., under the management of the Goldberg Brothers, of Phœnix, is preparing to put on a 10-stamp mill.

H. J. Bennett, who owns the New York group of claims, near Phœnix, says he has put men to work. With Eastern men he has incorporated the Buffalo-Arizona M. & M. Co. to develop the mine.——The Gold Quarry M. Co. property is temporarily shut down.

Mohave County.

J. Barry, who has a hond on the Alger-Tohy mine, near Kingman, will put men to work opening it up. The mine shows gold values in the outcrop and in the shaft.——It is reported the Samoan Co. will put in a hoisting plant and sink a shaft on the Samoa mine.

C. G. Krook, who has bought the interests of J. A. Marshall and W. Chapman in a group of mines near Burro Creek, near Kingman, has put men to work.

J. Carter, superintendent of the Cedar Valley M. & M. Co., reports completion of tho wagon road from Yucca to Cedar. High grade ore has been struck and will be shipped. A mill will be built.

Pima County.

The Arizona C. M. Co., near Tucson, proposes building a smoltor. G. H. Parker of Los Angeles, Cal., is secretary of the company. Ore is being piled on the dumps. The mines are 4 miles from the Southern Pacific main line.

The Indiana-Arizona Dev. Co. has hought the Carbonate group of mines near the Old Boot mines, in Silver Hill mining district near Tueson. Development work has begun.

Pinal County.

(Special Correspondence).—The Phœnix & Eastern railroad has laid its track up to Cochran station, on the Gila river. On both sides of the road are said to be bodies of copper and gold ores. The Cochran mines are showing progress. The railroad line runs to the mouth of the tunnel driven on a dyke showing copper.

Florence, June 6.

Santa Cruz County.

Manager J. T. Brickwood of the Chicago-Patagonia G. M. Co. has fifteen men at work at the Old Soldier camp near Harshaw.

Yavapai County.

The J. Phillips group of minos, 7 miles south of Prescott, has been leased to G. U. Young. He has put additional men to work.

The Oro Grande mine, north of Wickenburg, is placing its machinery for additional five stamps, and will have ten stamps dropping by June 15th. The only question left to solve is the water problem. A well is being dug on the Hassayampa river.

The Cypress and Burlington mines, near Prescott, will be equipped with additional machinery, including an air compressor and drills. H. L. Dooley of Rock Island, Ill., and P. Federson of Davenport, Ia., are interested.

Manager J. S. Jones of the Jessie M. Co. says the company will build a 200-ton daily capacity cyanide mill at its mines at Chaparral, to handle the low-grade ores. The high-grade ores will be shipped to the smelter. He is enlarging the shaft to double compartment and is down 265 feet. The shaft is 665 feet deep.

Fire on the 2nd inst. at the Hackberry mine, near Big Bug, destroyed the hoisting plant and is reported to have resulted in the death of two miners. The hoist building was located directly over the shaft, and when the fire occurred two miners were at work in the mine and the exit was cut off by the fire.

CALIFORNIA.

Amador County.

(Special Correspondence).—The report of the Central Eureka M. Co., operating near Sutter Creek, for the year ended April 1st, shows the shaft has been sunk 225 feet, making total depth of 2380 feet. The 2100-foot level north drift has been extended 285 feet, the face showing 20 feet of low-grade quartz. Other work has been done on the 1500, 1700, 1800, 1900 and 2000-foot levels.

ORE MILLED DURING THE YEAR.

	Tons.
From 1500-foot level	3,868
From 1700 foot level	925
From 1800-foot level	3,814
From 1900-foot level	10,490
From 2000-foot level	11,493
From 2100 foot level	24,536
From 2200-foot level	1,000
From 2300-foot level	875
Total ore milled during the year	57,001
57,001 tons ore yielded in free gold	$194,228 09
1,054⅛ tons of sulphurets yielded	57,663 72
Total	$251,891 81
Average value in free gold per ton	$3.407
Average value in sulphurets per ton	1.0116
Average assay of tailings per ton	.38
Actual value of ore	$4.7086
Net value, after deducting cost of refining bullion and reduction of sulphurets.	$4.1979
Quicksilver fed inside batteries, ounces	17,284
Amalgam cleaned up, ounces	33,486
Average yield per ounce of amalgam	$5 80

The mill was idle ten days owing to a strike among the miners in the district.

COST SHEET.

Items.	Mining.	Deadwork and Development.	Milling.
Salaries	$1,700 00	$1,700 00	$1,650 00
Office	300 00	234 83	300 00

Totals	$81,694 75	$25,148 03	$24,707 41
Cost of mining, per ton			$1.4858
Cost of development, per ton			.4413
Cost of milling, per ton			.4334
Total cost per ton			$2.3605

Dividends paid during the year $111,559, making, to date, $289,358.95. ——The president's report says the dirrctors have concluded a ten years' contract for olectrical power to run the mill and rock breaker at a rato of $4.50 per horse power per month as against $6.50, the price paid under the old agreement that expired last year. The saving per month in the expense account may be further reduced by taking electrical power to run the hoist if present negotiations are closed. E. B. De Golia is president and W. R. Thomas superintendent.

Sutter Creek, June 7.

At the South Eureka mine, near Sutter Creek, thirty men are at work underground, cleaning out and retimbering the shaft and drifts. The mill is shut down, but work is being done on the equipment.

At the Madrone mine at Pioneer developments are progressing so that the owners have concluded to build a 5 or 10-stamp mill and thus save the expense of hauling the rock to a custom mill. L. Cassinelli, of Volcano, is manager.

G. S. Andrews at Defender is preparing to take the water from the Grand Prize shaft and repair the tunnels.

At the Fremont-Gover mine, near Amador City, the strike situation remains unchanged. Sixteen men are at work putting in the sand flume, says Superintendent Palmer. No definite time has been set for starting up the mine. The union men have two day guards on duty. The company has three men on duty at night looking out for the plant.

Calaveras County.

Twenty of the stamps at the Metropolitan mine, near Angels, were started dropping this week. The other twenty will also be repaired.

The Crown Deep mine, near Shasta, is shipping ore to the smelter. Four-horse teams haul the ore loose to the hill above Middle Creek, and it is then sent down a shoot to an ore bin that feeds direct to cars.——The Wiser Bros. are opening up a mine on the Muchmore claim.——It is reported that J. Sallee has a bond on the Reid mine at Old Diggings, near Redding.

Men are at work grading for a millsite at the What Cheer gravel mine, near Mokelumne hill, under Superintendent H. Birch.

At the Del Monte mine, near Jesus Maria, the mill is steadily running, with the stamps dropping on ore from the upper tunnel. In the lower tunnel the ledge has been followed on both sides.

El Dorado County.

At the Karolyi mine (the Lady Emma), near Kelsey, work is progressing under B. Peters as superintendent. Last month a pocket was taken from the Heyden shoot. A shaft has been sunk to 100 feet, a crosscut 25 feet and a drift north to catch the old workings. A 2-stamp mill for testing has been placed below the new shaft, with a concentrator, to save the sulphurets.

El Dorado reports say the Noon Day copper mine will resume work.

Fresno County.

Work on the Coalinga Oil & Transportation Co. pipe line from Coalinga to Monterey has begun. The survey having been completed, the poles and wire for the telephone line are on the ground, while the 6-inch pipe for the main line is being hauled to the line. Twenty-five miles of 6-inch line and material and machinery for three brick pumping stations will be hauled from the Coalinga end of the line. The receiving station will be built on section 18, on the property of the Pleasant Valley Farming Co. From that point a 6-inch line will be run to the Commercial, with a 4-inch extension to the Caribou. It is expected to have the 110 miles of pipe line in full working order by the end of the year.

Kern County.

W. F. Brizius and H. Hatch have bought the Star mine in the Democrat mining district, near Bakersfield, for $3000. A roller mill and concentrator are in place and development work will start this week. Additional machinery will be put in.

Nevada County.

L. A. Sutherland, superintendent of the Federal Loan quartz mine in Willow valley, near Novada City, is overhauling the machinery and putting in a thousand feet of pipe from the South Yuba ditch to insure steady supply of water for power.

The Shady Creek Dredging Co., near the Cherokee diggings in Bridgeport township, near Grass Valley, is increasing development work. The centrifugal pump with which the gravel is elevated 35 feet to the sluice boxes handles 1000 cubic yards of material a day. It is claimed the ground worked so far demonstrates that the original gravel in place up to 8 feet in depth yields $2 per cubic yard. The material, from surface to bedrock, produces an average of 30 cents per cubic yard. The work so far has been largely experimental, and it is now planned to substitute for the present pump another of the same character, but having greater capacity. Where the company is working the creek is 500 feet in width, its grade beiug about 3%.

Placer County.

(Special Correspondence).—La Rita M. Co., J. H. Meyers, superintendent, has six men working on the Old Spanish ledge near Forest Hill. A shaft is being cleaned out, which was last worked forty-nine years ago. Spokane, Wash., and Boston, Mass., men are interested.

Forest Hill, June 8.

Santa Barbara County.

W. H. Sutherland and C. Bradley have leased the Allen property in Shepard's canyon, Carpinteria, and will prospect it for oil. This tract, consisting of 400 acres, is said to show surface indications of oil formations.

Shasta County.

The mining dredger of the Port Huron Submarine Con. Co. is again at anchor in the Sacramento river, near Middle Creek station, near Redding. The boat was carried 3 miles down stream during the flood of last winter. Improvements and repairs have been made on the dredger. A new 20 H. P. boiler and a horizontal engine have been put in.

The Hazel G. M. Co., operating the Gladstone mine at French Gulch, will have its machine shop in operation this month. A drill press, together with counter shafting and attachments and a steel planing machine, are being added.

The Mount Lassen Water & Power Co. has been incorporated at Redding for creating electrical power in Shasta county. The company proposes to put up a 10,000 H. P. plant on Battle creek, 35 miles southwest of Redding, and will furnish power and light to Redding, Red Bluff, Corning and Chico.

Sierra County.

Nineteen men are working at the Keystone mine at Sierra City. They are grading for the mill and the electric plant.

Siskiyou County.

In the Salmon river country the Yreka M. & M. Co.'s plant is idle on account of litigation, says the Journal.——H. Brokaw of Yreka is making preparations to develop the Advance quartz mine and other ledges in the Salmon river section. He is also putting up a quartz mill at his mine on Hull gulch, near Oro Fino, and intends putting up another at Indian creek, near the Golden Eagle mine, near Fort Jones.

The Maplesden Bros. & Hammer of Hamburg are operating the Thomas Quigley mine, below the mouth of Beaver creek, in the Oak Bar mining district. They are equipping the mine to reach bedrock this season.——Johnson Bros. of Yreka are opening up their placer mine on Horse creek, in Oak Bar district.——A. Montgomery of Oakland is opening up the White Cloud group of mines on Horse creek, near Oak Bar. ——The Horse Creek mine, near Oak Bar, has been sold to the Ethelyn G. M. Co. of San Francisco. They have started work cleaning out the ditch preparatory to developing the mine and intend putting in a sawmill. ——The M. Mott placer mine is operating above Oak Bar. The company has been delayed in getting the mine equipped, owing to high waters in the Klamath river.

The Ethelyn G. M. Co. will put up a sawmill at its Horse Creek mine, near Yreka.

The Etna Advanee says machinery for the Morrison & Carlock mine at Quartz valley, near Etna, is on the ground and being placed. Superintendent J. M. Morrison has put in an assay outfit.

Tehama County.

(Special Correspondence).—The Basler M. & Dev. Co. has been incorporated at Saeramento, with L. A. McClean, H. H. Grau, C. M. Basler and W. L. Rennie as officers. C. M. Basler is manager. The mines of the company are 9 miles from Lowrie and 30 miles west of Red Bluff.

The ore carries values in gold, copper and silver. Manager Basler has men at work in the tunnel, which has been driven in 900 feet. He will increase the number of men.

Lowrie, June 8.

Trinity County.

The Potillo quartz mines on Mt. Bally, 9 miles from Weaverville, have been bonded to a company for $30,000. There are three mines in the group. A tunnel will be started at the foot of the mountain and a shaft will be started at the top to connect with this tunnel. The tunnel will be 3500 feet long and the shaft will be 2000 feet deep. The mine is in the granite and has a 4-foot vein. The company expects to build a 10-stamp mill. The ore carries free gold. The company which will be incorporated is composed of T. O. Jones of Reno, Nev.; B. V. Dolph of New York City; D. C. Dedrick of Junction City, M. G. Womack and W. V. Livesly of Reno, Nev. A road will be built to the mine.

Strode Bros. are working the Strode mine near Carrville. A gasoline hoist is being set up.——At the Yellow Rose of Texas mine the lower tunnel is within 100 feet of the shoot and is expected to cut the same about June 20. The mill will be started this week.

At Trinity Center the Bloss & McCleary mine is being worked steadily.——A large area of placer ground in same section has been bonded to W. H. Christie, including the Vollmers and Haskins ground. It is expected the bond will be taken up and dredgers installed there.——The Unity mine at Minersville is under bond and they are doing developing and prospecting work.

At Trinity Center the Sikes Hydraulic M. Co. expects to make a satisfactory clean-up this season, and much new ground will be prospected in that section for dredge mining. L. McDonald, interested in the Sikes company, is operating the Bloss & McClary mine. Although they have a sufficient supply of water to run throughout the year, the mine will be closed down July 20th for the annual cleanup.——W. H. Christie says he has options for dredging purposes on the lands owned by the Sikes M. Co., L. & T. McDonald, W. Vollmers et al. A driller will be put to work prospecting the ground.——The Cleary, Payne & Keenan mining dredge, which has been operated on Trinity river above Trinity Center, will be run again this summer.

Tuolumne County.

(Special Correspondence).—The Ranch M. Co., R. B. Stanford, manager, having about finished paying for the Doyle property, near Columhia, has put in a 50 H. P. boiler and is building a 60-foot head frame. A plant (including a 3 stamp quadruple discharge mill) to treat 100 tons of gravel daily is on the ground and is expected to be in operation by July 1.

The company owns 2 miles of the Table mountain channel and has opened up bodies of payable gravel both loose and cemented, some of it high grade.

Columhia, June 8.

The Dreisam M. & M. Co. at Arrastraville, near Carters, has started operations again. Men are retimbering the crosscut tunnel that taps the Good Luck vein. After the mine is in working order the lead will be explored.

At the Mt. Jefferson mine at Groveland the cyanide plant has been put in operation. The Huntington mill, equipped with drag shoes instead of rolls, will grind the sulphurets to a sufficient fineness to ensure an extraction, and Metallurgist Leithold expects to treat four tons of sulphurets daily. The output of the mine will be increased. Underground the west drift at the 600-foot level is being driven ahead. The mill is running steadily with twenty stamps dropping on ore from the stopes in the east levels.

The Free Lance mill, near Tuolumne, started up last week on ore. Superintendent Bartlett reports a find of ore showing a ledge 3 feet above the lower vein.

J. B. Scofield has bought the Silken quartz claim, near Big Oak Flat.——H. Williams has hought the Marryatt quartz claim, adjoining the Gagnere, near Tuttletown.——E. A. Jones has bonded the Sievert quartz mine and its northeast extension, on Bald mountain, 2 miles northeast of Sonora.

The double-geared hoist is in operation at the Santa Ysabel mine, near Stent. Arrangements have been made to adopt steam when the electric power is forced out of commission by the fall shortage of water. The shaft has reached a depth of 450 feet and stations are heing cut.

Yuba County.

It is expected the Hammon gold dredgers on the Yuba river east of Marysville will hegin operations the first week in July. They are expected to work 60 feet beneath the surface.

COLORADO.

Boulder County.

(Special Corrcspondence).—The Snow Flake, Monarch, Wheeler, Dewey, Little Eddy and Cyclone claims are being worked hy E. C. Pohle, of Boulder. These claims adjoin the Big Five property. Work is being done by contract hy G. D. Kay. He has the tunnel in 65 feet. The surface shows 4 feet of honeycomhed quartz, carrying free gold.

Frances, June 6.

(Special Correspondence).—Twenty-one leasers are at work on the Big Five group, taking out ore. The Big Five Co., J. J. Willis superintendent, is remodeling its mill, putting in Wilfley tables and an Elspass mill, and expects to have the mill in operation about July 1st.——W. B. Rundle is operating the Boston mill on custom ore.

Frances, June 5.

(Special Correspondence).—The Copper Rock G. M. Co. has a vein 4 feet wide, said to average $12 per ton. They have a tunnel 500 feet in length and a shaft 375 feet deep. The tunnel is heing driven ahead to connect with the shaft. A cyanide plant will he built. R. B. Thurman is manager.

The Sunset G. M. & M. Co. is operating the Marcial group of claims, also the Routt and Ruhy. They have a 10-stamp mill which is kept in operation. They are also running the Ruby mill at Sunnyside. The mines and mills are under management of F. Soper.

Sunset, June 5.

(Special Correspondence).—The Wood Mountain mill is heing overhauled and made ready for operation. Development work continues in the mine. J. B. Annear is superintendent.

The mill of the Wall Street G. Ex. Co. has been remodeled and in future the cyanide process will be used. The mill is ready to hegin operations. It is under control of the Nancy G. M. & T. Co., F. Mitchell general superintendent. The Nancy company has thirteen claims. One crosscut tunnel on this group is 1300 feet in length, which connects with the Gillard shaft. This shaft is 537 feet deep. They are doing all their work through the tunnel. They have put in a 16-drill compressor. The mill will have a capacity of 100 tons a day. An aerial tramway will be put in this summer. W. Mitchell is superintendent of the mine.

Wall Street, June 6.

(Special Correspondence). — The Progressive Con. & M. Co. is operating the Boyd 10-stamp mill on custom ore. In this mill they have jigs, Tetrault concentrators and Tetrault slime tables. E. C. Pohle is president and A. Tetrault is superintendent.

Boulder, June 6.

(Special Correspondence).—On the Colorado & Northwestern Railway, 26 miles northwest from Boulder, is Ward. Mining in this section is improving. One and one-half miles north of Ward the Myrtle M. Co., in Quiglyville gulch, owns thirty acres of mineral land and has 2000 feet of development work. The shaft is down 370 feet and is equipped with an 8x10 hoist. Down the hill is the 50-ton mill. This mill has been remodeled from stamps to crushers. They have put in a roaster 48 feet long and 5 feet in diameter. From the first crushing bin the ore goes on to the dryer, which is practically a smokestack lying horizontally above the roaster with a flat upper surface, over which the ore is dragged and dried. It is then discharged into an elevator, which carries it to the screens and is then delivered to the roaster. From the roaster it is elevated into the vats and prepared for cyanide treatment. The mill is lighted by electricity. The ore is a sulphide carrying gold and silver, with a small amount of copper.

Farther down the gulch is the Quiglyville 10-stamp mill, doing custom work under management of G. A. Kline.

On the St. Vrain river, 2½ miles north of Ward, is the Ward-Struggler property, consisting of 180 acres patented ground. One vertical shaft is 60 feet deep and will be sunk several hundred feet additional. The incline shaft is 310 feet deep. Tunnel No. 1 is 762 feet in length; tunnel No. 2 is 50 feet and tunnel No. 3 is 75 feet long. The past winter they built a 75-ton concentrating mill, which is in operation. The mill contains crusher, stamps, Huntington mill, classifiers, four Wilfley tables, two Frue vanners and one Wilfley slimer. G. M. Mitchell is manager and E. A. Smith superintendent.

Ward, June 6.

The Enterprise mill, near Eldora, began crushing ore last week. The roaster has been fired up. Work at the mine is progressing and Foreman G. Miller says they are breaking twenty tons of ore per day.

The Golden Trail M. Co. has been organized to work the Wilder-Rogers group at Wall Street. The officers are President C. E. Bonnel, H. W. Greene, D. M. Rogers, J. M. Ramsay and W. F. Durell. They will put in a steam plant on the H. & C. shaft, from which all the properties can be developed. D. M. Rogers is in charge.

Chaffee County.

The Coma mine, in Whitehorn district, near Salida, has been taken over hy R. G. Baker et al. of Denver under a $20,000 bond and lease. Baker will increase developments. At the bottom of the shaft is an ore body 4 feet thick averaging $10 gold per ton. The shaft is down 55 feet and the management will explore the vein to a depth of 500 feet.

Clear Creek County.

All litigation over the Stanley mine, near Idaho Springs, having been settled, A. G. Brownlow, the owner, is preparing to resume operations. The Stanley is 1 mile west of Idaho City, on the line of the railroad. It is equipped with a steam hoisting plant, ore-sorting rooms, ore bins, side tracks, etc., a water power compressor plant of 250 H. P. and a concentrating mill. The shaft is down 700 feet. The plant is to have increased capacity.

Cottingham & Reihel have resumed work on the Klondike group of claims at Silver Plume. They are driving a drift on the North West lode that will cut the other veins at depth.——Stevens & McGrath, operating the Mendota mill, shipped 75 tons of lead ore last week, and also several carloads of zinc ore. They report having struck an ore shoot in the lower workings and the output from the mill is heing increased.

This week the Capital mill at Dumont will be running full time on the ores from the Jo Reynolds mine. With tho exception of a few months, this mill was never operated since its erection five years ago, says the Times. The mill was huilt at a cost of $30,000, and an aerial tramway built to connect it with the Senator mine. The mill has been bought by J. G. Roberts and R. B. Morton of Idaho Springs.

At the Consolidated Gem shaft, at Idaho Springs, they are extending the sixteenth, seventeenth, eighteenth, twelfth and fourteenth levels, and in this work are taking out 100 tons of ore a day. This ore is broken with machine drills and the product is not sorted. The ore goes down the Gem shaft to the Newhouse tunnel, thence through the tunnel hy means of trolley cars, thence loaded on Colorado & Southern gondola cars and conveyed to the Newton and Newton annex mills for treatment. A water box has been completed in the manway of the Gem shaft, which renders the ore chute practically dry.

Dolores County.

The Emma group of mines at Dunton, under management of R. Keller, is regularly producing a carload of concentrates per day, says the Rico News.——Manager Larson of the Horlick mine and mill (formerly the Mt. Goram) is getting the mine and mill in working condition and will increase the mill capacity.——J. Shaver says he is developing a 2-foot vein of anthracite coal near the summit of the divide between the east and west forks of the Dolores river, near Rico.

Fremont County.

The oil companies operating in the Florence field report progress. Several wells have been opened in the first five months of the year. There are twenty-two companies doing business in oil. Besides these, five others have heen organized and are arranging to drill. Three companies are in process of formation and expect to he drilling in July or August. A year ago the combined daily expenditures of the operators had reached $1000 a day, and the amount is to-day much heavier. Sixteen wells were under way during month of May. A few of these wells have already gone through small streaks of oil sand, but will send the drills deeper. The best wells, recent developments have shown, were opened at depths varying from 2500 to 3000 feet. Some wells have heen pumping continuously since opened, fifteen or eighteen years ago.

Gilpin County.

It is reported the Gilpin King group of mines in Lump gulch, near Rollinsville, have been leased and bonded to F. P. Davey, and that developments are to be started. Copper and lead ore has been taken out of this group. Shipments to the stamp mills and sampling works have been made and results reported satisfactory.

Decatur, Ill., parties are interested as the Decatur M., M. & T. Co. in a group of claims in the Moon gulch section, near Rollinsville, and they are continuing developments. Good headway is being made in driving the main tunnel. The work is under management of W. M. Bloomer. The company expects to build a mill of at least 50 tons daily capacity.

The Interstate Con. M. Co. has been organized by the owners of the Happy Hollow group, 1 mile south of Rollinsville. Chicago, Ill., parties are interested and O. J. Duffield is local manager. It has been partially developed by tunnel and shaft workings, hut it is intended to concentrate efforts toward development of the entire group through a central shaft and they will put in a steam hoisting plant and top buildings. G. E. Churchill is underground superintendent.

Gunnison County.

Operations have been resumed on the Red Jacket group of six claims, near Pitkin, under management of J. C. Teller of Denver, part owner, and who also holds lease and option on the property. Teller has the Iron Crown and the Iron Cap lodes adjacent to the Red Jacket. An incline has been sunk 90 feet with 100 feet of drifting done, and a vein of carbonate ore is showing. About fifteen cars of mineral have been shipped. A 4-drill compressor is being set up.

Hinsdale County.

The Contention mine, near Lake City, is in steady operation and Superintendent Kazar has thirty men at work in mine and mill.

It is reported work will resume on the World's Fair claim of the Dupre Co.'s group, near Lake City.——Between five and six tons of concentrates are being made daily at the Hidden Treasure mill. The new level started is progressing, says Superintendent McCarthy.

Jefferson County.

J. W. Boyd of Idaho Springs, member of the company which has bought the smelter at Golden, states that the smelter will he blown in about July 15. The company is to he known as the Independent S. & R. Co. Improvements are being made on the plant and they will make a number of changes before starting operations. The plant is to he made automatic.

Tests made a few miles west of Denver have proven the land carries gold values, says H. J. Reiling of Chicago, Ill., who, with others, has organized the Clear Creek Gold Dredging Co. and the National Dredging Co. Over 700 acres of land on Clear creek, 4 miles east of Golden, have been secured hy the companies and preparations to work it are being made. The building of dredgers, with a capacity of 80,000 yards per month, and to cost $85,000 each, have heen started at Placer and Eleanor, and a third will also he built. The hulls of the first two dredging machines are complete and about October 1 it is expected the machines will be in operation. They will employ thirty men. They will be of the "endless chain" elevator type. They rest in 8 feet of water and work the land to bedrock, which, near Golden, is said to be in places 60 feet. The dredgers will have a chain of eighty buckets, each having capacity of 5 cubic feet. Sixty men are at work on the two dredgers heing built at Placer and Elcanor and the third will also be at Eleanor. The land on which the dredgers are heing built is along the line of the Denver & Northwestern electric line. The dredgers will be named Eleanor Nos. 2, 3 and 4.

La Plata County.

(Special Correspondence).—The season has opened and shipments are heing made from prospects and small mines all over the district. The Durango Girl shipped a carload last week, the smelter returns showing $500 gold and 106 ounces silver per ton.——The May Day made a shipment of two carloads and the Chief shipped one car of twenty-five tons. The latter company proposes building a mill, rope tram and compressor plant.——Men are at work driving a tunnel on the Tribune claim to cut the extension of the Comstock vein, a 100-foot coutract having heen let.——The R. G. S. Railroad is putting in a spur on the Mesa, 5 miles west of Hesperus, for the henefit of mines in La Plata river district. It will probably be extended to the May Day this summer.

Mancos, June 5.

The May Day mine, near Durango, is driving its crosscut tunnel with air drills and making daily shipments to Durango from the shaft. They have a 117-foot shaft and 122 feet of drifting.——The Comstock, near the May Day, has resumed operation, the workings having been cleaned out and improved, and the mine will be among the regular shippers hereafter. The Bay City, operated hy Puehlo men, continues its drift into the mountain.——The Bonnie Girl M. Co. continues work at its mines and in construction of the mill which, it is expected, will be in operation next month.——The Empire G. M. Co. is operating the Small Hopes group, driving a tunnel 1450 feet to cut seven known veins. An air compressor is employed.

Montrose County.

N. C. Westerfield of Philadelphia, Pa., has an option on the property of La Salle C. M. Co. in the Paradox mining district, near the Utah line. The property consists of twelve claims, and has been

worked for several years. The tunnel is in a distance of 1132 feet, and above this tunnel level ore containing values in native silver and copper has been taken out. Work is being confined to driving a drift at a point 100 feet below the tunnel level. There is a 35-ton smelter on the ground. Westorfield says he will do a year's development work, sinking and opening up the ore, and will then be in shape to make output and run the smelter.

Ouray County.

It is reported the Camp Bird mine, Ltd., at Ouray continues to improve. Twenty-eight tables are constantly running in the vannor room of the mill. Men are being added daily to the working force. The mill is being enlarged for an addition of ten stamps, and the eyanide plant will also be increased. A saw mill will be added.

San Juan County.

The Astor M. Co., near Eureka, working thirty-three men, says Manager Condit, is grading for a 1600-foot pipe line to convey water from the Animas river to the millsite. The grade will be completed and the pipe laid by July 1. Part of the machinery for the concentration mill is on the ground and it is expected the plant will be running by October 1.

J. Essley and T. Anderson have started work on their Dolliver group on Boulder mountain, near Silverton. The group comprises five claims. Development consists of a 200-foot crosscut which is expected to break into the Republican lead. Next will be the Roberts lead, then the Crogan.

The Dawn of Day group in Dry gulch, near Silverton, will be operated on bond and lease for tungsten this season, says the Silverton Standard.

The Bavarian M. Co. has started operations for the summer on its crosscut tunnel on Tower mountain, near Eureka, which is in 135 feet. At the foot of King Solomon mountain men have been put to work on another crosscut. W. Barkow is in charge.

Summit County.

The vein of the Colorado & Wyoming Dev. Co., near Breckenridge, is being developed. They have opened up bodies of ore at a vertical depth of 400 feet from surface of Mineral hill. The ore is 6 feet across. The management proposes building a concentration plant which will have a daily capacity for handling seventy tons of ore, adapted to the iron-lead-zinc ore of the property.

The Breene property on Elk mountain, near Kokomo, has put on another shift. Ore is being broken daily and large shipments made. P. W. Breene is manager. ——Considerable development is going on at the Milo. The underground workings show bodies of good grade ore, running well in lead, says Manager E. E. Byron. ——The Connors Bonanza property has started work on the tunnel.

The Carr G. M. Co. has been incorporated, to operate near the head of Blue creek, near Breckenridge, by J. P. Howe, F. C. Hamiltion, J. C. Mellor at al.

Teller County.

The output from Cripple Creek district for month of May amounted to $1,901,800; the tonnage was heavier than for April, despite the fact that the snowstorm closed down many of the mines for about a week. This amounted to 1000 tons more than April. The average value of the ore was $32 per ton, or a gain of $2 over the average value of April. Steady increase in the production is noted for several months. This increase, says the Gazette, can be attributed largely to the many lessees operating, and who during the past few months have opened large bodies of ore. Ore to the value of $9,000,000 has been produced in the district since Jan. 1. The figures obtained from the mills and smelters are as follows:

Plants.	Tons.	Total.
Smelters	11,000	$660,000
U. S. R. & R. Co.	22,000	484,000
Portland	8 000	240,000
Telluride	7,000	175,000
Dorcas	2,800	168,000
Economic	2,900	150,800
Homestake	4,000	14,000
Sioux Falls	2,000	10 000
Totals	59,700	$1,901,800

The R. E. A. & A. Co., leasing on the Wild Horse mine, near Cripple Creek, and which is putting up a cyanide mill to treat the Wild Horse dump, has received machinery for the mill, including rolls and crushers. The building is completed and the work of setting up the machinery started. The capacity will be 100 tons daily.

J. J. O'Hara et al., of Denver, have bought the Edwin, Mamie and Lizzie mining claims (formerly the Galesburg, Henshaw and Brooklyn), on Grouse mountain, south of Victor. Development work has been started and a crosscut tunnel several hundred feet will be driven. When they cut the first vein, which has been exposed on the surface, the lode will be followed.

On the morning of the 6th inst., while non-union miners who had come off shift from the nearby mines were waiting for the train at Findley station, near Independence, a quantity of dynamite was exploded beneath the station platform, supposedly by union men. Eleven men were killed and a number of others injured, two of whom died later. Later in the day, during a riot in the streets of Victor near the Miners' Union hall, two men were shot. Several local and county officials (including the sheriff), who were union men, were forced to resign by the Citizens' Alliance, and other men appointed in their stead. The military has again assumed full control of Teller county affairs. A large number of union men have been arrested and on the 7th inst. fifty were deported by special train to Denver and warned not to return. Practically all the mines of the district have been closed down, except the Portland at Independence, which employs union men. Work will be resumed as soon as quiet is restored. Two slight skirmishes occurred between the militia and union men on the 8th inst., and most of the union men were captured.

The Longmont L. & M. Co. has a lease on the Sitting Bull claim of the Keystone M. Co. on Bull hill, Cripple Creek, and has started to sink the shaft an additional 200 feet which will give it a depth of 440 feet. Considerable lateral work will be done during course of sinking. The lessees have plant of machinery on property capable of hoisting rock from depth of 500 feet. A sublease on the east end has been let to P. Burke of Independence. There are several shallow shafts on the sublessee's territory.

Lessee Walsh & Co., operating under lease the Bonanza Queen mine on Ironclad hill, Cripple Creek, north of the W. P. H. mine, have started sinking the main shaft another 200 feet, giving it depth of 1200 feet from surface.

The management of El Paso Gold King on Womac hill up Poverty gulch, near Cripple Creek, will start up work. The El Paso Gold King has been closed down since August, last year. The mine was nearly flooded with water in the lower workings, and it was decided then to quit and allow the El Paso tunnel to drain it. This has now been done, as there is little water in the shaft, which has been sunk to 920 feet.

There are forty-two sets of lessees operating on the Gold Coin mine, in Victor. There are still twenty-five blocks, which will be leased by the Woods Investment Co. Practically all of the lessees have some ore, while a half dozen are making high-grade shipments. F. M. Woods says there were several good blocks to be had on the tenth level, but so far no one would go in there on account of the water.

S. Warren, superintendent of the White City G. M. Co., reports opening up a body of ore on the Friday claim, at Cripple Creek. He put men on an abandoned shaft 75 feet from the main working shaft on this claim. Prospecting they found a 4-foot vein of ore in the bottom of the shaft at 40 feet from surface showing values. A carload shipment is being saved. They are getting out the ore by a windlass and Warren intends after the first shipment to put up a plant of machinery. The Friday claim adjoins the Hoosier on Tenderfoot hill.

The Peggy G. M. Co., working a fraction of ground containing half an acre, on Gold hill, Cripple Creek, has a lease from the Mary McKinney Co. on a block of ground 75x100 feet from the surface down to any depth desired. The block adjoins the Le Claire on the west side and is said to contain the extension of the ore shoot in the Le Claire. The Peggy Co. is required to pay a royalty of 33⅓%. The Le Claire vein strikes across the McKinney block diagonally and 100 feet of the vein will be within the boundaries of the lease.

IDAHO.

The United States Assay office in Boise has issued its annual statistical report, showing the mineral output of Idaho mines for the calendar year 1903. The total production of the precious metals was $20,451,933. This is an increase of $5,000,000 over the previous year. Shoshone county is the leading producer of the State, the total value of all the metals for the year having been $7,235,222. Owyhee county was the leading producer of gold. It is also the second county in silver production and second in total valuation of mineral product. Of the total production of 83,737 fine ounces of gold in the State during the year, 47,506 ounces were of quartz origin and 36,231 ounces came from the placer mines.

Blaine County.

W. Herrick of the Minnie Moore mine at Hailey says the mine will be equipped with heavy pumping machinery and opened to greater depth. The principal work is being done on the 1100-foot level. ——A Scranton, Pa., company, which owns the Hattie group, near J. Q. Packard's Tip Top mine, 10 miles from Hailey, is preparing for operations.——The Argosy mine at Hailey has been sold for $75,000 to L. Cramer et al. of Hailey.

Custer County.

There are 200 men at work in the mine and smelter of the White Knob C. Co. at Mackay.

Idaho County.

Work is progressing on the Atlas mine at Buffalo Hump and they expect to strike the main ore body in the lower levels next week, says G. T. Crane of Spokane, Wash., secretary of the company. The shaft is down 248 feet, or 100 feet below the upper level, and a station has been made. They are working sixteen men in three shifts and are drifting toward the ledge. If the ore body holds out in the lower level as it was in the 148-foot level they will put a 10-stamp mill on the property this summer. They have a hoist and pump with water power. The ore is free milling and went $16 in gold on the upper level. H. W. Peel is president.

At Hump work has been temporarily stopped on the Rob Roy, owing to water due to melting snow. They have cut the ore body in the tunnel, which is in 50 feet. —— The Lucky Lad M. Co. has put the Rob Roy men to driving a tunnel from the north end of its property and expects to tap the old workings in 300 feet. —— The Colonel mine is reported to show 18 feet of ore, which averages $42, with silver.—— Progress is being made at the Mother Lode No. 2. H. McFadden reports everything satisfactory at the Moonbeam and work in progress.

The Florence Electric M. & M. Co., Ltd., J. C. Northrup of Palouse, Wash., president, has resumed work of developing the company's mines at Florence.

The management of the Snow Storm copper mine, in the Cœur d'Alenes, is preparing to put in a leaching plant with a capacity of 200 tons a day, says W. Graham of Wallace, president of the Humming Bird M. Co. The Snow Storm is shipping 50 tons a day to the Tacoma smelter, so that the leaching plant will increase the output. —— The Springfield mine, 5 miles east of Milan, will let a contract for 400 feet of tunnel work. This tunnel is expected to tap the ledge 375 feet below the present workings, but will have to be driven about 1000 feet. The company has two tunnels in 300 and 400 feet.——They are working four men on the Humming Bird, at Burke, and expect to put additional machinery on the property during the latter part of the year. ——The Tiger-Poorman is working ninety men.

The Thunder Mountain H. Y. M. Co., D. Hiseok of Patchogue, N. Y., president, and C. J. Perkins of Roosevelt manager, is arranging to equip its Thunder Mountain property with a stamp mill and cyanide works.

Kootenai County.

M. O'Donnell, secretary of the Tyson Con. M. Co., operating at Tyson, says they propose putting in a hydraulic system to work the company's placer mines, the 16 to 1 and the Gold Nugget. It is proposed to take water from the St. Maries river at a distance of 21 miles from Tyson, which will give a 600-foot head.

Shoshone County.

Ore shipments are being made to the smelter from the Stewart mine, near Wardner, the 300-foot spur on the Sierra Nevada branch of the O. R. & N. having been completed. The ore is being sent to Colorado. The Stewart group consists of five claims on Grouse gulch, between Deadwood and Government gulches. H. F. Samuels is president and manager.

Operations will be started at the New Jersey mine, at Wardner, this week. The tunnel will be driven ahead and a two-drill compressor put in. G. Coleman is interested.

Arrangements have been completed whereby the Morning M. Co. will develop the Fanny Gremm claim through No. 5 tunnel of the You Like mine, near Wallace. The drift which will be extended into Fanny Gremm ground will reach the latter by running on the ledge about 200 feet. The depth will be 800 feet. J. H. Newbury is principal owner of the Fanny Gremm.

KANSAS.

Cherokee County.

The Sunnyside Co. started its concentrating plant at Baxter Springs last week and it is turning out jack.——The Mission mine in opening the drifts has cut payable ore, and Ford & Troupe, the owners, are rushing completion of the concentrating plant.

W. S. Norton and O. W. Sparks of Columbus have arranged to start mining on the Haskett lease south of Baxter Springs.

S. Cooper reports opening up a jack prospect on the Black Hills M. Co.'s lease south of Galena. He is working at a depth of 50 feet and is using a horse whim. —— The work on the pond at the Gay & Gardner mill, on the Battlefield mine, is proceeding slowly.——The mine operated by P. Wineman, H. Mack, W. Balch et al., west of the Frisco depot, is reported improving. A steam hoister is in operation and they expect to take out 300 tons of ore weekly.

E. C. Crawford reports a steam hoister in operation at the mine operated by him and A. Louderbach at Galena. This will enable them to take out twenty-five tons of ore daily. The ore from the shaft is said to run 20% zinc. They are working at a depth of 32 feet and have gone into the ore 14 feet. —— The Cousin Jack M. Co., operating the Duck Pond mine, is rigging up the Cousin mill and will use the rolls and breakers to handle its dirt. The hand jig will be set up and no steam jigs used. A new drift will be cut to make room for more men underground.

P. B. White, C. M. Jones, J. A. Grantham, R. Harvey, G. E. Rucker and E. W. Dawe have formed the Grace M. Co., and have leased sixty acres of the Lahadie land south of Baxter for mining purposes.

MISSOURI.

The output of zinc ores from Joplin district for the first five months of 1904 reached value of $3,765,635, and that of lead ores a value of $788,885, giving a total for the district of $4,554,520. The slump in the spelter market last week has effected the local zinc ore market. The highest price was $38.50 per ton, or 50 cents lower, and the assay basis was lowered in instances $1 per ton. The ores above 60% are commanding a basis of $35 to $36, and lower grade ores are selling at $33 to $34 per ton. The Missouri and Kansas Zinc Miners' Association again proposes to prevent accumulation of reserve stock (which the light buying of the past two weeks would indicate might be allowed to accumulate) by restriction of output. Lead ore sold at $56 per ton.

Jasper County.

R. E. Bruner of Kansas City, manager of the Tennessee, the Anderson and the Starr mills and mines of the B. & H. M. Co., says the company holds a 30-acre tract in Chitwood. The B. & H. mill is running double shifts.——The A. & R. M. Co., composed of A. H. Munger, R. R. Miner and J. D. Davison of Kansas City, has subleased from the B. & H. M. Co. the Anderson and the R. A. Starr mills and will operate them. L. Z. Lyman is manager. It is expected by June 15th both the A. & R. mills will be running double shifts, which will make three mills on the B. & H. tract.

This month three new mills will be put in operation on the Porto Rico lease, 3 miles southeast of Carterville. A plant is under construction by the Miami M. Co. and the Square M. Co. has bought a plant and is moving the same to its lots. Manager Millard of a company operating on the Porto Rico, has bought a mill and will have the same moved to their prospect. —— King & Co., composed of F. M. King, J. Ball, W. Owings, W. McAboy and A. H. Redding are developing a prospect on the Missouri Zinc Fields grounds near the plant being built by J. F. Coyne, near the Missouri Pacific railroad. They have a 14-foot face of ore opened. It is being found on a level of 141 feet. They have been hoisting there and have milled a part of their dirt. A concentrating plant will be built as soon as the drifts can be opened out sufficiently to provide room for operators to furnish the mill with ore.

The Mary Louise mill of T. F. Coyne on the Zinc Fields ground, near Carterville, is nearing completion. The plant is built on a self-feeder plan and is equipped with electrical power. The machinery included a sludge table. He expects to have the mill ready for operation this week. The ore is found on the 170-foot level and a face of 35 feet is opened up. —— J. M. Stewart & Co. have been developing the McCorkle hill property by surface drilling and carrying on development work in the old workings. Preparations are being made to build an electrically operated mill. Stewart will not only operate his mill and hoisters with electric motors, but will operate his pump and drilling machines with the same power, and is figuring on a hoisting and carrying system to be operated by motor. The Missouri Zinc Fields power plant will furnish the current.

Manager G. L. Cole says a drill hole on the Calumet mining land, near Neck City, went through 20 feet of lead ore at a depth of 114 feet last week. This drill hole is 200 feet from the Katherine shaft, at whose 200-foot level jack has been mined. —— Six lots, including the Sunflower mill and mine on the Eclipse lease at Neck City, were sold last week for $60,000 to Wolf, Snow & Coddell of New York and A. M. Wagner of Webb City.

There are three shafts on the ground, all in the ore body, and showing a 60-foot face of ore.

Newton County.

At Granby several of the producing mines of the district were shut down last week on account of a shortage of water for concentration mills. The Mascot and Prairie are among those shut down, and if no rain visits the section in a few days the Homestake will join them.——A good run of blende is reported opened up at the Blue Jacket mine 12 feet below the level of the drift, but cannot be successfully worked until a new shaft is sunk, which is being done. The shaft is 200 feet west of Blue Jacket No. 2 mine.

The pump at the Fortune Teller mine at Granby has been started up, and as soon as the water is out of the shaft work of driving a crosscut 30 feet to catch the run of ore will be begun.

MONTANA.

Deer Lodge County.

J. J. Wagener of Anaconda, part owner of the Golden Eagle group in the Flint Creek district, says a strike has been made in the tunnel and he will arrange to put in a roll mill and blast furnaces. The tunnel has been run 1000 feet and has attained depth of 600 feet. In driving the tunnel three ledges have been crosscut, the last one being 40 feet wide. He will put in an air compressor before the tunnel is driven farther.——The Flint Creek M. Co., of which J. C. Keppler of Anaconda is president, owns the adjoining property and has men at work.

Fergus County.

J. K. McKenzie of Chicago, Ill., general superintendent of the Gold Reef M. Co., operating at Gilt Edge, says progress is being made on the Drake mine. Two diamond drills are at work developing the property. It is proposed to add another roaster to the reduction plant during the coming summer.

W. G. Moore of Lewistown is preparing to put a diamond drill in operation on his mine near Kendall.

Flathead County.

The Libby Placer M. Co., composed principally of Butte men, intends to operate its mines on Libby creek, near Libby, this summer, says S. D. McCarthy, manager. The company owns most of the ground in the canyon, 2000 acres in all.

It is reported that additional machinery will be put in at the Snow Shoe lead and silver mine, near Libby, owned by the Rustler M. & M. Co. W. D. Wrighter is manager.

Silver Bow County.

The Washington M. Co. is working two claims at the head of Chaucer street, Butte. The shaft is 50 feet deep, at which depth has been cut a vein of copper and silver, with a paystreak of 14 inches, which is said to run 20% copper and 33 ounces of silver. In the Washington No. 2 another vein was cut at a depth of 12 feet, carrying gold and copper. A crosscut is being driven.——A strike has been made in the Liverpool mine, Lump gulch. Shipments are being made of a high-grade ore at the rate of two cars a week.

NEVADA.

Elko County.

High-grade gold and silver ore is reported struck at Mountain City, 20 miles north of Tuscarora. But little work has been done in the camp for several years.

G. L. Moats of Salt Lake City, Utah, manager of the Latham mine, in the Spruce Mountain district, says the Black Forest smelter will be blown in again. The Black Forest mine and plant are owned by C. M. Spence of Wells. About 1100 tons of ore are in the bins ready for treatment, while in the mine ore is blocked out. Manager Moats has arranged with Spence to deliver ten tons daily from the Latham mine.

Humboldt County.

An air compressor and power drills will be placed at the Sheba mines, south of Mill City, and they will resume driving the main tunnel. W. H. Childs of Salt Lake City, Utah, is treasurer.

Lander County.

G. D. Wheeler, who has bonded the Commonwealth group for $12,000, also has an option on the Grand Prize group of mines, near Battle Mountain, for $11,000. The group comprises three claims and a fraction. Wheeler has put men to work to explore the whole workings.

Lincoln County.

The Columbia group at Good Springs and the Boss group at Sandy have been taken by G. Gunn on an option and are being prospected.

W. Fiske and B. Hewitt of Cripple Creek, Colo., interested in a group of mines near Caliente, report that they propose to build a mill at Caliente, to handle gold-silver-copper ore.

Nye County.

The Johnnie Con. G. M. Co. has been formed exploiting two groups of mining claims, making fourteen claims and two mill sites, in all, in the Montgomery mining district. The claims are at the base of Timber mountain, at the head of Pahrump valley, 60 miles north of the Nevada Keystone mines, near Searchlight, and 80 miles from Ivanpah, Cal., which is the nearest railroad point. There are several shafts, the deepest of which is 400 feet. The ore is free milling and assays $10 in gold. The sinking of working shafts will be resumed. Two artesian springs, the water of which is piped to the company's camp site, are included in the company's holdings.

Washoe County.

E. Olinghouse reports development of Butte and Gold Center mines at Olinghouse progressing. A raise is being made with two shifts to tap the shoot on its dip to north on trend of vein.

NEW MEXICO.

Colfax County.

Near Baldy the 3000-foot tunnel of the Baldy Deep Tunnel M. Co. is in Baldy mountain 1250 feet and work is progressing. This tunnel will gain a depth of 2000 feet.

Lincoln County.

The Jicarilla M. & R. Co. has started excavating ground for its concentrator at Jicarilla. The mill will have a capacity of fifty tons per day. The engines will be 80 H. P. and boiler 125 H. P. Shafting will be equipped for a 100-ton plant, so as to be in shape to enlarge when necessary.——The Free Milling Co. is running its placer machine and reports satisfactory results.

Santa Fe County.

J. Martin reports opening up a mine of turquoise near Cerrillos.

Taos County.

Near Raton the South Fork M. Co. will build a 100-ton mill on its mine. Excavation for the site has begun. J. Morris is superintendent.

OREGON.

Douglas County.

F. P. Hogan and C. H. Fisher, of Spokane, Wash., have a year's option for $30,000 on a group of eleven claims on West Fork creek, in Douglas county. It is a sulphide ore carrying gold.

There is little snow left on the ground in Bohemia mining district, says A. Johnson, president of the Hiawatha M. Co., and the Grizzly group in Champion canyon, near Bohemia. He reports the Crystal Con., North Fairview, Vesuvius, Oregon-Colorado, Riverside and other properties in Bohemia district have kept up continuous development during the winter and have increased ore bodies. The Oregon Securities Co. is resuming work throughout its holdings. The power plant is working successfully transmitting electric energy over 6 miles of pole line to the air compressor plant at the 30-stamp mill at head of Champion basin. It is operating two drills in the tunnel being driven through the saddle of Grouse mountain, to make connection with the Musick mine. The Oregon & Southeastern Railway Co. has men at the end of its track laying rails on the section of grade completed last fall.

Grant County.

J. Shipp and E. E. Gibbs of Ukiah, Or., have bought the Oriental placer mine on John Day river, in Grant county, for $48,000. The claim is operated by dredger, but has been idle for two years. Additional machinery will be placed and work resumed.

Josephine County.

For $45,000 the Kirkland placer mines have been sold to McNicholas Bros. of Portland. The land is near Leland. J. H. McNicholas will have charge of the operations. A flume will be built and giants set up.

F. P. Hogan of Spokane, Wash., reports he has, with other Spokane men, taken bonds on two groups of claims, and expects to start work this month. A sixty-day option for $40,000 has been secured by Hogan and J. M. Allen on a group of seven or eight claims on Rogue river, about 20 miles south of Glendale. It is a free milling gold property.

The Waldo S. & R. Co. at Waldo reports work on the smelter well under way and when completed will have a capacity of 100 tons daily. Besides treating the ore of its own mine custom work will be done. The company has bodies of ore blocked out in the mine and has men increasing the ore reserves.

Lane County.

H. A. Troup, superintendent of the Uncle Sam mine at Blue River, says that the mill will be moved to the south side of the hill and will be in operation in September.

Wallowa County.

It is reported only a few men are being worked by the Fargo M. Co. at the mouth of Imnaha river, near Imnaha, as supplies of rails and powder have run short, and the company has discontinued the use of its electric drills until such time as the new boat has been put on the river and supplies can be received. The Fargo Co. is in on the lower tunnel 170 feet, and it is expected the ore body will be struck within the next few feet. In the upper tunnel, which was run in on the ore a distance of 260 feet, the vein was 6 feet in width. The crosscut tunnel being run will cut all the veins of the group.——At the Big Four claim on Salmon river, 2 miles above the mouth, E. E. Ellertson of Mayville, N. D., principal stockholder, says the company has a crosscut tunnel in 130 feet, and has let a contract for 150 feet more. It is expected the ore body will be struck within the next 100 feet. The Big Four, as well as the Fargo properties, are gold-copper propositions. The ore body in Big Four is said to be 50 feet in width, the copper values ranging 10%, with $12 in gold and silver. In the Fargo, ore from the upper tunnel, which is 260 feet in length, samples 11% copper.

SOUTH DAKOTA.

Custer County.

The Clara Belle M. Co. has started its Tremaine mill, near Custer, after an idleness of two years. During that time the shaft has been put down to depth of 225 feet and lateral work has opened a body of ore.

Lawrence County.

The Clover Leaf G. M. Co. at Roubaix is running its mill with sixty stamps dropping. For several months past but forty of the stamps have been in use. The shaft of the company is being deepened and the eighth working level will be established. In the meantime sinking will continue, and it is intended to go to 1000 feet. Provision has been made for sinking by the putting in an independent hoisting plant.

The Benedict M. Co. is preparing for development work at its mines near Deadwood. Men are steadily at work at the saw mill turning out lumber to be used in building a flume to the company's plant. The flume will be 2 miles in length, and the company expects to use water power for the plant.

As a result of heavy rains for several days in the Black Hills, Whitewood, Deadwood and City creeks overflowed their banks and did considerable damage in the mining towns of Deadwood and Central City.

The Lexington Hill G. M. Co. has resumed operations in its mill, near Deadwood. Experiments will be made on the ore found in its mine. A new style amalgamator will be put in. The company is running a tunnel 800 feet to strike three ledges of quartzite ore. It averages $10 and is said to be partly free milling, the remainder being a cyaniding ore. The company will build a 300-ton mill this summer. H. Bischoff is manager.

UTAH.

In the open market the settlements on ores and bullion during the month of May aggregated $2,004,700, says the Salt Lake Tribune. During same period there was forwarded by the copper smelters copper bullion, containing gold and silver, $4,000,000 pounds, for which the producers received approximately $1,000,000. Including the copper produced during the month at the furnaces of the American smelter the copper output in the State during the month amounted to 4,326,000 pounds. The enlargements at the Utah Con.'s plant at Bingham will go into commission about June 20. The Bingham Con. also promises a new record the present month with its battery of four furnaces in operation, while at the U. S. smelter a material increase is assured. The May record was as follows:

	Pounds.
Bingham Con.	1,080,000
Utah Con.	1,257,000
United States	1,051,000
American	938,000
Total	4,326,000

The output of lead bullion at the furnaces at Murray of the American S. & R. Co. during May attained a total of 8,400,000 pounds. The supply of ore is exceeding capacity of present equipment and is pledged under existing contracts to supply the company with sufficient to justify it in installation of at least two more furnaces, says Manager Whitley. Park City is the principal source of Utah's supply of lead.

Iron County.

The heavier pump added to the equipment at the Johnny mine at Stateline is in operation, and opening up the ledge on the lower level will be resumed. Meantime, the stamps continue dropping on ores from the upper workings.

Juab County.

At a depth of 1400 feet in the Centennial-Eureka mine, Tintic district, at Eureka, the management reports they are again in the main ore body on the west, the level having penetrated it for 36 feet, the ore as an average running well in copper and gold with normal values in silver. They have opened into it 200 feet vertically below the point at which it was cut on the 1200-foot level. The ore between this level and the 700 above has been practically untouched. No crosscutting has yet been done on the 1400-foot level. Meanwhile 300 tons of ore from the Centennial-Eureka is going out daily.

Piute County.

J. Long, Jr., manager of the Mammoth mine in Gold Mountain district, near Marysvale, says he has ordered a resumption of work at the mine.

Salt Lake County.

The United States tramway at Bingham is said to be moving an average of 600 tons of ore per day from the company's mines up the canyon to its smelter in the valley. In addition to this, there is tonnage coming from the Centennial-Eureka mine at Tintic, which is also a United States property, as well as some custom ore.

The Davis & Gebhardt group at Bingham has been sold to a Massachusetts company headed by E. B. Mullen, of Cambridge, Mass., for $100,000.

The Utah C. Co. has made arrangements with the Bingham Con. C. Co. for use of the water flowing from the Mascot tunnel of the Dalton & Lark group. With this source to draw from Superintendent Janney says his company will have a supply sufficient for treatment of a tonnage of ore reaching 4000 per day. The present flow consists of 1800 gallons per minute, while the management expects it will hold up to 1200 gallons at low water.

Summit County.

Both of the mills at the Daly West M. Co. of Park City, with which second-class ores and the slimes therefrom are treated, are in steady commission, says E. Bamberger, assistant manager. The ores that went down in collapse of the bins are being fed to the plant and will have all been cleaned up by next week, while reconstruction of the bins will follow a week later.

The tailings from the mills that have collected on ground between the Daly and Daly-Judge offices at Park City, and that were brought down by the high waters, will be worked, says the Miner. A trough 1 foot square and 12 feet long is placed on the bank, one end about 2 inches lower than the other. In the upper end is a set of screens pointing up stream at an angle of about 60°. A small stream of water is carried into the trough by another trough, and into the upper trough the tailings are slowly shoveled. The screen takes out the coarse gravel, while the ore settles in the bottom of the lower trough. The best and heaviest particles of ore settle in the upper end of the trough, while the slimes and sand run off. The concentrated ore is then shoveled out. If it is desired to make a closer handling the middlings which have settled along the center of the box are run through again. The tailings are concentrated in the proportion of about five tons into one. The richest of the tailings are said to carry about fifteen ounces of silver per ton and a little lead. At the Daly West is a pond containing several thousand tons of tailings which carry up to twenty ounces of silver, and these will in time all be worked over in the new tailings mill. There will then be but small values running away in the creek.

Tooele County.

E. W. Clarke, receiver for the Overland M. Co., will resume work on its properties at Sunshine, Camp Floyd mining district, the interests of all parties under the agreement to continue under the general supervision of the District Court. Machinery will be added.

The Peoria M. & M. Co. has been incorporated to operate in Tooele county by E. Clarey, J. G. Brown and W. M. Gundy of Salt Lake City.

Washington County.

A 65,000-pound consignment of copper bullion from the Dixie smelter, near St. George, was shipped last week. The shipment is the first to be sent over the new wagon road from Shem to the San Pedro station at Acoma. The additional furnace with which the smelter has been equipped will be blown in by the 15th inst. and the output of the plant increased.

WASHINGTON.

Ferry County.

R. Angus, superintendent of the Quilp mine at Republic, has bonded the Copper Key claim for $10,000. The Copper Key is south of the Belcher mine.——E. R. Delbridge says he will develop the Oversight group, on the Belcher vein.

Contracts have been let to build the railroad extensions to the Granby smelter, Phœnix and Midway, B. C., which is caus-

ing revival in Republic and other mining districts in Ferry county, as also in those adjoining in Stevens county, particularly those near Orient, on Kettle river, in Ferry county. As soon as the branch from Grand Forks to Phœnix is completed, it is expected the First Thought mine, near Orient, will resume operation and begin shipping ore.

Work has been resumed at the Knob Hill mine at Republic after several weeks' cessation.

Machinery will be put in and work started on the Insurgent mine, in Republic, this summer, says G. B. Dennis, president of the Insurgent G. M. Co., of Spokane, last evening. The property has been idle for two years. The shaft is down 135 feet and in 15 feet of $12 ore. The new work will be in this shaft. The company owns the Insurgent and the V fraction.

Okanogan County.

Mining development is reported progressing in Moses district on the Columbia river, near Nespelem. The ledges carry values in gold, silver and copper. This summer operations will be resumed on the Apacho. The Hattie E. group, bonded by the Moses M. & D. Co. of Vermont, consists of the Hattie E., Campaigner, Sulphide and Bruno claims. The Hattie E. has a 100-foot shaft and a crosscut. The Campaigner adjoins the Hattie E. and has a 120-foot tunnel. This coming season a regular line of boats will run on the Columbia river, connecting with the railroad at Wenatchee, giving outlet for the production of the camp.——The Muttuonah M., M. & D. Co. is running a 1000-foot tunnel to tap the main ledge on Squaw mountain. It is in 500 feet and has cut several veins of ore. The claims are on apex of the mountain. Besides quartz properties, the company owns a tract of placer ground in the angle formed by the Columbia and Nespelem rivers.——The Pacific G. M. Co. of Alleghany, Pa., has a group of five claims in Kaiser camp. It has fifteen men at work. A whim has been set up.——The Nespelem river has a fall of 800 feet in a distance of 2 miles, giving available water supply for power.

WYOMING.

Carbon County.

Near Grand Encampment the El Rey gold mine on Purgatory gulch is being prospected. The work is being done on the ore shoot opened last winter. The management expects to open up the ore by sinking and drifting. A stamp mill will be figured upon, says Superintendent Watson. The El Rey is owned by the Con. G., C. & C. Co., Pennsylvania men. The property is 5 miles from Grand Encampment.

Fremont County.

The Dexter M. & D. Co., operating at Atlantic City, is arranging for a 100-ton cyanide mill and plant. D. G. Cahoun is president. The property of the company comprises fifty quartz claims, 5000 acres of placer ground and 20 miles of canals.

FOREIGN.

AFRICA.

Rhodesia.

The Rhodesian Chamber of Mines at Bulawayo reports gold output for month of April at 17,862 ounces (Matabeleland, 14,811 ounces; Mashonaland 3051 ounces), as compared with 1903, the monthly returns of gold and silver since January 1 have been as follows:

	Gold.		Silver.
	1904.	1903.	1904.
	Ozs.	Ozs.	Ozs.
January	19,359	16,245	3,521
February	18,673	17,090	3,461
March	17,756	19,626	5,453
April	17,862	20,727	4,275

The following analysis of gold production for March, 1904, is also given: Matabeleland, 19 mines (313 stamps); Mashonaland, 6 mines (78 stamps); total, 25 mines (391 stamps).

	From Mill.		Tailings.		Concentrates.	
	Ozs.	dwts.	Ozs.	dwts	Ozs	dwts.
Matabeleland	12,861	17.50	1,536	2.79	221	9.00
Mashonaland	2,328	12.87	250	0.00	565	15.50
	15,180	10.37	1,786	2.79	787	4.50

	Other Sources.		Total	
	Ozs.	dwts.	Ozs.	dwts.
Matabeleland	18	6.87	14,627	16.16
Mashonaland	4	0.00	3,148	8.37
	22	6.87	17,776	4.53

AUSTRALIA.

New South Wales.

The management of the British mine at Broken Hill proposes increasing the productive work and also resuming sinking either the Blackwood or Howell shafts. These shafts have not gone below the 600-foot level. Improvements will also be made at the concentrating plant.

Queensland.

J. Williams, of the Young Cumberland mill at Etheridge, is putting in an additional ten stamps for use of the Jubilee mine and Hawkins' Hill Co., whose residues, after passing through the boxes, will be cyanided.

Victoria.

During the half year ended April 15, the Victoria United Co.. at Ballarat, reports 13,307 tons of stone were crushed for 4157 ounces gold, including 241½ ounces from 162 tons pyrites. This yield shows an improvement of 14 grains per ton, equal to £1611 on that of the previous half year.

Western Australia.

Work is progressing on the additional 50-stamp mill at the Golden Horseshoe mine at Kalgoorlie and it is expected to be completed in July. The addition of these stamps will bring the reduction plant to 150 head.

BRITISH COLUMBIA.

Boundary District.

Operations will be resumed on the Last Chance mine, in Sky Lark camp, in August. The Last Chance is owned by the Spokane-Boundary M. Co., of which J. W. Graham of Spokane, Wash., is president. The property is 1½ mile from Greenwood, on the road to Phœnix, and has been idle for six years. There are 600 feet of shaft work, crosscuts and drifts on the property and it is intended to sink 150 feet farther on the main double compartment shaft, which is down 120 feet; then crosscut from 175 to 200 feet to the ledge. The ore carries gold and silver. They have a pump, a boiler, an engine, a hoist and a shaft house there now, and will put in other machinery.

M. M. Walsh of Rosalia, Wash., president of the Monterey G. M. Co., says the company will resume operations. The mine, which carries gold, copper, lead and silver, is 10 miles southwest from Greenwood, and has been closed for two years, due to litigation. The Monterey Co. has been granted a judgment in the courts giving it clear title.

H. G. Pemberton, business manager for the Montreal & Boston C. Co., is arranging for resumption of work at the company's plant at Greenwood. He reports the deal for consolidation completed. The two furnaces will be put in commission as soon as stores of ore and fuel can be assembled, and following that two additional furnaces and connecting works will be added.

The deal for purchase of mines in the Boundary country by the Montreal & Boston Con. M. Co. has been practically closed, says F. H. Oliver, manager of the Morrison mine, near Phœnix. The Montreal & Boston Co., which is controlled principally by New York men, has 70% of the Morrison stock. The company gets all the Dominion C. Co.'s properties, amounting to five claims, three-fourths of the Emma group, the other one-fourth being owned by the Hall's mines. The company already owns the Sunset, which will make four copper mines that will all be operated. In addition to this the company gets all the Athelstan gold and silver property. The 1 mile spur to the Morrison mill will be started this week. The smelter at Boundary Falls has two furnaces. One additional furnace is on the ground ready to be set up and another will be bought. In addition to this a converter plant will be put in this summer.

East Kootenay District.

The Blue River M. Co. has bought 1½ miles of river diggings on Bull river, near Fort Steele, portions of which are said to be rich in placer gold. About twenty men were employed by the company last year in cutting roads and building a flume. Operations will be resumed this week.

The Fort Steele Prospector gives the following statistics in connection with the mineral development of the Fort Steele mining division, which is waiting construction of the Kootenay Central Railway to provide adequate transportation facilities. Since July 1, 1903, there have been 200 mineral claims staked and recorded in the district, which represents $1100 in recording fees. There are 678 operating claims in this district. Of these 678 claims, 143 have been crown granted at an approximate cost of $542 each. Two hundred claims were staked in 1903, on which no work has been recorded as yet. This leaves a balance of 335 claims, on which $33,500 has been recorded in assessment work alone.——During 1903, 193 coal licenses were issued in the Elk river valley, on unreserved crown land. Under the new act the yearly rental of these claims will amount to $19,300. There were 231 timber licenses issued with an approximate cost of $100 each, and seventy-five renewals costing $115 each. Four hundred and sixty-five free miner's certificates were issued at $5 each.——The output of coal at the Crow's Nest collieries was 661,118 tons, valued at $2 per ton at the pit mouth. The coke output amounted to 167,739 tons, worth $5 per ton. During the past year, 697 applications have been made for coal prospecting licenses in the Flathead valley; under the new act, these licenses will cost $100 each.

Nelson District.

At Ymir, the Ymir, Hunter V., Wilcox, Queen, Arlington and Second Relief mines are reported making monthly output of 10,000 tons, of an approximate value, including low-grade milling and higher-grade shipping ore, of $10,000. There are five stamp mills in daily operation, viz., those of the Ymir, Wilcox, Fern, Queen and Second Relief mines. Besides these, the Hunter V. is shipping from 100 to 150 tons per day of ore and the Arlington a smaller tonnage of high-grade stuff, making seven producing mines. This is expected to be further improved later in the summer when the Dundee, Keystone and Canadian King will resume shipping.

The third gold brick for month of May from the Queen mine near Salmo was valued at $1400. The others were $1150 and $350, or a total of $2900, for less than a month's run. J. A. Turner & Co., who own the mine, have leased the Yellowstone stamp mill for two years. The ore which is being taken out runs $8 per ton. The vein is 14 feet wide. Last year the richer portions were taken out and sent to the smelter and averaged $45 to the ton. The remainder of the vein is being sent through the mill.

Rossland District.

The lessees of the I. X. L. mine and O. K. mill have suspended operations under their lease, having made an assignment of the lease on the O. K. mill to Le Roi C. Co. of Rossland, which will utilize the plant for experiments in concentration. The last run of four days netted the lessees $150 per day.

Rossland reports say negotiations are in progress for the amalgamation of the Centre Star, War Eagle and Le Roi mines at Rossland. Le Roi C. Co. smelter at Northport, Wash., would probably be included in the deal, but it is said these reduction works would be of little value if custom ore from other mines in the surrounding country is not available. With the product of the Centre Star and War Eagle mines the Northport plant would be of value if the Canadian Pacific railway refused to give Rossland mines a satisfactory freight and treatment rate at the Trail smelter. The Centre Star and War Eagle mines are said to control the situation at Rossland as regards water for concentration.

The Velvet mine, on Sophia mountain, near Northport, has resumed operations and shipments to the Northport smelter are again going out.

Slocan District.

The Slocan Star concentrator at Sandon was started up last week. The machinery has been remodeled. The Slocan Star mine has added twenty men to the payroll and will have a further increase as soon as the mill is in full running order.

H. McLellan and J. Louden have a lease on the Dorothy mineral claim (Ruth No. 2), near Sandon, and work was started last week.

Work will be resumed on the Utica group this month, says P. McCue of Kaslo. The mine is between Kaslo and Sandon and has been idle for four months. It is a silver and lead producer.

Erie reports say mining interests on the north fork of the Salmon river are looking up and prospects are good for the summer. The Relief M. Co. has started up its stamp mill and concentrator. They have men at work opening up the road and will take in supplies on pack trains.——The Lucky Boy M. Co. will start work on the Waffer mine, adjoining the Relief. The bond held by S. S. Myers on the Good Hope group of three claims at the head of Copper creek, and adjoining the Waffer mine, has been taken up by Eastern men. They have begun preliminary work. S. S. Myers is in charge.

Vancouver Island.

Coal has been struck in the new shaft being sunk at the Northfield No. 4—the mine which is being opened up by the Western Fuel Co. at Departure Bay, near Nanaimo. The first shaft had to be abandoned because a fissure which communicated with the sea let the water in in quantities which the pumps could not handle. The second shaft has been more successful, the coal being reached at a depth of 67 feet. The pithead machinery will be set up.

West Kootenay District.

W. B. Pool has bought the Horseshoe property near Trout Lake.——Crushing is under way on ore from the Nettie L. mine at the Great Western Co. concentration plant at Five Mile, near Ferguson.——In the Old Gold camp, over the divide from Ferguson, there has been a consolidation of properties under the name of the Con. M. & S. Co. J. Miller is manager for Michigan and other Eastern men.

CANADA.

Alberta.

L. K. Kean of Edmonton, Alberta, reports an oil discovery made by the Rocky Mountain Dev. Co. in the southwestern part of Alberta, 5 miles north of the international boundary and 45 miles south of Pincher station, on the Canadian Pacific Railroad Co.'s main line. It is on Oil creek. The well is down 1020 feet and the flow is yielding 200 barrels a day. The oil from this well is being used for fuel to further develop the property. Work is started on three more wells ½ mile above the present well. These wells are to be 6, 7 and 8 inches, respectively. One 35 H. P. engine, two 25 H. P. engines and three drills are on the ground. The Canadian Pacific will build a spur to the oil fields. The company is composed of J. Lineham of Okotoks, Alberta, president; G. K. Leeson, H. E. Hyde, W. Gillis, A. P. Patrick and E. R. Exham.

Yukon Territory.

The Yukon Government is preparing to build a wagon road from White Horse to the Alsek mining district. Territorial Engineer Thibeaudeau, after a trip of inspection through the mining fields, including Ruby, Bullion, Fourth of July and other creeks, reports the region can be easily and cheaply supplied with a good road. White Horse reports of results on Bullion creek show on No. 5, above Discovery, pans taken from the bedrock are running $2 each. From No. 8 to 46 below, ground is yielding 5 to 60 cents per pan.

Dawson reports of June 3 say that since sluicing began in the Klondike on May 8 a royalty has been paid on 55,753 ounces of gold, and that this is the largest amount ever produced up to June 1 in that district. Last year 11,000 ounces were taken out in the same period.

MEXICO.

Chihuahua.

G. M. Holmes is operating his Esmoralda gold mine, in El Cumbre district, west from Guadalupe y Calvo. He has a 10-stamp mill and the mine is a regular producer. Holmes is also manager for the Bazanopa M. Co. and the Galanista M. Co. of New York, both of which are engaged in development work.

T. H. Hecker et al. of Butte, Mont., are preparing to work a group of properties near Santa Barbara.

Coahuila.

A new coal field is reported found near Sabinas, about 7 miles from the International railway. The vein is said to be 7 feet in thickness.

The Compania Minera Penon, organized at Sierra Mojada, reports opening up ore carrying values in gold, silver and lead.

Durango.

The Compania Minera de Penoles, of Mapimi, is preparing to put in an electric storage battery equipment for its smelting plant at Mapimi.

C. G. Codman has a concession to build a smelter at Durango.

Guanajuato.

The Guanajuato R. & M. Co. has been organized by H. Hine, L. E. Curtis et al., of Colorado Springs, Colo. Additional machinery will be put in at the mines, near Guanajuato, which the company has taken over. A 500-ton mill will be built.

Jalisco.

Preparations are being made to put in machinery by the Amparo M. Co. from the United States for its Santo Domingo group, near Ezatlan. The Santo Domingo is shipping 1000 tons per month of first-class ores to the Mapimi smelter, and will double this output as soon as more cars can be secured. The wagon road connecting the mines with the Mexican Central station is in daily use.

G. E. McCormick & Co. have completed a wagon road from Ameca to the Solodad mine and are putting up a 3-stamp, quadruple-discharge mill, with amalgamating mill and concentrator. The Soledad mine is developed by shafts and tunnels. The values are in copper and gold, of which the gold is free milling.

Considerable mining activity is reported in the Palmarejo district, near Ameca. The Atravida mine, under the management of G. Hart, is being developed. The veins are large and the values entirely of free gold. It is equipped with a 3-stamp mill and concentrator. The mill is being overhauled and will start this week. Other properties in the district are under development, among them the Verdiana mine.

E. Cabrera is preparing to develop a copper property in the Guachinango district, near Ameca.—— T. Purcell has bought La Perla mine, near Guachinango, which he will develop.

Michoacan.

R. J. Decker of Salt Lake City, Utah, of the Carrizal G. M. Co., is preparing to

put in an electric plant at its mines, near Tlalpujahua.

Sinaloa.

It is reported New York men will reopen the Guadupana mines at Rosario.

Sonora.

At the Moctezuma mine, 12 miles from Cumpas, and 7 miles from Nacozari, it is reported additional bodies of chalcopyrite have been opened up. A 500-ton smelter and a concentrator will be huilt, also a branch railroad to Nacozari.

W. E. Defty of Phœnix, Ariz., manager of the Arizona Mexican C. Co., is preparing to put in machinery for the company's mine at La Gran Proveedora in Altar district. It includes hoisting machinery, gallows frames, boilers, pump, pipe line, etc., to be placed on the mine by July 1. The lowest working is 540 feet helow apex of the ore body which carries values in gold, copper and silver. A smelter will be placed on the property next fall.

Tepic.

The Barranca del Oro mining property, south of Ixtlan, having been sold to C. Fenelon, B. W. Wallace and J. S. Ickis, is reported showing progress. They have struck two new veins on the fifty pertenencias denounced by them, and all the workings said to show ore. It is a free milling gold proposition, averaging twenty-four grams gold per ton. The 6-stamp mill is operated by a turbine water wheel and is crushing fifteen tons of ore per day. The owners propose putting in an electric power plant and tramway to avoid the heavy freight expense, as all the ore is transported to the mill on mule back.

Vera Cruz.

N. S. Plaisant of Mexico City has a concession to explore for petroleum in the canyon of Jalacingo. The striking of oil at Ebano has caused activity among oil prospectors.

NEW ZEALAND.

The Keep-it-Dark quartz mine at Reefton milled 12,372 tons of quartz during the year, the yield being 3714 ounces of retorted gold, or an average of about 6 dwt. per ton. Profit was also made from 9000 tons of tailings treated by cyanide. The working costs have been kept at 14s 9d per ton for mining, raising and milling the ore, leaving a profit of about 10s per ton. While the tailings yielded over 9s per ton, the working costs only absorbed 3s 8½d per ton.

TASMANIA.

The Mount Lyell and North Lyell mines, at Mount Lyell, are maintaining the usual outputs. Five furnaces are in operation at the reduction works, three of these being at No. 2 plant, with six blowers providing the blast. At the Lyell Blocks the halance shaft has heen sunk 180 feet, the last 8 feet for a sump. Opening out to drive east under the office tunnel is in 100 feet, and a crosscut from the end of it started. The driving of the office tunnel is temporarily stopped. The main tunnel is in 287 feet, and a crosscut from this point has been started east, to increase the southern extension of the ore hody, and providing material for the mill until the main tunnel is through. The mill made a trial run May 7.

Trade Treatises.

A neat folder from the Union Gas Engine Co., San Francisco, Cal., is descriptive of the 1904 type of Union, three-cylinder, marine engine, built in sizes from 30 to 125 H. P.

"South African Rock Drill Tests" is a leaflet just puhlished by the Rand Drill Co. of 128 Broadway, New York City. It is a facsimile reproduction of a page taken from the Johannesburg, S. A., Star, and contains an account of the drill tests carried on hy the Engineers' Association of the Witwatersrand. The circular will be mailed to all mine owners requesting it. The verbatim report of the engineers finds for the drills of American make.

"Cyanide Plants and Accessories," is the title of a neat catalogue just issued by the Redwood Manufacturing Co. of 8 California street, San Francisco, Cal. The catalogue is well illustrated, showing the various tanks and other equipment used in the cyanide process, heside which it contains tables of value to others using tanks, as well as cyanide men, together with many valuable hints on testing and working ores by the cyanide process, written by R. Stuart Brown, an experienced cyanide operator. Considerable space is given to slimes treatment and arrangement of cyanide plants. This valuable book of reference will be sent upon application of those desiring it.

Personal.

EBEN SMITH of Los Angeles, Cal., is in Denver, Colo.

D. R. REED has returned to Ouray, Colo., from Denver, Colo.

J. B. HUNTER has been appointed city engineer of Denver, Colo.

H. G. SHUCK of Central City, Colo., is examining mines in Oregon.

E. A. LEE has been at Ouray, Colo., on mining husiness from Denver, Colo.

J. N. GILLIS of Sonora, Cal., is in San Francisco, Cal., on mining business.

J. H. MACKENZIE has returned to San Francisco, Cal., from Rossland, B. C.

W. E. DUNCAN of Oroville, Cal., is in San Francisco, Cal., on mining business.

P. SEVERANCE of Harrisburg, Pa., is in Los Angeles, Cal., on mining business.

H. E. PICKETT of Placerville, Cal., is in San Francisco, Cal., on mining business.

J. S. & R. J. CARY have returned to Denver, Colo., from Routt county, Colo.

S. R. SWAIN of Denver, Colo., is engineer for the Guggenheim Exploration Co.

J. A. CUNNINGHAM, a mine owner of Salt Lake City, Utah, is in San Francisco, Cal.

J. B. WEIMER of Salt Lake City, Utah, is in Philadelphia, Pa., on mining business.

F. BAKER, president of the Venture Co. of London, England, is in Denver, Colo.

L. A. SUTHERLAND is superintendent of the Federal Loan mine, near Nevada City, Cal.

G. F. BADGETT, a mine owner of Tonopah, Nev., is in San Francisco, Cal., on husiness.

S. A. HARSH of Denver, Colo., has returned from Arizona, and is in Milwaukee, Wis.

N. C. BONNEVIE has returned to Denver, Colo., from a professional trip to Wyoming.

L. Z. LYMAN is manager of the A. & R. M. Co., operating at Chitwood, Jasper county, Mo.

S. C. WIEL of San Francisco, Cal., is making mine examinations in Trinity county, Cal.

R. COX, manager of the Silver Lake mines, of Silverton, Colo., has returned to Denver, Colo.

L. KING, formerly manager of the Ruby mine, near Sunset, Colo., is examining mines in Nevada.

F. D. FULLER is manager of the Sumpter smelter at Sumpter, Or., vice E. W. Mueller, resigned.

W. E. THORNE has returned to Denver, Colo., from mine examinations at Breckenridge, Colo.

J. P. WOODBURY is superintendent of the Con. New York mine at Virginia City, Nev., vice R. C. Kyle.

W. F. DETERT, president and manager of the Argonaut M. Co. at Jackson, Cal., is in San Francisco, Cal.

J. C. CARRERA of Mesilla Park, N. M., has gone to Europe on mining business for properties in Mexico.

G. WILSON of Salt Lake City, Utah, is in Humboldt county, Nevada, on examination of mining properties.

W. F. DEANER, manager of the La Plata mine, Leadville, Colo., has returned from a trip to Chicago, Ill.

W. A. FRANKLIN, president of the Jicarilla M. &. R. Co., is in Chicago, Ill., from Jicarilla, New Mexico.

A. A. TALMAGE, manager of The Blaisdell Company of Los Angeles, Cal., is on a business trip through Mexico.

C. A. GEHRMANN of Denver, Colo., is manager of the Stanley M. Co., with mines near Idaho Springs, Colo.

E. J. ROBERTS is manager of the Sullivan Group M. Co. of Spokane, Wash., operating near Fort Steele, B. C.

F. A. THOMSON has heen appointed superintendent of the New Western Reduction Co. at Forks creek, Colo.

J. G. KIRCHEN, formerly of Salt Lake City, Utah, is superintendent of the Sumpter smelter at Sumpter, Or.

H. E. FISKE, secretary of the Mine & Smelter Supply Co., of Denver, Colo., is at Galveston, Texas, for a few weeks.

J. W. BLAIR of Ipswich, Queensland, Australia, is Minister for Mines for Queensland, vice W. H. Browne, deceased.

J. BROCK of Salt Lake City, Utah, president of the Tonopah M. Co., is in Philadelphia, Pa., on company business.

E. K. HUM, superintendent of the North American C. Co., at Encampment, Wyo., has returned there from the East.

T. A. TURNBULL is manager of the Mineral Belt C. M. Co., operating in Upper Aniseed valley at Nelson, New Zealand.

B. OWEN, superintendent of the Gum Tree M. & M. Co., of Idaho Springs, Colo., has returned there from Detroit, Mich.

P. J. HICKEY, manager of the Ivanhoe mine at Sandon, B. C., returned there last week from a business trip to Spokane, Wash.

G. L. MOATS of Salt Lake City, Utah, manager of the Four Metals Co., is in Omaha, Neb., to attend a stockholders' meeting.

H. H. NICHOLSON of the University of Nebraska at Lincoln, Neb., is examining copper properties near Rawhide Buttes, Wyoming.

J. A. FARWELL, vice-president of the J. Geo. Leyner Engineering Works, of Denver, Colo., has returned there from Chicago, Ill.

J. R. RYAN has been appointed superintendent of the Andes and Mexican mines at Virginia City, Nev., vice G. McM. Ross, resigned.

ARTHUR GOODALL, manager of the Fremont Con. M. Co. at Amador City, Cal., is in San Francisco, Cal., on company business.

E. R. ARGERSINGER, superintendent of the Western mine at Rich Gulch, Calaveras county, Cal., has gone East on company business.

H. W. TURNER has returned to San Francisco, Cal., from mine examinations in the Seven Devils district, Washington county, Idaho.

J. MORRIS, till recently with the American G. M. Co., is superintendent of the mill of the South Fork M. Co., near Raton, New Mexico.

O. H. FAIRCHILD of the firm of Fairchild & Brainard, Denver, Colo., is in Chicago, Ill., on business connected with Prescott, Ariz., M. Co.

O. H. SONNE, recently assayer at the Ophir Hill mine, at Ophir, Utah, has been appointed superintendent of the Overland mine at Sunshine, Utah.

J. R. WILLIAMS, manager of the Amparo M. Co., has returned to Philadelphia, Pa., from the company's mines at Ezatlan, Jalisco, Mexico.

J. K. MCKENZIE, general superintendent of the Gold Reef M. Co., has returned to Chicago, Ill., from the company's mines at Gilt Edge, Mont.

S. S. CAMPBELL, manager of the Chase Creek C. Co., after five months at the mines of the company near Clifton, Ariz., has returned to Brookline, Mass.

C. M. BASLER, manager of the Basler M. & Dev. Co., has returned from San Francisco, Cal., to the company's mines near Lowrie, Tehama county, Cal.

MANAGER H. JOSEPH, of the Carisa and other Utah mines, has returned to Salt Lake City, Utah, after an examination of the Greenback mines in Oregon.

F. L. BOSQUI of San Francisco, Cal., has gone to Deadwood, S. D., to conduct cyaniding investigations at the plant of the Horseshoe M. Co., near Terry, S. D.

A. GROTHE, manager of the Hacienda de San Francisco M. Co. at Pachuca, Pachuca, Mex., has returned there from Virginia City, Nev., and San Francisco, Cal.

C. J. BUSH, manager of the Denver, Colo., branch of the Canton Steel Co., has resigned to accept a position with the Vulcan Crucible Steel Co., Denver branch.

A. A. BLOW, formerly of Leadville, Colo., and now manager of the Illawarra Smelting Works, at Dapto, New South Wales, is in San Francisco en route to Denver, Colo.

H. HERMAN, geologist of the Victorian Mines Department, Australia, has accepted the position of assistant manager of the Mount Bischoff M. Co. at Mount Bischoff, Tasmania.

M. M. GREEN of the mechanical and engineering department at the University of Colorado at Boulder, Colo., has resigned to accept a position with the International Graphite Co. at Niagara Falls, N. Y.

L. H. HALL of San Francisco, Cal., consulting engineer for the Comstock Pumping Association at Virginia City, Nev., has heen retained hy the Washoe Power & Dev. Co. of Nevada as consulting engineer.

PROF. H. S. MONROE of Columbia College, New York City, is in Colorado, and will have charge of ninety students from Columbia, Boston Technical, Yale, Harvard and School of Mines of Golden, Colo. Operations will be carried on at the Dives Pelican mine at Georgetown, Colo.

PAUL M. MOWREY, who for the last three years has heen connected with the Merchants' Trust Co. as adviser on industrial investments, has assumed the office of vice-president of the Engineering Co. of America, 74 Broadway. Mr. Mowrey has been prominently identified with the engineering and contracting business since 1888, when he became connected with the Edison Illuminating Co.

Commercial Paragraphs.

THE Davis Calyx Drill Co. of New York has opened an office in the Johnston Building, Cincinnati, Ohio, in charge of J. F. Munn.

HENSHAW, BULKLEY & CO. of San Francisco, Cal., report the sale of four Kinkead mills to a Pachuca, Mexico, milling company.

THE Preston S. & R. Machinery Co. is preparing to build a plant at Boulder, Colo., for the manufacture of machinery of the Preston type.

MACHINERY HALL, unlike the other huildings at the St. Louis World's Fair, is not closed in the evening. It is open until 11 P. M., and visitors in the evening will find at work there, among other ohjects of interest, the 5000 H. P. Allis-Chalmers-Bullock engine and generator producing the electric current for the 120,000 or more decorative lights.

C. C. TYLER has resigned as superintendent of the works of the Westinghouse Electric & Manufacturing Co. at East Pittsburg, Pa., and has been appointed general superintendent of all the works of the Allis-Chalmers-Bullock interests in the United States. Mr. Tyler will enter on his new duties on June 15th and will make his headquarters at Milwaukee, Wis.

A SUIT for infringement has been commenced in the United States Circuit Court against the Standard Gas Engine Co. by the Union Gas Engine Co. of San Francisco, Cal., for an infringement of the Union Gas Engine Co.'s vaporizer patents. On account of the alleged infringement, the Union Gas Engine Co. asks for an injunction and damages against the Standard Co.

GEORGE MOORE of the General Metals Co., 11 Broadway, N. Y., returned last week from a three months' business trip to South Africa and Australia. While in the latter country he superintended erection of a Moore slimes process plant for the treatment of gold ores at Kalgoorlie, Western Australia, and also installed a 100-ton plant in the Rand, near Johannesburg, South Africa. Mr. Moore is now in Colorado Springs, Colo., to supervise construction of a demonstration plant at that place for the company.

THE Barberton City Water Works of Barberton, 5 miles from Akron, Ohio, has placed an order with the Pneumatic Engineering Co., through the Pittsburg, Pa., office of the Rand Drill Co., for a complete air lift plant for their new group of twelve wells. It is proposed to set up the air compressor in the pumping station, 1500 feet from the wells, and carry the air through a 5-inch main, with branches to the several wells. The compressor will be a Rand compound condensing, type 10, having steam cylinders 10x18x14 inches and duplex air cylinders 14x14 inches. The equipment includes a surface condenser, air receiver, piping, etc. The capacity will be 3,000,000 gallons of water per day. It is expected to have the plant in running order by August 15th.

Obituary.

GEORGE RICHMOND, engineer, author and translator of technical books, died in New York City, June 4.

J. A. VALENTINE, a mining engineer of Los Angeles, Cal., died on the 4th inst. while on a trip in Kern county, Cal., examining mines.

Latest Market Reports.

SAN FRANCISCO, June 10, 1904.

METALS.

SILVER.—Per oz., Troy: London, 25½d (standard ounce, 925 fine); New York, bar silver, 55½c, refined (1000 fine); San Francisco, 55½c; Mexican dollars, 45½c San Francisco, 44½c New York.

COPPER. — New York: Standard, $12.87½; Lake, 1 to 3 casks, $12.87½; Electrolytic, 1 to 3 casks, $12.62½; Casting, 1 to 3 casks, $12.37½; San Francisco: $15.00. Mill coppor plates, $17.00; bars, 18@24c. London: £56 10s spot per ton.

Copper has shown a downward tendoncy the past two weeks, and the present quotation is lower than it has been for somo timo past. In view of the relativo production and consumption of the motal, this fall in price is difficult to undorstand. It is thought that the lower prices will stimulate buying and that a somowhat better price may be anticipated.

LEAD. — New York, $4.35; Salt Lake City, $3.50; St. Louis, $4.25 San Francisco, $4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, $4.85. London: £11 13s 9d ₱ long ton.

SPELTER.—New York, $4.75; St. Louis, $5.00; London, £21 15s ₱ ton; San Francisco, ton lots, 6¾c; 100-lb. lots, 7c.

The ore market at Joplin has a downward tendency, a cut-off of $2 on the ton being reported on this week's sales. This brings tho assay basis down to $34. It is said that the output is beyond tbe demand of tho purchasing agents, and it is said the smelters have eased off in thoir weekly purcbases in ordor to force down prices. For the past two weeks an aggregate of 800 tons is said to have been added to the surplus, which, although not so alarmingly large at tbis time, will increase rapidly at that rate. There is some talk of the producers combining to restrict ore output, as they have successfully done berotofore.

TIN.—New York, pig, $27.00@27.20; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 29½c; bar tin, ₱ lb., 30@32½c. London, £121 17s 6d spot.

PLATINUM. — San Francisco, crude, $18.50 ₱ oz.; New York, ingot, $19.00 ₱ Troy oz. Platinum ware, 75@82c ₱ gram.

QUICKSILVER. — New York, $44.50@45.50, large lots; London, £8 2s 6d; San Francisco, local, $43@43.50 ₱ flask of 76½ lbs.; Denver, $46.00. Export, $43.00@43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER. — Half-and-half, 100-lb. lots, 18.50c; San Francisco, Plumbers', 100-lb. lots, 16c.

ZINC.—Metallic, chemically pure, ₱ lb., 50c; dust, ₱ lb., 10c; sulphate, ₱ lb., .04c.

NICKEL.—New York, 40@47c ₱ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $13.35@13.60; gray forge, $12.50; San Francisco, bar, 3c ₱ lb., 3½c in small quantities.

STEEL. — Bessemer billets, Pittsburg, $23.00@23.00; open hearth billets, $23.00@23.00; San Francisco, bar, 7c to 12c ₱ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6¼c; loss than 500 lbs., per lb., 7c; in 25-lb. tin pails, ¼c ₱ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER. — (Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwbile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4 and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $1.25 country, $1.25 city ₱ bbl.

CEMENT.—Imported, $2.15@2.65 ₱ bbl.; California carload lots, $2.10 f. o. b. at works; small lots, $2.45 ₱ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY. — New York, Cookson's, 7¾c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than ono ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c: less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than ono ton, 12c. No. 2, 35%, carload lots, 9½c; less than ono ton, 11½c. No. 2** 30%, carload lots, 9c; less than ono ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, ln lots not less than 1000.

FUSE. —Triplo tape, $3.60 por 1000 feet; double tape, $3.00; singlo tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ₱ set; 14 oz., 40s., 10c.

CHEMICALS. — Cyanide of potassium, 98%-99%, jobbing, 23@24c ₱ lb.; carloads, 23@23½c; in tins, 30c; soda asb, $2.00 ₱ 100 lbs.; hyposulpbite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c ₱ lb.; Cal. s. soda, bbls., $1.20@1.40 ₱ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrato of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, $2.00@2.25; California refined, 1¾@2c; sulpbide of iron, 8c ₱ lb.; copper sulphato, 5½@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ₱ lb.; nitric acid, carboys, 8c ₱ lb.

COAL. — San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.00; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, bd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $11.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $11.50, long ton.

BONE ASH.—Extra No. 1, 5@6c ₱ lb. No. 1, 4@5c.

OILS.—Linseed, boiled, bbl., 49c; cs., 54c; raw, bbl., 47c; cs., 52c; Lucol oil boiled, bbl., 44c; cs., 49c; raw, bbl., 42c; cs., 47c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c.; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22½c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural Wbite, 70c; Bleached, do., 80c; Whale Oil, cs., 52@57c.

RED LEAD.—500 lbs. and over at one purchase, ₱ lb., 7c; less than 500 lbs., 7¼c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ₱ lb.

BORAX.—Concentrated, 6@7c ₱ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ₱ lb., 60c.

SODIUM.—Metal, ₱ lb., 50c.

BISMUTH.—Subnitrate, ₱ lb., $2.10.

MERCURY.—Bichloride, ₱ lb., 77c.

MOLYBDENUM.—Best, $2.00 ₱ lb.

CHROMIUM.—90% and over, ₱ lb., $1.00.

PHOSPHORUS.—American, ₱ lb., 70c.

SILVER.—Chloride, ₱ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ₱ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ₱ lb., $3.50.

(Tbese prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CORE DRILL.—No. 761,332. May 31, 1904. F. Stone, Spokane, Wash. Assigned to Diamond Drill Contracting Co. of Spokane, Wash., a corporation. This invention relates to improvements in drilling apparatus of the type employed usually in prospecting for precious metals, coal and the like and which is adapted in penetrating into the earth to remove a solid section or "core" of all strata passed through for the purpose of determining their depth and character.

CURTAIN OR DRAPERY PROTECTOR.—No. 761,293. May 31, 1904. Maggie Goldsmith, San Fancisco, Cal. This invention relates to an improved device for gathering up and protecting curtains or draperies when the room in which they are hung is to remain unused for any considerable length of time or when it is desired to sweep the room. The dimensions of the device or bar and its shape will depend upon the shape of the window or the arrangement of the curtain or drapery

AUTOMATIC WEIGHING MACHINE.—No. 761,587. May 31, 1904. G. Hoepner, San Francisco, Cal. Assigned to Union Scale & Manufacturing Co. of San Francisco, Cal., a corporation of California. This invention relates to an apparatus for automatically weighing substances which will flow by gravitation. It consists of a weighing bucket suspended from a scale beam, which beam has the desired counterweights, adjustably attached to the end, and the poise weight, by which the parts are properly balanced. The feed hopper is located above the beam and adapted to discharge the load into the bucket, first, in a large primary flow until the weight is nearly complete, and thereafter by a smaller flow the bucket is filled until it counterbalances the weight. This flow is accomplished by means of two gates, both of which are open during the primary and larger flow, when one is closed, but has a small opening through it for the completion of the load, after which the other is closed and the flow entirely cut off. At the same instant a discharge-gate at the bottom of the bucket is opened and the contents discharged, after which the parts are returned to the first position and another load delivered into the bucket. There are also other details of construction.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING MAY 31, 1904.

761,624.—FURNACE—W. N. Best, Los Angeles, Cal.
761,195.—FLEA TRAP—R. Bosshard, Los Angeles, Cal.
761,212.—MANIFOLD BOOK—H. P. Brown, S. F.
761,442.—BOTTLE WASHER — W. E. Brown, Los Angeles, Cal.
761,443.—BED AND BATH—F. R. Buck, S. F.
761,579.—ORE BREAKER—A. E. Calkins, Los Angeles, Cal.
761,357.—ENVELOP — W. J. Carpenter, Spokane, Wash.
761,151.—CLAMPING HOSE BANDS — W. A. Cummings, Spokane, Wash.
761,065.—PUMP—R. W. Elliott, S. F.
761,290.—DOOR RELEASER—W. A. Fagan, S. F.
761,216.—AIR BRAKE — F. B. Flanders, Seattle, Wash.
761,371.—PHONOGRAPH—E. Gilbert, Portland, Or.
761,293.—CURTAIN PROTECTOR—Maggie Goldsmith, S. F.
761,219.—LEVEL—B. A. Goodwin, Lathrop, Cal.
761,375.—FIRE PROOF FLOOR—O. Hanson, Seattle, Wash.
761,486.—PIPE BAND—A. W. Hight, Ballard, Wash.
761,587.—WEIGHING MACHINE—G. Hoepner, S. F.
761,074.—CATTLE GUARD — W. Houghton, North Bend, Wash.
761,382.—EXCAVATOR — Jackson & Adkins, Portland, Or.
761,231.—BALE TIE—R. L. Johansen, Los Angeles, Cal.
761,504. — SURGICAL APPARATUS — J. Kleinbach, Spokane, Wash
761,595.—FENCE CLAMP—W. C. Matteson, Stockton, Cal.
761,525.—SLAG CAR—G. Mitchell, Naco, Ariz.
761,596.—SOLAR HEATER—E. Moss, Kingsburg, Cal.
761,091.—OIL SUPPLY PIPES—D. H. Mostoller, S. F.
761,248.—SHOW CASE—C. F. Murray, Los Angeles, Cal.
761,601.—HAT CREASE RETAINER—O. P. Oliver, Seattle, Wash.
761,097.—ROUTER PLANE—M. H. Parker, Los Angeles, Cal.
761,397.—BUNGHOLE BORER—Pfluger & Christensen, Portland, Or.
761,609.—BUCKET LATCH—B. C. Riblet, Spokane, Wash.
761,610.—TRAMWAY—B. C. Riblet, Spokane, Wash.
761,258.—WAVE RECEIVER—Shoemaker & Giddings, Pasadena, Cal.
761,418.—FIREBRICK—Shupert & Wormald, Hillyard, Wash.
761,814.—WEIGHT TESTER—E. A. Smith, Seattle, Wash.
761,332.—CORE DRILL—F. Stone, Spokane, Wash.
761,266.—ORE MILL—W. Taylor, Los Angeles, Cal.
761,272.—COMBINATION TOOL—Waguiere & Van Alstyne, Los Angeles, Cal.

UNIVERSALLY RENOWNED, THE BURT EXHAUST HEAD.—In nearly every country where steam is used as motive power for plants, Burt Exhaust Heads are also used. Verdict the world over is: The Burt Exhaust Head gives perfectsatisfaction.

"We have quite a number of Burt Exhaust Heads in use in our plants, both in this country and in foreign countries, and have always found they give perfect satisfaction."—The Diamond Match Co., Barberton, Ohio. Order to-day, with size of pipe; if dissatisfied, return.

THE BURT MFG. CO.,
Largest Manufacturers of Oil Filters in the World.
221 Main St., Akron, Ohio, U. S. A.
Supplied also by Engine Builders, Dealers and Power Contractors.

SITUATIONS WANTED.

AN EXPERIENCED CHEMIST, ASSAYER AND Mill Man desires position. Address H. T. S., this office.

ASSAYER AND ANALYTICAL CHEMIST, first-class technical education, wants opening with reliable company. Foreign experience. Address "B," care of this office.

ASSAYER AND CHEMIST DESIRES POSITION nt mine, mill or smelter Is competent. State salary when writing. Address C. A., this office.

ASSAYER, WITH KNOWLEDGE OF BOOKkeeping, wants position with mine or mill. Address J. L., this office.

EXPERT MINE FOREMAN WANTS POSITION. Competent to handle extra difficult conditions underground. Address "Limestone," Room 602, 330 Market St., S. F.

EXPERIENCED SUPERINTENDENT, ENGIneer, Metallurgist; technically and liberally educated; 15 years handling men and machinery of smelters, mills and mines. See testimonials. Address Prof. Stickney, Mountain View, Cal.

MANAGER OR SUPERINTENDENT FOR A gold, silver or copper property; 20 years' experience in different parts of the country. Al reference. Can furnish any bond. Mexico preferred. Address D., this office.

MILL AND CYANIDE SUPERINTENDENT wants position. Thoroughly understands milling of gold ores and the cynniding of same. Good assayer. Address D. A., this office.

MINE MANAGER DESIRES CHANGE; 20 years' western U. S. and Mexican mining, milling, cyaniding and assaying experience. Al credentials. Address H. B., this office.

MINE SUPERINTENDENT IS OPEN TO ENgagement with a live company. Thoroughly understands his business. Address B. R., this office.

TECHNICAL GRADUATE WITH SEVERAL years' practical experience in assaying, surveying and cyanide work, would like a position with progressive mining company. Address "Berkeley," care of Mining and Scientific Press.

WANTED — POSITION AS MANAGER OR Superintendent of mining property. Gold and silver with concentration, or free milling, preferred. Have heen a large operator for twenty years, having mined, milled or handled $13,000,000 of ore. Have experienced captains nnd mill men at immediate command. References and unquestioned standing. Address G, Box 1338, Denver, Colo.

HELP WANTED.

WANTED—AN EXPERIENCED SALESMAN to handle Rock Drills for prominent makers of mining machinery. Address Mining and Scientific Press, 1104 Monadnock Bldg., Chicago, Ill.

The Business Men's Clearing House, Century Building, Denver, Colorado, furnishes mining companies in United States and foreign countries with managers, superintendents, engineers, mill men, assayers, electricians, bookkeepers, stenographers, etc.; good positions for competent men.

WANTED.

WANTED — A FINE SLIME PROPOSITION with good values—one that has caused trouble preferred. With particulars as to amount, value and location, address "Slime," care of Mining and Scientific Press.

WANTED—TO CONTRACT HAULING OF 15 tons daily of matte from Takilma to Crescent City; 10 tons coke daily Crescent City to Takilma. Distance about 50 miles. To commence about July 1st. Will guarantee tonnage sufficient to warrant reliable parties to bring in outfit. Also require guarantee of fulfillment of contract. TAKILMA SMELTING CO., Albert I. Goodell, Mgr., Takilma, Josephine County, Oregon.

"Time is the soul of business"

Ancient and Modern Mining.

Mining is an industry which has been carried into almost every country in the world. Scarcely a country exists which has not valuable mineral deposits. Mining is one of the earliest industries known to history, as it is today the most important. From the dawn of civilization, mines of iron, copper, gold and silver have been known and worked. When unknown countries have been explored it has been found that the savage peoples inhabiting the land were mining, in some manner, the ores and metals most necessary to their comfort if not their existence, and in these same countries are often discovered the evidences of an earlier and far distant civilization in the extensive workings made by a people who antedate all knowledge of the country. Particularly is this the case with the old world. In the heart of Africa are found extensive workings of ancient gold, iron and copper mines. The whereabouts of Solomon's mines of Ophir still remains a disputed question, unless the ancient workings of Rhodesia are, as claimed by some, those famed producers of the gold of the Temple. Wherever the modern civilization penetrates there are found mineral deposits and ofteu evidences of ancient workings, several of which are claimed by various writers to be the ancient land of Ophir.

Stamp Mill and Cyanide Plant in Annam, Indo-China.—See Page 409.

The accompanying engraving is that of a modern gold mill and cyanide plant in Annam (Indo-China). Here are old mines, recently taken over by a French company, and equipped with modern American machinery, a description of which appears elsewhere herein. These mines, operated years ago in a primitive manner, were abandoned upon the appearance of sulphide ores. which the ancient workers were unable to successfully treat. By the introduction of modern methods these mines are again active and promise to become largely remunerative. So it is in many other regions which we have considered as prolific of nothing more important than strange people, with strange customs, but the idea of valuable mines being among the resources of the country has occurred to but few. Egypt is one of the oldest countries of the world aud travelers have been visiting that region for centuries, but it is only of late that the world at large became acquainted with the fact that there are ancient miues in the land of the Pharoes. These old workings are now being explored and ere long it is probable American stamp mills will be built on the hills overlooking the valley of the Nile, and a stream of gold will once more come out of the land of Egypt. The march of civilization goes irresistibly onward, and in a few years more it seems probable that there will remain no new unexplored land unless it be within the Antarctic circle, a region which thus far has resisted all attempt at encroachment, but should there be found rich gold deposits in the region of the South Pole, it is a safe assertion that metropolitan cities, having every modern convenience will quickly spring into existence there under the magic influence. Only a few years since Alaska was a terra incognito—to-day it is almost as well known as British Columbia. Railroads are penetrating the country and the prospector is pushing into the most remote sections of the most northern portion of it, which lies largely beyond the Arctic circle.

The Old Dominion Mine, Globe, Ariz.

The Old Dominion mine was formerly known as the Globe mine. It comprises a group of nine claims. The original Globe and Globe Ledge claims are located on a fault fissure, and have produced the bulk of the ore. The consolidated mines have produced considerably over 140,000,000 pounds of copper besides a large amount of gold and silver. The present annual production of copper is about 18,500,000 pounds. The company owns an extensive plant, which is illustrated in the accompanying engraving. The principal opening on the mine is a 3-compartmeut vertical shaft. The mines are extensively developed by various shafts and tunnels. The workings are nearly 4000 feet long and 1000 feet deep. The Old Dominion ore is much mixed and requires sorting both underground and on the surface. The rocks associated with the ore deposits are quartzite, limestone, diabase and dacite. The ore occurs in both limestone and quartzite. The occurrence of copper glance in the transition zone of these mines as a characteristic mineral resulting from secondary enrichment is interesting. This feature is more strongly brought out by the structure of the ore itself, which is often found formed in concentric shells around a nucleus of small grains of pyrite. The geology of the district is very interesting and has been described in detail in Professional Paper No. 12 of the U. S. Geological Survey by F. T. Ransome.

WHEN testing machine drills to determiue relative air consumption, it is necessary to take into consideration the progress of peuetration of the drill, as well as the cubic measure of the drill hole. In the recent tests made at Johannesburg, S. A., this was done, under the direction of a committee of mechanical engineers. The factors observed and noted in those tests comprised the air (gauge) pressure, size of bit employed, net time of drilling, depth drilled in inches, depth drilled per minute, capacity of the hole drilled in cubic inches, equivaleut free air used at 70° F., 24.8 inches barometer, equivalent free air used per inch drilled, equivalent free air used per minute run, and equivalent free air per cubic inch of hole drilled. An abstract of results obtained will be found elsewhere herein.

ELSEWHERE herein is published in full another important decision of the United States Circuit Court of Appeals for the Ninth Circuit. This is another of the numerous cases growing out of the long-continued contest over extralateral rights in Shoshone county, Idaho. Heretofore, the privilege of taking up an intercepted extralateral right beyond the limits of the conflicting rights has only been assumed, but in this decision the court distinctly interprets the law, and has decided that the junior apex proprietor may take up his intercepted right beyond the zone of intersection. "The first in point of time is also first in point of right," declared the court in the Bunker Hill-Last Chance case. The peculiar geological conditions under which these ore deposits occur aud a misinterpretation of the direction of the strike of the vein by the miners who located the several claims has resulted in an entanglement which has only recently been unraveled by the Supreme Court, and for the first time the relative rights of the conflicting interests have beeu determined. The decision herein published and that appeariug iu the issue of Juue 11 are among the most important decisions of the court in several years, as they decide points at law which were previously without precedent.

Let There Be an Investigation.

Throughout the week the deportation of Western Federatiou miners from Teller county, Colo., has continued, and much has been said in the press throughout the country both for and against the miners. While the measure is an extraordinary one, it is the direct outcome of a condition in that State for which the Western Federation is largely, if not wholly, responsible. A number of men are held under military guards, and these, it is understood, are to be formally charged with criminal knowledge of the murder of the non-uniou miners last week at Independence station. A great many mines in the Cripple Creek district have resumed, the Portland being au important exception, and quiet has once more been restored. It is thought that, as what is considered the dangerous element is uuder arrest, or has been deported from the district and State, mining may now be carried on without further trouble. The unfortunate conditions existing in Colorado is having a decided and restraining influence upon the mining industry throughout the West, and it is a well-known fact that it has already driven capital seeking investmeut in mines into Mexico. The county of Teller is under military rule; but in San Miguel, after mouths of martial law, the troops have been withdrawn, and President Moyer of the Westeru Federation of Miners, who has beeu a military prisoner for months, has been turned over to the civil authorities. The United States Circuit Court at St. Louis, Mo., has issued a writ of habeas corpus, commauding that cause be shown why Moyer is restrained of his liberty. These unusual occurreuces in Colorado have resulted in several large bodies of organized labor, among them the Butte, Mont., Miners' Union, numbering 15,000 members, aud United Mine Workers of Illinois, numberiug 50,000, petitiouing President Roosevelt to interfere and to make au investigation of labor conditions in Colorado. The President of the United States is powerless to do anything in this matter, as far as interfering with the action of the authorities of that State. The Federal Government can not interfere with the affairs of a sovereign State unless requested to do so by the Goveruor of such State. He may, however, in a private capacity, investigate the condition of labor in Colorado or in any other State, and request a number of gentlemen to act as a committee to carry on such investigation, as in the case of the Pennsylvania coal strike. If such investigation is made by the President there is little doubt that it would bring to light much desired information as to the true purpose of the Western Federation of Miners and the methods employed by it to accomplish desired ends. When such things as have occurred in Colorado within the past year—the destructiou of property, the murder of peaceable citizens, and the declaration of martial law in three separate counties of the State—there must be something radically wrong. That miners can organize a union and maintain it, and become numerically and financially strong, and still pursue an even course, working peacefully for many years, is evidenced in numerous instances. A notable example is the Lead City Miners' Union of South Dakota, numbering over 2000 men. It was organized in 1877, and for twenty-seven years has grown stronger year by year, and yet the first strike has to be reported. During all these years the members of this, one of the strongest unions in America, as it includes almost all, if not every one, of the men employed in the Homestake and neighboring properties, have worked steadily and peacefully. Another instance is found in the Butte, Montana, union, and the unions of Grass Valley and Nevada City, Cal. Neither of these has ever had a strike which was not promptly adjusted in a manner satisfactory to both sides. The reason for the different results in Colorado must be sought in the difference in the personnel of the officers of the union organizations in that State.

Railroad Land Classified as Mineral.

Much interest has been manifested in the recent classification as mineral of a tract of 600,000 acres of what had been claimed as railroad land, in Idaho. The land in question lies south of Wallace, in the Cœur d'Alene region, and was included iu the lands granted to the Northern Pacific railroad. The lands were examined several years since by the Mineral Land Commission and was then classified as mineral. The railroad protested and a hearing was ordered, which was held in the Cœur d'Aleue land office, the notice of which appeared in a small semi-weekly paper in Kootenai county. As a result, those most interested were not awarc of the time set for hearing, and the only party to submit evidence was the railroad company. Consequently the Cœur d'Alene land office declared the land to be non-mineral and this decision was sustained by the General Land Office. Affidavits were prepared by those having mining claims in the disputed area, and these were submitted to the General Land Office, together with a request for a rehearing of the case. The petition was denied. An appeal was taken to the Secretary of the Interior, who found that the notice of a hearing of the case was published in the St. Maries Courier, 35 miles west of the lands in question, while the decision of the classification of the lands was published in Wallace, Mullan and Wardner papers. Wardner is but 12 miles from the lands. The proceedings appearing to have been irregular, and not in accordance with the law, the Secretary ordered the lands set aside and notified the General Land Office that should the Northeru Pacific Railroad make application for a new hearing, if allowed, the General Land Office should send a special agent to examine and pass upon the character of the lands with a view to furnishing evidence at such hearing, aud that in case of any such future hearing notice should be given all who are iuterested having claims in these lands.

The Premium System.

One of the most satisfactory solutions of the labor problem in metal mines is the premium system. This has been applied with marked success in various manufacturing industries, and it has also had a fair trial in mining, and without exception, as far as known, the results were satisfactory to both employer and employe. The experieuced miner knows about what is expected of him by his foreman, or superintendent, aud he also knows that if he falls very far short of the requirement an investigation is likely to follow which may result to his disadvantage. If, however, he knows that earnest industry and additional effort will meet with not ouly appreciation, but substantial reward, he is inclined to try and earu the increased compensation. In many mining operations time is an important factor, due to the fact that large capital is interested, and delayed accomplishmeut of the work means increased interest charge, and consequently increased expense. If, then, the work can be advanced more rapidly by any system or method of encouragement to the workmen, it is well to offer this stimulus to their energies. Though the paying of a bonus is a direct increase in expense, it may prove, if properly fixed, a stroke of economy.

It may be urged that if the workman can do more work under the encouragement of a premium he is not doing his full duty under the ordinary wage system, but experience has proven that it is the part of wisdom for the mauagement to show a just appreciation of extra effort on the part of the workman by increased pay. In no branch of mining is this more completely exemplified thau in shaft siuking. Under stated conditions the work should advance at a rate about which competetent judges will not greatly disagree. The miner is also aware of what this rate of advance should be. In almost every instance the offer of a premium will result in a surprising increase of this rate of monthly progress in shaft sinkiug. The economy of the premium system is shown by the saving of cost per foot charged to all top expenses, superintendence and general expense, beside interest on iuvested capital. These various amounts in the aggregate usually justify the payment of a bonus in an amount as great as $10 per foot for each foot made in excess of the minimum amount of progress required for the month's work. If the rate required is 100 feet in a single month it is good business to offer $10 for each foot suuk in excess of this requirement. It requires good judgment to determine the minimum, but this can generally be safely fixed after two or three months careful observation of the work accomplished as related to the conditions under which it is performed.

CONCENTRATES.

THE best device for using a volume of water sufficiently large for ground sluicing would be a pump run by a gas or distillate engine, in a region where fuel is scarce. It is improbable that a hydraulic ram would raise a sufficient amount for the purpose. A ram is a device of very low efficiency.

****

FOR many years quicksilver flasks have been loaded with 76½ pounds of mercury, but some time since in Europe 75 pounds were substituted for the former custom of 76½ pounds. Recently the California dealers have adopted the European rule and hereafter newly-filled flasks will contain only 75 pounds of quicksilver net.

****

IT is customary in smelting in reverberatory furnaces to partially roast sulphide ores before charging. It is not uncommon for zinc and other base metals to enter the matte as well as the copper. The smelting of raw pyritic ores in a reverboratory furnace is something like pyritic smelting, in which a large amount of iron enters the matte.

****

SELENITE (calcium sulphate) has not the property of double refraction like iceland spar (calcium carbonate). The two minerals may also be distinguished by their crystallization. Selenite is much softer than calcite (iceland spar). Heavy spar (barium sulphate) resembles both selenite and iceland spar when transparent, but may be distinguished by its superior weight.

****

THE diamond drill is valuable as a means of prospecting, as it usually makes it possible to examine the character of the rock passed through by means of a core. The prospecting holes should be distributed systematically, as a single hole, or several of them, directed in a haphazard manner are of little value. For prospecting sand or gravel, a churn or well drill may be used with good effect.

****

THE country rock at the Homestake, South Dakota, mine has been variously described as hornblende schist, hydro-mica schist, sericite schist, etc. Hornblende and chlorite are present in the rock, and the ore-bearing formation is intruded by large dikes of light gray felsite, containing innumerable, almost microscopic, crystals of pyrite. It is not known that the dike rock contains gold or silver in paying quantity.

****

THE reopening of a flooded mine may be facilitated somewhat if the levels are permitted to drain for a few days, or even weeks, after removing the water from the shaft, particularly in the case of soft ground, as the flooding of the mine has resulted in saturating the county on all sides with water, and it generally will be found that the vein will stand better if permitted to drain before resuming stoping and drifting.

****

THE adhering of the reduced lead in an assay charge to the slags may be due to too low a heat in the furnace; to too little reducing agent; to too viscous a slag, causing the upper portion of the lead prill to be impure—to any or all of these causes; also, possibly, to presence of antimony or arsenic, which would affect the lead, causing it to crystallize. Possibly more experience in manipulation may lessen the liability to this annoyance.

****

THE grade of cinnabar in ore which will pay is, like all other classes of ore, dependent upon local condition, character of ore, cost of mining and reduction and market price of the metal. All cinnabar deposits are not associated with serpentine; but, as far as known, the great quicksilver mines of the world, without important exception, are associated with sandstone and serpentine. This includes the mines of America, Spain and Austria.

****

THE employment of the stadia method of measurement in surveying is permissible over very rough ground or through a country covered with dense thickets of brush. With care, stadia measurements up to 600 feet may be made with an accuracy equalling the results attending tape measurement under similar conditions. Attempts to measure distances exceeding 1000 feet are likely to result in small inaccuracies, due to difficulty in close reading of the rod.

****

A MAN may be a good blacksmith and understand tempering drill bits, but he may be incompetent to repair machine drills. This class of work requires a man of experience. Each drill should be tested in the shop before being sent into the mine. One very common fault which the machinist finds is that the drill runner has failed to properly oil the machine. When a piston has been cut, it can rarely be properly dressed with a file. It is better to bush the machine and turn the piston down to fit.

****

THE cost of compressing air to operate machine drills depends largely upon the cost of initial power. Free water power is undoubtedly the cheapest power, and often water power for which a charge is made on the basis of the amount used, is also less expensive than steam, electricity or other power. The cost is also dependent upon the capacity of the compressor, a large machine compressing air more cheaply, relatively, than a small one. Cost of drilling with machines depends upon many factors—hardness and condition of the ground, kind of machine used and its condition, and to no small extent upon the man running it. Greater progress can be made with high pressure of air than with low pressure, though breakage is greater with high pressure.

****

WHEN it is intended to develop a buried gravel channel by means of a crosscut tunnel through bedrock the first thing to determine is the depth of the bedrock below the surface. This is important, as a tunnel driven too high to drain bedrock is usually of little utility, if not useless. Next, a careful estimate of the probable volume and value of the gravel which would be available should be made, together with cost of tunnel, equipment, and mining and washing or milling gravel. If the value of gold probably obtainable does not show a good profit on the investment, the proposition should be abandoned, as any deductions to be made from the estimate should be charged against the probable yield of the mine, as determined by bore holes, and the production of mines above and below the property, if there be any, on an equal area of the channel.

****

WHERE the ore slimes badly the operator has the choice between the decantation process and the employment of filter presses. Those who advocate the former method say they can decant the solution after clarifying to a bulk representing not more than 20% of the original quantity. The solution decanted is run through the zinc boxes separately. The remaining sludge is diluted to its former volume, resettled and again decanted to one-fifth of its volume. By the first decantation 80% of the value was run off to the precipitating boxes. The remaining 20% is decanted to 20%, making 16% of the remaining values, or a total of 96%. If the values are still high the dilution, resettling and decantation may be repeated. It is a well known fact that very weak solutions do not precipitate readily, and such solutions must be brought up to the proper strength by addition of the necessary amount of strong solution at the head of the precipitation boxes.

****

WHILE employing hydraulic formulas, owing to the imperfection of the work, it is advisable, if not necessary, to allow liberal factors for safety. In the case of a pipe line 900 feet long taking water from a ditch, the first 100 feet of which has a fall of 40 feet and the remaining 800 feet an up-grade of 35 feet, has only a 5-foot head. The water has to overcome the resistance at the head of the line, the resistance due to curves and friction within the pipe, and to give the water the uniform velocity with which it flows through the pipe. The entry head is almost nothing in long lengths of pipe. A pipe large enough to deliver 200 miner's inches a distance of 900 feet under 5 feet head, if straight or nearly so, develops little friction. When a pipe of uniform diameter is flowing full and the discharge end is open, without any obstruction, such as the contraction due to a valve or gate, the velocity of the water will be equal to that at the discharge end, and something over 200 miner's inches will flow through a circular pipe 15 inches in diameter and 900 feet long, having a head of 5 feet. This allows for all the factors and deductions necessary to be considered. If the pipe were laid at a uniform gradient on a trestle a somewhat smaller pipe would carry the water, but it would be far more than overbalanced by the cost of the trestle.

****

AN iron gossan may consist wholly of iron oxide, silica and earthy matter and show no copper of any kind and still conceal a valuable deposit of copper ore beneath. Copper sulphide decomposes, and when it reaches the condition of copper sulphate, that salt is soluble in water, and if conditions are suitable almost every trace of copper may be leached from the surface ore. In such cases the copper is often found concentrated in the form of oxides and carbonates at some lower point, and sometimes entirely outside the vein proper, the mineral having saturated the adjoining country rock. The iron gossan, however, often contains other evidence suggestive of copper below, and this is sometimes found in a glossy iridescent coating on the iron ore. Under the magnifying glass the surface of such an occurrence presents the appearance of a group of rounded grains, resembling the skin of an orange. Although the prevailing color is generally brown, it seems tarnished with shades of purple, green and dull crimson or bluish shades, none of which are what would be called pronounced colors. When this condition is observed, almost invariably copper will be found in depth beneath the iron cap; but the occurrence described can not be considered as an index of the amount of copper content of the normal ore below. Usually the first ore below the iron cap will be oxides and carbonates of copper, and succeeding this downward may be found enriched sulphides, notably copper glance, and still lower the normal iron-copper sulphide, chalcopyrite and pyrite. In many copper mines zinc sulphide also appears in depth. In some instances the transition from oxidized to sulphide ore is abrupt; in others the transition will appear gradually, extending by degrees through considerable depth. The changes from one zone to the next sometimes require a radical change in methods of reduction.

****

THE fact that only sand was found on bedrock in the ancient river channel in El Dorado county, Cal., instead of gravel and gold, as anticipated, need not be considered so discouraging as to discontinue prospecting, if the channel is known to have been profitably worked above and below the barren place referred to. Nearly all channels have poor as well as rich spots, due to the conditions prevailing at the time of the formation of the channel and the deposition of gravel and gold, with which the overlying volcanic cap has no connection whatever. The so-called overflow from the channel is not an "overflow" at all, but is the result of erosion subsequent to the formation of the channel and its covering by volcanic mud and ash. It is seldom that a channel is rich directly opposite the mouth of a tributary stream, though both streams may contain gold. The pay streak of a river channel or creek has a tendency to run in as straight a line as possible, and though the course of the stream may be sinuous, that of the pay streak will be much less so, having a tendency to run from bar to bar in the shortest possible distance. This disposition is somewhat modified by the depressions in the channel and the erratic occurrence of hard bosses of bedrock, which, resisting erosion, stand up like islands in the channels, though not reaching the surface, and deflecting the pay streak to one side or the other, and sometimes dividing it. Bench deposits or bars are probably the result of earlier deposition. Gold-bearing bars occur along modern streams at heights varying from the creek level to 500 feet or more above it. It is sometimes difficult to account for the occurrence of placer gold, no recognized theory being able to account satisfactorily for the presence of gold. Among these puzzling occurrences is the finding of gold on the "outside" bend of a stream and the existence of gold in the grass roots, or only a few inches below the surface and several feet above bedrock, where there is no gravel and no heavy wash of any kind. Both of these occurrences are common in the dry placer region of the Black Hills, South Dakota.

****

THE most generally accepted theories of ore deposition are that of replacement of the original rock mass by ore, or infiltration of mineral into spaces of discision. This occurs in vein-like zones, or in masses of irregular form, where the country rock has been subjected to crushing and in some instances to shearing. In the former case the ore deposit will have no particular form, but exist as a deposit of irregular size and form, or there may be several deposits occurring along a common direction, either vertically or horizontally, or both, for a considerable distance, and having an apparently common origin or genesis. In such deposits, there generally occur many pieces of unaltered or only slightly altered country rock. In some instances the fragments of country rock have a rounded appearance, due to the alteration and disintegration of the outer portion of the fragment. Where there has been much shearing, the deposit will probably have a banded structure. These bands occur in zones which vary in width. The zones are not confined for considerable distances between defined walls. In one part of the deposit the vein may be considered a fissure, say 4 feet wide between well defined walls. The ore is removed and the vein has every appearance of being identical throughout, but 50 feet away it may be found that the mineralization has extended beyond the planes of the "walls" and the fissured zone is much wider. Zones of this kind are sometimes many feet in width and crosscutting is necessary in the operation of a mine of this character. A third type is one in which the mineral has replaced the country rock without any considerable crushing or movement of the rock mass, although there is generally present one or more fissures. Instances of this character are seen where slates have become silicified and constitute gold-bearing veins. Another type is found in the material filling a pre-existing fissure. These are of comparatively rare occurrence and do not represent as a rule large deposits or veins. Beside the above there are many other types or modified forms of those mentioned, but it may be safely asserted that it is necessary to see the ore in place, together with its geological relations to make it possible to classify the type of deposit or vein to which it belongs. A hand specimen rarely conveys a safe indication of the type of deposit to which it belongs, even by the use of a magnifying glass. The "angle of crystallization" is constant in mineral species, whether formed from ascending "thermal waters" or by "infiltration," or otherwise, and this angle can rarely, if ever, be correctly read or ascertained by employing a simple magnifying glass, particularly if the crystals are imbedded in a mass of ore. Instruments called goniometers are employed for this purpose. The simplest kind are held in the hand, and consist of a graduated semi-circle to which is attached an adjustable index, which marks the angle of any crystal placed in the proper position in the instrument. A more accurate instrument, known as the reflecting goniometer, is also employed. The best instruments of this class have two telescopes. The measurements are made with great care and precision. It is not a fact that no mines of value occur in eruptive rocks, such as diorite, diabase, etc. The reverse is rather the case. Most important mines are directly associated with eruptive rocks, but ores occur in rocks of almost every description. Valuable mineral veins occur in rocks of every geological age, and it has not been shown that any particular kind of eruptive rock is either advantageous or the reverse in this regard, though basalt is of rare occurrence in connection with ore deposits. Basalt dykes associated with valuable ores are reported in Cripple Creek district. Many valuable mines occur hundreds of miles from the nearest known volcanic rocks.

The Mines of Bong Miu, Annam.*

Written for the MINING AND SCIENTIFIC PRESS.

These mines are situated 25 kilometers from the sea and 150 kilometers south of Tourane, and embrace several flat veins, and one vertical quartz vein carrying iron pyrites and galena in ancient schists. There are also some veins of low-grade auriferous mispickel.

The principal vein dips at an angle of only 15° to 20°, and outcrops 200 meters above the base of the mountain and for 2 kilometers in length. The mountain is covered with a forest. There is also a parallel vein. All outcroppings and the alluvium—in a word everything which would yield gold on crushing—have been worked 50 or 100 years ago by Chinese and by the Emperor of Annam.

They were forced to stop, however, on finding pyrites and galena, for crushing and panning shows but very little gold. As for myself, I have only succeeded twice in finding free gold in pyrites. The average thickness of this vein is between 1.2 meter and 1.3 meter (about 4 feet). It is almost everywhere formed of bands of quartz, more or less pyritic, and bands of schist containing little or no pyrite, but it generally appears that when we find quartz and schist together, it is the quartz which contains the most pyrites. In general, the richest portion of the vein is from 2 to 3 feet. The ore carries from 8% to 13% of pyrites, 50% to 60% of schists, 10% to 15% of clay, and ½% of galena.

On careful panning, a residue remains which contains only one or two grams (one dwt.) of gold a ton. The pyrites, according to location, carry between 30 and 100 grams of gold (one to three ounces), and as much silver; the galena, carrying 8 to 50 grams of gold and 100 to 500 grams of silver. There are also traces of copper, cobalt, etc.

The local conditions are very favorable for the work. No pumping or hoisting of water required, everything going out by the drifts. Labor is very cheap—miners, 20 cents; coolies, 8 to 10 cents; but it takes two Annamite workmen to do the work of one European. Easy transportation from the port (the harbor of Tourane) to the mine, $5 a ton. Fine motive power by two waterfalls; one, 200 feet in height, is available close to the mill, but during three months only gives 20 H. P.; the other, 80 feet in height, but with a minimum of 100 H. P., 500 meters away from the mill. Wood is plentiful. We are in the middle of a great forest. The engraving on the front page illustrates the mill and surroundings.

As to treating the ore, a beginning was made in experimenting on the ore in different ways by a small mill of three stamps. Finally, the Peletan-Clerici process was tried; but it did not succeed well, and, I believe, after a study of the character of the mineral, that the reason was that the gold is in too large particles to be rapidly dissolved by cyanide. A large part of the gold being associated with pyrites, prevents satisfactory amalgamation.

Finally, a 10-stamp mill from the Risdon Iron Works of San Francisco, Cal., was erected; but amalgamation was discontinued because it gave hardly any results, and, besides, in Asiatic countries such a means of ore treatment can be only used by adopting the most extraordinary precautions against robbery.

Finally, there was added to the stamps and to the Bryan mill built in connection with the Peletan process tanks for cyaniding and a plant for precipitation by zinc, similar to the plants on the Transvaal; but we had great difficulties to overcome by reason of the enormous quantity of fines coming from the mine and the slimes caused by the crushing of the schist.

We had to be contented up to this time to treat the concentrates from the spitzkasten only and to work the sand again, and to impound in a basin the tailings which still contain 10% of pyrites, and sometimes 12%, and three to twelve grams of gold.

Having come here to study the method of treatment, as in 1896 I had come here to expert the mine, I believe, after numerous experiments, it will be necessary to abandon the Transvaal method here by reason of the following considerations:

First—The sulphide mineral being abundant, but not rich, it will be necessary to work for large capacity without endeavoring to secure a very high extraction.

Second—It is very important to note that the gold everywhere follows the pyrites and galena, and, if the slimes and part of the gangue are well separated, they contain scarcely any gold.

Third—The fines are a very large proportion and very poor.

The concentrates coming from a Johnston table, and containing 23% of quartz and 77% of pyrites, were treated by screening test as follows:

	Per Cent.
Remaining on screen with holes 1.12 millimeter	0.0
Remaining on screen with holes 0.67 millimeter	0.7
Remaining on screen with holes 0.47 millimeter	1.0
Remaining on screen with holes 0.32 millimeter	1.3
Remaining on screen with holes 0.12 millimeter	15.0
Underneath the screen	82.0
Total	100.0

Conclusion: To treat such a mineral without using a large plant, as at the Transvaal, embracing concentrating tanks for sand and slimes, and for electrolytic treatment, and with a low net cost, it is necessary:

First—To wash the mineral and throw away the muddy clay after the deposit of their pyrites, sort with care all the schist, and rejecting even the white quartz containing little or no pyrite; schist to be thrown away even when appearing to contain 5% of pyrite, for the pyrites contained in schist are worth only one-third of the value of those contained in quartz; to regulate the stamps for large crushing capacity without amalgamation; crushing by a rock breaker, quite fine, followed, if need be, by a second crushing.

Second—Great quantity of water.

Third—Heavy stamps.

Fourth—A short fall for the stamps, in order that a greater speed may be obtained.

Fifth—Low discharge.

Sixth—Screens quite coarse, up to No. 14 or No. 18, but not larger, the gold requiring, perhaps, eighteen to twenty days for a dissolution of 85% in cyanide solution; classification by spitzkasten; elimination of barren slimes; concentration by vanners or by tables, giving three products, the other classes from the spitzkasten—low grade—to be thrown away, leaving pyrites for the cyanide process and galena to sell, this last containing lead and silver, lost by the cyanide process; cyaniding by percolation of the concentrates obtained with difficulty after eighteen to twenty days, and constant or frequent circulation and pouring off a fair extraction.

But I would recommend very particularly the following: As the presence of the sand facilitates the leaching, and as in all concentrating apparatus, when one endeavors to obtain rich sulphides, one also usually has rich tailings, it would be necessary here to work not according to custom in order to secure pure concentrates, but, on the contrary, to obtain poor tailings, deprived of pyrites and containing not more than two or three grams of gold per ton. Then almost all of the gold of the mineral will be in the sulphurets, which will still contain, perhaps, 40% or 50% of quartz.

But even if the ensemble of the fines and poor sands separated by washing, sorting and concentrating forms 60% of the raw mineral, the rest will contain 75% to 80% of the initial gold, and will be easy to work by one operation. One would have for a yield only 60% or 70% of that initial gold; but if this result is not very satisfactory to the engineer, it certainly will please the stockholders better, because it leaves a greater margin of profit and at the same time requires less capital for the plant.

*See illustration on front page.

Mining in Nicaragua, C. A.

Written for the MINING AND SCIENTIFIC PRESS by H. E. WEST.

There seems little doubt that in this country, as well as in all the other countries comprising Central America, considerable deposits of gold occur. Many of these have been worked from ancient times by the Indians, most probably from knowledge acquired from their Spanish conquerors. The Leonesa mine has also been worked off and on, from the time of the Jesuits, 150 years ago, to the present day. The style of mining adopted was by shallow adits and inclined shafts, up which walked the mozos (laborers), packing the ore on their backs, as can be seen to-day all through Mexico and Spanish America. The "gallery" system was adopted in stoping, as is their usual custom—doubtless a safe, but a very wasteful, method of working ground. The ore was carried by mules to the creek and there treated by arrastras.

Speaking of Nicaragua in general, while there would appear to be numerous small mines scattered around in several provinces, there is not one with a respectable monthly bullion return. The Santa Francisca mine, near Leon, up to some eight years ago was worked on a comprehensive scale, and yielded good returns—just how much I am unprepared to state—but I understand the ore body is phenomenally wide and of considerable gold contents, most of the ore averaging over the ounce, and in places the ore body running over 100 feet in width. This deposit is apparently of solfataric origin, and the water is so hot that miners can work but short shifts, reminding one of the Comstock before the advent of the Sutro tunnel. This mine is now treating its accumulation of slimes by filter presses, with more or less success, and I understand they are now sinking, or about to sink, their main shaft to 1000 feet or so, and so prove the deposit in depth before opening out on a larger scale than heretofore. This mine is owned by the Nicaragua Development Company, owned and controlled by London capitalists.

In the province of Segovia and others, this same company owns other mines, which are being brought into the line of producers in a small way, and which also bid fair to ultimately yield large returns, as in all cases the ore bodies are of very considerable extent, necessitating operations being conducted on an extensive scale.

In the province of Segovia, which borders on Honduras, an American company holds a large and valuable concession from the government to work mineral lands, and I understand the prospects are excellent, but there would not appear to be very much actually in progress that can be classified as mining.

In several other parts of the country, on the east side, there are small mines producing their quota, but of these I have no definite information.

Along the Coco river, which empties into the Atlantic, there is some placer mining being conducted by English and Americans, but I have yet to hear of any very brilliant results accomplished. It is true, I believe, that operations to date are being conducted on a very modest scale, and with limited means as to equipment.

In the Leonesa mine, near Matagalpa, there is a very strong vein, extending over a mile through the company's property, of considerable width and with gold contents distinctly payable. The vein is composite in structure, comprising a soft manganese portion, in which invariably the highest gold contents occur. This ore is, however, "gritty" to the touch, and contains more silica than would appear to be in its composition. Usually on the north wall there is a "friction breccia," consisting of angular pieces of wall rock, cemented together with an agglomeration of quartz crystals; this ore is also payable. Extending on either wall, there often occur small quartz "stringers" or "hilos perdidos," as they call them here, that often run for a considerable distance from the vein proper, causing in places wide zones of enrichment, that with a comprehensive scale of operation would be capable of profitable extraction. The ore is thoroughly oxidized, soft, and with quartz cellular in structure, never massive.

There is almost a mile of development work done in the several tunnels, raises, etc., which opens up a very considerable quantity of ore; and it is not often that one finds such a reserve to draw from at their disposal, when a mill is for the first time ready to work.

With regard to the treatment, we are now engaged in putting in one-half of a 60-head stamp mill. The ore will be raised from the mine through a short shaft, in reality, an elevator, and dumped into the coarse breakers, from whence it falls into the mill bin, located not more than 300 feet from the shaft. All the mine buildings will be located within a very small area, contiguous to the mine; these comprise a general machine and smith shop, a large general store, assay offices, etc.

The ore first passes through the breakers, thence into the bin, from thence through the battery in the usual manner. It is contemplated to crush with weak cyanide solution, and dispense with plates. The pulp then goes through a tube mill, an adaptation from cement manufacturing practice. This machine is such as is at present largely used in Western Australia for the pulverizing or sliming of the telluride ores of that region. The use of this machine on our ore here is for very fine grinding. This is accomplished by passing the pulp from the battery through an iron cylinder lined with "silex" lining; this cylinder is partially filled with flint pebbles, which, by the revolutions of the cylinder, cause the attrition of the ore, and the flowing off of same in a fine state of division with the escaping water. The usual spitzlutten and spitzkasten are then utilized for the separation of the coarser product for regrinding in the mill, and the latter for the thickening of the pulp, for supplying the agitation vats. After agitation with weak cyanide, the pulp is run into montejus in the usual manner and fed to three presses, each 50-plate, 40 inches square, for 3-inch cake.

The pumping through of wash water is effected by other montejus worked by compressed air. Precipitation of the liquor is effected by zinc boxes, and the gold slime cleaned up by the usual sulphuric acid process, the residues being collected in a small clean-up filter press.

The cyanide liquors are again made up to strength and pumped to the upper tanks, preparatory to again running same through the batteries, the liquors being again made up to requisite strength in the agitation vats.

Such is the process that has yielded good results by laboratory experiment. The process has been worked out and the mill designed by Philip Argall of Denver, Colo. There is nothing altogether novel in the plant; all that can be said of it is that it accentuates somewhat the modern practice of sliming all ores for the more efficient extraction of their auriferous contents.

THE development of Alaska is proceeding with increasing earnestness and vigor and each year sees new districts opened to the world. The building of roads and trails and the construction of railroads as soon as it is demonstrated that the resources of any particular section warrants it, are the principal factors in the development of the country, though back of this is the richness of the placers. Of late it looks as though Alaska was about to develop valuable copper mines, and possibly tin mines also, while the gold-vein mining industry is increasing in importance with each year. The present season a number of new roads and trails will be opened, and it is expected that the usual development of the sections directly benefited will follow.

Mining in Sierra County, Cal.

Written for the MINING AND SCIENTIFIC PRESS.

Sierra county has added materially to the output of gold in California. It has developed some of the most noted quartz mines in the State and has also some of the richest hydraulic and drift mines. Among the former are the Sierra Buttes mine, operated for many years at large profit; the Young America mine, the Mountain mine, the Colombo, and numerous others.

The mining districts are, generally speaking, at a considerable altitude, above the average of gold mines of the State, ranging about 6000 feet above the sea, and this fact has placed the district at some disadvantage, owing to prolonged winters and deep snows which render transportation during a considerable portion of the year difficult and expensive, if not impossible. The Sierra Buttes are the most prominent landmark in the county, and in their vicinity are several large groups of mines. It is said the Sierra Buttes mine has produced about $15,000,000 in gold. Until lately this mine had been idle for a number of years, but it was recently bought by San Jose, Cal., people and has been reopened. The original Sierra Buttes mine is said to have been practically exhausted to the main tunnel level, but the properties lying at either end, and which were included in the purchase, are still intact and will be developed and worked through the Sierra Buttes tunnel, which holds the topographical key to the situation. The topography of the county makes it possible to work the mines of the section through the medium of adits, dispensing with hoisting and affording perfect ventilation and drainage.

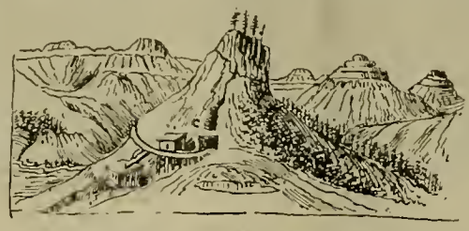
The Young America mine is also extensively developed by a series of tunnels and in former years was a large producer. Many thousands of dollars were expended in the construction of roads, and everything possible done at this mine, as at others of the district, to reduce the expense of operation, and yet freight costs from $25 to $28 per ton. The mine is credited with a production exceeding $1,500,000.

The Mountain mine is another of the extensively developed properties of the district, and, like the others mentioned, is opened by a series of tunnels on the lead or crosscutting to it. This property, like many of the others of the district, has been idle for years until recently reopened by San Francisco, Cal., capital. It consists of a group of claims aggregating 688 acres of mineral land, the greater portion of which is patented. The mine equipment consists of a 40-stamp mill, an aerial tram 6000 feet long, and numerous necessary buildings. The company owns a private road 3 miles in length, connecting the mine with the county road, which is now open after an unusually heavy winter's snowfall. The veins occur at contact of greenstone and slate and are well defined and large. The development consists of thousands of feet of tunnels, raises and crosscuts, exposing large blocks of ore. When formerly worked, metallurgical science had not reached the advanced stage it has now attained, and with the introduction of modern appliances and methods the lower grades of ore formerly left in the mines of this district may now be worked at a profit. Four tunnels have been driven into the mountain at depths ranging from 300 feet in No. 1, which extends entirely through the mountain, to 700 feet at No. 3. Tunnel No. 4 is in 600 feet and is about 1450 below the croppings. It is expected that the ore shoot will be reached in a further distance of 200 feet. A still lower tunnel is projected to be driven from the opposite side of the mountain nearly 300 feet below No. 4. A large ore reserve is said to be in sight in the upper workings which it is thought will be largely increased by the extension of tunnel No. 4 through the ore shoot. The ore is quartz, containing, in addition to free gold, about 1% sulphurets assaying $72 per ton. A portion of the old workings has been cleaned out under instruction of the manager, L. H. Carver, of San Francisco, Cal., and the necessary timbering done to place the property in condition for renewal of stoping and milling. The buildings and mill are being renovated and soon the stamps will once more be dropping. Concentrators are to be added to the mill, which was previously run without this necessary adjunct to proper treatment of ores containing valuable sulphurets, equal to about 72 cents per ton of ore. It is also the intention to put in a dynamo to furnish light to mine and plant. It is believed from 2½ to 3 tons can be crushed daily per stamp, and, it is said by Manager Carver, that working through tunnels the expense of mining and milling is expected not to exceed $1.75 per ton. Other improvements are contemplated for the future, including the removal of the aerial tramway from tunnel No. 3, the present upper terminal to tunnel No. 4, when the latter has been driven through the ore shoot and sufficient ore developed to insure a supply to the mill. This will shorten the tramway several hundred feet. It is also proposed to place rock breakers tandem at the mouth of No. 4, breaking the rock much smaller than is now possible with the present equipment in the mill, which is calculated to materially increase the capacity per stamp.

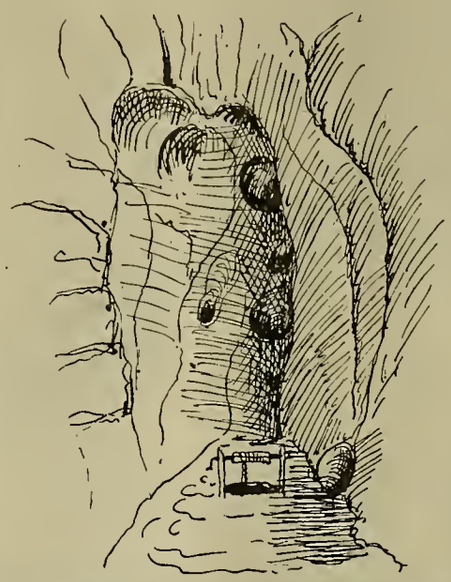
The Cave Mines of Red Mountain District, Colo.

Written for the MINING AND SCIENTIFIC PRESS by ARTHUR LAKES.

On the picturesque road between Silverton and Ouray we reach, at Ironton, a district with marked peculiarities; the one consists in some of the striking yellow, red, orange, gray, lavender and purple coloring of the hills conceivable in nature, hence the name Red Mountain, given to the district. This coloring is due to the oxidation of minute iron pyrites and other iron bearing minerals in the volcanic rocks. The other feature is the appearance of isolated knobs of quartz scattered over the area, some of which, by



National Belle Mine, Red Mountain, Colo.



Natural Entrance to Jedd Mine, Red Mountain, Colo.

Fissure Cave Entrance to National Belle Mine, Red Mountain, Colo.

their hardness, form the tops of castle rocks, like that above the National Belle mine. Most of these knobs carry ore and have mines in them, some of which are entered into from the surface by natural fissure-like caves full of kaolin and decomposed ores. When these ore deposits were first discovered they were known as "cave mines." The ore occurs in so-called "chimneys"—that is, nearly vertical bodies of ore roughly circular or elliptical in plan. The country rock is andesitic breccia, and the knobs of quartz are breccia that has been silicified by hot waters. The ore bodies are found down in these elliptical-shaped chimneys within nearly vertical zones of fractured, altered country rock, locally known as "ore breaks," which, according to the U. S. Geological Survey, were formed by "complex intersecting fissuring and were enlarged both by solution and by metasomatic replacement." At the intersection of two or more of these fissures the country rock was usually brecciated and furnished channels for ascending currents of warm or hot mineral-bearing waters, which effected the metamorphism so conspicuous in the rocks of this region. The area may have been a center of volcanic activity and the ore was deposited by the fumaroles which usually succeed such action. The mines of this class contain a great variety of minerals, some of them rare.

The common ores are galena, zincblende, gray copper, enargite, chalcocite, bornite, chalcopyrite and pyrite. The upper portion of the mines usually carries galena and the lower copper and low-grade iron pyrites. Bismuthiferous ores of silver and lead occur and also hubnerite or tungstate of iron. Among the rare minerals are covellite and kobellite, the latter a sulphantimoniate of lead with bismuth. Proustite and polybasite are found with tennantite, zincenite, zunyite and guitermanite.

The large caves such as were a feature in the upper workings of the National Belle mine at the time of our first visit, appear to have been formed by surface water, which dissolved the sulphide ores and country rock, as they moved along fracture planes. Some very rich ores in large quantities were taken from the upper workings, assaying from $150 to 3270 ounces of silver per ton. The National Belle, Yankee Girl, Guston and Zuni are mines of this Red Mountain class. The Jedd mine, at Ironton, was a "cave chimney" mine, said to have been discovered by a hunter who dropped through the snow into the orifice of the chimney, and on reaching the bottom found himself surrounded with pockets and vug holes full of decomposed ore. The cavities where the ore was extracted we saw in early days as we descended the chimney to the bottom and climbed out through a hole or natural outlet on the side of the mountain.

THE PROSPECTOR.

The mineral specimens from Forest Hill, Cal., are for the most part representative of a series of rocks which are the result of alteration of a dark-colored basic igneous rock. Nos. 1, 5 and 6 are massive or semi-schistose rocks, composed largely of chlorite and talc scales. By a gradual transition, which is partly represented by No. 4, these rocks pass over into a massive granular to a semi-schistose talc rock, represented by Nos. 2, 3 and 9, respectively. These rocks are dolomitic, and consist of the carbonates of lime, magnesia and iron. Identical rocks occur at many other places in California, notably near San Andreas, on Esmeralda and Indian creeks, near Dogtown and near Angels, in Calaveras county, and near the Buchanan mine, Tuolumne county, near Coulterville, Mariposa county, and at Grub Gulch, Madera county. No. 7 is much decayed, but is seemingly a diorite, which in depth will become much darker in color and very much harder and tougher. No. 8 is also a diorite, in which the hornblende needles and plagioclase feldspars can be plainly seen.

The small, black specimen from Gottville, Cal., appears to be the result of fused minerals. It is highly magnetic. This property is commonly observed upon heating iron-bearing minerals to the point of fusion.

The mineral from Greaterville, Ariz., is specular iron, a micaceous variety of hematite, in quartz.

The rock specimens from the Wichita mountains, Oklahoma, are mostly silica (quartz), with reddish brown iron oxide and green iron silicate. The rock may contain both gold and silver.

The rock specimen from Liberty, Ariz., is pyroxene, variety augite, which often (as in this instance) forms rock masses nearly free from associated minerals. It is usually of eruptive origin.

The drillings from Virginia City, Mont., numbered 1 to 4, under the microscope show sub-angular grains of quartz and feldspar, decayed hornblende and iron minerals. It is evident, from an examination of the grains of sand resulting from the breaking up of some of the granulated, partly decayed gneiss accompanying the drillings, that the latter are derived directly from the gneiss. The worn appearance of the grains of sand in the drillings is due to attrition in the bore hole, for, although under a low magnifying power they seem rounded, by magnifying them to fifty diameters it is seen that they are rough and not water worn, as are grains of sand in a river channel or on a sea shore. The brown pieces of spongy mineral are in all probability scales of rust from the pipe or drill rod, and the long, fibrous material may be small shreds from the rope used in drilling. If not the latter, then The Prospector must acknowledge ignorance of their origin. The fibers are not mineral, but organic. If further search is to be made for the channel, it should be made in a direction across the course of the stream.

Another Important Decision.

Following is another important decision of the Circuit Court of Appeals, in which heretofore uncertain phases of the law of extralateral right have been determined:

IN THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE NINTH CIRCUIT.

EMPIRE STATE-IDAHO MINING & DEVELOPING COMPANY, A CORPORATION, Appellant,
vs.
BUNKER HILL AND SULLIVAN MINING AND CONCENTRATING COMPANY, A CORPORATION, Appellee.

Appeal from the United States Circuit Court for the District of Idaho, Northern Division.

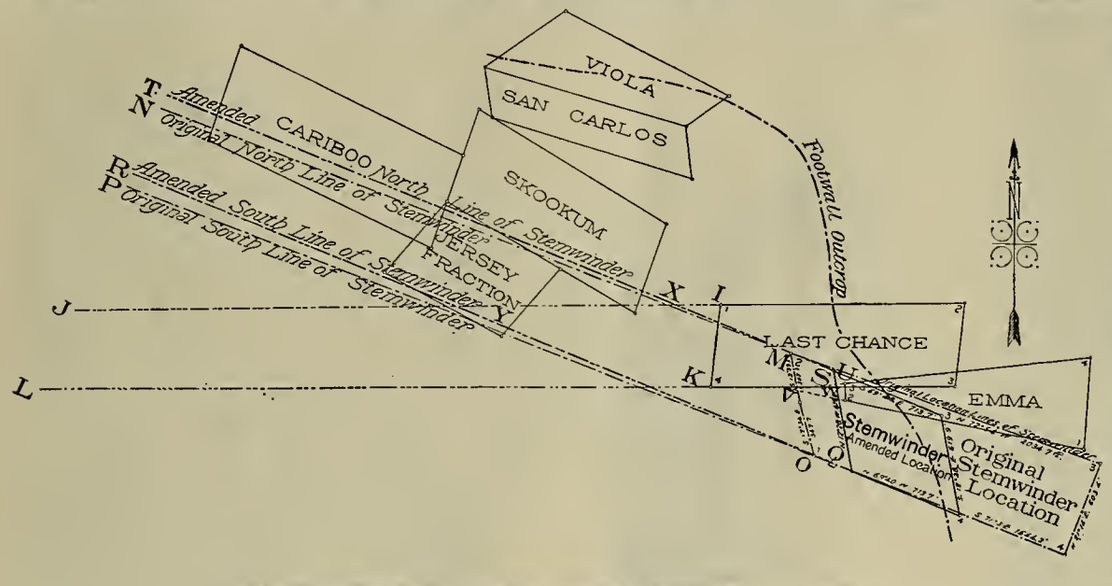
W. B. Heyburn counsel for appellant.

Curtis H. Lindley, Henry Eickhoff, John R. McBride and M. A. Folsom, solicitors for appellee.

Before Gilbert, Ross, and Morrow, Circuit Judges.

Ross, Circuit Judge, delivered the opinion of the court.

This is an appeal from a decree quieting the appellee's title as against the appellant to the Stemwinder lode claim, and defining its extralateral right in and to the ledge apexing within the surface boundaries of the claim. Annexed to and made a part of the decree is the following diagram, indicating the location of the various claims mentioned in the record and the course of the vein in question.



Map of Claims Involved in Recent Decisions of Supreme Court of Appeals.

The bill avers that the appellee owns and is in possession of the Stemwinder claim, the surface ground of which is indicated by the parallelogram marked on the diagram "Stemwinder Amended Location," except such portions thereof as are included within the surface lines of the Emma and Last Chance claims, and excepting also such parts of the lode or vein having its apex in the Stemwinder boundaries as lie within the surface lines of the Emma and Last Chance, and as lie underground between planes drawn downward through the end lines of the Emma claim produced southwestwardly to their intersection, and between planes drawn downward through the end lines of the Last Chance claim extended indefinitely in their own direction. The bill alleges that the courses of the apex of the vein at the surface is as shown upon the diagram, and that its downward course is westwardly; that the appellee owns and is in possession of all the veins apexing within the surface lines of the Stemwinder, throughout its entire depth, on its downward course between the end-line planes, as indicated on the diagram, except such parts thereof as are embraced hy the end line planes of the Emma and Last Chance claims. The hill avers that the appellant claims an interest adverse to the appellee in the Stemwinder claim, and in such part of its vein as lies westerly of and beyond a vertical plane drawn downward through the westerly boundary of the Stemwinder claim and northwesterly of and beyond a vertical plane drawn downward through the northwesterly boundary of the Last Chance claim, and between vertical planes drawn downward through the end lines of the Stemwinder claim extended westwardly indefinitely in their own direction; that the claim of right so asserted hy the appellant is false and groundless, and a cloud upon the appellant's title; that since Septemher 1, 1899, the appellant, hy means of underground workings, of which it has exclusive possession and control, has penetrated into that part of the underground vein so claimed to lie within the Stemwinder's extralateral houndaries and heyond the end line plane of the northern houndary of the Last Chance claim, and that the said underground vein, where so penetrated, contains large and valuable ore hodies which appellant is extracting, and threatens to extract, unless enjoined from so doing.

The demurrer and the plea filed hy the appellant to the hill in the court helow, were hefore this court and were here considered and determined on the appellant's appeal from the order of the trial court awarding the appellee an injunction. The decision here was that the hill was good and sufficient, and that the plea in hoth of its hranches was bad. Empire State-Idaho M. & D. Co. v. Bunker Hill & Sullivan M. & C. Co., 58 U. S. App. 311. That decision has become the law of the case, and those points, again elahorately discussed by counsel for appellant, are not open to further consideration.

The appellant in its answer to the bill denies that the appellee is now or ever was in the possession of or entitled to the possession of the Stemwinder lode claim as described in the hill, or was ever in the possession of any part of the Stemwinder lode claim, except as particularly set forth in the answer; denies that the diagram annexed to the hill as an exhihit correctly shows the surface houndaries of the Stemwinder claim, or the course of the apex of the vein, or of any veins, at the surface through that claim, or that such vein or any vein passes through the surface of the Stemwinder claim as shown upon that diagram. The appellant admits in its answer that there is within what it terms the pretended Stemwinder claim and within the Emma and Last Chance lode claims, a vein of mineral-bearing rock, hut denies that the general course or top or apex of the same at the surface is as stated in the hill, or as shown upon the diagram annexed thereto; denies that the Stemwinder claim has any northerly boundary line except as the southerly line of the Emma lode claim may he so considered; denies that the lode or vein has a downward course as indicated upon the diagram annexed to the hill, and denies that it passes on its downward course hetween the end lines claimed hy the appellee as the end lines of the Stemwinder claim, or extends indefinitely heyond a vertical plane drawn through the line claimed by the appellee as the westerly houndary thereof; denies that the appellee is or ever was the owner in fee of the Stemwinder claim, or is or ever was the owner in fee or at all of the vein heyond the westerly line of the Stemwinder claim; denies that the appellant claims any estate, right, title or interest in the Stemwinder claim, and denies that the appellee has any interest, right or title to any vein which may intersect or lie within the Stemwinder claim after such vein has departed from the exterior houndary lines thereof, or to any vein lying westerly of and heyond the westerly houndary line of the Stemwinder claim, or beyond the northwesterly houndary line of the Last Chance claim between vertical planes drawn through the end lines of the Stemwinder, as claimed hy the appellee; denies that the Stemwinder claim is of any value, hut admits that the portion of the vein in controversy is of the value of $50,000. The appellant then alleges that it is the owner of the ledge and ore hodies here in controversy, because of its ownership of the San Carlos lode claim; that the vein in which the said ore hodies lie passes on its strike or course through hoth end lines of the San Carlos claim, and outcrops throughout the entire length thereof, and descends into the earth on planes drawn through the end lines thereof in a southerly direction to and through the ore hodies claimed hy the appellee in this suit, and that such ore bodies are the property of the appellant hy reason of the fact that they are a part of the lode having its top or apex within the San Carlos claim, and are reached through continuous workings on that claim, following on the downward course of the ledge within planes drawn on the end lines thereof, and not otherwise; that the Stemwinder claim is unpatented, and that its houndaries are not marked upon the ground at all; that it lies far to the east of the ledge and ore hodies sought to he recovered in this suit, and has no connection therewith; that there is no means of approach to said ore hodies or to said portions of the ledge from the Stemwinder claim, and that no developments from the Stemwinder claim to the ore bodies in controversy have been made, and that there are intervening hetween the said ore hodies and the Stemwinder claim the Emma and Last Chance patented mining claims, helonging to the Last Chance Mining Company, not a party to this suit; that in a suit heretofore pending and determined in this court, the Last Chance Mining Company was adjudged to be the owner of the Last Chance and Emma lode claims and of the ledge and ores therein, as against the appellee, by reason of priority and right of title thereto; that the appellee has no right of way or ingress or egress through the said Emma and Last Chance claims, and has no right to follow from the Stemwinder claim to the ore hodies in controversy through or over the Emma and Last Chance claims. The appellant then alleges that the Stemwinder claim, such as it is, is junio in point of time and right to the Viola, San Carlos and Skookum lode claims owned hy the appellant; that the Stemwinder claim never did extend north of the south line of the Emma claim as patented, and that the locators and claimants of the Stemwinder claim, under whom the appellee claims title, did by agreement, in conjunction with the owners of the Emma and Last Chance claims, erect a monument on the south line of the Emma claim for the purpose of marking the extreme northern limit of the Stemwinder claim, and of any right which that claim had on the surface or underground; that no stakes or monuments marking the pretended north end line of the Stemwinder claim, or marking any corner or line of that claim, were ever placed on or within the Last Chance or Emma claim with the consent of the owners thereof, but that every attempt to place any stakes of the Stemwinder upon the Emma or Last Chance claims was forhidden and prevented by such owners, and the parties so placing said stakes were compelled to withdraw them, and that in order to definitely establish the limit of the Stemwinder location to the northward, the said monument was erected jointly by the owners of the Emma and Last Chance and Stemwinder claims; that in patenting the Emma lode claim the said monument was recognized as the houndary, and the official line established thereon; that notwithstanding the said monument and the patenting of the said Emma claim, the successors in interest of the Stemwinder claim undertook to ignore the said boundary and the monument, and upon the making of the application for patent by the owner of the Emma location, the then owner of the Stemwinder claim filed an adverse claim in the United States Land Office and commenced a suit in support thereof against said application for patent, which suit involved the question of whether the Stemwinder claim ever extended over a part of the Emma and Last Chance claims, or north of the said monument and south line of the Emma claim as surveyed for patent; that the said suit was tried and judgment rendered therein against the Stemwinder claim, and that it was decreed that the ground in controversy hetween the Emma and the Stemwinder claims was a part of the Emma claim as located and claimed hy the locators thereof on the 17th day of September, 1885, that this judgment remains unreversed, and was affirmed in the Supreme Court of Idaho and hy the Supreme Court of the United States; that the owners of the Last Chance lode claim made application for United States patent and gave notice thereof in the usual manner, and that the claimants of the Stemwinder claim filed no adverse claim against such application for patent; that at the time of the attempted location of the Stemwinder claim, on the 17th day of September, 1885, the lode and surface ground attempted to he located was not a part of the vacant, unappropriated puhlic land of the United States, and that the location thereof was void as to every part thereof north of the original south line of the Emma location; that the claim attempted to he located as the Stemwinder was not the same location or lode claim that appellee now claims and seeks to recover upon in this suit, as to shape, direction, or identity; that the appellee has heen guilty of laches in asserting its pretended claim, in as such as the appellant has openly claimed the premises sued for since 1898, and has openly mined and extracted ore therefrom, and heen in the open and notorious possession thereof since 1899, of which the appellee has had full knowledge. The appellant then alleges that the plane upon which the appellant is seeking to follow between its pretended end lines is laid along the strike of the ledge and not upon its downward course or dip, and that the ore hodies claimed by the appellee in this suit are not upon the downward course of any ledge having its top or apex within the Stemwinder claim.

To this answer the appellee filed its replication, and upon the issues thus raised the cause was tried in the court helow.

Allusion has already been made to the previous decision of this court in respect to the sufficiency of the bill, and of the pleas thereto interposed hy the appellant.

Another point again argued by the learned oounsel for the appellant was also determined adversely to his contention in our former decision in this cause, namely, that the intervention of the extralateral rights of the Emma and Last Chance claims did not cut off or extinguish the right of the owner of the Stemwinder to follow its vein or lode beyond the end line planes of the Emma and Last Chance (58 U. S. App., 311). And still another point argued by appellant's counsel, to wit, that the awarding the appellee the extralateral right in question is to permit it to follow the vein more upon its strike than upon its dip, was decided against his contention at the present term, in the case of the Last Chance Mining Co. et al. v. Bunker Hill & Sullivan Mining & Concentrating Co.

Several other points, however, remain to be considered and determined.

The case shows that the Stemwinder claim was originally located in Septemher, 1885, its location notice bearing date Septemher 17th of that year. At the time of such location it was thought hy its locators that the vein outcropping within the claim ran easterly and westerly. Accordingly, its length was laid in that direction, as is indicated on the diagram. The same mistake was made hy the locators of the Emma and Last Chance claims and of other claims in the same vicinity, as appears in this and other records in this court. The Stemwinder has not been patented, and it is contended hy the appellant that it does not appear from the record that that claim ever was marked or staked on the ground as claimed hy the appellee. One Devine was the original locator. His testimony in respect to the marking of the

boundaries of the claim is as follows:

Q. What did you do, if anything, with reference to marking the boundaries of that claim?

A. I put up three stakes on the east end; that is, I blazed them. I had a small ax, and I blazed them that day and put up one stake—made a monument and put up one stake on the northeast corner, and the other two were blazed on the east end. On the west end I blazed two trees, and did not put up my southwest corner stake that day. I put them all up but one that day.

Q. When did you put up the last stake?

A. Shortly afterwards.

Q. Within how many days afterwards?

A. I think the next day, or the next day but one.

Q. Now, let us go to those corners and see if you can recollect what the character of them was and how they were marked. What was the northwest corner?

A. It was a pine tree, about 12 inches through, I guess. We afterwards squared it up and cut the tree off.

Q. Made stump of it?

A. Made a stump of it; yes, sir. A stake of it proper.

Q. How was that tree marked?

A. It was marked "Northwest corner of Stemwinder claim."

Q. Did you set a stake at the west center end?

A. No, sir. I marked on a stub, a big stub, probably 50 feet high; blazed it on each side. I didn't cut that off.

Q. A standing tree?

A. No, sir. It was a stub at the time, probably 40 to 60 feet high.

Q. A dead tree?

A. Yes, sir.

Q. Standing in its natural position?

A. Yes, sir.

Q. Did you square that?

A. I squared it on four sides, but I did not cut it down.

Q. How did you mark it?

A. I marked it "West center end of the Stemwinder."

Q. With regard to the southwest corner, what was the character of the marking at that point?

A. Well, that day I did not put up any mark there.

Q. You put it up on the next day?

A. On the next day or two I put up a stake.

Q. What was the size of the stake, and how high did it stand up above the ground?

A. Oh, the stake was probably 5 inches through after it was squared up, and stood 4 or 5 feet above the ground. I suppose 4½ feet; I don't know exactly. I know I got it long enough.

Q. Was it firmly planted in the ground?

A. Yes, sir.

Q. How was it marked?

A. It was marked "Southwest corner of Stemwinder."

Q. What marking, if any, did you place at the southeast corner of the claim?

A. At the southeast corner?

Q. Yes.

A. I blazed the tree and cut that off on the southeast corner, and made a stake of it. It was a stub at the time I cut it off.

Q. You squared the tree, did you?

A. Yes, sir.

Q. What was the size of it after it was squared?

A. Oh, I suppose it was 5 or 6 inches through.

Q. Five or 6 inches square?

A. I think so; yes, sir.

Q. How was it marked?

A. Marked "Southeast corner Stemwinder claim." I posted the notice on it, the same as all the stakes I put on the ground.

Q. What marks did you make at the east center end, if any?

A. The east center end was a tree about 12 or 14 inches through.

Q. A live tree?

A. No sir, it was dead; and I marked that "east center end of the Stemwinder," and afterwards cut the tree down.

Q. Did you substitute anything for the trees afterwards?

A. No, sir. There was a stake there, yes, but then there was also the notice on the tree when I cut it down, making a stake of it, too.

Q. Was there a post substituted for that center end?

A. Yes, sir.

Q. What was the character of the post.

A. It was a hewed post, probably 5 or 6 inches through, squared up.

Q. How high did it stand above the ground?

A. Four or 5 feet, I don't know exactly.

Q. What did you place, if anything, by the northeast corner?

A. At the northeast corner was a little monument of rocks, and I placed a little stake in that, the day I located the claim, and afterwards put a good stake there, probably 4 or 5 inches through. That was the northeast corner.

Q. How did you mark that?

A. "Northeast corner of the Stemwinder."

Q. Did you mark the east center end stake?

A. Yes, sir.

Q. How did you mark that?

A. Marked it "east center end of the Stemwinder."

Q. Wherever there were stakes placed in the ground, were they all firmly placed?

A. Yes, sir.

Q. I will ask you with reference to this marking, whether or no the lines could be readily traced from this marking?

A. Yes, sir, they could.

Q. Where did the Stemwinder claim lie with reference to the Bunker Hill?

A. It laid nearly north of the Bunker Hill, a northerly direction.

Q. How close to it?

A. It is laid right next to the Bunker Hill.

Q. And northerly from it?

A. Yes, sir, northerly.

We also extract from the examination of the surveyor who marked the boundaries of the amended location of the Stemwinder, the following:

Q. Mr. Loring, you testified yesterday that you had made an amended location of the Stemwinder for the Stemwinder Mining Co., copy of which was recorded. What did you do with reference to marking that claim on the surface?

A. I established a post at either corner and at the north and south end centers.

Q. Describe the character of the post, and the markings that were placed upon them.

Mr. Heyburn: Wasn't that all gone into?

Mr. Lindley: No sir, it was overlooked.

Mr. Heyburn: If counsel will state that perhaps we may shorten—what is it you want?

Mr. Lindley: The stakes of the amended location of the Stemwinder. I wish to prove that they were properly marked; and with regard to the northeast corner stake the manner in which he ultimately tied that stake to a certain point. The stake itself in later years, of course, has been—is gone; it has been replaced by data furnished by Mr. Loring.

Mr. Heyburn: Is it not a fact that as a matter of law you would be bound by the point fixed upon if there has been an official survey, and that the surveyor-general would require that post put on that point if there is any dispute about it.

Mr. Lindley: All I wish to show by this witness is that the Stemwinder stakes were all of the proper size required by law, of the amended location, and that they were properly marked according to law, and that the northeast corner stake, as now delineated on the maps of James M. Porter, is where Mr. Loring placed it.

Mr. Heyburn: There is no controversy about it; we will let it go in.

M. Lindley: Go ahead.

A. To the south and (end) center was a post 6 feet long and 6 inches square, and marked "south end center of the amended location of the Stemwinder." The southeast corner was a post 5 feet long, 4 inches in diameter, squared, and marked "southwest corner Stemwinder Lode, amended location." Southeast corner was a post 4 inches in diameter, 5 feet long, marked "southeast corner Stemwinder Lode, amended location;" and the southeast corner, as I described, was 207.8 feet from the northwest corner of the Bunker Hill lede, as originally staked. The northwest corner was a post 4 inches in diameter, squared, and 5 feet long, and marked "northwest corner of Stemwindor Lede, amended location," and the northeast corner was a post 5 inches in diameter, squared, 5 feet long, marked "northeast corner Stemwinder Lode, amended location." The north and center I think I have not described yet. A post 4 inches in diameter, squared, 5 feet long, marked "north end center Stemwinder Lode, amended location."

Q. Does that complete the marking?

A. It did.

Q. In any subsequent period, Mr. Loring, did you have occasion to fix the locality where that stake stood with reference to any other survey?

A. You refer to the northwest corner? I did.

Q. State how you tied that particular corner stake subsequently.

A. In July of that year I made a survey and planted center corners. I then connected the northwest corner of the Stemwinder lede, amended location, with that center corner.

Mr. Heyburn: The corner of this claim?

A. Of a survey I made.

Mr. McBride: July of what year?

A. 1887.

Mr. Lindley: At the time the corner stake of the Stemwinder was still standing?

A. They were all standing for at least two years thereafter.

At the time of the making of the original location of the Stemwinder, no objection appears to have been made by anybody to its lines as laid.

Although, as has already been said, it has been determined in previous litigation between the owners of the Stemwinder, Emma and Last Chance that the two last-mentioned claims were prior in point of time to the Stemwinder, Devine's testimony in this case is to the effect that, as a matter of fact, at the time he marked the boundaries of the Stemwinder neither the Emma or Last Chance had been located, and the testimony of J. I. Smith, one of the locators of the Emma and Last Chance, rather corroborates Devine in that particular. At all events, the boundaries of those three claims, all of which were located on the same day, and all upon the mistaken impression of their locators that the vein or lode outcropping within them ran easterly and westerly, overlapped; and the question of overlapping having arisen between the owners of those claims, who seem to have been friendly at the time, they went upon the ground and measured 300 feet northerly from the Stemwinder discovery point, and there built a stone monument which they orally agreed should be a point in the northerly line of the Stemwinder and the southerly line of the Emma. So far as appears, no other point in such line was designated, and no record anywhere made of such oral agreement. Time ran on, and on the 15th of March, 1887, the Stemwinder Mining Co., a corporation, acquired the Stemwinder claim, without, so far as appears, any knowledge of the oral agreement concerning the stone monument, and on the 23rd of May, 1887, amended the location of the Stemwinder in the manner indicated on the diagram, from which it will be seen that the amended location is almost entirely within the original, although in defining the end lines of the amended location courses were slightly varying from those of the original side-end lines were given. At different times, commencing with February 20, 1886, and ending with May 21, 1887, the Viola, Skeokum, San Carlos, Cariboo, and Jersey Fraction claims, belonging to the appellant herein were located. The relative position of these intervening claims is also shown on the diagram.

The purpose of amending the Stemwinder location was thus stated in the notice of such location:

"That said mining claim was duly located on the 17th day of September, 1885, by S. R. Devine, who was a citizen of the United States, over the age of 21 years, and notice thereof posted on the claim and recorded in the records of Shoshone county, Idaho Territory, in Vol. C of quartz locations, page 318, on the 26th day of September, 1885, to which record reference is hereby had and made a part of this amended location, and as a basis thereof, and thereafter said locaters by conveyances duly made and recorded sold the same, and the said company by divers mesne conveyances has become and is now the owner of said mining claim and is in possession thereof and owns all the right, title and interest of said locaters therein formerly owned and held by them. That since said location was made the true course, position, and the strike of the vein as originally located, marked out as the Stemwinder vein or lode, has been demonstrated and determined, and within the line as originally staked and located herein, and by survey it has also been demonstrated that said locators staked out on each side of said vein, ground in excess of 300 feet on each side of said vein, and the object of this amended notice is to conform to the laws relating to mining claims both national and local, and to mark and define and record the same to the extent and with the boundaries hereinafter set forth, the same being within the boundaries so located, marked and staked in the original location thereof, and not otherwise. Therefore, the said Stemwinder Mining Co., by and through its said officers duly authorized hereby, give notice that it hereby locates the vein and lode so discovered originally by way of Amended Location for the purposes aforesaid, and hereby claim the vein within the limits and to the extent as follows, to-wit:

"Beginning at center of southeasterly end of claim at a post upon which amended location notice is posted, thence 69° 40′ west, 356.85 feet, to southwest corner, whence a prominent peak bears south 8° 22′ east, another prominent peak bears north 84° 35′ east—northwest corner Bunker Hill lode bears north 69° 40′ west, 207.8 feet; thence north 12° 28′ west, 619.6 feet, to the northwest corner; thence south 69° 40′ east, 713.7 feet, to the northeast corner; thence south 12° 28′ east, 619.6 feet, to the southeast corner; thence north 69° 40′, west 356.85 feet, to place of beginning, situate about ½ mile southwesterly from town of Wardner, on easterly hillside in Yreka mining district, county of Shoshone, and Territory of Idaho.

"And that said company intends to hold and work said above-described mining claim as provided by the local laws and customs and the mining laws, both local and national. It is further intended not to abandon in any manner or by implication any rights, privileges, property, possession, or title derived, originated, owned and held under the original location thereof; but that the purpose hereof is to more particularly mark, locate, define, and describe the ground, vein and premises held by said company, without waiving any rights under said original location, all of which the said company claims as the legal successor in interest and title and possession derived from said original locators."

The decree of the court below excepted the rights—surface and extralateral—pertaining to the Emma and Last Chance claims, and gave to the appellee the balance of the surface embraced by the lines of the amended location of the Stemwinder, and such portions of the underground segment of the vein apexing within its surface boundaries as lie northwesterly of and beyond a vertical plane drawn downward through the northwesterly line of the Last Chance claim, and between vertical planes drawn downward through the amended north and the amended south lines of the Stemwinder, extended westwardly indefinitely, "save and except such as accrue to said respondent (appellant) under and by virtue of its ownership of the Viola, San Carles, Jersey Fraction, and Cariboo claims shown upon said Exhibit "A" (the diagram above set out). That as against the rights accruing to said respondent (appellant) by virtue of its ownership of the Viola, San Carlos, Skookum, Jersey Fraction, and Cariboo claims this complainant is the owner of all such underground parts of said vein as lie between a vertical plane drawn downward through the southerly boundary of said Stemwinder lede claim, and such line produced indefinitely in its own direction north 69° 40′ west, marked on said Exhibit "A" "Amended south line of Stemwinder," and a vertical plane drawn downward through the original north location line of said Stemwinder, and such line extended indefinitely in its own direction north 72° 54′ west, being the line marked on Exhibit "A" as "Original north line of Stemwinder."

While disputes have been many, and seemingly bitter, between the present owners of the respective claims in question, and objections were made by some of the appellant's grantors to some of the lines and stakes of the Stemwinder, subsequent to its original and amended locations, it does not appear that such part of the lines of either the original or amended Stemwinder claims as were laid upon the Emma and Last Chance ground were put there forcibly or surreptitiously or otherwise fraudulently or against the consent of the owners of either of those claims, at the time. The same conditions appeared in the case between the present parties, and others, reported in 109 Federal, 538, where we said:

"The priority of location of the Emma over the Stemwinder claim is not only found as a fact by the court below, but is conceded by the plaintiff in error; and the plaintiff further concedes, not only in its brief, but in its complaint, that the Emma has the right to follow the vein in its dip between vertical planes drawn through its converging end lines to the point of their intersection. The underground segment of the vein included within the triangle formed by the prolongation of these two vertical converging end lines and the westerly side line of the Emma, as well as the surface and everything under the surface of the Emma claim, is thereby eliminated from controversy. Notwithstanding the location and rights of the Emma, the Stemwinder claim was so located as to include within its lines a considerable portion of the Emma surface. The lines of the Stemwinder that cross the vein are parallel, and are, therefore, in law, the end lines of that claim, whether so intended by the locator at the time of its location or not. Mining Co. v. Tarbet, 98 U. S. 463, 25 L. Ed. 253; Argentine M. Co. vs. Terrible M. Co., 122 U. S. 478, 7 Sup. Ct. 1356, 30 L. Ed. 1140; King v. Mining Co., 152 U. S. 222, 14 Sup. Ct. 510, 38 L. Ed. 419. No doubt the owner of

the Emma mine could have lawfully prevented any intrusion upon his claim, and have maintained the exclusive possession thereof. As said by the Supreme Court in Del Monte Mining & Milling Co. v. Last Chance Mining & Milling Co., 171 U. S. 55, 83, 18 Sup. Ct. 895, 43 L. Ed. 85: 'A party who is in actual possession of a valid location may maintain that possession and exclude every one from trespassing thereon, and no one is at liberty to forcibly disturb his possession or enter upon the premises. At the same time the fact is also to be recognized that these locations are generally made upon lands open, uninclosed, and not subject to any full actual occupation, where the limits of possessory rights are vague and uncertain, and where the validity of apparent locations is unsettled and doubtful. Under those circumstances, it is not strange—on the contrary, it is something to be expected, and, as we have seen, is a common experience —that conflicting locations are made, one upon another, and sometimes the overlap repeated by many different locations. And while in the adjustment of those conflicts the rights of the first locator to the surface within his location, as well as to veins beneath his surface, must be secured and confirmed, why,' asks the court, 'should a subsequent location be held absolutely void for all purposes, and wholly ignored? Recognizing it so far as it establishes the fact that the second locator has made a claim and in making that claim has located parallel end lines, deprives the first locator of nothing. Certainly, if the rights of the prior locator are not infringed upon, who is prejudiced by awarding to the second locator all the benefits which the statute gives to the making of a claim? To say that the subsequent locator must, when it appears that his lines are to any extent upon territory covered by a prior valid location, go through the form of making a relocation, simply works delay, and may prevent him, as we have seen, from obtaining an amount of surface to which he is entitled, unless he abandons the underground and extralateral rights which are secured only by parallel end lines. In this connection,' continued the court, 'it may be properly inquired, what is the significance of parallel lines? Is it to secure to the locator in all cases a tract in the shape of a parallelogram? Is it that the surveys of mineral land shall be like the ordinary public surveys in rectangular form, capable of easy adjustment, and showing upon a plat that even measurement which is so marked a feature of the range, township, and section system? Clearly not? While the contemplation of Congress may have been that every location should be in the form of a parallelogram, not exceeding 1500 by 600 feet in size, yet the purpose, also, was to permit the location in such a way as to secure not exceeding 1500 feet of the length of a discovered vein; and it was expected that the locator would so place it as, in his judgement, would make the location lengthwise cover the course of the vein. There is no command that the side lines should be parallel, and the requisition that the end lines shall be parallel was for the purpose of bounding the underground extralateral rights which the owner of the location may exercise. He may pursue the vein downward outside the side lines of his location, but the limits of his right are not to extend on the course of the vein beyond the end lines projected downward through the earth. His rights on the surface are bounded by the several lines of his location, and the end lines must be parallel, in order that going downward he shall acquire no further length of the vein than the planes of those lines extended downward inclose. If the end lines are not parallel, then, following their planes downward, his rights will be either converging and diminishing or diverging and increasing the further he descends into the earth. In view of this purpose and effect of the parallel end lines, it matters not to the prior locator where the end lines of the junior location are laid. No matter where they may be, they do not disturb in the slightest his surface or underground rights.'

"The court accordingly answered in the affirmative this question propounded to it by the Circuit Court of Appeals for the Eighth Circuit: 'May any of the lines of a junior lode location be laid within, or across the surface of a valid senior location for the purpose of defining for or securing to such junior location underground or extralateral rights not in conflict with any rights of the senior location?'

"In the case of the Hidee Gold Mining Company, decided by the Secretary of the Interior January 30, 1901, (advance sheets), it was held that the location of a lode mining claim may even be laid within, upon, or across the surface of patented lode mining claims, for the purpose of claiming the free and unappropriated ground within such lines and the veins apexing in such ground, and of defining and securing extralateral underground rights upon all such veins, where such lines are established openly and peaceably, and do not embrace any larger area of surface, claimed and unclaimed, than the law permits.

"As, therefore, upon the facts appearing, there was no valid objection to the Stemwinder location, the next question is, what rights did the owner of that location thereby secure? Confessedly, he acquired nothing as against the Emma, either on the surface or underground. But how is it as against the goverument and every subsequent locator? In the absence of any objection on the part of the owner of the Emma, the locator of the Stemwinder had, as we have seen, the legal right to extend his lines upon and across that claim. The ground to the north and south of the Emma was, according to the findings, open and unappropriated public land, with a mineral-bearing ledge passing in a northwesterly and southeasterly direction through the Emma and into the adjoining unappropriated public land to the north and south of that claim. Across that ledge and on unappropriated public land the locator of the Stemwinder laid his southerly end line, and along the course of the ledge and on unappropriated public land he laid his westerly side line. Across the ledge, partly on unappropriated public laud and partly on the prior Emma location, he laid his northerly end line, parallel with his southerly end line, and along the course of the ledge, partly on the Emma and partly on unappropriated public land, he laid his westerly side line, almost, if not quite, parallel with his westerly side line. As, in the absence of any objection on the part of the owner of the Emma, the locator of the Stemwinder had the legal right to cross the prior location, his lines, as against the government and all subsequent locators, would therefore seem to have been perfectly laid. Under such circumstances, we are unable to see why, as against the government and all subsequent locators, the location should not carry precisely the same rights, surface and extralateral, that it would carry if none of the lines had been laid upon or over a prior location, which, under the statute governing extralateral rights, would give to the locator of the Stemwinder, as against the government and all subsequent locators, the right to follow the dip of the vein in its departure from the westerly side line of the claim indefinitely between vertical planes drawn through the parallel end lines extended indefinitely in their own direction. We think, too, that this is the logical deduction to be drawn from the reasoning upon which the judgment of the Supreme Court in the case of Del Monte Mining & Milling Co. v. Last Chance Mining & Milling Co., supra, was based. In effect, the court below made the south line of the Emma the north end line of the Stemwinder, thereby destroying the parallelism of the end lines of the Stemwinder fixed by its locator, and either destroying all of its extralateral rights entirely, or limiting them to converging lines intersecting at the point Y on the diagram. This is in conflict with what was held by the Supreme Court in the Del Monte case in respect to the line e—i of the New York claim. That line, which was the northerly side line of the New York, stood in the same relative position to the Last Chance claim there involved as the south boundary of the Emma claim does to the Stemwinder; and the Supreme Court, in answer to the third question submitted to it by the Circuit Court of Appeals for the Eighth circuit, held that the easterly side line of the New York did not constitute the end line of the Last Chance claim there in question. Locations of lode mining claims are made for the purpose of reaching the underground veins. 'The area of surface,' said the court in the Del Monte case, 'is not the matter of moment. The thing of value is the hidden mineral below, and each locator ought to be entitled to make his location so as to reach as much of the unappropriated, and perhaps only partially discovered and traced, vein as is possible.' 171 U. S. 75, 18 Sup. Ct. 895, 43 L. Ed. 85."

It cannot therefore, be now held, as claimed by the appellant, that no extralateral right pertains to the Stemwinder claim. Nor are we able to agree with the apellant's counsel that the extralateral right of the Stemwinder should be bounded on the northerly side by a vertical plane drawn downward through the patented south line of the Emma claim because of the placing of the stone monument already referred to; and this for several reasons: first, it does not appear that the Stemwinder Mining Co. or its successors in interest, the appellee herein, knew anything about the stone monument or the oral agreement under which it was built at the time they acquired their interest; second, the monument was but one point, and was insufficient to indicate any boundary line; and third, no connection is shown between the appellant and the Emma and Last Chance claims, or any of their owners or locators—there was no privity between them or any of them.

Did the court below err, as against the intervening claims of the appellant, in fixing the bounding planes of the extralateral right of the Stemwinder through the original north line of the Stemwinder and through its amended south line?

By this decision, it will be seen, the court confined the extralateral right of the Stemwinder within the limits of its original location, and did not extend it beyond the planes of its amended location, and in confining it, as it did, to planes drawn through the northerly end line of the original location and the southerly end line of the amended location, it is given less of the vein on its dip than would be included within planes drawn through the end lines of its amended location.

Was it right in going back to the original north line of the Stemwinder in fixing its extralateral right as against the intervening claims of the appellant? That question, it seems to us, depends upon whether or not the amendment of the location in question was an abandonment, for all purposes, of the original? If so, it would follow that the court below was in error in this particular. That there was no such intention on the part of the Stemwinder Mining Co., was expressly declared in its notice of amended location, wherein it was stated that the error in the course of the vein having been discovered, "the object of this amended location is to conform to the laws relating to mining claims, both national and local, and to mark and define and record the same to the extent and within the boundaries hereinafter set forth, the same being within the boundaries so located, marked, and staked in the original location hereof, and not otherwise." Again it is declared in the amended notice of location: "It is further intended herein not to abandon in any manner or by implication any rights, privileges, property, possession, or title derived, originated, owned or held under the original location thereof; but that for the purpose hereof is to more particularly mark, locate, define and describe the ground, vein, and premises held by said company, without waiving any rights under said original location, all of which the said company claims as the legal successor in interest and title and possession derived from said original locators."

At the time of the original location of the Stemwinder, none of the claims here set up by the appellant had been located. At the time of its location, it being supposed by its locator that the vein or lode outcropping within its surface boundaries ran in an easterly and westerly direction, and its then supposed side lines being, as a matter of fact, laid across the vein, and being substantially parallel, the law declares that those which the locator declared his side lines were in fact his end lines. Del Monte M. & M. Co. v. Last Chance M. Co., 171 U. S. 55; Last Chance M. Co. v. Tyler M. Co., 157 U. S. 683; Flagstaff M. Co. v. Tarbet, 98 U. S. 463; Argentine M. Co. v. Terrible M. Co., 122 U. S. 478; King v. Amy Silversmith M. Co., 152 U. S. 222; Bunker Hill & Sullivan M. & C. Co. v. Empire State-Idaho M. & D. Co., 109 Fed. 538; Empire M. & M. Co. v. Tombstone M. & M. Co., 100 Fed. 910; Cosmopolitan M. Co. v. Foote, 101 Fed. 518; Tyler M. Co. v. Sweeney, 54 Fed. 284. And as they were laid, as the evidence shows, openly and above board, without any forcible, clandestine, surreptitious or otherwise fraudulent entry upon the ground of another, and without objection on the part of any one, the location of the Stemwinder thus made, carved out, as against the government, and any and every subsequent locator, a segment of the vein throughout its entire depth, which belonged to its locator. Del Monte M. & M. Co. v. Last Chance M. Co., 171 U. S. 55; Empire State-Idaho M. & D. Co. v. Bunker Hill & Sullivan M. & C. Co., 114 Fed. 417.

Unless the amended location of the Stemwinder operated as a total abandonment of the original, that segment of the vein, within the limits of the planes of the amended location, remains the property of the successors in interest of the original locator, against all persons not possessed of some prior right. That such amended location was not intended to operate as any such abandonment has already been shown by the express declarations of the notice of amended location above quoted; and that, as a matter of law, it was not an abandonment of the original location, is equally clear. Thompson v. Spray, 72 Cal. 528; Hallack v. Traher, 23 Colo. 14; McEvoy v. Hyman, 25 Fed. 596; Morrison v. Regan, 67 Pac. 955; Duncan v. Fulton, 61 Pac. 244.

The great width of the vein or lode in question is also again pressed upon our attention by the learned counsel for the appellant, extending, as he insists the evidence shows, beyond the west side line of the Stemwinder claim. In respect to this matter the court below said, in its opinion:

"The defendant also maintains that the apex of this ledge is so wide that it extends far to the westward of the west line of the Stemwinder. Upon this subject there is much and some very interesting testimony by experienced and scientific mining men, but no one has been able to set definite limits to the ledge, and that it has no distinct banging wall cannot be doubted. Its one distinct and persistent feature is its foot wall; it was the axis of action; upon it the superincumbent mass of hanging country had its oscillating and grinding motion, resulting in the creation of that heavy selvage or gouge now found upon it, and in so shaking and breaking up that hanging country as to change the relation of its component parts, thus creating large masses of brecciated rock, fissures and cavities, through which the circulating mineral elements deposited their ores. It would be expected that those conditions would decrease as we advance from the line of fissure and action until reaching a point where there had been no disturbance of the rocks. We would expect the evidence of mineralization to extend far beyond the ore deposits and as far as the country had been disturbed, displaced or brecciated, but we cannot conclude that the legal hanging wall extends to the limits of these influences. It is a fact that, in many ledges having a distinct hanging and foot wall, the country beyond either is more or less mineralized, and at times even small deposits of ores are found beyond the lines of the walls. Yet no miner would say that such mineralized country rock constituted a part of the ledge. It appears that in this ledge the footwall country has very little mineralization or even mineral stains. The reason is evident—the heavy gouge prevented the escape in that direction of the mineral elements, and the rocks, having preserved their original compact formation, there were no cavities through which the mineral elements could circulate. To hold that the ledge extends to the extreme limits of all evidence of mineralization is not a reasonable or practicable proposition in such a formation as this. If not there, where then? Not beyond the ore deposit or where such strong indications of it are found, that the miner could work or explore with the expectation of compensation. It cannot be doubted from the evidence that far beyond where any miner, acquainted with this formation, would work for ore, there is much evidence of mineralized rock, quite similar to the material recognized as clearly within the ledge. So far as can thus be concluded from all the evidence or ore developments, at and within a reasonable distance below the surface in the Stemwinder, I doubt that the apex proper in that claim exceeds 250 to 300 feet in width. Suppose, however, that it does extend beyond the west line of the claim, the only effect would be, under the holding of the Court of Appeals in the King case, 114 Fed. 417, that if defendant owns that surface it would own so much of the apex as lies within it. What its underground rights would be is a problem I am not not called upon to now solve."

We are not prepared to hold that the court below was in error in the view thus taken of the evidence in the cause. But if it be conceded that the vein or lode be as extensive in width upon the surface as contended by the appellant, the priority of the original Stemwinder location over the claims of the appellant here set up being established, the extralateral right of the appellee would remain as fixed and decreed by the court below. Last Chance M. Co. v. Bunker Hill & Sullivan M. & C. Co., decided at the present term; Empire State-Idaho M. & D. Co. v. Bunker Hill & Sullivan M. & C. Co., 114 Fed. 417; St. Louis M. & M. Co. v. Montana M. Co., 104 Fed. 664, and cases there cited.

The judgment is affirmed.

(Endorsed): Opinion. Filed June 6, 1904. F. D. Monckton, Clerk.

The Philippines at St. Louis.

At the St. Louis Exposition the Philippine government board has made an elaborate display of the mineral products of the archipelago. This is the first time a systematic attempt has been made to collect and classify the minerals, and the result has been gratifying to those most enthusiastic about the development of the Islands. One building is entirely devoted to the display of the ores and mining products. There are exhibits of copper, gold and manganese. More than 1100 natives are quartered on the ground, including representatives of forty tribes.

Trials of Rock Drills for Air Consumption.

Several weeks since a series of tests were made at Johannesburg, S. A., to determine the consumption of compressed air by machine drills, in ratio of work performed. The test was made under the direction of engineers of the Mechanical Engineers' Association of the Witwatersrand, and the results are given in the Journal of that society in a lengthy paper on the subject by J. B. Carper, E. Goffe and W. C. Docharty, of which the following is an abstract:

The trials of the rock drills were made at the City & Suburban mine.

The method adopted of making the trials was as follows: All the holes were drilled in a block of red granite, 4 feet 9 inches by 4 feet 9 inches by 2 feet thick, having density and hardness the same as that of Peterhead granite. This granite block was firmly set in the ground in a bed of concrete, and had a quarry bar fixed across it at a height of 3 feet, supported at each end by posts and A frames, firmly set in the concrete. A second quarry bar had one end clamped to the fixed bar, with its outer end supported by a post with broad flange base, and could be traversed the whole length of the fixed bar. The machines were clamped either on the fixed bar, or the traversing bar, thereby rendering possible the drilling of any spot on the face of the stone. All the test holes were drilled vertically.

There were two air receivers, each 5 feet in diameter by 20 feet long, placed side by side, about 2 feet apart, connected by one piece of 8-inch diameter pipe with valve, this valve being kept full open during the tests.

An iron pipe 2 inches in diameter, 18 feet long, led the air from the receivers to the test stone. It was provided with a stop valve at the end, and was fitted with pressure gauge and thermometer tube near the stop valve. A flexible hose attached to the end of the 2-inch pipe supplied the machines.

The capacity of the two receivers, including piping up to the stop valve, was 756.6 cubic feet. At the time of the tests the pipe connection from the receivers to the mine was entirely disconnected and blank flange put on the receiver.

The general arrangement of the stone, receivers, etc., is shown by the accompanying engraving.

Making Drill Tests at City and Suburban Mine, Johannesburg, S. A.

Each run was conducted as follows: The compressor was worked until the gauge on the receivers showed the required starting pressure (say 80 pounds). The stop valve was then shut, closing connection with the compressor. The machine being in position on the bar and all ready was then started, and drilling continued until the terminal pressure of that stage (say 70 pounds) was shown on the receiver. The machine was then stopped and the depth of the hole carefully measured and recorded. The times of starting and stopping were taken, and lengths of any stoppages during the run noted, the net time of the run being thus found. The machine was then restarted at 70 pounds pressure and run to 60 pounds and again measured, and so on for each stage down to 35 pounds. Before starting a hole the bit was carefully measured. On starting and stopping each stage of the run the pressure and temperature of the air passing through the machine was observed as well as the atmosphere pressure shown by barometer.

It was intended originally to go through all the stages of pressure for each drill with one hole, but the stone being proved to be too thin by the first holes drilled, this scheme had to be modified, and the plan was adopted of running the first two stages only, viz., 80 pounds to 70 pounds, and 70 pounds to 60 pounds in one hole, then starting a new hole with a new drill bit and running three stages, viz., 60 pounds to 50 pounds, 50 pounds to 40 pounds, and 40 pounds to 35 pounds.

In working out the results the capacity of the receivers was calculated for every pressure observed, corrected for temperature and barometer reading, and reduced to the equivalent of free air at a temperature of 70° Fahr., and 24.8 inches barometer. The capacities of the holes drilled were calculated. The results may be summarized as follows:

Three and one-half-inch machines.—One 3½-inch machine was tested, the Hercules, which gave fair drilling results with an air consumption of 16.86 cubic feet per cubic inch drilled.

Three and one-fourth-inch machines.—New machines tested, Climax, Little Vixen, Ingersoll, Holman, Slugger, Hirnant and Little Giant.

Comparing the 3½-inch diameter new machines tested, the Slugger (Rand) shows air consumption for the whole range of pressures from eighty pounds to thirty-five pounds, 11.08 cubic feet per cubic inch drilled, and in addition shows an air consumption for one stage of 8 70 cubic feet per cubic inch drilled.

The Little Giant (Rand) showed an average consumption of 11.74 cubic feet of air per cubic inch drilled.

Old machines.—It was intended to test some worn machines for comparison, and a Little Giant about three mouths old, from the mine at City & Suburban, was put on the bar. A Climax Vixen was obtained from the Ferreira G. M. Co., but owing to a misunderstanding a practically new machine was sent which was overhauled and adjusted before reaching the test bar, so that the runs of these machines are not properly comparable.

Three and one-eighth-inch machines.—Two new 3⅛-inch Slugger machines were tested, which gave a consumption over the whole range of pressures of 10.92 cubic feet of air per cubic inch drilled. This machine worked stiffly at first and in consequence did not show so good a record in the higher stages. The second 3⅛-inch Slugger was quite new also, but before starting the test was adjusted for sinking work by the removal of a plug in the valve chest provided for that purpose, which gives a more free movement of the air in the machine. The average consumption of this machine was 10.52 cubic feet of air per cubic inch drilled.

Three-inch machines.—There were four makes of machines tested, Hercules, Little Vixen, Water-Leyner and Daw, of which the Hercules worked with a consumption of 15.11 cubic feet of air per cubic inch drilled.

The Water-Leyner machine was given two runs at the higher stage pressures, eighty pounds to sixty pounds, with an average of 21.52 cubic feet of air per cubic inch drilled.

Two and fifteen-sixteenths-inch machine.—An Ingersoll machine was tested at request of S. Hancock, manager, Jumpers Deep, Ltd. It consisted of an ordinary 3¼-inch machine fitted with cast iron bush bored down to 2 15/16 inches in diameter, with piston turned down to suit. Average consumption 13.92 cubic feet of air per cubic inch drilled.

Two and three-fourths-inch machine.—Tests were made on 2¾-inch bore machines, a Climax and a Slugger, each machine being run with both 2-inch and 3-inch drill bits, with the idea of finding whether a small machine was capable of drilliug a full-size hole economically.

The tests could not be carried through in exactly identical stages owing to difficulties entailed by the use of small drill bits and machines, the feed running out, as well as the drill going through the stone in several cases.

The Slugger machine was tested with both small and full-size bits, the air consumption being 10.45 and 11.09 cubic feet per cubic inch drilled, respectively.

In both the depth of hole drilled with the full-size bits, and economy of air used, the 2¾-inch machine was equal to the larger machines.

Two and one-half-inch machines.—One 2½-inch bore machine, the Climax Little Vixen, was tested for Mr. Marley, manager, South Nourse, Ltd., being the machine iu general use in development work at the mine. This was run with a 2-inch drill bit. Consumption of air 20.29 cubic feet per cubic inch drilled.

Two and one-fourth-inch machines.—The Hercules consumed 31.04 cubic feet, and the Little Giaut ran with an air consumptiou of 19.48 cubic feet per cubic inch drilled.

Pan Amalgamation at Rosario, Mexico.*

NUMBER II.

Written by A. E. Drucker.

The Use of $FeSO_4$ in the Pans.—Formerly it had beeu the practice to use ferrous sulphate in the pans. We failed to see chemically how $FeSO_4$ did any real good in the process, uuless it aided in the reduction of AgCl by iron. It is said the iron has a stronger reducing action on AgCl in presence of $FeSO_4$ in solution, but I found that the reduction was just as good without it, and the extractions were not benefited by its presence, so its use was discontinued.

Action of Iron on AgCl.—The wearing of the shoes and dies, while grinding, causes considerable fine iron to be distributed throughout the charge. As the AgCl comes iu contact with these fine particles of iron, it is quickly reduced to silver and amalgamated. To show how readily AgCl is reduced by iron, try the following experiment:

Dissolve some silver in HNO_3 and add NaCl to obtain a white precipitate AgCl. Wash free from acid and add iron filings with some quicksilver. Notice how readily the chloride is reduced and amalgamated. The presence of an excess of NaCl solution greatly aids in the reduction.

$$2AgCl + Fe = 2\ Ag + FeCl_2.$$

We can see now how necessary iron particles are in reducing AgCl in the pans.

The average loss of iron from the pans in grinding is 3 pounds per ton of ore treated. Sometimes the loss reaches 10 pounds, depending on the amount of $CuSO_4$ used and the amount of grinding. Fine iron present reduces the HgCl formed to some extent when in a large excess. Salt greatly increases the reduction of AgCl by iron on account of AgCl being soluble in salt and increasing the surface of attack for the iron. An excess of salt is necessary in each pan, about 20 pounds.

Effect of Copper, Lead, Zinc, Manganese, Arsenic and Antimony Ores on Mercury.—Copper ores do no harm, except soluble $CuCO_3$ or oxides giving copper in the amalgam. Lead ore sickens the quicksilver, aud it is sometimes easily amalgamated, causing quicksilver to be readily floured. The more chemicals used the more will the lead be amalgamated. Cerussite and galena are not affected, but wulfenite gives base lead bullion. Lead chloride ($PbCl_2$) is easily amalgamated. This is a soluble chloride precipitated by iron in the pans.

Zinc ores are not amalgamated, since zinc is positive to iron. Zinc sulphide or blende dirties the mercury, causing losses by flouring.

Arsenic and antimony ores are very difficult to work. They flour quicksilver and make it sick and dirty, so that it will not easily amalgamate. Clean the mercury by digesting with nitric acid and retorting. The only way to treat such an ore is to roast it.

Manganese oxides froth in the pans and cause high losses in quicksilver and low extractions. Manganese oxide (MnO_2) gives pure bullion. Wheu present in considerable amount 100 pounds of bluestone will show no copper in the bullion.

Causes for the Flouring of Quicksilver.—Losses of quicksilver range from ½ to 3 pounds per ton of ore worked. The highest loss results from roast amalgamation mills treating copper ores. A fair average total loss on easily worked ores may be taken at ½ to 1 pound per ton and on refractory ores 1½ to 2 pounds. The quicksilver which escapes with the tailings as floured Hg is the principal loss. This loss is greatly increased by grinding in the pans, so that it is preferable to crush fine in the battery and keep the pan mullers off the dies.

Calomel (HgCl) formed by the action of Cu_2Cl_2 on quicksilver and dissolved in an excess of salt solution causes a continuous loss of mercury in the tails. The losses may be greatly reduced by keeping the mer-

* Abstract Cal. Jour. Tech.

cury clean by the use of nitric acid or by the use of a little sodium amalgam. About 5 grams of sodium amalgam were used in the charge of mercury for each pan and were found to clean the quicksilver and make it very active. A noticeable increase in the extractions (5% to 6%) was shown by the assay whenever it was used. Zinc amalgam also keeps the quicksilver sharp, and runs floured mercury together by cutting the chloride film which may cover the quicksilver particles. This fact was made use of in working up concentrates in the pans which contained more than half their value in floured quicksilver. We had no trouble in running the finest mercury together by this means.

The working of slimes alone tend to flour Hg. The fine mud coats the mercury globules throughout the charge and prevents them coming in contact with the silver. Therefore low extractions and great losses of mercury result. Since the grinding of slimes is unnecessary no fine iron particles are produced in the pans to reduce the silver chloride. But with the coarse sands settled in the tanks fine iron is obtained from the battery along with the iron resulting from grinding in the pans, thus giving the necessary iron to reduce all AgCl.

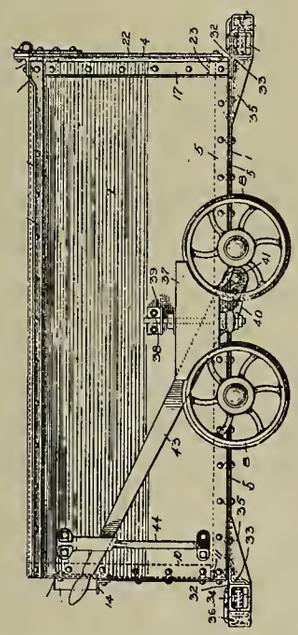
Mining and Metallurgical Patents.

PATENTS ISSUED JUNE 7, 1904.

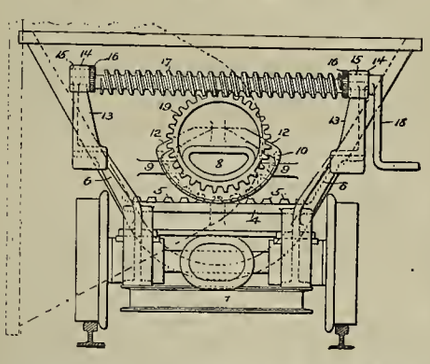
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MINING CAR.—No. 761,264; A. Stucki, Allegheny, Pa.



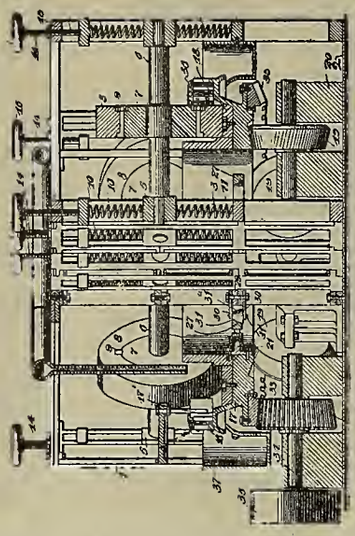
Body for mining car having one end open and comprising floor and side plates and one stationary end plate, flanged bars connecting plates, flanged bars secured to upper edges of side plates, flanged bar extending across open end of body and secured to sides, door hinged to bar, and means for locking free end of door.

SLAG CAR.—No. 761,525; G. Mitchell, Naco, Ariz.



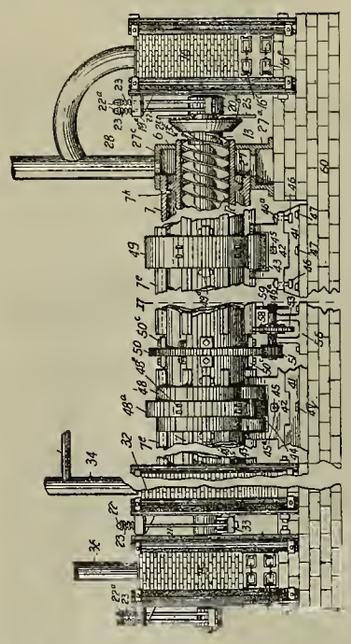
In dumping car, combination with receptacle pivotally supported and topheavy when full, of worm wheel connected with receptacle, worm to turn worm wheel and tilt receptacle, eccentric supports for worm, and means for turning supports to throw worm out of engagement with worm wheel to permit receptacle to dump.

ORE PULVERIZING MILL.—No. 761,266; W. Taylor, Los Angeles, Cal.



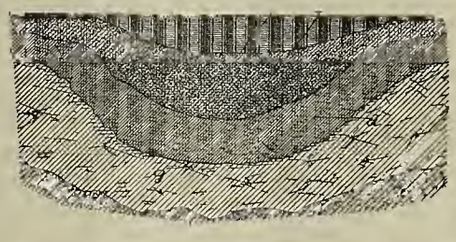
Combination in a pulverizing mill, of outer and inner series of posts, annular revoluble mortar located between two series of posts, mortar provided upon bottom with ring gear, driving gear operating in connection therewith, means for operating driving gear, conical rollers supporting mortar, mortar centering ring provided on mortar, roller bearing means provided upon inner series of posts, mortar centering ring and roller means provided with co-operating faces oppositely inclined with respect to mortar axis and adapted to bear one against other, whereby mortar is held against lateral displacement.

ORE TREATING FURNACE.—761,646; A. M. Beam, Denver, Colo.



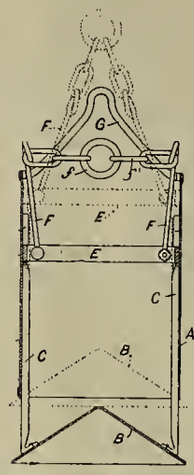
In ore treating furnace, combination of three concentric cylinders and smoke chambers operatively connected with opposite ends of two of cylinders, means for feeding ore into, conveying through, and discharging out of middle of cylinders, suitable means for connecting cylinders, meaus for supporting them, and suitable means for rotating them.

METHOD OF RAISING SUBTERRANEAN RIVERS.—No. 762,042; L. P. Friestedt, Chicago, Ill.



Method herein set forth of elevating subterranean rivers to surface, which consists in driving joining sheet-piling sections down through earth to bedrock and forming solid wall transversely to running direction of watercourse.

BUCKET.—No. 762,151; W. P. Davis, Durban, Natal.

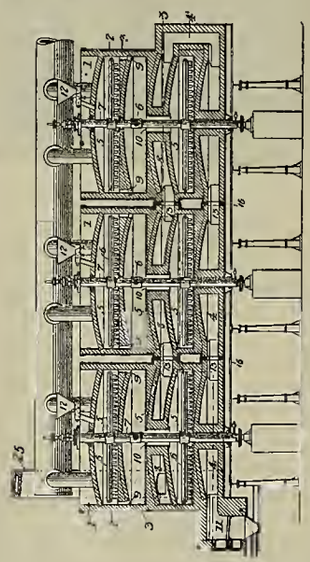


Device comprising casing, guides secured to inner surface of casing, movable bottom provided with uprights engaging guides upon inner surface of casing, and means connected to casing and uprights for lining movement of bottom.

WELL BORING TOOL.—No. 761,742; M. J. Woodward, Petrolea, Canada.

Well boring tool, combination with drill holder formed in two complementary parts comprising cylindrical section having bore formed centrally within upper end, and tubular section carrying shank fitting withiu bore and having threaded engagement with cyliudrical section, conical bearing surface upon shank, elongated sleeve fitting loosely within tubular section, head integral with sleeve arranged within bore for slight sliding movement, and frusto-conical shoulder upon head adapted to engage bearing surface upon shank.

MUFFLE ROASTING FURNACE.—No. 761,691; F. Meyer, New York, N. Y.



Roasting furnace, comprising series of roasting chambers separated by intervening spaces, heating furnace common to series, and flues for heating gas connecting with heating furnace at one end and stack at other through successive chambers.

Mining Summary.

Specially Compiled and Reported for the Mining and Scientific Press.

ALASKA.

In the Tanana, A. Chisholm of Fairbanks reports the season's output estimated at half a million dollars. The winter output was half of that with only two large boilers in use. Many more are now being taken in by steamers. Chisholm says Tanana has 30 miles of traced pay streak. Fairbanks, Cleary, Goldstream and Esther are the richest creeks. Chena and Fairbanks both have newspapers. Eggs are $50 per case and flour is $10 per sack.

Superintendent R. Day of the McGinnis Creek mining property, near Juneau, says the two hydraulic giants are operating and bedrock is exposed.

W. H. Hoggett, superintendent of the Jualin mines, is opening up work at Berners bay.

W. Gaus and W. Gleason are cutting a trail from the north end of Loch Mary to the Skookum quartz claim on south side of Mount Bandy, near Windham bay. They report having a ledge 5 feet wide, running northwest from discovery. Free gold is found in the Black Jack and Galena and assays from the quartz run $7 in gold.

ARIZONA.

Cochise County.

(Special Correspondence).—Despite the fact that the blowing in of the Copper Queen smelter at Douglas makes probable the suspension of the Bisbee smelter of the Copper Queen Co., the camp continues active and production of copper is in no way diminished. The smelter is likely to continue in operation for a few months yet at least. Preparation for greater ore production is being made. The Czar shaft with the Holbrook, Spray and Lowell have been supplemented with the Gardner shaft, on which a steel gallows frame and heavier hoist are being installed.

The Calumet & Arizona Co. is steadily increasing production. At its Pittsburg & Duluth shaft last week was put in another pump, and is nearing the ore body, while sinking is progressing on the Oliver shaft.

The Higgins property is being prospected with a diamond drill. —— The Junction is drilling an 8-inch hole on its property east of the Lowell, now down about 100 feet.——The Saginaw, farther east, is beginning operations. —— The Easter Sunday, a gold property 4 miles east of Bisbee, owned by Wallace, Devine, Brown and other local men, is being worked under lease and ore shipped to El Paso, Tex. There are several hundred feet of work on the group, which consists of four patented claims. —— The Shattuck-Arizona Dev. Co. expects to start development work on its seven claims between the Copper Queen, Pittsburg and Duluth, C. & A. and Wolverine. It is composed of Eastern men, associated with L. C. Shattuck, the original owner.

Bisbee, June 13.

(Special Correspondence).—The Tombstone Con. M. Co., E. B. Gage, manager, has solved the water trouble in the Contention mine and made it a steady producer. Superintendent E. W. Walker states the company is shipping forty carloads of ore per month to the El Paso smelter, most of this being the product of the Contention shaft, though a small part of it comes from development work which is being done on the West Side, Emerald, and Silver Thread - Tranquility groups. G. Rafferty, J. W. Clark and W. Tomlinson are in charge of these workings, respectively, and J. H. Macia has charge of the Contention.

The Contention has a four - compartment shaft 7x22 in the clear, and steel gallows frame located 300 feet west of the old Contention shaft, now caved in. A strong flow of water encountered at a depth of 570 feet caused the mine's abandonment. The new shaft is down 780 feet, and by handling 3,500,000 gallons of water per day the mine is kept drained. Moreover the water level of the whole district is being gradually lowered. In the Emerald shaft, 1½ mile distant, the level is 100 feet lower than formerly. This water is furnished to the Tombstone Improvement Co. for the town supply, and the overplus is piped down the canyon ½ mile to a point where a granite dike crosses. Here it is set free without danger of return through underground channels and flows for several miles toward the San Pedro river.

The pumps that raise this water are as follows: On the 600-foot level a triple expansion pump, 15, 23 and 39 by 13 by 24. On the 700-foot level three pumps; two are 15, 23 and 39 by 9½ by 24, which originally were intended for the 1000-foot level; and a compound duplex 10 and 16 by 10½ by 12. Besides these there are four duplex sinkers, 14 by 8 by 12, in the shaft, which is not now being lowered, but work will be resumed there this month. At present drifting on the 700-foot level is going ahead. Three shifts of three men each attend to the pumps. Two shifts are worked in the mine, and the total number employed aggregates 175 to 200 men.

Power is supplied by five 200 H. P. marine boilers with California fuel oil (using about 4000 gallons per month), and there are, besides, a set of boilers in reserve. A well equipped machine shop, blacksmith shop and carpentor shop are grouped around the shaft, and an assay office checks all shipments and development work.

The mine is 1 mile east of Tombstone on the hill and a spur track is extended to it, by which oil is hauled directly to the tanks and ore taken out from the mine chutes. In addition to ore from the mine about 100 tons per day are being shipped from the old dumps, of which there are several under lease to Mexicans.

The ruins of former workings, dismantled mills and hoists, notably among which are the Toughnut (site of the original discovery), the Sterling, Waterville, Girard, Lucky Cuss and others, are to be seen, none of which have been worked for several years. Outside of the Consolidated little work is being done.

Tombstone, June 12.

A 10-stamp mill will be built at the mines of the Gold Nugget M. Co. of Bisbee, in the Chiracahua mountains.

Gila County.

The Old Dominion C. M. Co. at Globe, which has been increasing its production of copper for the past several months, made an output of blister copper from the furnaces for the month of May of 1,600,000 pounds, or 100,000 pounds greater than the April product. Over thirty-six hours were lost—not counting minor detentions —by the breaking down of the foundation of the blowing engine.

A group of six claims near Globe was sold last week to G. W. Woy and Phœnix parties, who own interests in the property of the Iron Cap M. & M. Co., adjoining Copper Hill. Development work has begun and it is intended to save ore from the start, as sample runs show a high grade in silver and copper. The paystreak at 10 feet is 6 inches wide. This property adjoins the Old Continental on the south, the extensions of the Big Johnny on the north, and the Mineral Farm property on the east.

Graham County.

C. E. Stevens, superintendent of the Cuprite C. Co., near Clifton, reports the work on the company's tunnel progressing.——A strike in the mine of the Polaris M. & M. Co., near Clifton, is reported by Secretary Nicholls. The strike was made at intersection of the Phonolite tunnel with the Golden Eagle lead. The lead was cut by the tunnel 85 feet below the former lowest working on the lead, where 6 feet of ore of an average value of $60 a ton was said to be found, besides 12 feet of concentrating ore worth $8 per ton. Drifts will be run along the vein from the tunnel.

Clifton reports say the copper companies are running full handed and will all show increase in production this year. The smallest increase will probably be shown by the Detroit C. Co., though its gain will be important. Its increase, however, will be the smallest for the reason that changes to be made at the concentrator will take at least a month from its full operating time. The concentrator building will be doubled in size, enabling the handling of 1200 tons of ore instead of 600 tons. Shifting the machinery and putting in the new equipment will occasion loss of time, though it is intended to try to run at least a part of the plant continuously.

F. Weaver, operating near Clifton, is shipping his gold, silver and copper ore to the El Paso smelter.——Ore has been struck by Awalt & Crawford at 225-foot level of their mine at Gold Hill. The ore from this property runs high in gold values with 20% lead.——T. Nardelli has resumed work on the Summit group of claims near Metcalf. —— Broschear & Randolph of Metcalf, who have a group of claims near the camp, and who are opening their property with a tunnel, report striking ore running 5% copper.

Treasurer Hazen of the Shannon C. Co. says the Shannon Co., operating at Clifton, is making an average of 1,000,000 pounds of copper per month. In March the output was 1,152,000 and in April 1,040,000 pounds. On an average of 1,000,000 pounds of copper per month, he says, they are making net earnings of $20,000 to $25,000 per month. During the past year the Shannon has made a number of improvements, having completed an addition to its concentrating plant. During the present year it also took up a bond of $28,000 on the Yankie group of claims, which came out of the earnings of the company.

Maricopa County.

The Black Rock M. Co. is working its mine near Constellation in Wickenburg district. It is claimed the ledge has average width of 4 feet with a 16-inch pay streak. The ore has gold, lead and copper values. There are several parallel veins. A double-compartment shaft is down 240 feet. A hoist and gasoline engines are on the property. An electric plant and a 150-ton capacity mill are also proposed. A. D. Bellingor is president and manager, and J. K. Murphy is superintendent.

H. J. Bennett of Phœnix says he expects to begin operations on the New York group at Morristown this month. ——E. J. Bonsall, manger of the Gold Quarry M. Co. at Morristown, reports that the company will have its property in operation by July 15.

F. J. Sparks, operating the Bettor group of claims, 16 miles east of Morristown, has organized a company and expects to increase the number of men at work.

Mohave County.

The Gold Road M. & Exp. Co., near Acme, is sinking below the 400-foot level and expects to reach the 500-foot point next month. On the 400-foot the ore body is being opened up. For 2000 feet the outcrop is showing values and several shafts are proposed on the Gold Line and Billy Bryan locations. At the mill the new crushers are in place and a test of finer crushing and amalgamation will be made. If the results are favorable, wet crushing will be inaugurated and the capacity of the plant added to.

J. Barry of Los Angeles, Cal., interested in mining in Chloride section, has taken a bond on the Alger mines, near the Great West. He is preparing to start up work. ——S. Miller and J. Willard have a lease on the Grounds group at Music mountain, near Kingman, and have opened up a body of ore in a tunnel below the old workings.

ARKANSAS.

Boone County.

The Alma M. Co. has forfeited its lease in the Sugar Orchard district, near Harrison, and mining rights have reverted to the owner, W. H. Almy. The company's mill and mining plant will be sold and moved to other properties. The steam hoist went to Kingdon Springs last week.

Marion County.

Mann & Echols of St. Joseph, Mo., will start work on the Frazier mines, on George's creek, near Yellville, having contracted for a core drill to do the work.

The mines still find difficulty in getting teams, says the Yellville Republican. The Silver Hollow mine has 200 tons of ore on the dump, but owing to the bad roads and scarcity of teams is unable to get it to market.

CALIFORNIA.

Amador County.

At the Kennedy mine at Jackson, mules have been taken underground to haul ore along the lower levels to the shaft.

Calaveras County.

At the Gwin mine 300 men are on the payroll. Considerable work has been done on top, building, repairing, etc. The 80-stamp mill is running steadily.

At Railroad Flat the Bullion & Riverside Con. mines have been bonded to E. L. Holder, C. W. Higgins and F. Brackett, and development work has been started. Manager C. W. Higgins will begin grading for a mill site this week. The mines are located on the South Fork of the Mokelumne river. 1½ miles from the Fox ranch.——On the Licking fork of the Mokelumne river, J. Haley of West Point has a group, reported showing up well. He is working on two of the claims with arrastras, and the quartz besides free gold carries sulphurets.——P. B. Aikon of Jackson, who has two claims on the Licking Fork, has resumed operations.

J. C. Benson, general mannger of the Benson mine at Angels Camp, says machinery is being placed in the mill the Benson Co. is building. The mill will accommodate ten stamps, but for the present only five stamps will be set up.

Garland, Madson and Moorehead of Angels of the Gertrude M. Co. which is preparing to operate the Demarest mine, near Fourth Crossing, report they will start up the mine July 1.

El Dorado County.

Superintendent Everson of El Dorado C. M. Co. is increasing work on the old shaft of the Eureka gold quartz mine near Georgetown.

N. L. Kohn & Co. of Georgetown report developing pay in the Old Gregory mine, north of Smith's Flat. Gravel 90 feet above the main channel pays $5 to $10 per carload.

At the Mammoth mine, near Georgotown, which is being opened up by Superintendent W. T. Shurtleff, they are breaking ore with a 10-stamp steam-power mill.——At the Jaspor mine, where they are sinking a shaft, high-grade ore is being taken from the 120-foot level.

Fresno County.

C. Boyd reports he is shipping fuller's earth from the C. E. O. mine, near Huron, in which he is interested. The company has two quarter sections of land. They have contracted to supply one party with three carloads a week. The mine is on the line between Kings and Fresno counties, south of Huron.

Inyo County.

Improvements have been made in the buildings at Poleta mine at Poleta. Superintendent Macgregor has put in a steam hoist, air compressor, engine and other equipment.

Kern County.

Work done in the Kern river field for the month of May is reported as follows:

Wells drilled	11
Wells finished	9
Wells pumping	505
Rigs built	8
	Barrels.
Shipments by rail	820,000
Stored by Standard Oil Co.	400,000
Stored by oil companies	110,000
Total production	1,330,000
Increase in storage	510,000
Increase in shipments	120,000
Decrease in production	20,000
Total oil in storage:	
	Barrels.
Standard Oil Co.	7,280,000
Companies in field	490,000
Total amount of oil in storage	7,770,000

It is reported the Associated will begin erection of the largest reservoir yet constructed in the Kern River field, says the Oil Reporter. It will have a capacity of 2,500,000 barrels and will be beside its 1,000,000-barrel reservoir, being built.

Los Angeles County.

In the Los Angeles oil field during May production was steady, says the Oil Reporter. Storage supplies have been drawn upon to meet some local demands, but the stocks were not appreciably reduced. The increase in the local output in May was 6500 barrels. Some wells were deepened and more were abandoned. The main interest still is centered around Sherman and Santa Monica. The oil production is reported larger. Prices ruled from 75 to 90 cents a barrel on the average. The statistical position of the Los Angeles field, including the Sherman section, during May, was as follows:

Wells being drilled	11
Wells suspended	2
Wells pumping	981
Wells abandoned	0
Tanks and reservoirs	600
Barrels in tankage	56,500
Barrels produced during May	82,496
Shipped by rail	11,250

Nevada County.

Preliminary work to building a mill at the Siberian mine at Badger hill, near North Columbia, is under way. Superintendent A. S. Bigelow has men digging a ditch and running a pipe line to supply water power for the mill. He has bought the 4-stamp mill formerly at the Reward mine.

It is reported the New Eureka M. Co., J. H. Rosewall superintendent, will build a mill at its mines in Gold Flat district, near Nevada City.

At the Round Mountain Champion mine, near Nevada City, the machinery is being set up. It consists of a pump, boiler, engine and hoist. A shaft will be sunk 300 feet deep. The bond is held by G. Kartschoke.

One mile from French Corral, the South Yuba M. & S. Co. continues development of its Red Ledge copper mine. Superintendent J. McPherson says tunnel No. 6 is at a point midway between the top of the hill and the bed of the South Yuba river. Backs can be had in No. 6 tunnel from 500 to 700 feet. A smelting plant is being considered.

The Union mine on Banner mountain, near Nevada City, will be reopened by a company of local men, including N. J. Webber, W. H. Dunlap, S. L. Leiter, W. Black, W. J. Palmer, F. Simonds and G. A. Nihell. They will begin operations this week. The drain tunnel will be opened up and the three-compartment shaft will be retimbered. A hoisting plant will be put in and will be operated by water.

The Buckeye M. Co., at Nevada City, has dissolved the original incorporation under New Jersey laws and reincorporated under Arizona laws, the name of the new company being the Buckeye Con. M. Co. J. T. Morgan, G. C. Shaw and T. B. Gray are directors, the latter being president. Work will be resumed this week on the drain tunnel and development increased.

The owners of the Blue Tent mine have

bought the Grizzly Hill gravel claim, on north side of South Yuba river, near Nevada City. The Canada Hill group of mines has been sold to J. F. Littlefield of San Francisco. The properties are collectively known as the Charonet mine and work will be resumed at the Charonet. The Grand Vein mine, a ledge property, was worked by a French company, and a tunnel run 1200 feet and hoisting works put up, but work was suspended on account of the heavy flow of water. The Grand ledge, which is included in the properties, is reported to be of low-grade ore. There are two hoisting rigs on the property, one being on the Charonet mine and the other on the Grand Vein. They are connected by a pipe line running from a reservoir below the South Yuba ditch. The Grizzly Hill owners will work that mine by drifting, as it is well situated in regard to tunnel and millsites. C. Graham, superintendent of the Blue Tent mine, will have the general direction of the development in connection with Manager Canfield.

Plumas County.

At the Gold Run hydraulic mine, above Elizabethtown, 3 miles north of Quincy, a gold-bearing quartz ledge is reported uncovered last week by F. E. Thomas in his hydraulic mine, showing 6 feet across. As it is near a dangerous bank, and as the hydraulicking has been suspended temporarily until the debris dam can be raised, little development has yet been made on the ledge.

At the Claybank tunnel, at La Porte, notwithstanding the great precaution exercised after the first mishap in raising the shaft a few months ago, when a sand streak was tapped, causing about 200 feet of the tunnel to be filled, similar trouble is reported occurring last week. During progress of raising their last shaft, soft rock was encountered which gave evidence that the channel was near. The pressure became too great in the face, and, without warning, a greater part of the face broke in, causing a rush of water, sand and gravel, filling the tunnel for a distance of 130 feet, pausing then for a short while, when it broke again. The next rush filled the entire tunnel for 500 feet. Work is suspended for the present.

Machinery is on the ground for the Bellevue mine, near Quincy, to be used in cutting down the main tunnel, which seems to be too high for the channel.

Shasta County.

A test of the effectiveness of the dredger of the Detroit & California M. Co., in operation on Clear Creek, near Horsetown, near Redding, is to be made. By hydraulic force the gravel is dislodged and then pumped to the sluices on board the dredger, says the Searchlight. Satisfactory returns have been obtained. The pond of water where it has been operating will be extended and a dam will be built dividing the pond in two. The water will then be pumped from the pond where the dredging operations have been carried on and the bedrock prospected to ascertain if all of the gold is being secured by the dredger.

It is reported a 100-ton mill will be built by the Quimby M. & M. Co. near Redding.

Sierra County.

The Steamboat mine has been bonded by the Alleghany M. Co., whose property it adjoins, near Alleghany.

P. Mason has started operations near Bunker Hill, near Downieville, on mines owned by the Golden Scepter M. Co. He has men at work getting out timber and putting up buildings. As soon as the outside work is finished more men will be put on underground.

Siskiyou County.

It is reported Manager Lane of the Mount Vernon mine, at Cherry creek, near Yreka, is preparing to put in a mill with concentrators, and also a sawmill. ——Manager Brokaw of the Golden Eagle mine, on Indian creek, near Fort Jones, says he expects to have his mill ready to start up next week.——The two hydraulic mines on Cherry creek are still piping gravel, with an abundance of water, and expect the water to last until August, says the Journal.

J. R. Stearns and H. G. Elliott of Oakland having bought quartz mining property on McKinney creek, near Oak Bar, intend starting development.——A. G. Harvey of San Francisco and R. G. Elphiaston of Auburn are at Oak Bar starting work on mining property.

The Mount Vernon mine at top of divide, between Greenhorn and Cherry creeks, near Yreka, is reported yielding satisfactory returns under Superintendent Lane. The ledge varies from 1 foot to 4 feet in width.

A shaft sunk 25 feet on the Lucky Jack ledge of the Headwaters claim at Humbug, near Hawkinsville, is said to show ore. The 65-foot shaft at another point also exposes a ledge with a great amount of water, in which it is intended to raise by stoping. The Roosevelt ledge of the group also shows values, though little developed. A sawmill of 10,000 feet capacity will be put in for getting out mining lumber.

Trinity County.

The Quimby G. M. Co. has been incorporated by J. A. Brent, C. A. Marriner, J. M. Duke, W. A. Merralls and W. R. Beall of San Francisco to operate in Trinity county. Arrangements are being made to build a road 30 miles long as an extension to the rail and wagon road from Eureka, Humboldt county, in direction of the company's property.

M. G. Womack of Hay Fork has bonded for $30,000 the Potillo group of mines on Mt. Bally, in the Weaverville mining district. The group consists of three quartz claims, a placer claim and the water rights appurtenant. Reno, Nev., and New York men are interested. Men will be put to work this week on development. The lower tunnel will be extended and a shaft sunk to connect with the lower tunnel. Womack also says he has bonds on the Dedrick mines on Pony creek and also a mine near Dedrick. These will be developed and improvements placed on them.

Tuolumne County.

At the Draper mine, near Soulsbyville, twenty-five men are at work. A 10-drill compressor is being set up and will be used to run the pumps to complete unwatering the mine. There are about 100 feet of water remaining in the mine. When the mine is clear the mill will start up, says President Herthel.

At the Mt. Jefferson mine at Groveland water has been struck in the 600-foot level, west drift, and the men were driven to the level above and the pump pulled up. The 600 is flooded, and will remain so until a pump of greater capacity is set up. The ore shoot, in the 500-foot level, east, is proving satisfactory. There are 10 feet of it exposed. The mill is running steadily on this ore. The cyanide plant is in full operation. The fuel supply is accumulating daily.——D. Gilliam and J. Pool have a lease on the Newsom claim, near Groveland, and are drifting in search of a pocket.

At the Belle mine, near Tuttletown, the mill is running with twenty stamps dropping, says Superintendent W. J. Rule.

At the Longfellow mine, at Big Oak Flat, work is progressing. The raise between the 400-foot and 500-foot levels is completed and circulation of air is assured to all the workings of the mine. Ore is being taken out and run to the mill, which is keeping the five stamps dropping. The management proposes placing heavier machinery on the property. An 80 H. P. boiler will take the place of the present small one. Work in the west drift at the 500-foot level will be resumed and raises will be driven to the level above at intervals. At about 300 feet west they expect to strike the Mexican workings that were sunk to a depth of 120 feet.

COLORADO.

(Special Correspondence).—A number of students from the State School of Mines at Golden have started their work at the summer school, near Georgetown, where the management of the school has a lease on the Dives-Pelican mine. This mine will be operated by students from several colleges in the East and West, including Yale, Harvard, Columbia and Massachusetts Institute of Technology. If it proves a success it is believed it will be the means of a permanent institution of this kind located some place in the West where they can get actual work in the mines.

Work has been started on the branch line of railroad from Sunset to Eldora in Boulder county. This work is being done by the Colorado & Northwestern Railway, which runs from Boulder to Ward. The branch will open up mineral land which has been idle for several years, owing to lack of transportation facilities. Eldora has had to haul ore and supplies 22 miles to Boulder.

Clear Creek county has issued a souvenir booklet which will be distributed throughout the country for advertising the resources of the county.

Military law has been declared at an end in Las Animas county. In San Miguel county affairs are reported quiet. Things are still unsettled in Cripple Creek since the blowing up of the Independence depot on the morning of June 6, thereby killing thirteen non-union miners. As a result of that over 200 union miners have been deported from the camp and the leaders of the Western Federation of Miners in the district have been arrested and held on serious charges. Military law was declared shortly after the explosion. The operators have promised to give their decision as to the employment of union help in a few days. The Portland mine which employed none but union men has been closed by order of the militia and many of the miners arrested.

Attorneys for the Western Federation have asked the Supreme Court of Colorado for a rehearing of the trial of President Moyer, the Supreme Court having upheld the action of the Governor in detaining Moyer as a military prisoner.

Denver, June 13.

Since the above was written, U. S. Circuit Judge A. M. Thayer at St. Louis, Mo., has granted the application for a writ of habeas corpus for Moyer.

Boulder County.

The Scroohy M. Co. has bought the Bell mine at Nederland and will work it for its tungsten.——The Sparkling Jewel mine at Sugar Loaf has been improved by addition of machinery.

Clear Creek County.

A contract has been let to drive the Burns-Moore tunnel, near Idaho Springs, another 1000 feet and work has begun. The property is equipped with a compressor plant, driven by water. The Burns-Moore tunnel is 6 miles above Idaho Springs, on north side of Chicago creek. It is in 1000 feet.

The shipping record of Idaho Springs mines for May shows increase, as in May, 1903, there were 112 cars shipped, and this year 138.

At the Yankee Con. group, on Yankee hill, at Yankee, Colo., the 15-stamp rapid-drop mill is running steadily on ores, and making satisfactory clean-ups, says Manager Seeman. The mill is automatic throughout and its capacity is fifty tons per day. There is an ample supply of water to keep the mill running all of the year. The mill is fitted with amalgamators below the copper plates, and four table concentrators. P. M. Nelson is in charge. About twenty-five men are employed, which number will be increased. ——The Chemung-Belmont property, in Lake district, has been taken hold of under lease and bond by the Central Bonding Co., with N. G. Mitchell as superintendent. The milling ores are said to run two ounces gold per cord, with the smelting product $40 per ton. The property is equipped with plant of machinery and top buildings, and during the past month the company has been repairing the shaft from top to bottom, a depth of 620 feet, and intends to sink the main shaft an additional depth of 200 feet, as well as extend the lower west level.——At Yankee is the Puritan group, owned by New York men, with G. R. Steuart as manager. They have a group of seventy-two claims, which will be cut by the Puritan tunnel, which has been driven 1200 feet. Last week they started up their compressor, which is run by water wheel, the water supply being obtained from St. Mary's lake. The tunnel is a crosscut proposition, and three leads have been cut in driving thus far. Ores have been taken out of surface workings which have been shipped to Idaho Springs.——The Blair (formerly the Annex mine), in Lake district, is being worked by its Denver owners, and after crosscutting at a depth of 150 feet ore has been opened up. At this point there are two veins coming together which makes 6 feet of ledge matter, and they are taking out concentrating and smelting ores, the latter showing gray copper and galena. They will sink the main working shaft addition of 200 feet.——Eastern owners have started operations on the Gold Nugget property, in Illinois Central district, under management of A. C. King of Idaho Springs. The water has been lowered in the main shaft, which has depth of 250 feet, and the work of drifting west is being carried on at depth of 200 feet.——The Hidee G. Co. has started stoping at a depth of 380 feet northwest of its main shaft in the Lake district, and has 3 feet of free milling ores and a pay streak of smelting ores averaging 7 inches wide. They are sort-sorting the mineral into first and second classes, and last month received returns of $160 to the ton for a first-class shipment to the local sampling works. St. Joseph, Mo., parties are interested, and H. Fleuspach is superintendent.

It is reported work on the Newhouse tunnel, near Idaho Springs, will be resumed. The tunnel has been driven into the mountain nearly 3 miles at an approximate cost of $750,000. An extension of the tunnel from its present heading to the Saratoga mine, a distance of 1500 feet, will begin by July 1st. When the tunnel crossed the Gilpin county line Manager S. Newhouse expected the mining men of that county would form a pool to assist in the work, but they did not respond and the tunnel was abandoned. A contract has been signed in Idaho Springs whereby Idaho Springs parties take a bond and lease on the Saratoga group and will extend the tunnel to the mine at their own expense, the cost thereof to be repaid in credits on royalties for drainage and transportation. When the tunnel reaches the Saratoga a raise will be cut to the shaft and the water drained out. This will enable the lessees to work the Saratoga on a larger scale. By another deal the Golden smelter is said to be leased and bonded to a company operating in connection with the men in control of the Saratoga. These works will be improved wherever necessary and started up probably on common ores from Gilpin, Clear Creek and Boulder counties, pending completion of the tunnel. F. R. Carpenter will have charge of the smelter as heretofore. It is thought the extension of the Newhouse tunnel to the Saratoga mine will result in its continuance to Quartz hill according to the original design.

The Democrat Mountain M., M. & T. Co. has filed articles of incorporation with the following as incorporators: C. Jarheau, K. L. Burt and C. I. Burt. This is a reorganization of the Kelly tunnel holdings and it is intended to increase development on Democrat mountain, near Georgetown. For the present work will be centered on the west side of the mountain and several shafts will be sunk, in addition to driving the Bonanza and Jordan tunnels.

Increased work is being planned by the Mazeppa M. & M. Co., near Georgetown, and more men will be put on. Contract for 100 feet of development work will be let. Considerable work has been done by the Mazeppa Co. during the past three months. A crosscut tunnel has been driven 350 feet. This crosscut was started for gaining additional depth and at the same time cut under the old workings which are in 600 feet. With the objective point reached it is intended by Manager D. W. Shepard to put in a raise. The company is composed of St. Paul and Duluth men.

Machinery for the Terrible mine, near Silver Plume, has been put in place. The air compressor and mill are being operated by water power. The number of men will be increased.

Custer County.

The Bassick mine, near Silver Cliff, will resume sinking and timbers have been ordered. The assay office is ready for business, as the furnaces are finished. It is understood plans are being drawn up for the new mill, the insurance money having been paid.——T. A. Rippey, president of the Custer M. & R. Co., made arrangements to continue sinking the shaft on the Dolomite, and the contractors have the work under way. A whim has been placed, and as soon as the contract is finished a crosscut will be run to the vein.——The Muster M. & D. Co. has extensive operations in view for the summer. Superintendent Raymond of the Toledo mine, near Rosita, is starting a shaft 500 feet northwest of the old shaft. Square sets are being used in timbering and the shaft is 4½x9 in the clear.

The Franklin mine at Ilse is preparing to resume. It has lead ore in sight.

At Stratton's Homestead mine, 5 miles east of Custer (Rosita P. O.) the tunnel is in 160 feet and a survey shows they are nearing the vein, which runs in gold, silver, lead and copper values.——E. Spaulding, of Ilse, is making shipments of ore to the smelter carrying values.

Gilpin County.

The Bullion G. M. & M. Co., under management of G. N. Davenport, has added a steam hoist and ten stamps, which gives it a 20-stamp mill. A crosscut tunnel through the Caney point is being run to reach the main shaft, which, when completed, will give a depth of 450 feet. The company has opened up a body of low-grade ore. The property is in Silver Lake district.

The Mackey and Sarah Jane groups and the Mountz & Palmer mill, near Central City, have been sold to the Imperial G. M. & M. Co., in which Missouri men are interested, and developments and operations are to be increased. Sinking operations are to be carried on at the Mackey and the main shaft is down 120 feet, and is showing a vein 4 feet wide, most of which is a milling proposition. A steam plant of machinery will be put in, and it is intended to sink this shaft to depth of 500 feet. There is a good tonnage of surface ores which will be taken out through the tunnel, after which all operations will be carried on through the main shaft. The Sarah Jane main tunnel is being driven ahead and is in 530 feet, and it is expected that the Vanderbilt vein will be cut this week. The breast shows ore and in the winze ore has been opened up. After overhauling the Mountz & Palmer mill and adding a concentrating table for trial purposes, they started the mill and it is running on ores from the Mackey. L. J. Mountz is manager of the consolidated properties and mill.

The Evergreen mine, near Central City, is being worked by the Evergreen G. & C. M. Co., with Colorado and Missouri men interested. J. L. Walters is manager. Day and night shifts are at work and the main tunnel is in 200 feet. The tunnel is being driven to get it under the center of

the hill, so that the entire group of claims can be developed from the tunnel by drifting and crosscutting. The Evergreen ore carries copper values, with gold and silver.

The Missouri & Colorado M. & M. Co., in which Missouri men are interested, owns 100 acres of lode and placer claims at head of Silver creek, near Central City, and W. C. Hollister is manager. At present the company is confining its operations to the Snowdon group, adjoining its own group, and which is being worked under a lease and bond. The main lower tunnel on the Snowdon group is in 400 feet, and in the main part of the tunnel they have opened up 6 feet of free milling ore which carries values of $6 per ton. They are stoping and the vein in the stope is 3 feet wide. The company is making tests of these ores to determine the most economical method of handling them with a view to building a mill. Besides concentrating and milling their ores they are having them tested with cyanide. Last week they shipped a car of smelting ores. The company intends to raise from the lower tunnel to the surface with a view of operating the property through a central shaft for development of the entire group. When this raise is made they will put in machinery to gain additional depth. The Missouri & Colorado Co. has developed the Old Ann or main shaft on its group to depth of 425 feet, and intends to resume operations there and do considerable work in drifting and crosscutting. It is equipped with a steam plant and top buildings.

Gunnison County.

At Bowerman a vein was opened in the Omy lode on the Copper mountain property of the Corona G. M. Co. It was cut in the tunnel at 112 feet from the portal. The quartz is 18 inches wide and assays $40 in gold. The tunnel is being pushed ahead to cut the contact between the diorite and the granite, where ore bodies are expected, says Superintendent W. J. Nourse.

The galena-lead camp of White Pine, on upper Tomichi creek, is 25 miles on an air line across the range from Salida, and near the Chaffee-Gunnison county line. Work in mining, milling and smelting is increasing. In addition to development under way by the several older companies operating here, many new companies have begun work.——The Spar C. M. & T. Co. is rapidly advancing its tunnel on the vein of gold-bearing copper sulphides. This ore nets $30 per ton at the Salida furnaces. The Spar Co. is composed of men interested in the Cripple Creek Homestake Co., operating a cyanide proposition on Ironclad hill. W. F. McIntyre of Chicago, Ill., and F. W. Downs of Davenport, Iowa, are interested. They are also owners in the Colorado L., M. & R. Co., operating the Page cyanide mill at Florence, and the Decker mine at Cripple Creek.—— The Clover Mountain Con. M. Co., J. V. Sheppard president, is increasing development, adding to its ore reserves of milling quality. The properties are near the Brittle Silver and Legal Tender mines at Camp Sherrod. E. C. Hare of Rochester, N. Y., is interested and says they propose building a mill.——The Congress G. M. & M. Co. of Hartford, Conn., has been organized by Hartford, Conn., men and is starting operations on Galena creek on the zinc-lead belt near the Eureka and Erie mines. Operations are in charge of G. Williams of Denver and F. A. Porter of White Pine. Buildings are being erected and machinery set up to advance the tunnel on the deposits of gold-zinc-lead sulphides. An air compressor plant is being placed.

Hinsdale County.

L. Wagner, who has a bond and lease on the Big Casino group on Henson creek, near Lake City, is increasing development. Since he took hold of the Big Casino 50 feet of sinking has been done in a body of high-grade silver-lead ore.

Lake County.

A body of ore has been opened in sinking the Cleveland shaft of the New Monarch M. Co., at Leadville, being quartz with a streak running through it that carried high values in gold. The air in the property was bad, so Manager Goodwin decided to connect the shaft with the Winnie by drift and a body of iron sulphide was opened about half way that is said to run 5 ounces gold, 37 ounces silver and 10% lead. The drift will be continued until connection is made with the Winnie shaft. The sinking of the New Monarch shaft will be started by the 20th inst.

An output of 65,000 tons was shipped from Leadville mines during month of May. There was a slight falling off in the tonnage of some kinds of ore, but this was more than made up by the shipments of other kinds and the signing of contracts for ore, which will add to the tonnage in the coming months. The tonnage handled by the American S. & R. Co. was about 45,000 tons during May. The production of oxidized iron ore was cut down 5000 tons during the month, because there was more of that class of ore than could be handled by the smelter. This was the only curtailment of ore during the month. Contracts were made for manganese ore by the Colorado F. & I. Co. which is expected to result in shipments of that class of ore in excess of the amount of oxidized ore cut off. These shipments have been commenced. The zinc shipments during May were slightly in excess of those for April.

Manager MacDonald of the Arkansas Valley smelting plant at Leadville says another furnace has been put into operation.

With the discovery of $100 ore in the Nisi Prius mine, the opening up of bodies of iron and manganese ore, and a body of high grade silver ore in the Cloud City mine, and the finding of ore which runs 10 ounces in gold, 37 ounces in silver and 10% lead, in the drift between the Cleveland and Little Winnie, last week, mining is improving, says the Carbonate Chronicle.

La Plata County.

At Durango the Neglected mine is closed down temporarily. A larger mill will be built 1 mile from the mine and an aerial tramway installed. A heavier plant of mining machinery will be put in for sinking deeper. The mine has paid $12 per ton on all ore and concentrates to Durango and $12 on all supplies going in. The State a year ago appropriated $5000 for building a wagon road, contemplating that La Plata county would furnish enough money to make up, but the county has failed to do this.

San Miguel County.

U. S. Circuit Judge A. M. Thayer, at St. Louis, Mo., on the 15th inst., granted the application of C. H. Moyer, president of the Western Federation of Miners, for a writ of habeas corpus, directing that Moyer be brought before him on July 5. The writ is directed against Governor J. H. Peabody of Colorado, Adjutant-General Bell and Captain B. Wells of the Colorado National Guard, to show cause why Moyer is being restrained in "the bull pen" at Telluride. On the same date, Governor Peabody issued an order declaring martial law in San Miguel county at an end, declaring the release of the troops from duty and ordering Captain Wells, in command of the troops, to turn over to the civil authorities President C. H. Moyer of the Western Federation of Miners.

Summit County.

(Special Correspondence).—G. H. Evans & Co. have a body of ore opened in the Wellington mine in French gulch near Breckenridge. Values are in silver, lead and zinc. A streak of high grade galena is showing. One miner on this is said to take out enough each month to meet the pay roll and other expenses of ten men. The entire vein is in places seventeen feet between walls. It is opened by a crosscut and there are 350 feet of backs. A lot of low grade ore in this property is ready for a mill.

The French Gulch placer mine is in full operation. It has an Evans elevator working with a 67-foot lift. Manager Dwyer, of the North American M. Co., on Swan river, has the Bucyrus dredge running. It is working in ground about 50 feet to bedrock.

The Oro Grande M. Co., 1 mile below Dillon, has three elevators covered in a slide, but will be all right in a few days. Manager Mathews has about thirty men on the payroll.

The Gold Pan M. Co., G. H. Evans, manager, has ninety men on the payroll. Three elevators are working with a 97½-foot lift, all doing satisfactory work. A belt conveyor for handling boulders is in operation. They also have two dirigible cranes and one Evans cable hoist for handling rock and other material.

The Jessie M. Co. has its mine and mill in full operation on silver-lead ores. A large number of leasers are doing well in this camp in the silver-lead mines, also in the gold mines. This county has produced about $1,000,000 yearly for thirty years—this, too, in spite of the inaccessibility of a good part of it during at least one-half the year. This season promises well, as there is an abundant supply of water.

Breckenridge, June 12.

(Special Correspondence).—The Masontown M. & M. Co. dropped its stamps and began operations at its milling and cyanide plant on June 1st. This company was organized in October, 1903, and bought from L. Mattson of Frisco the group of claims known as the Victoria mines. For the past seven months men have been employed in erection of the mill, assay and other offices and camp buildings, and in opening up the mine to put it into shape for steady and larger production. That point is now considered reached. The ore from the mines is trammed from the lowest tunnel directly into the mill, where it is fed to an ore crusher and into bins, which supply the automatic feeders for the twenty stamps. After amalgamating the free gold on the plates, the pulp runs to leaching tanks, where it is cyanided. The liquor is then drawn off into the gold solution tanks and run through zinc boxes. The clean-up room is equipped with sump tanks, acid tank, pump, vacuum pump, smelting and drying furnaces. The zinc-gold precipitates will be treated there. The mill is lighted by electricity, as are also the mine, assay department, offices, quarters and camp generally. D. H. Lawrance is consulting engineer for the company and is in charge of milling and cyanide operations. A. E. Keables is manager and secretary; and J. V. Hoover of Masontown, Penn., is president.

Frisco, June 13.

A tunnel to cut the veins of the Ten Mile range at Geneva lake, 3 miles above Frisco, will be driven. The mouth of the tunnel opens above the Ten Mile river and the tracks of the Denver & Rio Grande and Colorado & Southern railways. This enterprise is under management of the North American M. Co. A contract has been let to drive the tunnel 500 feet, in which distance several veins will be opened. When completed the total length of the tunnel will be not less than 3000 feet and it will attain a depth of 3000 feet under the crest of the Ten Mile range, intersecting twenty fissures and contact veins in that distance.

Teller County.

G. L. Keener, operating a lease on the Globe and Lady Stitb claims of the Stratton estate, on Globe hill, Cripple Creek, shipped out during May 1550 tons, which gave average returns of one ounce gold per ton. Keener was breaking the ore down from a 30-foot vein from a stope, which had gone through to the surface, making a hole in the ground 125 feet wide, says the Times. The ore was gouged out and run through the tunnel for a distance of 500 feet, loaded into wagons and shipped to the mill. Keener, however, has found this vein cut off, and will now have to do crosscutting and development work to recover it.

El Paso mine on Beacon hill, Cripple Creek, shipped out during month of May 900 tons of ore, which gave values of $70 per ton, or a total of $63,000, says the Gazette. Besides this four cars, containing 100 tons of ore, returned gross values of $14,000 to the car, or $56,000 in all, making a gross total for the month of $119,000. ——On the Doctor-Jack Pot Co. ground on Raven hill six sets of lessees sent out 420 tons during May, which gave average returns of $30 per ton. The tonnage would have been much larger had it not been that a large amount of development work was in progress.——The output of the Pullen & Mayhew lease on the Jerry Johnson, on Ironclad hill, aggregated 200 tons for the month, with average value of $60 per ton. The Pullen & Mayhew lease expires July 1.

Affairs in the Cripple Creek district have quieted down and over 200 union miners and their sympathizers have been deported by the military to Kansas, New Mexico and Utah. Most of the mines have resumed operations, except the Portland, which was closed down by General Bell, as a "military necessity."

IDAHO.

Bannock County.

In Portsmouth canyon, 6 miles south of Pocatello, H. A. Jacobs, treasurer of the Portsmouth M. & M. Co., says operations are progressing on the company's mines. The company has holdings in Portsmouth canyon and in Black Rock creek. Sinking on the former the management has, at a depth of 76 feet, struck ores carrying copper and silver, with some gold and lead. To afford a more economical outlet and to open up the ledge at a depth of 450 feet, a tunnel is being driven, connection to be made at 200 feet distant from the present breast. The mouth of this tunnel is above railroad tracks of the Oregon Short Line.—— The Roder group on Black Rock creek has been prospected on the surface with ore showing 10% copper. To get under this depth the company is driving a tunnel which has penetrated the zone for 230 feet, 200 feet more being required. To reach the Short Line with the ores from this source a haul of a mile and a half is required. The company has been incorporated by H. A. Jacobs, S. Lewis, G. Brough, J. Borer, W. E. Slater of Pocatello, and H. Markowitz of New York City.

Idaho County.

(Special Correspondence). — Developments on the H. Y. group are meeting with satisfactory results. J. B. Whitlock, superintendent, reports the tunnel driven to cut the shoot of ore on the Dakota claim has reached 310 feet and values are showing. Assays taken at regular intervals have averaged $6 per ton for 300 feet. At 304 feet a high-grade shoot was cut. The Mullie tunnel, on same group, has been driven 52 feet and values at the face give $60 per ton. A 20-stamp mill is being arranged for.

The double-compartment shaft on the Climax mine is down 64 feet in soft ore and quartz. An assay of the ore from the bottom of the shaft shows gold values.

At the Sunnyside mine Superintendent Abbott reports the west crosscut, started in January, has been driven 208 feet and drifted on for 137 feet, and, with raises and winzes, has opened up the ore body. This ore averages $8 per ton. Within this area, 42 feet in length of the crosscut gave an average of $33 per ton. The Burr Oak tunnel has reached 1390 feet and is in [illegible]rhyolite, yielding marcasite, and is getting wet.

The Dewey mine is being steadily developed toward the south; the work has opened up a stope 70 feet wide that shows satisfactory values.——The tunnel on the Mysterious Slide group of five claims has been driven 430 feet and values obtained; sulphides in petrified wood and charcoal are some of the peculiar features met with in the tunnel.

Pack trains are starting and bids for transportation of several hundred tons of freight are being asked for. The season promises to be more active in development and installation of mining plants than any former year.

Roosevelt, June 10.

J. B. Eldridge, manager of the Independence mine near Roosevelt, reports the ores of that mine amenable to the cyanide process, and that they will be worked, says the Boise Statesman.

The Thunder Mountain Gold Reef M. Co., near Roosevelt, has bought the Mayflower group and has been working during the winter. The work is under the management of J. Jewell and ore has been taken out that will be shipped as soon as the roads are open. Two shifts are being worked, driving crosscuts to tap the ore shoot, and ore from other portions of the lead will be taken to the outside to be tested for determining the proper method to treat the main ore body.

Shoshone County.

The Wake Up Jim G. M. Co. has been incorporated at Wallace. The properties of the company are quartz claims in Beaver and Summit districts. The following are the incorporators: C. S. Crysler, T. Shuster, A. B. and J. A. Ward and B. M. Crysler.

After a closedown of six months, the Gold Hunter mill, at Mullan, has started grinding again, says Manager J. Gearon. About thirty men are employed, and this number will be increased.

The main Hercules lead has been cut on the Ajax property, says A. J. McAlpine of Spokane, Wash., secretary and treasurer of the Ajax Co. The mine is 1½ mile from Burke, and adjoins the Hercules mine on the east. Near the west end of the property they have a tunnel in 110 feet. Lately they have been working on the east end of the property and last week miners went into the old tunnel on west end and found galena. Men have been put to work in this tunnel drifting toward the Hercules.——Near Burke, the Moonlight has men driving a 1000-foot crosscut tunnel, which is in 600 feet.—— The Benton is making a showing. Ore is being taken out of the Oom Paul. The Humming Bird, at Burke, is working five men.

It is intended to open up the Black Bear fraction this summer, says P. Bernier of Wallace, Idaho, part owner. The property is a quarter of a mile from Gem, and adjoins the Frisco mine. A tunnel 2500 feet long will be driven to tap the ledge at depth of 1400 feet.

The Stewart mine, on the ridge between Government and Sierra Nevada gulches, near Wardner, is shipping ore, a spur having been put in for the purpose. They have put in a Cornish jig for treating the second-class ore.

Owyhee County.

A. F. Stevens, manager of the Addie mine, near Silver City, is preparing to increase equipment for the mill before starting a run on the ore being taken out. He has completed a survey for the raise to be made to connect the tunnel with the Calaveras shaft, 400 feet above it, to get air. The shoot of ore in the tunnel is being opened up. They are timbering behind the face and found in cutting hitches in the walls that there was still rich ore behind what they had taken to be the walls. They are now in the Calaveras ground.

Washington County.

In Seven Devils district, near Weiser, the Ladd Metals Co. has a grant of several acres of land at Landore and will begin work on construction of a smelting plant, says the Weiser Signal. It is also stated that the Ladd Metals Co. will begin moving to Landore this week; all the ma-

chinery and supplies of the company at Homestead, Or., where they first proposed building. It is also stated the Ladd company has secured control of the Blue Jacket, White Monument, Peacock and Helena mines, owned by the American M. Co., which they will operate in connection with their smelting plant. These mines are producers of copper ore.

MISSOURI.

Jasper County.

W. R. Caulkins, manager of the Golden Rod mine (the Yellow Dog), states that they are making 74,600 pounds of zinc ore and 10,000 pounds of lead ore on each day's run. He also states that the mine is clearing $1100 per day. They have put down a well 150 feet deep for water to use in their boilers. This mine is ½ mile north of Webb City. The American Co. is said to have struck the same run of ore north of Center creek.

The Durby & Bryant M. Co.'s ore at Neck City brought the top price last week of $39. Their mine is on the Smallhouse land and they are hoisting 250 tubs of dirt a day and making sixty tons a week of 64% ore.

The Portland M. Co., under the management of G. Y. Bast, is making turnins of both lead and jack. A mill is proposed for a shaft which the Portland Co. has finished near Webb City.——O. J. Raymond of Webb City has started a shaft on the Burgner land.——Ashcraft & Burcb have started a shaft on the drill hole on the Ashcraft & Reynolds land north of Webb City, and are down with it 40 feet. Tbe drill log shows lead and jack, shallow as well as the deep sheet run of ore. The drill has been moved to the northeast corner of the land next to the Golden Rod mine, and another hole will be drilled.

O. E. Duenweg of tbe Cornucopia M. Co., on the Eclipse lease at Alba, reports that he has rented the Cornucopia mine and mill to Alba and Carthage men.——J. M. Stewart has his electric mill under cover and is making progress on the interior works. Mr. Stewart reports a strike in one of his drifts.——T. Coyne is setting up the electrical equipment for his mill on the Missouri Zinc Fields ground.

The work of developing the Vancil lease of forty acres at Prosperity continues. This tract adjoins the Aylor forty.——A sub-lease on the Vancil forty owned by F. E. Carringer and J. Vancil is making satisfactory showing. Three-fourths of this sub-lease is held by Carringer. A drift was driven at a depth of 180 feet and a body of lead and zinc ore struck. A drill hole was put down on the lease 300 feet west of the shaft and a 14-foot face of ore found at 160 feet.——Patton & Dodge of Webb City have bought an interest in the J. P. lease on the Vancil land and tbe name has been changed to tbe Eleven O'clock, the shaft being north of the Ten O'clock. The shaft is down 50 feet. The drill hole showed a 27-foot face of ore, for which the company is sinking.

O. W. Sparks, E. H. Cullison and L. H. Winter of Joplin, interested in a mining tract at Badger, have sunk a shaft on the Riverside mine. They have reached a depth of 150 feet, where they struck a 15-foot ore body. There is a crusher on the ground and they report making ten to twelve tons of jack per shift.

The highest price reported paid for zinc ore at Joplin last week was $38 per ton for one bin of 64% zinc, but this lot of ore was not loaded. However, some ore bougbt the previous week and loaded last week brought that price. The assay basis price was quoted from $32 to $35 per ton of 60% zinc, says the News-Herald. ——The shipment last week was the smallest in zinc, in lead and in value of any week of the year. It was the smallest since the second week in December, when all the smelters were restricting their purchases. In fact, that is the present situation. The reserve stock has been increased in two weeks to 2000 tons. The excuse was made that a lack of cars prevented loading the ore. Even with the night shifts taken off at most of the mines and the output already reduced about 500 tons from this cause and the heavy rains of last week, it is more than probable that more ore will be added to the reserve again this week.——Lead likewise suffered a decrease in price and the shipment was correspondingly reduced.

The Millard M. Co. of Carthage has been incorporated by J. H. and J. V. Millard, D. M. Knigbt, S. A. Sylvester, J. D. Bing, G. L. Jameson, W. E. Gilchrist, R. C. Baker, J. Netcott, P. C. Heege and G. Chandler.——The Lehigh M. & M. Co. of Carl Junction has beeu incorporated by T. C. Reddish, O. F. Elliott, D. Stiers and C. F. Smith.

Manager Conukey of the company which is building the Gravity mill at the Incline shaft, near Webb City, says tbe mill will be completed this week. It is built on tbe gravity system, requiring no power in transmitting the dirt from the crusher to the rolls, and from the rolls to the jigs, etc. A series of screens will also size the dirt for the jigs. The mill will be run by electric power supplied by the Southwest Missouri E. L. Co., whose plant is at Grand Falls. This company expects to build a transformer station on the hill near the Incline mine. The motor for the mill will be a 75 H. P. —— The Ashcraft mill, owned by the Nicholson M. Co., has been rebuilt and is ready to be put in operation.

At Sarcoxie J. J. Dinkelbihler, of Joplin, is preparing to develop lead and zinc prospects on the Roper land. He says the mineral face is 30 feet wide and 90 to 100 feet deep.

The Cornucopia L. Co., of which G. F. Wittmer, of Carthage, is president, has a lease of forty acres on the Ware farm, 1 mile northeast of the United Zinc Co. mines, in Peacock Valley. A strike of jack was made in the first drill hole last week at a depth of 186 feet.

Serage Bros. have started building a lead smelter on the site of the one recently destroyed by fire. near Joplin. Manager C. B. Serage states it will be completed by July 1.

In Webb City and Carterville section the Chicago Lead and Zinc Co. on the Guinn land is building a concentrating plant.——The Leo mill, soutb of Prosperity, has been sold to the operators on the Porto Rico lease, and is being moved over and re-erected.——A concentrating plant is being built by Carterville parties on the Burgner land, northeast of the J. Durby mill.——E. Burch, J. Veatch, W. E. Beatty et al. are sinking a shaft on a lease 2 miles southeast of Scotland. Indications are said to be favorable for a shallow lead deposit.

The Premier Lead and Zinc Co. on the Guinn land near Webb City has begun building a mill. The frame work is up and ready for cover. The 10-inch drill hole which was sunk for ventilation purposes, 50 feet south of the head of the south drift, struck a lead prospect.

J. G. Wilbur, W. M. Scott, J. W. Durby, T. S. Creighton and C. B. Rice have organized the Great Scott M. Co. at Carterville.

Lawrence County.

At Aurora the Gold Dust mine on the Kentucky land has been sold to the Allen M. & M. Co. The latter company is still getting out ore from the Little Nugget mine.——Progress is being made in the work of enlarging the Big Bob shaft on the U. Z. ground, which will be put down to a depth of 225 feet, says the News-Herald.

MONTANA.

Deer Lodge County.

The Chicago & Montana G. M. & M. Co. will build a 10-stamp mill this summer at its mines near Cable, says Manager J. C. English. He will begin operations as soon as a roadway can be cut through the snow. The company has been working five men at the mine all winter. Tbe tunnel has been driven 200 feet and they have broken into a body of ore that contains gold. They will sink the shaft, which has depth of 35 feet.

Prospectors are working over the territory west of Anaconda, especially at Olsen gulch and Georgetown Flat, says the Inter-Mountain. Ores are said to carry values in gold.

Flathead County.

The Homestake M. & Dev. Co., composed of Spokane, Wasb., and Eastern meu, has taken up its bond for $25,000 on the Homestake group of seven claims, the Oregon group of three claims and the California group of five claims, near Libby. The Homestake group is within 16 miles of the railroad. The ore bodies carry values in silver and lead. The Oregon group is a copper-gold proposition. On the California group is a ledge 20 feet wide averaging $5. Work has been started.

D. P. Bowers of Latah, Wash., reports he is negotiating for the Silver Cable mine, near Libby, and is preparing to increase operations there. The mine has values in gold, silver and lead, and is 20 miles from transportation. There is a concentrator at the mine and a few men are at work, but it is intended to make the mine a shipper.

NEVADA.

Esmeralda County.

A. H. Mayne of Salt Lake City, Utah, who has bought a group near Sodaville, says he will begin forwarding ore this week. He has an 8-foot ledge showing values in copper, with gold.

Lincoln County.

The Duplex mill has been started up by the Santa Fe M. & M. Co., near Searchlight, with M. McKee in charge. Two shifts are at work. An ore road has beeu built up to the mill and a 40-ton bin erected. At the mine a 50-ton bin has been placed at the head of tbe shaft. Operations are being increased underground to make room for more men. Sinking is in progress in all three shafts, and in No. 1 north and south drifts are being run on both the 50-foot and 100-foot levels.

At the Quartette mine at Searchlight the electric plant has been started up. There is a 25 H. P. dynamo which will be used to generate power for the lighting system and also for operation of the pumps. The station on the 700-foot level is completed and sinking will be resumed.

Washoe County.

At the Standard mine at Olinghouse they have cut through 2 feet of ore carrying $30 per ton in the crosscut tunnel at a depth of 120 feet, says the Wadsworth Dispatch. J. Caravanta and S. Capura are owners.

NEW MEXICO.

Grant County.

J. L. Wells, who has a lease and bond on the Last Chance mine, near Lordsburg, has fitted up the boiler and hoist and put in a pump. Tbe workings have been unwatered. Tle ore is said to run 50% iron, a little manganese and lime and twenty-five ounces in silver.

Development work is being done on the coal fields near Steeple Rock. A number of new locations have been made.

The Chatham smelter at Silver City has been blown in. The furnace bas a daily capacity of 75 tons. A black copper product will be produced. There are about 300 tons of ore on the ground, with regular shipments being made daily from the Burro Mountain and Pinos Altos districts. The site of the smeler is advantageous, with water enough to run a larger plant. It has good dumping facilities and 100 feet from the railroad track. The iron for flux comes from Boston hill and the lessees of the Providential mine at Chloride Flat furnish the lime. W. Clayton is superintendent of the plant.

J. C. Woodward has again taken possession of the Casino mine, in the Burro mountains, south of Silver City, ownership having reverted to him througb forfeiture by the company which bad closed a deal for it. Woodward will resume operations.

The Colorado Fuel & Iron Co. will resume operations at Fierro this week. Arrangements have been made to ship fifty cars of iron ore per day.

The Chatham C. Co. has blown in its smelter at Silver City. The mill is of sixty-ton capacity.——Tbe Comanche M. & M. Co., which bought the Silver City Reduction Works which was burned a year ago, has men at work cleaning up the site. They are taking out all of tbe old machinery which will be repaired, and as much as possible of it used. The smelter will have two 100-ton capacity stacks. It is intended to also build a refinery in connection with tbis plant.—— The headquarters of the American Con. C. Co. will be removed from New York to Cincinnati, O. The company will start development on its properties in Grant county in August.——The National Co. is at Steins Pass drilling for water to be piped to the National mill.

Lincoln County.

The Mescalero M. & M. Co. has bought the Ririe group of nineteen mining claims in the White Mountain district. The principal values are in gold, silver and lead. J. Ririe of Roswell is interested.

Santa Fe County.

The machinery and other equipment owned by the Cochiti G. M. Co. at Madrid have been sold at a receiver's sale for $25,000.

Sierra County.

M. Henesy last week bought tbe interests owned by thirteen parties in the placer fields at Pittsburg, east of Hillsboro, on the Rio Grande river.

Socorro County.

The Dividend M. & M. Co. is developing the leads on Colorado Nos. 1, 2, 3 and 4 claims at Estey City. The ore is carbonate and will be treated in the mill by leaching and precipitation. The mill has two 125 H. P. boilers and four engines from 30 H. P. to 125 H. P. These run crusher, dynamos and blower. Two dynamos run the power and light plant for the camp. The mill and smelter will handle 125 tons a day. The crusher has a daily capacity of 200 tons. The company has a water storage tank of 90,000 gallons capacity and a laboratory and assay office, says the New Mexican.

Owing to the scarcity of water, the mill of the Mogollon G. & C. Co., at Cooney, is hampered. From March 31, 1903, to May 1, 1904, the company shipped 78,049 ounces troy of silver; 182.4 ounces troy of gold; and 1,064,915 pounds of copper. Ore strikes were made on the fourth and the fifth levels near the junction of the Bar and Twig veins.

Taos County.

The South Fork M. Co., of Raton, proposes to build a 100-ton mill at its mines, says Superintendent J. Morris.

OREGON.

Baker County.

President R. J. Davison of the Oregon M. Ex. Co., owning the Snow Creek mine near Greenhorn, and Manager F. D. Smith have made final payment on the Snow Creek property, the sum aggregating $17,500. A reduction plant is in full operation.

The mill on the properties of the Gold Ridge M. Co. at Durkee is in operation again.

W. H. Plummer of Spokane, Wash., and Eastern associates have bought the Cougar mine, near Sumpter, for $600,000. Machinery will be put in to increase the producing capacity.

Clackamas County.

The Molalla Central M. Co. proposes putting in a reduction plant to handle the ore taken from its mine on Ogle creek, near Molalla. Work has been continued on the mine all winter. The ore is gold bearing.

Crook County.

The Red Jacket M. Co., with head office at North Yamhill, having property at Ashwood, is putting in a pumping plant. Work has been shut down on the property for a month. The shutdown was caused by a heavy flow of water in the 300-foot level. As soon as the pump is ready, development work will be resumed.

P. A. Brady, superintendent of the Humboldt and Red Lion mines, in the Greenhorn mountains, near Greenhorn, says sinking will be resumed at the Humboldt this week. The company has bought the Forty-Nine Jimmy, a parallel property, and Brady says the plan is to sink to the 100-foot level, crosscut to the Jimmie lead, a distance of 100 feet, and work this property through the Humboldt shaft. The shaft is down 70 feet. The Humboldt was equipped with a 500-foot depth plant last summer. Machinery for a mill will be put in on the Red Lion.

Grant County.

A. H. Willett, of Portland, M. L. Byck and W. P. LaRoche, of Savannah, Ga., have bought one-quarter interest in the Copperopolis C. Co., for $30,000. The company's holdings are in Quartzburg mining district. They will build a concentrating and leaching plant, which it is proposed to have in operation by January 1 of next year. The present equipment includes a compressor plant for operating air drills and steam power, a 100-light electric dynamo, operated by water power, and 1200 feet of flume for conveying water to the power plant and buildings. Ten claims are included, comprising 200 acres, and ore bas been opened up carrying values in copper, with gold and silver. Tbe property is on tbe west fork of Dixie creek, and near the north end of Cougar ridge. The mill to be built will be of 100 tons capacity. During the present year the extension of the Sumpter Valley Railroad to Prairie City will give the advantage of railroad connection only 3 miles distant, with easy grade and good road. The railroad will be built along Dixie creek.

Jackson County.

At the Shorty-Hope mines, near Ashland, it is reported the night and day shifts are still drifting on the Golden Spike ledge and are in 508 feet. The vein has widened. The 401 feet of 8-inch galvanized iron pipe has been put in place; extending from the raise to the face of the drift, this pipe ventilates the tunnel and removes the gases after shooting. The officers of the company are considering putting in air compressor, receivers, drills, hoists, pumps, etc., the compressor to be run by water power.

Josephine County.

Machinery for the Takilma smelter at Takilma is on the ground. Shipment included an 80 H. P. boiler, a Connersville blower with direct connection with 60 H. P. engine, and engine and dynamo with a 20 H. P. engine for the sampler. Smelting will be started about July 1st. Other machinery is arriving, says Superintendent A. I. Goodell.

The Granite Hill mines, near Grants Pass, are being developed and equipped by the American G. F. Co., of Chicago, Ill., of which W. J. Morphy is manager and L. Y. Wickersham superintendent. In the mill, a six-drill compressor, a 65 H. P. engine, an electric dynamo, with separate engine and a 120 H. P. boiler, are at work. Ten 1000-pound stamps and four Frue vanners are being set up and will be put in operation next week. Superintendent Wickersham says they propose putting in ten more stamps by the close of summer. The main shaft is being sunk by machine drills on three eight-hour shifts. Other drills are at work in the drifts on the two levels and a body of ore is being uncovered. Free gold, pyrite and galena are showing.

About 500 men are on the payroll of the Granite Hill, and this list will be increased.

For $15,000 the Golden Wedge mine has been sold to Wilmington, Del., men. The property has a 2-stamp mill. The values are in gold. It is intended to put in a larger plant and operate the property. The mine is near Galice creek. A. B. Cousin of the Galice Con. Co., near Grants Pass, is interested.

SOUTH DAKOTA.

Lawrence County.

The Bear Gulch M. & M. Co. is developing its gold and tin prospects along Bear Gulch, near Tinton. The company's ground covers 400 acres, and adjoins the Tinton Tin Co. group. W. E. Fritt, of Chicago, Ill., is secretary of the company.

The Minnesota M. Co., which bought the Garden City M. Co. group, the Bill Phillips property, and the Waller millsite, at Maitland, has started its shaft on north end of the Garden City group. A wagon road has been opened by the company to the sito of the shaft.

Pennington County.

It is reported the Montana mine, near Rochford, has resumed operations. Shaft sinking is under way.

UTAH.

Box Elder County.

The management of the Iona M. Co. of Park Valley is preparing to build a mill. Extensive bodies of milling ore are being developed, similar in character to those in the Century, says Manager Madson. He expects to have the plant in operation by October 1st. —— Superintendent C. J. Peterson says a shipment of concentrates from the Century mine was forwarded last week. On the same car were eight tons of high-grade galena, which, he says, assays 65% lead, 45 ounces in silver and $6 in gold.

The Sunrise mine, near the Century mine of Park valley, will be equipped with machinery and started up, says Manager Simon. The ore is gold-bearing.

Juab County.

About forty men are on the payroll at the Uncle Sam mine, near Eureka. The mill has ten men.

The management of the Centennial-Eureka mine in Tintic at Eureka is increasing work. The ore bodies which yielded values on the upper levels have been opened on the 1400-foot level, and are being blocked out, says General Superintendent Allen.

Salt Lake County.

Twenty cars of concentrates were dispatched from the Utah C. Co. concentrator at Bingham during month of May.

L. La Vine of Boston, Mass., manager of the Bingham West Dip Tunnel enterprise, is arranging to start development. A compressor plant and other machinery are going in. A road has also been built from the railroad to the mines, a distance of 4 miles. The principal works of the company are on west side of the Oquirrh range of mountains, where a tunnel 5x6.8 feet in the clear with 2x3-foot water drainage beneath track, has been driven to 300 feet. The tunnel is headed southeast and will tap some of the principal veins of the West Mountain district at depths ranging to 2000 feet. The tunnel will serve also to drain the mines of the district.

The delivery of copper, gold and silver-bearing matte from the Yampa smelter in Bingham canyon at Bingham to the converters of the valley has been resumed after an interval of thirty days, during which the company's plant has been remodeled, under direction of Superintendent Bellinger.

Salt Lake City reports say 200 miners employed in the mines at Bingham, 20 miles from Salt Lake City, were discharged on the 14th inst. in consequence of taking a day off without permission. Notices were posted at all of the mines in Bingham several days before notifying employes that if they took a lay off on Miners' Union day they would be discharged. A large number of the men contended that they were entitled to their annual holiday and disregarded the notice and the wholesale discharge followed.

At a distance of 6200 feet from its mouth the tunnel with which management of the Bingham Con. is draining the Dalton & Lark group of mines at Bingham is opening up the Brooklyn ledge, with which connection was made last week, says Manager MacVichie. The station at which connection was made is 1400 feet below the apex of the ledge. To connect with the main channel in the Miner's Dream, in which ore is exposed above, they will be required to drive 800 feet from the point at which the intersection with the ledge was made. Adapting the course of the tunnel to the strike of the ledge a variation of 45° has been necessary, and this change has been made. The flow of water from the tunnel has been reduced to about 1600 gallons per minute, with very little appearing in the breast, says Manager MacVichio.

At Alta shipments of high grade ore have been resumed from the Alta-Quincy mine. The Alta-Quincy is on the south side of Little Cottonwood Canyon, south of the Columbus Con. group, and also adjoins the South Columbus. The vein opened in the Alta-Quincy is said to show a width of 25 feet, mostly milling ore, which will be concentrated. There is, however, ore of a grade which will warrant shipment direct to the valley smelters.

Manager Lavagnino of the Butterfield mines at Bingham is continuing development work. Soon after operations began in the Eagle Bird vein, in the Queen tunnel level, a body of shipping and milling ore was cut into. From development work nearly 3000 tons of ore are on the dump. The concentrator at the mouth of the Queen tunnel, undergoing changes, will be ready to start up in July with a daily capacity of fifty tons. It was formerly a stamp mill, but rolls, jigs and other machinery are being added.

Sevier County.

The Live Oak M. Co. has been organized at Richfield to develop eight lode claims in Sevier county. The officers are W. W. Clark, O. Keeler and E. Clark.

Summit County.

Work on the Brown Eagle mine, in Elkhorn district, near Park City, was started last week and a shaft is being sunk. The surface showing is encouraging.——The approach of summer has been the cause of placing a number of jigs on the creek in Woodside canyon, flowing from the King mill, says the Park Record. Jigs have also been set up in Empire canyon, near the old Daly dump, and good values are reported as being obtained by the parties operating them.

Tooele County.

Preparations are under way for starting work on the 800-foot level of the Honerine mine at Stockton. This level has been drained by the tunnel. The retimbering of the intermediate shaft will begin this week, Manager Snyder says, and the work of sinking to the tunnel level will be started. The arrival of the machinery for the new sampler has been delayed.

WASHINGTON.

Ferry County.

W. J. Casey et al. have started development work on the Art Dumont, a silver-lead mine on the Thirty-mile divide, 2 miles northwest of the Congress mine, on Bridge creek, near Republic. There is a 60-foot shaft and a tunnel has been driven 200 feet. This taps the ledge at depth of 150 feet below apex. The ledge is 7 feet in width; of this 5 feet is said to be shipping ore. The mine will be made ready for stoping. The wagon haul will be about 15 miles. All but four of this will be over the Republic-Keller wagon road.——G. W. Spence has a group of claims on Ninemile, 15 miles east of Keller, which are being opened up.

After testing the ores of the Mountain Lion mine at Republic, the mill has been closed down and the shipping of ore to the smelters will be resumed.

Stevens County.

G. B. Dennis, C. E. Mitchell and J. C. Kleber, of Spokane, are preparing to develop a group of molybdenum mines, 15 miles from Bossburg. A mill will be built.

Plans for increasing the output of the quarries of the Crystal Marble Co. and enlarging the finishing plant in Spokane are being made. G. M. Annis, president of the company, says they are working fifteen men at the quarries, near Colville. It is intended to put in additional machinery at the quarries this summer, including two derricks and a channeler. The plant in Spokane will be enlarged to three times its present size.——J. N. Jones, of Spokane, secretary of the Great Western Marble & Onyx Co., which owns quarries at Blue creek, in Stevens county, says the company's plant has been idle since December 25. They are waiting to put in finishing machinery to market the product. The quarries are opened up.

WYOMING.

Carbon County.

El Rey gold mine, on Purgatory gulch, near Encampment, is being prospected. The work is being done on the ore shoot which was opened last winter. A stamp mill is being figured upon, says Manager P. Lee. Superintendent Watson says the ore carries free gold. El Rey is owned by the Consolidated G., C. & Coal Co., backed by Pennsylvania coal men.

The North American Copper Co. concentrator at Grand Encampment is in full operation, with R. B. Lamb as superintendent. The capacity of the mill has been increased and the cost of operation decreased. A better grade of jig and table concentrates is being produced, the concentrates averaging 29% and the table concentrates 30% copper, says the Encampment Herald.——Another change is the cutting out of the roaster, which is not at present used. It is planned to do away with roasting concentrates altogether, and the skip track which led from the mill to the roaster has been taken up and relaid from the mill direct to the smelter bins.——The water wheel that operated the crusher on the first floor has been taken out and a 20 H. P. direct-current motor substituted. This motor drives the crusher and conveyor No. 1. The ore after being crushed is elevated to a ¾-mesh screen, from which the undersize goes to ore bins below and oversize to rolls. From the ore bins the material is raised on elevator No. 2 and divided into two parts. The ore passes into a 2-mesh screen, and oversize of this screen, which is undersize of ¾-mesh, goes to first jig, called the coarse jig, while undersize goes into the second screen, which is 5-mesh. Oversize of 5-mesh screen, which is undersize of 2-mesh, goes to the second jig, which produces medium product. Undersize of 5-mesh goes to classifiers. Product from first pocket of classifiers goes to the sixth course tables. These tables make three products—concentrates, middlings and tailings. The concentrates go to the smelter bins, the tailings to waste, and the middlings to the third elevator and are carried up with the middlings from the first and second jigs into a 6-mesh screen. Undersize goes to classifiers and oversize to the third jig.——Product of second pocket of classifiers goes to three tables on either side of concentrator floor, the next pocket to six other tables. The overflow from first set of classifiers is handled by a separate type of classifiers, the product from the first pocket going to one table, next to another and the balance to a Wilfley slimes table. There are three jigs in each unit, two double 2-screen and one single 2-screen. The outside jig on each unit is the coarse jig, and makes an intermittent bed product only. The second or middle jig makes a continuous bed product, while the third makes a "hutch" product.

Two of the jigs on the A side were built at Encampment. They are of the latest Hartz type, the others being an older type with semi-circular bottoms. Each jig is run at a different speed and stroke. The first jig has the longest stroke and slowest speed, the second a shorter stroke and greater speed, and the third takes still shorter stroke and higher speed—the stroke and speed varying with character of ore.

There are eleven trommels in the mill, one common to both units and five on each unit. There are two elevators common to both units, and one elevator to each unit, and eight dewatering screens to each unit. Changes have also been made in the four 14x27 rolls. They have been fitted with a new type of dewatering feed boxes and with back springs to take the motion off the tension spring. Wooden cheek plates have been added. The rolls have been converted into friction-driven rolls and fitted with paper driving pulleys and friction clutches. There are two rolls to each unit, one crushing the intermediate product and the other the final product of the rolls. The roll common to both units is 16x30. By a system of dewatering launders the product is passed to a settling box, going from there to elevators and passing to the jigs.——The slimes tables are not used to any extent. Tailings are pumped into a flume which empties on the ground on east side of river. A centrifugal pump, with 8-inch suction and 6-inch delivery, is used, being capable of delivering 1200 gallons of pulp per minute.——A new system of reporting work has been instituted in the mill as well as in all other departments of the plant. Every millman makes out his individual report for each shift and this information embodied in a general concentrator report. Daily postings are made of tailings and concentrate assays for guidance of millmen in their work. The table concentrates show an average of 10% silica, while the jig concentrates contain an average of 15% to 16% silica. ——Concentrates are passed from the jigs to the bins, and by a system of tramways both jig and table concentrates are brought to a common point and conveyed to the smelter by skip. Every bucket of material is weighed, and assays for silica, copper and moisture are made for smelter purposes. By this method definite information is secured on every ton of concentrates handled. The skip is operated by an electric hoist, carrying three-fourths of a ton per load.——Another improvement is a 42,000-gallon water tank, being built south of the mill, from which tank the mill will be supplied. Including the man who operates the aerial tram and skip, and the man in charge of the power house, the entire working force of the mill for a twenty-four-hour run has been cut down to twenty-five men. While the mill was originally built for a capacity of 300 tons, the former management expected it to handle only 200 tons. Superintendent Lamb says during a run of twenty-four hours he handled 400 tons of ore, dry weight, and turned out fifty-one tons of concentrates. It cannot be stated at this time just what the maximum limit of the mill will be, as the launders are not of sufficient size to handle the amount of material which the other parts of the mill will send down to them. The launders are being enlarged. The mill has made 650 tons of concentrates since start-up in April.——The smelter of the company has been blown in and copper bullion is being turned out. E. K. Hum is general manager of the company.

FOREIGN.

AFRICA.

Transvaal.

The details of the accident at the Robinson Deep mine at Johannesburg, April 25 last, have been made known by the official inquiry. It shows that there were no safety clutches, as the shaft is equipped with steel guides. The rope, which was of the flat type, broke as the cage neared the surface, dropping forty-five men 2000 feet to the bottom of the shaft. It was an 8-ton rope, with a breaking strain (new) of 113 tons.

AUSTRALIA.

Since the beginning of the present year gold to the value of $23,088,565 has been shipped to all countries, a falling off of $5,158,545 for the corresponding period of last year, writes J. P. Bray, U. S. Consul-General at Melbourne.

Victoria.

The gold returns for the central division of the Ballarat mining district for the quarter ending March 31st show 38,008 tons of quartz were reduced for 12,555¼ ozs. of gold. In addition, 335 ozs. 2 dwts. were obtained from cyanide, 19 ozs. 3 dwts. from tailings and 80 ozs. 5 dwts. from alluvial, making a total of 13,009 ozs. 14 dwts. Dividends to the extent of £6150 were paid. For the corresponding period of last year 40,026 tons were treated for 12,030 ozs., and alluvial, pyrites, etc., brought the total amount of gold produced to 12,821 ozs.; and dividends reached £2000.

The March gold yield of the Bendigo district reached 24,031 ozs. This is said to be the highest return for March in any year since 1876, and with two exceptions is the best for any month for twenty-one years past. The total yield for the first quarter of the year is 60,505 ozs., being an increase of 14,147 ozs. over the aggregate for the corresponding period of last year.

BRITISH COLUMBIA.

Boundary District.

Van Debogart Bros. and J. Falls are at Hall Siding opening up their placer lease. They have 160 acres of ground half a mile from the railroad track, and on either side of Hall Creek leased from the Government. Work has resulted in finding coarse gold, besides a large amount of black sand carrying values. If the tests which are being made on this black sand prove satisfactory a hydraulic plant will be set up.

About 800 H. P. of electrical machinery is being set up in the British Columbia C. Co.'s smelter at Greenwood, says D. McIntosh. Two more convertors have been blown in. Bonds and leases are being taken on a number of properties, and much development work is being done. ——M. Kane et al. of Greenwood have a bond on the Mavis property. A. Miller of Greenwood has bonds on the Helen from the Helen M. Co. and the Barber from G. R. Naden & Co. Work has been started on all these.

W. T. Smith and J. Haas have a bond on the properties owned by the Boundary Creek M. & M. Co., near Greenwood, and have started work on the Spokane claim. Work is being resumed on the Defiance, which was idle all winter, and a hoist, a pump and other machinery are being put in. These are silver and gold producers.

The Oro Denoro is shipping 50 to 100 tons a day to the Granby. The Emma is shipping ore to the Granby, the Greenwood, the Trail and to the Hall Mines smelter. The ore is said to be valuable for fluxing.

East Kootenay District.

Operations have been resumed on Bull river, near Fort Steele, by the Gold River M. & P. Co. The company will build a dam across Bull river 2 miles above the Pack bridge, and from this point to the diggings a flume 16x5 feet will be constructed, which will be about 1½ mile in length. The equipment of the company will consist of hydraulic pipe, monitors and sluices, and a sawmill capable of cut-

ting 20,000 feet of lumber daily, which will be used in the construction of the dam and the flume. Superintendent D. S. Guinter has forty-five men at work.

Lillooet District.

(Special Correspondence).—The Iowa-Lillooet G. M. Co., Ltd., C. T. Hancock of Dubuque, Iowa, president, has built a gold dredger on the Fraser river, at Lillooet.

An English company has one dredger in operation at Lytton and another under construction, which is expected to be completed this month.

Lillooet, June 12.

Rossland District.

At the Spitzee mine, at Rossland, connection has been made between the first and second levels. The new workings will be utilized for ventilation and for delivering ore to No. 2 station. The management expects to increase shipment.

Vancouver Island.

It is expected to start the smelter at Crofton about July 1st for a continuous run of both furnaces, says H. C. Bellinger, manager. The smelter was closed down pending negotiations for a sale and also because of a shortage of ore. They are accumulating ore.

West Kootenay District.

The Kingston and McMinnville group of claims at Camborne have been bought by an English company. K. Burnett of Rossland is interested. The Kingstou group comprises the Kingston, Pittock, Maggie R., Tongue, Senator and Howard fraction claims, and the McMinnville group is made up of the Ishpeming and Houghton claims. On the Kingston are two tunnels, one in 50 feet and the other 65 feet, being 100 feet lower than the first. Both are being driven on the same lead of free-gold quartz, 42 feet wide.

CANADA.

Alberta.

The Canadian Pacific Railway is opening up an anthracite coal mine at Banff and invites tenders for driving a tunnel 1200 feet long.

Yukon Territory.

The annual report of the Department of the Interior of the Dominion of Canada for 1903 gives the following concerning the production of gold in the Yukon Territory: The gold production for the year ended June 30, 1903, amounted to $12,113,-015.34, as compared with $9,566,340.52 in the previous year. The output of last year is attributed to an unusually rainy season, owing to the fact that a large amount of the pay dirt is removed by hydraulic methods.

Dawson reports say that a nugget was found on May 25th on a bench claim on the left limit of Dominion creek, opposite No. 9, which weighs 126 ounces and is worth $2000. Claim No. 5, above Discovery, on Sulphur creek, which was sold last year under the supposition that it was worked out, is said to be paying. Two winter dumps were taken out, from one of which $25,000 worth of gold was washed out in May. The other dump is larger and is being washed. The claim is owned by W. Ripley, J. Banning and A. Baird.

MEXICO.

Chihuahua.

It is stated that P. Gintber, Santa Rosalia, manager of the Encinillas M. Co., Ltd., 65 miles southeast of Santa Rosalia, is preparing to enlarge the smelter from its present capacity of 80 tons to 300 tons. The shutting down of development after two years of work, the failure to haul any ore and the leaving of the present smelter idle after its completion several months ago, are unexplained. The traction engines and the ore trains have been at Santa Rosalia several months idle and the roadway is completed to the mines.

R. M. Dudley, J. Pothast et al., of Chihuahua, have bought the Esperanza mine of P. Alvarado at Parral and adjoining his Palmillo mine. They have had an option on the Esperanza mine for several months and have done considerable prospecting and development work.

W. W. Fiske of Boston, Mass., who is developing the Oro Fino gold property near the Sinaloa line, near Choix, Sinaloa, says he has the ore body exposed and is arranging to build a quartz mill in the fall.

Durango.

New York and Boston, Mass., men have organized the Mexican Con. M. & S. Co. to develop the Nueva, Australia and Porvenir mines, at Guanacevi. J. A. Coram of Boston, Mass., says a concentrating plant and smelter are proposed.

G. H. Sowers, president of the Amazon G. Co. of Chacala, reports the 100-ton smelter of his company was blown in last month and is working satisfactorily. The property is a gold-bismuth mine, carrying some copper and lead and largely furnishing its own flux. Although only 60 miles from the coast and over a good wagon road, it requires about twenty days to haul freight from Topolohampo to Chacala, and notwithstanding that an agent is kept at San Francisco, Manager Sowers says it takes months to get freight from the states to the mines. Fourteen Americans are employed at the smelter and mine, and 100 laborers besides packers and wood choppers.

O. Koehler and O. Warmund, of San Antonio, Texas, and S. D. Bridge, of Monterey, Mex., are increasing work on their San Domingo and Hay Tunnel properties adjoining the Velardena mines, near Durango. D. C. Irish, of Central City, Colo., is in charge with 100 men at work, which number will be increased. The output will be shipped to smelters.

Jalisco.

At Las Moras mine, 6 miles southeast of Ameca, arrangements are being made to put in a concentrating plant. The property is owned principally by Philadelphia, Pa., interests; G. E. McCormick, Ameca mining man, manager. Las Moras mine is a copper proposition. It has a large body of low grade copper ore. The principal development consists of a crosscut tunnel 700 feet in length. The vein has a north and south course. The formation is said to be a mass of brecciated porphyry, the copper occurring mainly along the lines of fracture. There are through the mass frequent occurrences of calcite, but siliceous material in the shape of quartz is scarce. The principal ores are copper pyrites and red oxides. Concentration tests by jigging have been made. The average value of the ore through the tunnel is 3% copper with a little silver.

B. H. Hammet, who holds title to 250 pertenencias of gold placer ground in Pihuamo district, says he expects to start operations in August. Two carloads of hydraulic machinery are on the land, and three additional carloads are expected at Tuxpan station, the terminus of the Zapotlan branch of the Central. Water will be piped from the Belem river, a distance of 2 miles.

N. Z. Seitz of Philadelphia, Pa., vice-president and manager of the San Felipe M. Co., operating near Guadalajara in Hostotipaquillo district, says a 100-ton mill for amalgamation and concentration of ores is in process of erection and will be ready for use in August. The power for its operation will be secured by utilization of a fall of 147 feet in the Amajac river, near the millsite. From this power, electricity will be generated by a Pelton wheel. The electric light and power plant will be used not only to light the mines and their vicinity, but also to furnish power for electric drills and the crushing and milling operations.

It is reported the iron mines at Ferreria de Tula, together with the foundry in operation there, will pass into the hands of Americans, as an option has been given on the property to R. E. Beach, president of the New York company operating there. The price specified in the option is $700,000 gold. The New York company has been operating the iron mines and foundry for several years, paying a rental of $30,000 per year. The company proposes to build a standard gauge railroad from the mines to Colfradia, a station on the Zapotlan branch of the Mexican Central road north of Sayula. Work on the line has been started. At present the company has to transport the foundry products for several miles in carts.

The Philadelphia C. & G. M., M. & S. Co. continues development near Ameca. The ground contains several parallel veins, which are developed by shafts reaching a depth of about 300 feet. It is equipped with a 35-ton concentrating plant and is shipping concentrates. The mine also produces a quantity of high-grade shipping ore. The values are in copper, gold and silver. E. A. Hall is president and A. J. Hall is resident manager.

Lower California.

(Special Correspondence). — It is reported that the Yharra mines, near Calmalli, have been leased for a term of two years to E. I. West of San Francisco, Cal., who will make needed improvements in the plant.

San Diego, Cal., June 13.

G. P. Brown, superintendent of the Esperanza mines on Cedros Island, off the west coast of Lower California, has bought the plant of the National S. and R. Co., at National City, San Diego Co., Cal., and will move it to the Esperanza mines.

Oaxaca.

A flow of natural gas is reported by S. Pearson & Son, who are prospecting for oil near Jaltipan. J. B. Body is superintendent.

C. A. Hamilton & Co., operating mines near Taviche, propose to build a customs smelter at Taviche, to have a daily capacity of 140 tons. Copper converters will be included in the equipment, also auxiliary lead furnaces.

L. G. Teruel of Mexico City, owning the Ferrocarril de Oaxaca a Ejutla, is reported preparing to build a smelter in Oaxaca, to consist of lead-silver and copper-matting furnaces.

Sonora.

A car of ore from the Tiger mine in Sonora has just been sent out to the smelter which is said to run over $10,000. The Tiger Combination M. Co. of Bisbee, Ariz., B. F. Graham, manager, operates these mines. The company is considering placing the proposed mill at the Bavispe, a distance of 12 miles from the mines, and where sufficient water power can be had the year to run the plant. In case the mill is built at the river a larger tonnage can be handled and it is proposed to either build a wire cable way or a narrow gauge railroad between the mines and the mill site to handle the ore.

The smelter of the Yaqui River S. & R. Co. at Toledo, 90 miles east of Minas Pritas, has been blown in and is reported making a successful run. The value of the Barranaca natural coke was proved to their satisfaction, says President Klauser. The coal gave a residue of 12% asb, of which 2% is iron, making it desirable for fluxing. The 30-ton furnace was used and run on silver-lead ore. That is now converted to copper and the 100-ton lead stack is approaching completion. Another 50-foot stack is also to be built. The plant is in operation.

Teric.

The Buena Vista mine at La Yesca, owned by City of Mexico men, is reported producing values to the extent of $80,000 a month. The property is under American management. The ore runs from 2 to 2½ kilos of silver and from 12 to 14 grams of gold per ton. A mill with a capacity of 100 tons daily is in operation.——The same vein on which the Buena Vista is located is said to run through the property of the Zapopan G. M. Co., a Guadalajara company in which G. E. Purnell and C. C. Bruckner are interested. There are three antigua mines on the property, none of which is producing at the present. Development work is in progress, however. The Zapopan company is operating the San Miguel mine, also in La Yesca district, and ore is being taken out. There are 300 tons of ore ready for milling, and a 25-ton mill will be started this week.

Personal.

O. B. STEEN of Santa Monica, Cal., is in San Francisco, Cal., on mining business.

J. F. THOMPSON of Lewiston, Idabo, is in San Francisco, Cal., on mining business.

W. LANGDON is master mechanic for the Old Dominion C. M. & S. Co. at Globe, Ariz.

J. W. SELOVER, a mine owner of Seattle, Wash., is in San Francisco, Cal., on business.

H. M. DEAVITT of the Chicago office of the Engineering Co. of America is in Boston, Mass.

E. COPLEY of Salt Lake City, Utah, is in the East on business connected with Nevada mines.

W. L. CARD returned to Denver, Colo., last week from a professional visit to Bingham, Utah.

C. L. DIGNOWITY of Salt Lake City, Utah, is in old Mexico, on examination of mining properties.

W. E. THORNE of Denver, Colo., has gone to Dillon, Colo., as superintendent of the Oro Grande M. Co.

W. E. DEFTY of Phœnix, Ariz., is in Sonora, Mexico, on mining business, to be gone till after July 1st.

J. M. HADLEY of Nevada City, Cal., interested in Nevada county mines, is in San Francisco, Cal., on business.

T. A. LISTER, president of the North American C. Co., returned last week to Lordsburg, N. M., from a visit East.

A. A. STEEL of the Engineering Co. of America is engaged in examination of low-grade gold properties in Colorado.

ELMER BISHOP, for several years manager of the P. & O. mine, adjoining the Bassick at Querida, Colo., has resigned.

J. POLIN, superintendent for the Grand Central M. Co. at La Colorada, Sonora, Mexico, is in Denver, Colo., on business.

C. R. DOWNS, superintendent, the Bunker Hill mine near Amador City, Cal., is in San Francisco, Cal., on mining business.

H. S. STEWART, manager of the Duquesne M. & R. Co., is in Pittsburg, Pa., from Nogales, Ariz., on company business.

J. T. BAILEY of the Engineering Co. of America has returned to New York after having finished important work in Alabama.

L. D. HUNTOON, of Paterson, N. J., is at Silver Plume, Colo., in charge of the Yale students at the summer school of mining.

M. FRIEND of the Compound Metals Co. of London, England, is manager of a smelter company at Taviche, Oaxaca, Mexico.

J. G. LOUGHRAN is manager of the P. & O. mine at Querida, Colo., vice E. Bishop, resigned. J. Fitzgerald is superintendent.

W. J. CASEY, president of the Union Gas Engine Co. of San Francisco, Cal., is visiting the St. Louis Fair and other Eastern points.

G. CRISMON, president of the Utah mine at Fish Springs, Utah, has returned to Salt Lake City, Utah, from a trip to Alberta, Canada.

W. F. SNYDER, manager, and C. Ellingwood, secretary, of the Western Exploration Co., are visiting Eastern points from Salt Lake City, Utah.

W. H. RUSSELL, E. M. of Inyo and Mono counties, Cal., is at present reporting on properties in the State of Guerrero, Mexico, for an Eastern company.

F. W. BRADLEY of San Francisco, Cal., has left for his annual summer trip of inspection of mines under his direction in California, Oregon, Idaho and Alaska.

H. SCHEERER, at the head of the faculty of the Freiberg School of Technology, Freiberg, Germany, is visiting the mines, mills and smelters of Utah.

W. H. BRULE, formerly at De Lamar, Nev., is assistant to Superintendent R. B. Lamb at the concentration plant of the North American C. Co. at Encampment, Wyo.

W. CONNELLY has succeeded A. J. Houle as superintendent at the Ferris-Haggerty mine of the North American C. Co. at Rudefeha, Carbon county, Wyoming.

E. S. KESKEYS, who has been superintendent of the Juhilee company at Carl Junction, Mo., has resigned to take a like position with the B. & H. mine at Chitwood, Mo.

P. A. BRADY has charge of the Humboldt, Red Lion and '49 Jimmy mine, near Greenhorn, Or., having resigned as superintendent of the Belcher mine in same district.

O. O. LARSON, consulting engineer for the Mascot company at Salida, Colo., has gone to Gladstone, San Juan county, Colo., to take charge of the Venetian mill and assay office.

W. Y. WILLIAMS, superintendent of the mines of the Granby Con. M., S. & P. Co., at Phœnix, B. C., has been appointed consulting mining engineer for all the mines of the company.

R. J. COLEMAN has gone to New York and Boston after a two months' trip to Lluvia de Oro mines in western Chihuahua, Mexico, from which place he returned last week to Nogales, Ariz.

CHARLES R. VAN HISE, an American geologist, for several years identified with the United States Geological Survey, was on the 7th inst. inaugurated as president of the University of Wisconsin at Madison, Wis.

G. McM. ROSS has resigned as superintendent of the Andes mine at Virginia City Nev., and is in San Francisco, Cal. He will go to Copperopolis, Calaveras county, Cal., as manager of the Union group of copper mines.

E. R. WOAKES of London, England, manager of John Taylor & Sons' lead mines and smelters in Spain, has been granted by the Spanish Government the official title of "mining engineer," permitting him to direct mines in Spain.

G. E. ANDERSON of Logan, Utah, has gone to the properties of the Norway Nickel M. Co. on the west coast of Norway and will begin forwarding its ores to reduction works. W. Christopherson, of Salt Lake City, Utah, is superintendent.

A. B. W. HODGES, superintendent of the Granby smelter at Grand Forks, B. C., has been appointed general superintendent of the Granby Con. M., S. & P. Co. properties, and will have charge of both

the smelter works at Grand Forks, B. C., and the mines at Phœnix, B. C.

A. E. SALAZAR of Santiago, Chile, professor of engineering in the National University of Chile, is in San Francisco, Cal. He has visited Cornell, Michigan, Wisconsin and other universities, and will visit the engineering departments of the University of California at Berkeley and Stanford University at Palo Alto, Cal.

Trade Treatises.

"Electric Locomotives for Gathering Purposes" is the title of Bulletin No. 8 from the Jeffrey Manufacturing Co. of Columbus, Ohio. The instructive descriptions of these locomotives for underground haulage are accompanied by numerous cuts.

"Graphite as a Lubricant," 8th edition revised, is an instructive treatise on the subject of lubrication of machine parts, from the Jos. Dixon Crucible Co., of Jersey City N. J.; and will be supplied on application of any one interested in the care and running of machinery.

The Wellman-Seaver-Morgan Co. of Cleveland, Ohio, have issued an attractive pamphlet descriptive of their safety hooks for skips and cages in mine shafts, to prevent drawing a cage up into the sheave in case of overwinding. The booklet is well illustrated, showing the simple and positive operation of the hook, which not only prevents the cage or skip from coming in contact with the sheave, but releases the cable while safely suspending the cage over the shaft.

The Denver Engineering Works Co. have issued Bulletin No. 1026 on "Stamp Mills." It is well illustrated by halftones and line drawings, showing mill construction methods and all the apparatus and equipment of a complete gold mill, together with valuable descriptive matter and tables, giving much information in a condensed form. In addition to the above, it contains a complete specification of a 10-stamp mill and building, together with a complete list of material necessary to construct the building. This bulletin may be had on application to the Denver Engineering Works Co., Denver, Colo.

Commercial Paragraphs.

THE Denver Engineering Works of Denver, Colo., report they are furnishing the Summer School of Mining at Georgetown, Colo., with a Box electric drill.

THE Rand Drill Co. of New York report having a contract from the Safe Investment G. M. Co. for an air compressor and several rock drills of the slugger type.

AN exhibition of mining and hydraulic apparatus, open to all countries, will be held at Barcelona, Spain, in September and during the following months of this year. This will be an excellent occasion for American machinery makers to exhibit their goods, and will undoubtedly pave the way for their gaining a foothold in that market, writes J. G. Lay, Consul-General at Barcelona, Spain.

GEO. W. LORD CO. of Philadelphia, Pa., has issued a handsome reproduction of a photograph taken in India, which illustrates the peculiar and ingenious construction of poles to carry electric wires in that country. It is of interest to electrical and other engineers throughout the world. A prominent feature of the illustration is several cartloads of Lord's boiler compound, on carts pushed and pulled hy half-nude natives.

Books Received.

"Mining and Mine Investments" is the title of an unusual publication having mining as a subject, written hy A. Moll. It is a volume taking up the mining industry from the popular standpoint and is intended hy the author to be a means of information on this subject in the hands of those who have or wish to acquire mining interests, but who have neither practical nor technical knowledge or experience. It treats of various kinds of mining in simple language, devoid for most part of technical phraseology, making, what is to many, a mysterious business, plain and easy of comprehension. The book contains several illustrations which will be a valuahlo aid to the understanding of mining reports and operations to those unfamiliar with them. Price, 2s 6d net. Methuen & Co., 36 Essex street, Strand, W. C., London, Eng.

Latest Market Reports.

SAN FRANCISCO, June 17, 1904.

METALS.

SILVER.—Per oz., Troy: London, 25 7/8d (standard ounce, 925 fine); New York, har silver, 55¼c, refined (1000 fine); San Francisco, 55¼c; Mexican dollars, 46¼c San Francisco, 44¼c New York.

COPPER. — New York: Standard, $12.75; Lako, 1 to 3 casks, $12.75; Electrolytic, 1 to 3 casks, $12.50; Casting, 1 to 3 casks, $12.50; San Francisco: $15.00. Mill copper plates, $17.00; hars, 18@24c. London: £56 2s 6d spot per ton.

Following are the figures of the German consumption of foreign coppor for the months January-April, 1904, compared with the same period of time in 1903-1902:

	1904.	1903.	1902.
Imports, tons.....	40,859	27,260	27,309
Exports, "	2,651	3,833	2,905
Consumption, tons..	38,208	23,427	24,404

LEAD. — New York, $4.20; Salt Lako City, $3.50; St. Louis, $4.25 San Francisco, $4.50, carload lots; 4¼c 1000 to 4000 ℔s.; pipe 6½, sheet 7, har 5¾c; pig, $4.85. London: £11 7s 8d ℔ long ton.

SPELTER.—New York, $4.75; St. Louis, $5.00; London, £21 15s ℔ ton; San Francisco, ton lots, 6¾c; 100-℔. lots, 7c.

The supply of ore on hand in the Joplin, Mo., district is increasing, duo to the smelters not huying up their full capacity. The local reason given is shortage of cars. The mine owners are still agitating a united movement to restrict production.

TIN.—New York, pig, $26.20 @ 26.45; San Francisco, ton lots, 28c; 500 ℔s., 28½c; 200 ℔s., 29c; less, 29½c; har tin, ℔ ℔., 30@32½c. London, £119 10s spot.

PLATINUM. —. San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $19.00 ℔ Troy oz. Platinum ware, 75 @ 82c ℔ gram.

QUICKSILVER. — New York, $44.50@45.50, large lots; London, £8 San Francisco, local, $43@43.50 ℔ flask of 75 ℔s.; Denver, $46.00. Export, $43.00@43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER. — Half-and-half, 100-℔. lots, 18.50c; San Francisco, Plumhers', 100-℔. lots, 16c.

ZINC.—Metallic, chemically pure, ℔ ℔., 50c; dust, ℔ ℔., 10c; sulphate, ℔ ℔., .04c.

NICKEL.—New York, 40@47c ℔ ℔.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

STRUCTURAL MATERIALS.

IRON.—Pittshurg, Bessemer pig, $13.35 @13.60; gray forge, $12.50; San Francisco, har, 3c ℔ ℔., 3½c in small quantities.

STEEL. — Bessemer hillets, Pittshurg, $23.00@23.00; open hearth hillets, $23.00 @23.00; San Francisco, har, 7c to 12c ℔ ℔.

WHITE LEAD.—Per ℔., in kegs: 500 ℔s. and over at one purchase, per ℔., 6¾c; less than 500 ℔s., per ℔., 7c; in 25-℔. tin pails, ¼c ℔ ℔. above keg price; in 1 and 5-℔ tin cans, 100 ℔s. per case, ½c. per ℔. above keg price. Dry Lead—In hhls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER. — (Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50 @5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00 @35.00.

NAILS.—This week the hasic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4 and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $1.25 country, $1.25 city ℔ hhl.

CEMENT.—Imported, $2.15@2.65 ℔ hhl.; California carload lots, $2.10 f. o. h. at works; small lots, $2.45 ℔ hhl. in sacks, 4 sacks to hhl., 10c for each sack roturned.

GENERAL SUPPLIES.

ANTIMONY. — New York, Cookson's, 7¾c; Hallett's, 6¾c; San Francisco, 1000-℔. lots, 8c; 300@500-℔s., 8¼c; 100-℔. lots, 10½c.

POWDER.—F. o. h. San Francisco: No. 1, 70% nitro-glycerine, per ℔., in carload lots, 15½c; loss than ono ton, 17½c. No. 1*, 60%, carload lots, 13½c; loss than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black hlasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, 8$; Lion, $9, in lots not less than 1000.

FUSE. –Triple tape, $3.60 per 1000 foet; douhle tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feot and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ℔ set; 14 oz., 40s., 10c.

CHEMICALS. — Cyanide of potassium, 98%-99%, johhing, 23@24c ℔ ℔.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 ℔s.; hyposulphite of soda, 3@3½c per ℔.; caustic soda, in drums, 3@3½c ℔ ℔.; Cal. s. soda, hhls., $1.20@1.40 ℔ 100 ℔s.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, hhls., 10c; caustic potash, 10c in 40-℔. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3¼@3½c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ ℔.; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carhoys, 66% B, 1¾@2c ℔ ℔.; nitric acid, carhoys, 8c ℔ ℔.

COAL. — San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.00; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymho, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumherland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $11.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in hulk, $13.00 in sacks; Sunnyside, $11.50, long ton.

BONE ASH.—Extra No. 1, 5@6c ℔ ℔. No. 1, 4@5c.

OILS.—Linseed, hoiled, hhl., 49c; cs., 54c; raw, bhl., 47c; cs., 52c; Lucol oil hoiled, hhl., 44c; cs., 49c; raw, hhl., 42c; cs., 47c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 23c; Elaine, 26c; Water White, in hulk, 13½c; Mineral Seal, iron hhls., 18c; wooden hhls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c.; Deodorized Stove Gasoline, hulk, 16c; do., cs., 22½c; 86° Gasoline, hulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in hulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E W. S., hhl., 75c; cs., 80c; Neats-foot Oil, pure, hhl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 70c; Bleached, do., 80c; Whale Oil, cs., 52@57c.

RED LEAD.—500 ℔s. and over at one purchase, ℔ ℔., 7c; less than 500 ℔s., 7¼c.

LITHARGE.—Pure, in 25-℔. hags, 8@9c ℔ ℔.

BORAX.—Concentrated, 6@7c ℔ ℔; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ℔ ℔., 60c.

SODIUM.—Metal, ℔ ℔., 50c.

BISMUTH.—Suhnitrate, ℔ ℔., $2.10.

MERCURY.—Bichloride, ℔ ℔., 77c.

MOLYBDENUM.—Best, $2.00 ℔ ℔.

CHROMIUM.—90% and over, ℔ ℔., $1.00.

PHOSPHORUS.—American, ℔ ℔., 70c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ℔ ℔.; 100 ℔s., 35c; 1000 ℔s, 34c; ton lots and over, 33c, Pittshurg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittshurg.

URANIUM.—Oxide, ℔ ℔., $3.50.

(These prices are wholesale, f. o. h. San Francisco, unless otherwise noted.)

Obituary.

SAMUEL MONTGOMERY, a pioneer miner of Carihoo, B. C., died at Barkerville, B. C., June 1st. Deceased was horn in Inniskillen, Ireland, in 1814.

S. S. ROBINSON, well known in the copper country of upper Michigan and in the West as a mine manager and bridge huilder, died at Detroit, Mich., on the 14th inst., aged 81 years. Deceased was at one time manager of an iron and silver mine at Leadville, Colo., and of the Mimbres silver mine in New Moxico.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports nf the fnllnwing U. S. patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING JUNE 7, 1904.

761,808.—SHAVING APPARATUS—W. R. Allen, Ho quiam, Wash.
761,810.—CARGO CONVEYOR—C. H. Anderson, S. F.
762,125.—ELECTRIC ALARM—J. P. Bolton, Fresno, Cal.
761,941.—ELEVATOR—M. Bradfield, Los Angeles, Cal.
762,133.—BALING PRESS—W. Bullard, Chico, Cal.
761,817.—MITER BOX—S. C. Burris, Seattle, Wash
761,819.—SHOE HOLDER—O. G. Gates, Los Angeles, Cal.
762,146.—HORSE COLLAR MEASURE—W. Cosbie, S. F.
761,767.—CAN COVER HOLDER—E. W. Hayden, Bayles, Cal.
761,839.—REVERSING MECHANISM—E. Johnson, Seattle, Wash.
762,174.—GOLD SEPARATOR—W. Laudahn, S. F.
761,893.—TROUSERS HANGER—W. S. Lee, Tacoma, Wash.
762,076.—BROOM BRIDLE—N. N. S. Matcovitch, Sacramento, Cal.
762,849.—GLOBE VALVE—W. A. McGowan, Cathlamet, Wash.
761,897.—CIGAR CUTTER—M. P. McIntire, Lakeside, Wash.
762,213.—NUT LOCK — W. L. Morrow, Stockton, Cal.
762,247.—LOOM SHUTTLE—J. H. Northrop, Tustin, Cal.
762,084.—AMMUNITION—C. Petersen, S. F.
762,195.—SAW SWAGE — W. C. Renie, Hoqulam, Wash.
761,914.—LIFTING JACK—G. Riggs, Bothell, Wash.
762,209.—LASTING MACHINE—L. B. Stamm, S. F.
762,212.—BEAN THRESHER—J. Trethewey, Stockton, Cal.
761,797.—WRENCH—F. W. Vogel, Santa Monica, Cal.
762,216.—TRUNK—C. P. Weil, Baker City, Or.
761,803.—SKIRT SPREADER—G. H. Wickelherg, Seattle, Wash.
36,943.—BADGE DESIGN—J. L. Mallery, Grants Pass, Or.

Notices of Recent Patents.

Among the patents recently nhtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy nf special mention:

LASTING MACHINE.—No. 762,209. June 7, 1904. L. B. Stamm, San Francisco, Cal. This invention relates to improvements in machines for lasting hoots and shoes. Its object is to provide a machine particularly for lasting that portion of the shoe intermediate nf the heel and toe, whereby both sides of the upper may he drawn equally and simultaneously over the last, stretched, laid upon the last and held while the tacks are driven in.

BROOM BRIDLES.—No. 762,076. June 7, 1904. N. N. S. Matcovitch, Sacramento, Cal. This invention relates to an improvement attachment for brooms which is designed to increase the life of a broom hy strengthening it adjacent to its point of attachment with the handle and to preserve its shape hy gripping and clamping the straw in such manner as to control its spreading, whereby compensation is made for the wear which usually takes place hy reason of the operator sweeping always with one side of the broom or exerting more pressure on one side than on the other.

AMMUNITION.—No. 762,084. June 7, 1904. C. Petersen, San Francisco, Cal. This invention relates to improvements in ammunition, and particularly ammunition intended for use in rapid fire guns, where it is desired that the feed of the ammunition be continuous and automatic. The invention comprises a plurality of cartridges linked together in the form of a chain, said links consisting of a flexible extension carried hy each hullet and having a central loop to engage the shell of a succeeding cartridge.

ADJUSTABLE HORSE COLLAR MEASURE.—No. 762,146. June 7, 1904. Wm. Coshie, San Francisco, Cal. This invention consists of a ruler having one continuous side sufficiently long tn measure the depth nf the animal's neck, two transverse sides, one of which is slidable with relation to the longer side and two other independent sliding measures movable upon the transverse sides and adapted to fit the top and hottom of the animal's neck, so as to give all the necessary measurements.

GOLD SEPARATING AND RECOVERING APPARATUS.—No. 762,174. June 7, 1904. Wm. Laudahn, San Francisco, Cal. This invention is especially designed for working dry placer and other deposits containing gold and without the use of water. It is also designed for separating gold from auriferous heach sands. It consists in the employment of a chamber containing quicksilver, a mechanism hy which the gold-hearing sand may he forcibly submerged and allowed to rise through the hody of quicksilver so that the gold carried thereby will he brought into intimate contact with the quicksilver and amalgamated and obtained, while the waste or worthless material will he discharged over the top.

BEAM THRESHERS AND CLEANERS.—No. 762,212. June 7, 1904. J. Trethewey, Stockton, Cal. One-half assigned to George H. Harris of same place. This device is particularly applicable for threshing heans, flax and the like. It consists in the combination of mechanism for feeding the material, delivering it successively to a plurality of threshing cylinders running at different rates of speed, and thence transferring the separated heans or other material to cleaning shoes in the main machine, at the same time discharging the straw and refuse, and finally in transferring the material from the preliminary cleaner to a supplemental one, on which the work is completed.

BALING PRESS.—No. 762,133. June 7, 1904. W. Bullard, Chico, Cal. This invention consists in an arrangement of a horizontally disposed haling chamber, a second chamber substantially in line therewith and having a vertically movable hottom and operating connections, a feed hopper located above said second chamber having an intermediate revoluhle hottom adapted to receive the material to he haled in charges, and means hy which it may he periodically inverted to discharge the load into the chamher below, means for operating and locking the said revoluble hottom, a horizontally reciprocating follower adapted to compress the material into the haling chamher, and means for putting on the hinding ties by which the hales are held in their compressed condition.

MINE TELEPHONES

We can prove that a STROMBERG-CARLSON TELEPHONE will be an enormous saving to you in money and time value. We can convince you that your property and the lives of your miners are safer when they can instantly communicate by conversation over the

STROMBERG-CARLSON MINE-A-PHONE.

Invest a few minutes and a stamp. Tell us the size of your mine, the length of the shafts and drifts, the situation of foremen's stations, etc. Send us a rough plan of surface with superintendent's office and other important places where communication would be a necessity. We'll write you a letter, giving you suggestive advice and a possible price for complete installation.
Write to-day and let us stop your leaks. Ask for Bulletin No. 10-M.

You Know How Easy It Is To Be "Penny Wise and Pound Foolish."

That hits many cases with reference to mechanical loading.

You don't like to spend the money all at once for a loader—you say you must economize for awhile. That's the pound foolish part.

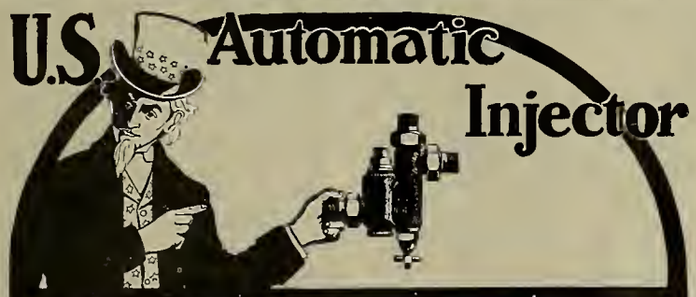
Real business economy is to have the right machinery. Buy a Christy Loader and save in expense enough to pay for it in less than a year—in the future that expense is profit. That's the "penny wise" part.

The Christy Loader is ABSOLUTELY DEPENDABLE.

For information, address

CHRISTY BOX CAR LOADER CO., 422 & 423 Equitable Bldg.,
DES MOINES, IOWA.

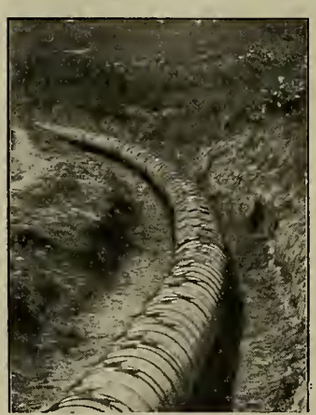
U.S. Automatic Injector



MAKE A FAIR COMPARISON.

If you are as interested as every engineer or power user should be in properly equipping his engine room, you will take the trouble to find out a few things about the U. S. Automatic Injector. You will find, on comparison, many features of superiority. One, for instance: A glance at the overflow valve of the U. S. Automatic will show that it will never wear leaky, like other injectors. Every part is built to operate without fail, and is easily exchangeable for new parts when old age makes replacement necessary. Send for our "Engineers' Red Book," containing over 500 facts of interest to engineers.

AMERICAN INJECTOR CO., Detroit, Mich.



24 IN. INVERTED SYPHON.

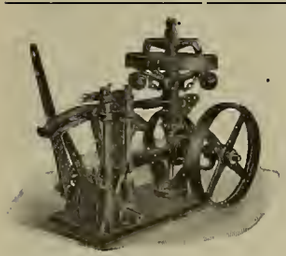
Wheeler Patent Continuous
Wooden Stave Pipe.
For any purpose for which Cast Iron is used.

For Mining Construction it is cheaper than high trestle flumes, and many times as durable. No expense for maintenance.

1 to 10 feet diameter. Pressure to 130 pounds per square inch.

Estimates Furnished. Catalogue on Request.

National Wood Pipe Company,
GENERAL OFFICES:
Sixth and Mateo Sts., LOS ANGELES, CAL.
SAN FRANCISCO OFFICE, 301 Market Street.



Water Wheel Governors

For Impulse Water Wheels of all descriptions; Electric Light, Power, Railway Stations, and all Mine Work.

We Are Now Prepared to
GUARANTEE ABSOLUTE SATISFACTION.
Write for References in Your Locality.

The Replogle Governor Works,
455 High Street, AKRON, OHIO.

THESE MACHINES
Are evaporating more than their weight of water every ten hours.

If you wish to DRY ANYTHING write us.

RUGGLES-COLES ENGINEERING CO.
New York, Chicago, Atlanta, San Francisco.

MINE BELL SIGNALS
ON OIL CLOTH.

Adopted, Used and in Force in Accordance with Law.

We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners."

We furnish these Signals and Rules, printed on good heavy OIL CLOTH so as to withstand dampness, 50 CENTS A COPY.

MINING AND SCIENTIFIC PRESS, 330 Market Street, San Francisco, Cal.

RIVETED SHEET STEEL WATER PIPE
For Placers, Water Powers, Irrigation, Etc.
THE WEIGELE PIPE WORKS

Whole No. 2292.—VOLUME LXXXVIII. Number 26. SAN FRANCISCO, CAL., SATURDAY, JUNE 25, 1904. THREE DOLLARS PER ANNUM Single Copies, Ten Cents.

Machine vs. Hand Drilling.

There is little room for discussion as to the respective merits of machine vs. hand drilling, for the reason that, generally speaking, machine drilling with almost any kind of a machine drill is less expensive than hand work. The rate of drilling is much more rapid and the larger hole made by the machine drill bit admits of a heavier charge of powder being placed where it will do the greatest execution. Occasionally a condition is found which does not require nor justify the machine drill. Thus in soft, spougy ground, the heavy blows of a machine drill simply pack the cuttings like so much hard putty, but in hard ground the machine drill finds its field of greatest usefulness aud economy. It is true that all mine managers do not agree on the relative efficiency of machine and hand drilling in shaft sinking, but it will be observed that those whose experience inclines them to favor hand work in any kind of mining, have been working in fairly soft ground. Those whose experience has been gained in very hard, tough ground will agree that the machine drill is far more serviceable and economical than the best hand work. Hard ground requires power behind the drill, and this the machine drill has. There are, it is true, conditions under which it is, perhaps, more desirable to resort to hand work, owing to the character of the ore. In a vein which is small, and much waste is broken when stoping with machines, more satisfactory work can often be accomplished by hand drilling, particularly when experienced miners are employed. A vein less than 2 feet in width with accompanying gouge, or in soft ground, can be more economically worked by hand than with machines. The practice in such cases generally is to cut out the soft ground first by picking or by blasting, if need be, thus stripping the vein, and when a sufficient area has been exposed to put in a series of holes across the vein, blasting off the clean ore with a minimum of waste. The reverse condition, when the walls are hard and the vein soft, would be treated by first cutting out and removing the clean ore, and then blasting out one wall or the other, for working room. Obviously in either of these cases a machine drill would be of little, if any, advantage over hand drilling, aud in some instances it would be a positive disadvantage. In machine drilling it is economy to run under high pressure, approaching 100 pounds per square inch at ordinary altitudes. The drill will not last as long as when operated under 60 pounds pressure, but it should do 25% more work aud this will pay for much more than the difference in the wear and tear on the machine. The disadvantage of the use of machine drills is in the cost of compressor plant, cost of the machines aud equipment and loss of time in setting up and taking down of machines. The same argument applies here as that before used—it pays to put in a compressor plant and drills if you have hard rock and enough work to do to justify it. In a certain mine the cost of driving headings by hand, cut 12 feet wide aud 10 feet high, was $16 per running foot. When machines were put in the same ground the cost dropped to $8 and $10 per foot. The cost of cutting five shaft stations, each 40 feet long, together with the ore pockets under the level, was reduced $1200 by the use of machine drills. As opposed to this the superintendent who had a gold mine in which the values occurred in streaks and cavities in a small soft vein, and who shot out twice as much hard country rock as he did ore, breaking vein and waste together, and subsequently sorting by hand underground, did not make his mine pay, though he used machine drills. His successor substituted single-hand drilling for machines in drifting and stoping, and in all other work on ore, soon found the mine out of debt and paying a monthly profit. He still retained the air plaut and used machines in shaft work, crosscutting, etc., and here they more than paid for their maintenance. The determination whether or not to use machine drills must be based, like many other questions in mining, upon the exercise of common sense.

An important influence in the matter of cost of mining with machines is found in the manner in which the drill is treated, by the miner. If he be careless, and fails to oil the machine properly, and through lack of care in starting has many fitchered holes, there will be much lost time, which means increased cost. The chuck tender, too, will increase expense occasionally by missing the chuck when he is attempting to free the bit by striking at it wi h a heavy hammer, and knocking off a few iuches of the flange of the shell. If a reasonable amount of pounding on the drill bar fails to release the bit it is cheaper to abandon the hole than to break the machine.

The Need of Foresight.

Mine management which is unable to see into the future and to anticipate the needs of a mine as to equipment and system of development is likely to prove to be extravagant. It is true that oftentimes the superintendent or manager is obliged by reason of insufficient means to do things which is contrary to his judgment, but not infrequently a short-sighted policy seems to direct the destinies of property well provided with money for equipment and development. Shafts are sunk in improper places; mills are located where they should not be; elevators are employed, when by a different arrangement gravity might have been taken advantage of; long tunnels are run to intersect veins or ore deposits which do not extend downward to the tunuel level. These and many other similar things are done which experience shows to be undesirable, unnecessary and often harmful to the best interests of the property. There are times when timidity influences the judgment of the mine superintendent. A fear of striking a large volume of water may deter him from running a crosscut, which in after years being run, in the face of the risk involved, disclosed as a result a valuable ore deposit. No mine manager likes to take the risk of flooding his workings, but in such a case the diamond drill will give the desired information while entailing no risk from water whatever, as the hole may be plugged. In one instance a mine superintendent, being desirous of connecting a new shaft with old workings, the upper portion of which was caved, went to great expense to surround himself with every precaution against the large volume of water he expected to strike. The workings were connected, and the old levels found completely drained by the new. This the management might have quickly learned at the expense of a few hundred dollars in the purchase and operation of a diamond drill, and he would then have the drill ou hand to continue prospecting investigations. These are only a few instances where foresight and knowledge save much time aud money.

A New Idea in Mine Promotion.

The recent rapid development of mining in Mexico has led, as may have been anticipated, to the promotion of schemes having little or no merit. United States Vice-Consul General Conley says of one of these concerns, which is advertising extensively in the United States, that it has title to no mines; has little or no development on the denounced claims, and that the pictures accompanying their prospectus and advertisement are those of another property, in which they have no interest. Among other inducements to would-be investors, and one which is calculated to inspire the unwary with confidence, is the offer of the promoters to defray the expenses of a trip to Mexico and return of any prospective investor who wishes to visit the property, provided he agrees to subscribe for a large block of stock. Such methods of mine promotion are reprehensible and do much damage to the introduction of new capital into the mining industry. It is no new thing to find mining property described in exaggerated terms, for the reason, perhaps, that in many instances the plain truth would form an unattractive propositiou for those who are seeking investment; and yet this plain truth may indicate to experieuced miners that the property was one of great possibilities. The old saying, "Mining is a gamble," has been worn threadbare. That mining to a certain extent is speculative can not be denied—so is railroading, farming, manufacturing, stock raising and almost every other industry and pursuit; but the business of mining is largely what the operators and managers of each property make it. Where there is a lack of geological, mechanical and commercial knowledge, a mining proposition is likely to become a gamble pure and simple, and the venture is most likely to prove a failure in such hands, while possessing the elemeuts of success. In undeveloped property the management should proceed with caution, and not undertake great expense that is not justified by the character aud condition of the property. Where a property consists of flat beds of ore lying at or near the surface, a deep shaft is inadvisable and a useless expense. So would be a lengthy tunnel run at a geological horizon far below the deposit. Nor would an extensive smelting plant be justified before sufficient ore were developed to, at least, pay for the plant. By the exercise of competent, experienced judgment, backed by an honest administration of the business affairs, mining is to a great extent robbed of its inhereut risks, but the extensive advertisement of fake mining schemes, where positive misstatemeuts concerning the property are made, should be prohibited. Unfortunately, generally, words of caution appearing in reputable mining journals seldom reach those who are likely to become the victims of unprincipled schemers, as this class of people do not usually read technical papers.

THE index in this number is for the issues from January 2 to June 25, 1904, inclusive—one volume, twenty-six issues. It contains over 3000 references to the contents of this one volume. The cost of this to subscribers was $1.50. Everything relating to mining and engineering, and their allied sciences, for the past half year is found therein. Probably the statement will not admit of successful contradiction when it is said that in no other way could such a compendium of information be secured and at such trifling cost. Much of what so appeared will be republished in various forms later on, but our readers, as usual, had it first. There is probably no other journal of the kind that coutains so much that is written by the men who do the things they talk about, or that is more alive to the immediate demands of the great basic industries that it represents. That this is so is attested by the universal commendation received from our myriad readers the world over, whose unsolicited testimony to this journal's great value is constantly and cordially appreciated.

THE eighty-seventh meeting of the American Institute of Mining Engineers will be held in Lake Superior iron and copper regions, beginning at Duluth, Minn., on Sept. 14. The iron mines of the Mesabi range and in the vicinity of Ishpeming, and the copper mines near Houghton, will be visited. A session is also to be held at St. Louis, Sept. 26.

A Monopoly in Mining.

In Western Australia the London firm of Bewick, Moreing & Co. have made somewhat of an innovation in undertaking the management of numerous mines which that firm does not own or control. The signal success attending their efforts in the development, equipment and operation of their own properties, may be considered as due to the careful selection of the mines and to the equally careful choice of experienced men to manage these properties. Doubtless the same care will be exercised in relation to the further selection of properties they may offer to manage, as well as in placing proper men in charge, and as long as good judgment is used in this direction success may be anticipated. In America J. D. Rockefeller is accredited with an idea which eclipses that of the London firm, in that the Standard Oil magnate is reported to be forming a syndicate with a capitalization of $2,500,000,000, the purpose of which is not only to manage all the important mines of the Universe, not taken up by Bewick, Moreing & Co., but to own or control them—excepting the Calumet and Hecla. As the latter is a copper mine, it may be that only the producers of the red metal are to be taken into the gigantic merger, but essentially some great combination of capital will doubtless undertake the monopolizing of the gold production of the world.

A Mine Jumping Case.

The "jumping" of the noted Vulture mines in Maricopa county, Arizona, the past week has attracted a great deal of attention in that sectiou, and the outlook for a long legal battle is promising. The Vulture property was discovered in 1863 and has been extensively developed and is equipped with a large milling plant. Although there are hundreds of thousands of dollars worth of development and improvements on the property, the mines were not patented, and if assessment work was not performed, the mines, nineteen in number, were subject to relocation. The laws of Arizona require the posting of an affidavit of assessment work performed, and the recording of the same with the county recorder within thirty days of the completion of the work, and the affidavit so filed is in that Territory considered prima facie evidence of the performance of the necessary work. If, however, the relocators can conclusively prove that the work was not done as required, then the affidavit is fraudulent and would be set aside by the courts. The Vulture is a large low-grade property and has had an interesting history, and numerous owners. Whether the new claimant will be able to retain possession legally remains to be seen.

THERE are few things in the operation of a mine more disastrous to the interest of all concerned than for a mine superintendent or manager to deceive himself as to the true condition of the mine. If samples are not actually representative they cannot be of great value in making conclusions. If they are too low the result is surprisingly agreeable, but this seldom happens. The reverse is usually the case, and large amounts of ore sent to mill or smelter often fail to come up to the grade represented by the carelessly taken samples. When the samples indicate a good profit should be forthcoming and loss results, owing to low grade of the ore, there is something which requires investigation. Either the sampler is at fault, the assayer is incompetent or the reduction works is responsible for failure to save the values, but investigation generally shows the trouble to lie in faulty sampling. The effect is demoralizing, and whatever the real merit of the property it is likely to do it great damage. Rich mines can stand these shortcomiugs and irregularities, but the low grade oues cannot, and suspension of all operations generally follows such mistakes in management, when under different and more careful direction success may be possible.

THE Supreme Court of Montana has unanimously decided the "fair trial bill" passed at the recent special session of the Legislature of that State to be constitutional. The law was attacked by the Heinze interests, the legislation haviug been passed through the influence of the Amalgamated Copper Co. It provides for a change of venue where either party to a suit is dissatisfied with the trial court.

CONCENTRATES.

IN Mexico the laws constitute shares held in mining companies' personal property, while the mines themselves are classed as real estate.

****

THE metric gramme, which is the unit of assayers' computation by the metric system, is equal to 15.432 grains. A gramme of pure gold is worth 66⅓+cents.

****

ALCOHOL has nearly double the expansive force of water at the same temperature. Alcohol has the same expansive force at 174° F. that water has at 212° F.

****

QUICKSILVER that has been "sickened" by lead may be cleaned by digesting with a weak nitric acid. When the lead is present in large amount it is better to retort the quicksilver.

****

A BOX to contain three tons of ordinary broken quartz ore may be made 5 feet long, 4 feet wide and 3 feet high. When level full this will hold 60 cubic feet, the equivalent of three tons.

****

THE iron mines of the Mesabi iron range of Minnesota produce a large amount of fines which are difficult and expensive to handle in blast furnaces of ordinary construction. It is the practice to briquette these fines before introducing them to the furnace.

****

THE value of second-hand mining and milling machinery depends to a great extent upon its location and upon the condition of the machinery. A second-hand mill would obviously be worth more to another mine in the same vicinity than one located at a great distance.

****

THE unit of the metric system is the meter, which was originally intended to be the one-ten millionth of the quadrant of the earth—that is, from the pole to the equator. In length the meter is equal to 39.37 inches as established by the Congress of the United States.

****

THE use of preservative paints on structural steel is advisable whether the steel is to remain exposed to the weather or is to be enclosed by brick or stone as in the walls of buildings. They lengthen the life of the material by preventing rust and corrosion by dampness or acids in the atmosphere.

****

A TANK for containing a solution of iron sulphate must be made without the use of iron nails or screws. Such tanks are made with framed lumber and the whole tightened by means of wedges. Boxes in which copper-bearing water is to be run for precipitation on scrap should be made in similar manner.

****

CONCENTRATES collected in the box beneath the end of concentrating machines may be settled, and the water caused to flow away by placing a hammer so it can be made to strike the box automatically. This causes the contents of the box to be jarred and the sulphides settle, relieving them of a large amount of the water.

****

SCHEELITE is calcium tungstate. It contains tungsten trioxide 80.6; lime 184. Molybdenum is usually present up to 8%. In addition to scheelite other tungsten ores of importance are wolframite, an iron-manganese tungstate, of variable composition; huhnerite, which is near wolfram in composition; powellite, a calcium molybdenum tungstate, and stolzite, a lead tungstate.

****

THE object of the brick arch in the firebox of a boiler is to hold the gas generated by the combustion of coal or oil in the firebox, so that air will mix with it, and it also protects the flues from sudden chill of cold air which rushes in when the furnace door is opened for firing. It also aids in restraining the escape of small particles of coal. It saves coal by holding the gas until it can burn.

****

STEEL HEAD FRAMES can be designed and constructed to meet any condition or requirement that can be met by wooden structures. They are as enduring as wooden frames and lack the liability to destruction by fire to which wooden frames are subject. The liability to damage by lightning seems small, as, although there are numerous steel frames in regions where electrical storms are common, no disaster from this source has attracted particular notice.

****

ALL concentrating machines are adjustable, and the speed of belt or number of vibrations may be regulated as well as the water feed, grade, etc. Machines must be changed to suit any change in the ore, or change in milling operations. A finer or coarser screen would make a difference in the discharge of pulp from the mortar, and this would in most instances necessitate a different adjustment of the concentrators. The same may be said of any other material change at the battery.

****

THE California State law requires that notice of assessment work on unpatented mining claims be posted and recorded, but provides no penalty for such failure. The actual performance of the work is the principal thing, and if the work be actually done the claim owner cannot be deprived of his holdings. Residence on the claim is not necessary, and a claim may be held by a resident of another State so long as the proper amount of work is performed. The work may be done by an agent. It is best, however, to post the notice of assessment work done and record the same.

****

WHEN an abandoned mining claim, or one upon which the owner has failed to perform the necessary assessment work, is relocated by another, any improvements thereon become the property of the locator, for the reason that the relocator holds possession, and whoever may seek to enter the property for the purpose of removing mills, hoists, smeltors or other fixed improvements, is a trespasser and as such may be prohibited by law from carrying out such intention. The relocator may use the machinery and buildings so acquired and convert them to his own use.

****

SOMETIMES the fitchering of a machine drill is due to the slipping of the clamp on the bar, or if the machine is mounted on a tripod, to the slipping of one of the legs. Tripods are not commonly used underground, but may be used to advantage where the roof of a stope has broken too high from the previous round to make it convenient to set up a bar. It is unsafe to employ too high a pile of blocking if the base of the blocking does not cover a good sized area. It should be built up in crib form. A machine may be set on broken rock or ore, if a substantial and wide base be provided for the bar or tripod.

****

MOLYBDENUM has been successfully concentrated by the oil process and also by electro-magnet. The ore should be crushed by rolls in preference to stamps, as the latter would have a tendency to slime the molybdenite, which occurs generally in the form of scales, and being very soft would be difficult to save by subsequent concentrating methods. Where molybdenite has been badly slimed a saving has been effected by catching the slime from the tanks which contained the greater part of the molybdenite, the coarse material being comparatively barren. For this purpose some form of hydraulic classifier should be used.

****

THE cause for the miniature explosions occurring in a crucible assay charge before fusion may be due to the presence of moisture in the charge or to too high a heat at the start. Have a more moderate fire at first and increase the heat by addition of charcoal or coke and arrangement of dampers and draughts, or, if a gas furnace, act accordingly. The fresh charge is necessarily porous and contains air in the interstitial spaces. The imprisoned air will expand under the influence of the heat and thus cause small explosions, which may occasionally be of sufficient violence to throw a portion of the charge out of the crucible.

****

ALTHOUGH XXXXX and XXXXXX exploders are more powerful and destructive than XXX or XXXX caps, they are not more dangerous to handle, as commonly supposed, for each kind is made from mercury fulminate of the same composition and strength, but the amount is increased in the higher grades of caps. Any force, whether blow or scratch, which would cause a XXXXXX cap to explode would also explode a XXX cap. In blasting operations the high-grade caps are more effective than the lower grades. They cause a more instantaneous and complete explosion of the nitro powder, thereby increasing the force of the shock and the rending power of the gases, and the amount of nitrous oxide is correspondingly decreased.

****

IF it is demonstrated that a mill method in vogue is no longer adapted to the ore the practice should be discontinued for one which will give more satisfactory results. If some one has a device by means of which he can make a saving from tailings going to waste it is a good idea to adopt it, if the loss cannot be stopped by a change in the method of treatment in the mill. Mercury traps are found inexpensive and often satisfactory adjuncts to a good mill. The fact that they collect both quicksilver and amalgam after the most careful amalgamator indicates that often a physical condition exists over which the millman has no control. The matter of coarser or finer crushing must be decided by the result of experiment. Coarser crushing increases capacity, but it may curtail loss. Finer crushing reduces capacity and may also result in loss because of increased sliming of the ores.

****

IN making connection between mine levels the work may be facilitated by sinking a winze to meet the raise. This will the more quickly secure good ventilation and the generally good result will in most cases more than offset the small additional cost of winze sinking. A small portable hoist operated by electricity or compressed air is a valuable aid in sinking winzes. Winzes may be sunk at an angle to the plane of the vein, and are often cut at as low an angle as 35°, to be used as chutes for timbers to be delivered to the stopes below. As the stope progresses upward the timber may always be delivered at the topmost floor and then taken to whatever point it is required. This is particularly useful in the square-set method of timbering, where a large amount of timber has to be handled, and it is a much less expensive method than that of hoisting timbers by means of snatch blocks from the level below.

****

AN economical "stamp mill" for crushing small amounts of very rich gold ore may be improvised by mounting a heavy, round cast-iron mortar provided with trunnions at the sides, in such a manner that it may be raised by a cam and tilted to dump its contents into a pan. The pestle should be about 4 feet long and provided with a heavy broad head that will fit the bottom of the mortar. The upper end should be attached by a small rope to a spring pole, which is strong enough to suspend the pestle about even with the top of the mortar. By this means a considerable amount of quartz rock can daily be reduced sufficiently fine to free most of the gold with the minimum of manual labor. Several pans and stout screens are required in the outfit; also quicksilver, to be used in amalgamating when panning. A valuable accessory is a grinding mortar for fine pulverizing. It will double the capacity of the plant.

****

A LARGE ore body may be stoped at low cost if only the expense of breaking down the ore and shoveling it into cars be considered. If, however, the additional expense of timbering is included, the cost is increased from 20 to 60 cents per ton, depending on the magnitude of the stope and the system of timbering adopted, as well as the cost of timber. If timbering is necessary, then it is safe to say filling must also be provided and this adds to the cost. This will be increased by superintendence, and if a shaft mine, by cost of hoisting, ventilation (generally) and drainage, beside interest charge and depreciation of plant. It is not unusual to find those interested in mines figuring upon the gross or assay value of their ore, when a long experience has shown that it is seldom safe to figure on more than 90% of the gross value. A mine statement for a period of thirty days is sometimes misleading, as it may omit many important general charges, and the expense of mining is thus made to appear less than it actually is. A mine which can be operated through tunnels can be worked at a lower cost per ton than one worked through a shaft when other conditions as to character of the ore, size of vein, etc., are similar.

****

"ROTTING IRON" is a term used in the United States Mint at San Francisco, Cal., for a process of extracting precious metals from ferruginous slags by melting with sulphur. This iron is originally derived from deposits of retorted amalgam containing base metallic scales due to the abrasion of shoes, dies, etc., in stamp mills. A considerable portion also finds its way into mint furnace slags from tongs, boods, grate bars and other tools used in melting operations. These iron slags are sent to the "sweep cellar," where they are ground in Chili rolls, and in passing through an amalgamator frequently "sicken" the quicksilver. The amalgam on being retorted leaves a "king" (button) of iron, rich in gold and silver. These iron kings are treated by the melter usually in a No. 80 crucible, a sufficient amount of sulphur being added to convert the iron into a sulphide. This is repeatedly dipped from the surface, great care being required to avoid taking up unsulphurized iron. The contents of the pot are finally allowed to cool, gradually forming a nearly perfect liquation, resulting in a king of precious metals in the bottom of the crucible. The resulting matte and the dipped iron sulphide are then returned to the sweep cellar where the remaining gold and silver are effectively amalgamated. Frequently heavy melting losses on deposits of poorly retorted amalgam are due to the base metal content.

****

THE mining law of Arizona in regard to affidavit of assessment work is as follows: "Within three months after the expiration of time fixed for the performance of annual labor or the making of improvements upon any mining claim, the person on whose behalf such work or improvement was made, or some person for him, knowing the facts, may make and record in the office of the county recorder of the county wherein such claim is situated, an affidavit * * * * that such assessment work and improvements were done and performed upon said claim, not including the location work of said claim (the location of a claim in Arizona requires the sinking of a shaft 10 feet deep, or equivalent work, as a part of the act of location, and this is in addition to the annual assessment). * * * * Such affidavit, when so recorded, shall be prima facie evidence of the performance of such labor or the making of such improvements, and said original affidavit, after it has been recorded, or a certified copy or record of the same, shall be received as evidence accordingly by courts of this Territory. The relocation of forfeited or abandoned lode claims shall only be made by sinking a new discovery shaft and fixing the boundary in the same manner and to the same extent as is required in making an original location, or the relocator may sink the original discovery shaft 10 feet deeper than it was at the commencement of such location, and shall erect new, or make the old, monuments the same as originally required. In either case a new location monument shall be erected, and the location notice shall state if the whole or any part of the new location is located as abandoned property, else it shall be void."

Quicksilver and Its Production.

The advance sheets of the "Quicksilver Production of the United States to the End of 1902" have been received from the United States Geological Survey, through the courtesy of J. Struthers, Ph. D., under whose direction the statistics and descriptive matter were compiled.

The production of quicksilver in the United States during 1902 was confined to the States of California and Texas. In 1889 production was reported only from California and Oregon. The following table shows the comparable items for the census years of 1889 and 1902:

	1902.	1889.
Number of mines	41	17
Number of operators	37	11
Wage earners—		
Average number	1,329	961
Wages	$ 881,340	$ 591,323
Contract work	23 164	(*)
Miscellaneous expenses	59,767	35,490
Cost of supplies and materials	322,267	219,622
Product (†)—Total value	1,550,090	1,190,500
Quicksilver—		
Quantity, flasks	34,291	26,464
Value	$1,467,848	(‡)$1,190,500
Cinnabar—		
Quantity, short tons	11,727	2,750
Value	$ 82,242	(*)

*Not reported. †The United States Geological Survey reports $1,467,848, which does not include 11,727 short tons of cinnabar, valued at $82,242, mined but not reduced. ‡Exclusive of 20 flasks, valued at less than $1000, produced in Oregon.

Idle mines reported for 1902 numbered fifty-six—fifty in California, three in Oregon and three in Texas. There were ten operative mines for which no production was reported, the employes being engaged in development work. Seven of these mines were located in California and three in Oregon.

The following table gives the production, in metric tons, and the value of quicksilver in various countries in the years 1899, 1900 and 1901, as reported by the United States Geological Survey:

COUNTRY.	1899.		1900.		1901.	
	Quantity.	Value.	Quantity.	Value.	Quantity.	Value.
United States	1,057	$1,452,745	983	$1,302,586	1,031	$1,382,305
Austria	536	492,021	510	499,052	525	547,513
Italy	205	246,000	260	312,000	278	361,400
Russia	362	321,814	304	270,256	(*)	(†)
Spain	1,361	1,481,229	1,095	1,193,550	754	1,105,890
Totals	3,521	$3,993,809	3,152	$3,577,444	2,588	$3,397,108

*Mexico exported 324 tons of quicksilver in 1899, 335 tons in 1900, and 335 tons in 1901. †Statistics not yet available.

THE EXTRACTION OF MERCURY FROM ITS ORES.—Mercury is extracted by heating the ore in a retort or furnace; the metal is expelled as a vapor, which is subsequently condensed in cooling chambers and collected.

Up to the present time mercury has been extracted from its ores solely by the dry process. Various chemical and electrolytic methods have been proposed repeatedly and numerous experiments made, but without commercial success.

Perhaps the development of electric current generated by water power in localities where the use of fuel is nearly or quite prohibitive will render profitable the extraction of the metal by some electrolytic process.

The principal ore of mercury is cinnabar, mercuric sulphide, accompanied at times with minute globules of native mercury. The metal may be extracted from the ore by a simple distillation, either in a retort or in a shaft furnace, and though mercury may be separated from cinnabar in numerous ways, only two methods are used on a large scale.

In present furnace practice the heat necessary for the decomposition of the ore, either with or without the admixture of lime or iron, is applied in two ways—first, by heating the ore charge in a tightly sealed iron retort, which produces the mercurial vapor undiluted with furnace gases; and second, by treatment in a large furnace, where the products of combustion come in direct contact with the ore and pass out of the furnace in the form of sulphur dioxide gas, nitrogen, and unused air, mixed with the expelled mercurial gases, from which the metal is obtained by condensation in the cooling chambers. Thus the essential difference between the two methods is that the vapors given off in the retort furnaces are entirely separate from the furnace gases of combustion. The retort method possesses the advantage of yielding the mercurial vapor in a concentrated and easily condensible form, which is more than offset, however, by the high cost of fuel and labor involved and the small size of a single charge. At present the use of iron retorts is restricted to exceptionally rich ores and mercurial soot and concentrates.

The furnaces now generally used in California are of the shaft type, into which the ore is fed continuously. There are two kinds of these furnaces—one called the "coarse ore" furnace, used for treating lump ore, and the other the "tile" furnace for medium sized and fine ores. In general they consist of a cylindrical brick shaft, into which the ore is charged at the top, while the cinders are removed at the bottom. The heat necessary for the reaction is supplied at or near the bottom of the shaft, the gases of combustion passing through the ore-column, and, together with the liberated mercurial vapors, pass out from the furnace through a pipe at the top and are led to the condensing plant. The general type of tile furnace consists of a number of narrow rectangular shafts, each having a series of tiles inclined inward and dowuward and so placed alternately on the louger sides that the fine to medium sized ore (up to 3.5 inches in diameter) will follow a zigzag path in its descent, until it is finally discharged at the bottom through the drawing pit. The ore is gradually heated in its descent by the products of combustion from the fuel burned in the fireplace at or near the bottom of the furnace.

The condensing plant generally consists of a cooliug device and a condensing chamber in which the liquefied mercury is deposited. The gases passing out from the furnace must necessarily be of a temperature higher than the boiling point of mercury (360° C.), and the mercury content of these gases by volume is often less than 1%. In addition to the products of combustion of the fuel and the mercurial vapors, these furnace gases contain sulphur dioxide, which is derived from the decomposition of the ore, which when cooled yields acid liquors that attack ordiuary materials of construction. In the construction of the condensing apparatus for the proper cooling and condensation of the mercury three factors must be taken into consideration: The distance the gas has to travel, the interior capacity of the chamber, and the area of the cooling surface. The details of adjusting the construction of the condenser to give the best results vary at each plant. The materials used in building the condensers should be non-absorbent of mercurial vapor, good conductors of heat, not affected by acid vapors or liquors, and capable of being molded into the required form. No one substance answers all requirements. Iron is a good conductor of heat and may be easily shaped, but it does not resist the corrosive action of the acid vapors, and to overcome this disadvantage the iron pipes are often protected from corrosion by a coating of cement. Brick absorbs mercurial vapors, is attacked by acids, and is a bad conductor of heat. Wood will resist acid, but is a bad conductor of heat, and cannot be placed near the furnace where the temperature of the gases is high. Glazed stoneware resists the action of acid and mercury, and may be made thin in order to offset its poor heat conducting qualities. As with the variations in the selection of the materials of construction used, so is it with the general arrangement of the condensing plant.

The Copper Deposits of Encampment, Wyoming.

The United States Geological Survey has recently published a description of the geology and copper deposits of the Encampment district, Wyoming. The author of this report (Professional Paper No. 25) is A. C. Spencer. The region investigated is an oblong area embracing 450 square miles, extending east and west across the north end of Park range. The town of Encampment and the settlements of Battle, Rambler, Copperton, Dillon, and Rudefeha, are the direct outgrowth of interest in the mineral resources of this district. Encampment, the distributing point, is 43 miles by wagon road from Walcott, on the Union Pacific Railroad. Though elevations range between 7000 and 11,000 feet, the slopes are gradual, and roads may be constructed at comparatively slight cost, so that all parts of the region are easily accessible.

The report gives the results of the first detailed study undertaken by the Survey of the pre-Cambrian rocks in the Rocky Mountain region south of Montana. Three sedimentary formations and an older series of volcanic flows are found closely folded together and intimately intruded by dark colored igneous rocks locally known as diorite. Large amounts of granite and quartz diorite also occur, but these seldom contain ore. The best ore deposits have been found in the quartzites, where the copper minerals form a cement in zones of brecciated rock, but there are other types of deposits—such as fissure veins, igneous dikes containing infiltrated sulphides, impregnations near igneous contacts, and metamorphic zones in hornblende schists that are marked by calcareous silicate minerals carrying chalcopyrite and magnetite. The dark intrusive rocks are regarded as the source of most of the copper in the ore segregations, and its concentration in veins and ore bodies is attributed to circulating waters. Copper is the predominant metal of value, although a few occurrences of silver-lead ores have been noted, and gold is found either by itself in quartz veins or in small amounts accompanying other metals. Valuable coal deposits exist and are worked for use at the mines and in the smelter situated at Encampment.

A large part of the report is devoted to a description of mines and prospects. It contains several topographic and geologic maps, and the occurrence of deposits is illustrated by forty-nine diagrams, which add to the value of the paper. It may be obtained, without charge, on application to the Director of the United States Geological Survey, Washington, D. C.

The Mines of Cananea, Mexico.*

Written for the MINING AND SCIENTIFIC PRESS.

At Cananea everything is assuming an appearance of solidity and permanency. Improvements are going steadily forward in every department. The concentrator, originally of 300 tons capacity, has been increased to 1000 tons per day, and another is well under way which will be handling another 1000 tons by the first of the coming year. This will then be the largest concentrating plant in the Southwest. The new building, as well as the remodelling of the old plant, is under charge of L. D. Ricketts, who is the Phelps-Dodge Co.'s consulting engineer and sunerintendent of their Globe mines.

The plant is equipped with every modern appliance known for successful concentration. The crusher house is situated apart from the concentrator and all ore is handled by gravity, fed by automatic feeders and finally taken by Robin's belt conveyers to bins above the coucentrator. There is a system of belts; the first takes the coarse ore to the crushers, while the fines, separated by grizzlies, are taken directly to the main belt aud dumped thereon along with the fine ore from the crushers. The whole system works automatically and economically. When completed the concentrates will be received directly into cars at the foot of the coucentrator, making the process completely automatic.

Seven furnaces are in operation at the smelter, and each month lately has marked an increase in the production of copper. For April the production was 5,400,000 pounds and in May the product was 15,000 pounds greater. The completion of the new brick dust chamber last fall has made an important saving of large quantities of flue dust that was a source of heavy loss formerly.

The camp's water supply is now conceutrated at Ojo de Agua, 9 miles east at the head of the Sonora river, and about 1,500,000 gallons daily are pumped, supplying town, smelter and concentrator. Some water from the mines is utilized, where it must necessarily be pumped out, but the several pumping crews formerly necessary are now reduced to oue, and that smaller than before.

At the Veta Grande a trausportation tunnel has been driven, connecting with a like one from Capote, and meeting under the Oversight mine. This has a total length of 6236 feet and will greatly facilitate production of ore from the Veta Grande and Oversight mines which formerly went to Capote chutes and Veta Grande chutes, near Capote. El Cobre Grande is again being worked, supplying about 100 tons per day, along with development work. Work at Puertocitos has been suspended for the present, and little is being done at Elenita, but the Elisa is working full force and with Capote supplies the bulk of the ore.

New buildings on the Mesa, the residence section, are not noticeable, though during the past year the large municipal building and the residence of W. C. Greene have been completed. This will be the residence district of the town's permanent population, the floating population preferring Ronquillo (Old Cananea) for convenience to the works. Ronquillo also has the postoffice, company store, offices, etc.

The old Democrata Co., located in the midst of the Greene holdings, and a producer, while it was yet necessary to ship to Nogales, is still a steady producer, in charge of P. Hook.

The Old Mexicana mine, at one time a heavy producer of silver-lead ore, and situated 4 miles east of Cananea, is now idle, but it is stated that work will shortly be resumed. It is owned by the L. L. Lewis Co., of California.

The Phelps-Dodge Picacho mine, near Bacoachi, 50 miles south of Cananea, is still shipping high-grade gold ore and carrying on development work.

It is reported that the Lightfoot & Howard property, near it, will change hands immediately on receipt of titles from Mexico City and that development work will be pushed rapidly. This is locally considered one of the best prospects, yet undeveloped, in Arizpe district.

Cananea, June 16.

*See illustrations on front page.

THE PROSPECTOR.

The mineral specimens from Copperton, N. M., are gypsum (calcium sulphate). No. 2 is the variety selenite.

The rocks from Churchill county, Nevada, are: No. 1, an aggregate of chlorite scales, the result of decomposition of a dark, basic rock. No. 2 is silica, and is evidently the silicification of a dike rock, probably apatite. No. 3 is trachyte, in which the feldspars and hornblende are distinctly seen; quartz is not recognized in the rock. No. 4 is felsite, a variety of acid eruptive rock.

The mineral from Lundy, Cal., is pyrite (iron sulphide); it may contain either gold or silver or both. Iron sulphide, thought to contain gold, may often be prospected satisfactorily, and tested for that metal by

roasting the pyrite and grinding the roasted ore in a mortar and carefully panning. In case of very fine gold, such as often occurs associated with pyrite, the gold may be invisible and float off in the slimes. In such case a fire assay would be necessary.

Topographic Work in Western States.

The field work of the Western division of topography, United States Geological Survey, during the season of 1904-05 will cover portions of eleven States. This work is under the general supervision of E. M. Douglas.

Under the direction of H. L. Baldwin, Jr., several 15-minute quadraugles will be surveyed in Montana. In addition to work on the 15-minute quadrangles, 200 square miles will be surveyed in co-operation with the reclamation service.

In order to determine whether mining operations at Butte cause subsidence of the surface, a number of bench marks will be carefully established with proper reference to distant points.

In South Dakota 2½ 15-minute quadrangles will be surveyed. It is also proposed to survey, in co-operation with the reclamation service, 190 square miles of area.

In Wyoming R. T. Evans will have charge of a party in the Medicine Bow quadrangle on a scale of 2 miles to 1 inch, with 100-foot contours. This sheet includes several mining areas, among the best known of which is that about Centennial. R. B. Robertson will connect the triangulation from the Colorado positions with those in northwestern Wyoming, carrying it across the southern portion of the Bighorn Forest reserve.

In Colorado, F. Tweedy, assisted by Pearson, Chapman, Moore, and Buell, will complete the topographic survey of the Blackhawk 15-minute quadrangle. They will also finish three special maps of the mining areas about Central City, Idaho Springs, and Silver Plume.

Work in California and Oregon will be under the direction of R. B. Marshall. The Iron Mountain special quadrangle will be completed by A. I. Oliver. Work in co-operation with the State will be continued in the Sacramento Valley, where it is planned to survey five 15-minute quadrangles. The oil center special sheet will be completed and the Bakersfield 15-minute quadrangle continued. Two 15-minute quadrangles north of San Jose and Mount Hamilton will be surveyed.

The survey of the Grant's Pass quadrangle in Oregon will be undertaken by A. I. Oliver and E. M. Fry. The Telocaset quadrangle will be completed by W. C. Guerin.

In Washington work on the Pullman quadrangle will be continued by L. C. Fletcher. A. H. Sylvester will complete the topographic survey of the Mount Adams quadrangle.

In Utah A. E. Murlin will complete the survey of the Gilbert Peak quadrangle, comprising a portion of the Uintah Forest Reserve. The survey of the Frisco quadrangle, which includes the Horn Silver district, will be commenced.

A. Stiles will complete the topographic survey of the Van Horn 30-minute quadrangle in El Paso county, Texas, and commence the survey of a 30-minute quadrangle to include the principal oil wells in and about Beaumont. The Bonham 30-minute quadrangle will be completed by F. McLaughlin.

During the fall and winter of 1904-05 topographic surveys will be extended, under direction of T. M. Bannon, near Phœnix and Mesa, Arizona. Surveys in charge of R. T. Evans will be continued in the Grand Canyon. A special map covering the Tombstone mining district will be made by R. H. Sargent, who is at present in China engaged in making surveys for the Carnegie Institution.

Surveys in New Mexico will be carried on under direction of R. H. Chapman. These will include the Socorro 15-minute quadrangle and the extension of triangulation southward and eastward from the Gila river forest reserve. It is planned also to measure a base line in the vicinity of Socorro.

A Coal Loading Machine.

Coal mining is one of the most important industries of the United States. It gives employment to hundreds of thousands of miners, and were it not for the introduction of mechanical devices in the mining and handling of coal it is doubtful if the rapidly increasing demand could be met. The first important innovation in coal mining was made twenty years ago by the introduction of the coal cutting machine. It was not well received by the miners, who regarded it as encroaching upon their domain, but since then higher wages have been paid them, and the selling price of coal is at least 20 cents per ton lower than it would have been but for the coal cutters.

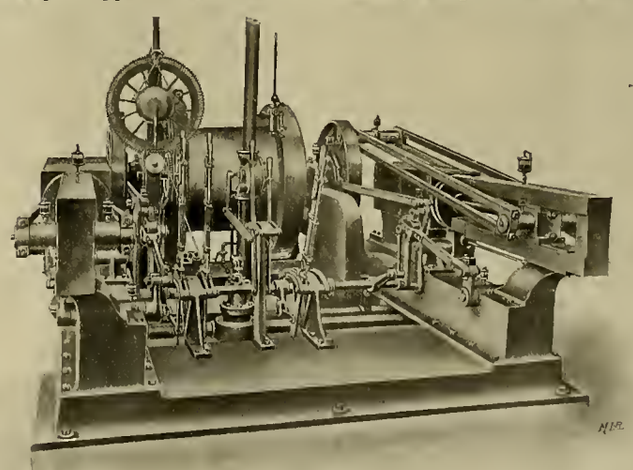
More recently electricity and compressed air have entered the mine and now an automatic loader is taking the place of the shovel. Under the direction of one man and a helper, said the manufacturers, it can do the work of ten shovelers. Its work is regulated by one man, who stands at a lever and directs its movements. It is stated that it can load 20 cubic feet (1000 pounds) of coal per minute, that it fills a two-ton car in four minutes. With one helper it can, it is claimed, send out the loaded car and bring back an empty one and clean up a room of twenty tons in one hour, and load and send out 120 tons from six rooms to the main entry in eight hours without the help of mules. To load this amount of coal requires the hard work of ten shovelers.

The accompanying photograph represents one of ten machines built for Joseph Leiter of Chicago for his mines at Ziegler, Ill. This machine is the invention of W. E. Hamiltou of Columbus, Ohio. In its operation the coal is gathered by a sweep, consisting of a special type of scraper-conveyor, so pivoted on the vertical head shaft that it may be oscillated through a sufficient angle to reach the coal across the entire face of the room, and at the same time accommodate itself to the surface of the floor. The lower end of this sweep consists of a hinged gathering plate, which is forced under the edge of the coal pile, thus bringing the coal in contact with the flights of the conveyor. These scrape it through a trough to the head, where it is discharged into a second conveyor of the apron type. This serves the double purpose of a picking table and conveys the coal back to the pit car. The sweep, which is forced under the coal by an automatic feeding mechanism, passes from one side of the room to the other and back, gathering coal as it passes in both directions, the machine being forced forward by its own power under control of the operator. The entire machine is carried by a steel truck which is self-propelling. The same truck carries a pair of drums connected to the motor by gears and clutches. These carry wire cables, which, passing over a snatch block at the cross entry, form a tail rope system for delivering empty cars to the machine and hauling the loads to the entry. The machines, as built for Mr. Leiter, are driven by electric motors, but can be equipped with either compressed air, gasoline or steam engines, and worked in veins of coal as low as 4 feet. While this machine will be used chiefly in coal mines in the East, it is thought it will be of service in many metal mines in the West, and can be used as well for loading ore, crushed stone, salt, and coal in yards, or on wharfs to cars or vessels. The machine is made by the Hamilton Manufacturing Co. of Columbus, Ohio.

Automatic Coal Loading Machine.

A Small Direct-Acting Hoist.

Henry Bolthoff, of the Hendrie & Bolthoff Manufacturing & Supply Co., of Denver, Colo., mining machinery, designing and constructing engineers, has recently brought out a new first motion hoist, built in small sizes only. The distinctive feature is in building in a self-contained frame a first motion hoisting engine occupying about one-half the space origiually occupied by such machinery. By examination of the accompanying engraving it will be seen that the cylinders are located at the drum end of the hoist. In order to accomplish this it has been necessary to make an extended crank pin and use a double connecting rod. The first impression of engineers may result in a critieism of this long crank pin and the assertion that this is a serious defect. However, in actual practice, such, the manufacturers say, has not been the case, and already this engine has been installed on a large number of properties in Colorado and Arizona and is said to be giving universal satisfaction. It is equipped with a reversing device of new design using a single eccentric for the control of each valve. The guides are square-box type, made in one piece, and the cylinder is encased in a square jacket with metal lagging. This engine is equipped with Bolthoff's automatic signal alarm indicator, having an attachment which can be set so as to stop the hoist automatically at any desired point, for instance, to prevent the cage being hauled into the sheave by overwinding. This device can be seen in the engraving. From the small sheave wheel below the dial a small wire leads to a quick-acting whistle-valve, operating the exhaust control with which these hoists are equipped. When the cage passes the danger point the indicator trips a releasing catch, dropping a weight which in turn operates the whistle valve, closing the exhaust of both cylinders instantly, thus bringing the engine to a dead stop. These hoisting engines are built in both single and double drum types, are equipped with post brakes, and the workmanship is above the average. By reference to the cut it will be seen that the



Small Direct-Acting Hoist.

length over all of this hoist is only about one-half of the length of a hoist of the same build in the older form. This reduces the cost of foundation material as well as the first cost of the hoist. It makes a simple and compact type of engine especially adapted to the lighter work. At the present time there are but four sizes in operation, as follows: 7x21, 8x24, 10x30, 12x36. These hoists are being manufactured and sold by the Hendrie & Bolthoff Manufacturing & Supply Co., Denver, Colo.

The Young Quartz Miner.

Written for the MINING AND SCIENTIFIC PRESS by MATT. W. ALDERSON.

PART I.—TOOLS NEEDED. HOW TO SHAPE, SHARPEN, HARDEN AND TEMPER THEM.

Some time since I received a letter from a young man who had completed his common school education and who plans this coming year to take a course at the State School of Mines of Montana. In the course of his letter he says:

"Cau you help me by suggesting how I can best get a good, practical kuowledge of quartz mining? I found that the short time I had spent as clerk and delivery man in a grocery store was a very great aid to me when I went to business college. I completed the course in half the time taken by many others. It seems to me that a few months actual work in a mine would help me in comprehending the course at the school of mines. I tried to get a chance to work in the B—— mine, but the foreman told me that the miners' union made no provision for apprentices, but required that all persons working in the mine be paid full wages, aud that orders from his employers were that he employ none but skilled help. So he couldn't give me a chance. I tried to find something about the use of tools iu the fine mining library we have here, but all the writers seem to 'shoot too high' for me. The only suggestion I found was that the prospector should have worked in some mine in the section he thinks of prospecting."

Recognizing that there are other youug men having the same ambition as the writer of the above, I give a geueral, open answer.

The young man who seeks to become a miuer should seek employment in a small mine. In a large miue the help is always classified, men being put at the kind of work at which they are found to be most efficieut. This is not possible in a mine where there are but a few men employed; for each must lend a hand at different things, as occasion requires.

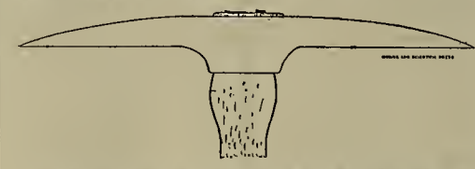
If the young man kuows of some one who has claims needing representation, a good plan is for him to take a contract to do the work and hire a skilled workman to help him. He will do well to select a man well aloug in years. The man of age may not be so active, and so one may be apprehensive that he will not be able to do as much work as some younger man; but, if the old man is a man of experience, and at least ordinary intelligeuce, the chances are that he will do more aud better work than a younger man, because he has learned to handle himself so as to do his work with ease and to the best advantage. The young man should bear in mind that this is his opportunity to learn, and he should select a helper capable of doing the work well and willing to tell how he has learned to do certain things in the easiest, best way.

If the young man cannot get the job of doing the representation work, possibly he may get employment from the man who does.

Having secured an opportunity to work, he must first familiarize himself with the tools. If he has secured a contract, he must know what tools he will need, so he may obtain them by purchase or otherwise. For awhile, at least, he will be a helper, so there will be but one miner. The necessary tools for this man will be oue shovel, two picks, one sledge, one striking hammer, fifteen drills in varying lengths, from 12 inches to 3½ feet, oue spoon and one gad, a large and small water can and some gunny sacks, the latter for making "mops" to prevent the mud from spattering wheu drilling wet holes. Other tools may be advisable under certain conditions, but the above are absolutely necessary. Fewer drills may be ueeded in soft rock, but in ordinary rock these are as few as will enable a man to work to advantage, aud in hard rock he should have not less than thirty. Do not cut too many short drills; the long "starters" soon become too short.

The size and shape of the tools are important to know. For all-round-work the shovel selected should be a loug-handled shovel with round pointed blade. The length of this shovel will be 5 feet from end of haudle to point of blade. For work in a shaft or drift this handle will be too long. It is made the required length by cutting off whatever may be necessary to suit its length to the place where the work is being done.

Ready-made picks are in general use in quartz mines in the West, preference being given to those all steel and weighiug five or six pounds. The six-pound is the weight in most general use in development work, the lighter weight being used in raising and stoping. Most illustrations picture quartz miuers swinging a crescent shaped pick, but one never sees such a sight in a Western mine. Picks used in quartz mines have the points straight out from the handle on the under side, the upper edge curving toward the ends to meet the point. They assist the reach and enable one to get into corners that could not be conveniently reached with a curved pick. (See sketch of pick).



The writer has had one man in his employ who used a single-handed striking hammer weighing seven pounds, and another whose hammer weighed four pounds, with a handle 16 inches in length; but the hammer favored by the majority of miners weighs 3½ to 4 pounds and has a handle 12 inches long. The hammer for double-hand work should weigh 6 to 6½ pounds and have a handle 2 feet in length. The sledge for general work should weigh 8 or 10 pounds, the lighter weight being the one most frequently preferred.

The spoon is made of a round bar of iron ⅝ inch in diameter and 40 inches in length. One end is flattened and formed into a half cylinder about 6 inches of its length, a half inch of which is turned up to form a scoop-like point, which is utilized for removing the pulp made in drilling a hole. The other end is drawn to a narrow flat point, useful in loosening and cleaning holes where the pulp does not crush easily, but packs, as when one is drilling a dry hole in clay.

Drills for single-hand work are of ¾-inch or ⅞-inch octagon steel; for double-hand work, ⅞ inch or 1 inch.

The young quartz miner who seeks to master his business and qualify himself for managing a property where numbers of men are employed, should certainly know how to shape, sharpen, harden and temper his tools. He will then know whether he may excuse a man who pleads that his drills were improperly sharpened, etc. His shop, in starting, should contain not less than a forge and good bellows, an anvil with hardy, a pair of gad tougs, a blacksmith's hammer and a tool hammer. All of these can be purchased at any hardware store in a mining section, and all will be ready for use but the hardy, which will need tempering. Good work may be done with either coal or charcoal as fuel. Coal containing much sulphur is inferior to charcoal.

It is important that a cutting tool be well shaped, also that it be sharp, and it is of vital importance that it be properly tempered. The tempering quality of steel is due to the presence of ¾% to 1¼% of carbon in the material, which gives it the power of possessing decided hardness simultaneously with a valuable degree of toughness. The carbon is thought to be dissolved in the iron under the influence of red heat and to be held in place by cooling.

To follow the usual instructions for tempering steel requires much more time than most blacksmiths can give. A man skilled in tempering may temper drills for a contest, but the smith who has 100 or more drills to sharpen in an eight-hour day is not likely to take the time that tempering requires. I have seldom known a mining blacksmith to temper drills—his practice is usually simply to harden them—though I have books in my library and a number of clippings from mining journals which say that tempering is what must be done and which tell just how to do it. Neither have I known a blacksmith to follow the system for tempering given in any work I have. I will describe, then, methods in use in my section, and the reader is at liberty to follow them, or otherwise, as his judgment dictates. But they are short methods, of proved excellence, and "time is money" in tool sharpening, as in everything else.

In working steel, the novice must be cautioned against heatiug the metal to too high a degree, for by so doing he is apt to drive the carbon from it, thus rendering it valueless. As steel is heated, it first assumes a dark red color; as it becomes hotter it is cherry-red; still hotter, it becomes yellow; hotter still, it becomes a pale color called a "white heat." The heat should never be raised beyond the yellow stage, except for welding, and when the metal has reached that point it should be worked and not be allowed to remain in the fire. In shaping drill bits, the blacksmith handles his steel quickly, and, giving the bit a few blows on one side, turns it over and gives a few on the other. This is to keep the grain of the steel straight and prevent it from becoming granulated. If iron be bent back and forth when cold, the fibers separate and the metal is soon broken, as any one can see for himself with a piece of wire. Blows on the steel, then, are struck so as to keep it going towards the point without its being bent back and forth.

(TO BE CONTINUED.)

GERMAN CEMENT manufacturers have adopted the following as the definition of the term Portland cement: "A hydraulic cement having a specific gravity when calcined of not less than 3.1 and containing by weight not less than 1.7 lime to each part of silica + alumina + ferric oxide, the material being ground raw, calcined to clinker and then pulverized to proper fineness."

Pan Amalgamation at Rosario, Mexico.*

NUMBER III.—CONCLUDED.

Written by A. E. DRUCKER.

The thickness of the pulp in the pans is a very important thing with pan amalgamation. If the charge is too thin, quicksilver will not be kept in suspension and will settle to the bottom of the pan, resulting in very poor amalgamation. The charge will also become cold, which should be avoided. On the other hand, if the pulp is too thick it will become too hot (caused by friction of the particles) and floured quicksilver will result. To attain the proper thickness for a charge, add water until the pulp will run with difficulty out of a dipper. Particles of quicksilver should be seen coming to the top and circulating all through the pulp. The mercury should always be added through a bag, so that it can be finely distributed throughout the pulp. By doing so it takes less to do the work and consequently there will be a smaller loss through flouring. If quicksilver is poured into the pans in a solid mass, it will all go to the bottom and will have to be worked up through the charge gradually. This method takes longer for the particles of Hg to distribute and mix thoroughly with the pulp; also a greater quantity is required.

The temperature of the charge is an important thing, and if over 180° F., quicksilver becomes very active and thin, causing a large amount to be floured. The temperature is about right when a person can just stand the heat, when putting the hand into the pulp. When the temperature is low the mercury is less active and amalgamation goes on slowly.

The speed of the muller should not exceed 75 revolutions per minute. A greater speed is sure to split up the quicksilver so fine that flouring will take place. Less than 65 revolutions will result in the charge becoming cold and steam heating must be applied, if the pulp is run thin. The higher the speed and the thicker the charge, the greater will be its temperature. If double discharge mortars were used with fine screens, so as to do as little grinding within the pans as possible, a great saving in quicksilver would result.

WORKING OF SLIMES IN THE PANS.—Slimes, if worked in the pans, take twice the amount of bluestone and salt required with the ordinary coarse sands. The same amount of mercury is needed. Slimes swell on adding water, and small amounts must be put in the pans. The muller is raised (no grinding) and the chemicals added and run for two hours; then Hg is added through a bag and run four hours. The loss of mercury with slimes is twice as great as with ordinary coarse sands. Slimes should be mixed with coarse sands to do good work.

RESULTS WITH TAJO ORES.—The average loss in quicksilver per ton of ore worked was 1.6 pound with very base ore containing large quantities of galena, zinc blende and some copper and iron pyrites. The value of ore was from 4 to 6 ounces of silver per ton and from 0.25 to 0.40 ounces of gold per ton. The extractions for silver were from 60% to 70%, and for gold 80% to 90%. This low-grade proposition was made to pay, and the loss of mercury was cut down from 150 flasks to 90 per month. Formerly the loss was 2.5 pounds of mercury per ton of ore worked and now the loss is 1.6 pound. It has been the practice to run the pans at 90 revolutions a minute, the settlers at 16 and 18 revolutions, while the amount of bluestone used was from 2 to 3 pounds. One gallon of mercury was used for each charge. The charge was ground for 1½ hours and amalgamated 3 hours. Formerly the ore was less base with higher values in gold and silver, the bullion being very base with half copper. The reason for this was the large excesses of bluestone used.

Now the pan mullers are running at 75 revolutions, the settlers 13 revolutions, and the amounts of bluestone for each charge varies from 10 to 14 ounces. Twenty pounds of salt are used in each pan, and a litte lime (1 pound per charge) to counteract the excess of bluestone. Sodium and zinc amalgam are used with the quicksilver to clean it and keep it active. These changes account for the reducing of the loss of quicksilver along with better extractions and the obtaining of almost pure bullion. The amount of mercury used in each pan was two quarts, added through a bag. The ore was ground for two hours and amalgamated for two hours more. The sixty stamps had a capacity of 180 tons in 24 hours, and 180 charges were run through the pans during 24 hours. Two agitators were formerly used to catch some of the lost mercury from the tailings. Now they are unnecessary and do not pay for themselves.

If the discharge boxes on the settlers are lined with copper sheets and amalgamated, almost all floured quicksilver escaping will be caught on the plates, and no agitation here will ever pay for itself. I believe also in lining the upper part of each settler with copper sheets, which would certainly catch a great deal of floured quicksilver, otherwise lost with the tailings.

The best form of shoes for the settlers, after experimenting with all shapes, are those made of cast iron, 4 inches high, as in Fig. 1, being hollow in the

* Abstract Cal. Jour. Tech.

center with no grinding surface at the bottom. These shoes give fine results and very little quicksilver was lost from the settlers. Wooden shoes of the same form, but having a grinding surface, did fairly well while they were 4 inches high, but as soon as they were worn below 4 inches the settler would not clean itself of the heavy sands and concentrates. If higher than 4 inches and the settler making 13 revolutions per minute, floured quicksilver would be thrown out and lost. The following forms of shoes do bad work and cause a large loss of quicksilver. No. 2 shoes may be used, when working heavy concentrates in the pans, for the settlers. They give excellent results, and very little floured mercury is lost after the speed has been adjusted. No. 3 shoes cannot be used, since they throw out large quantities of mercury. No. 4 is sometimes used with ordinary ores, but they have a tendency to keep the quicksilver up, causing floured mercury to escape in large amounts. Nos. 5 and 6 forms are not satisfactory and cause losses. No. 2. cannot be used on Tajo ordinary ores; they are only good with heavy concentrates.

Fig. 1

Fig. 2

Fig. 3

Fig. 4

Fig. 5

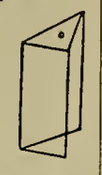


Fig. 6

The process of pan amalgamation is a very complicated one and requires skillful operators, if the loss of quicksilver is to be kept at a minimum. One must know what chemical reactions take place in the pans so as to know where to look for the losses of quicksilver.

Metallurgical Practice of the Witwatersrand.*

Written by H. S. Denny.

REPLY TO DISCUSSION.

In July last, when I presented my "Observations on the Metallurgical Practice of the Witwatersrand," I took occasion to remark in my conclusion that I had laid myself open to severe treatment at the hands of my critics.

In my replies to the many points that have been raised in criticism of my paper, I propose to deal with each member's remarks in the order in which they appear in the Society's Journal.

J. R. Williams begins, under the heading of "Sorting," by taking exception to my use of an all-round figure of 80% extraction from all sources.

He does not say that he objects because such a figure affects the comparison which I am trying to make, but he takes it on the specific ground that 80% is too low a figure, and one likely, therefore, to be misleading. He admits that later, in dealing with extraction by the cyanide process, I take a higher and correct figure, and he would have me take something nearer 90% in the comparison of sorting versus non-sorting.

For the purposes of comparison it would have been misleading to base it on a 90% extraction, as my figures are drawn to deal generally with the averages of the majority of the mines, and this majority does not treat its slimes, and certainly does not average 90% extraction.

In proof of this statement, I need only point out that in 1899, out of seventy-three producing mines, only twenty-two were treating slimes, while to-day, if all the companies with milling equipment were running, the disproportion would still be very great.

The following statement shows approximately the relative extraction as between the treatment and non-treatment of slimes on a basis of 100 tons of ore giving a 10 dwt. value at the screen:

NON-TREATMENT OF SLIMES.

Extraction by amalgamation, 5 dwts. per ton equals	500 dwts.
Extraction from sands—assume:	
No. 1—75 tons of sand treated carrying 400 dwts. = 5.3 dwts. per ton.	
No. 2—80% extraction equals	320 dwts.
Total	820 dwts.
Equals 82% extraction.	
Recovery by amalgamation, 63%.	

TREATING SLIMES.

By amalgamation as above, equals	500 dwts.
By sand treatment, equals	320 dwts.
By slimes treatment:	
25 tons at 4 dwts. and carrying 100 dwts., allowing 80% extraction, equals	80 dwts.
Total	900 dwts.
Equals 90% extraction.	

Naturally, the relative extraction by the three processes would vary considerably according to the particular mine from which the ore was taken. I have based the figures on a recovery by amalgamation of from 60% to 66%, independent of recovery from slimes. In both cases allowance must be made for losses in retorting, smelting and the handling of zinc slimes.

It is clear that in the foregoing comparison there is much to be gained in percentage extraction by the treatment of slimes. The question is, however, to gain that increased extraction in a plant that gives low initial outlay and low working costs. This point I touch upon in my original paper.

The point, however, which I wish to emphasize is that my figures are taken to represent more the general than the individual aspect, and I do not think it correct to take either the best or worst returns from the producing mines, but something midway that can be used as a framework on which to establish any variation, but not one that necessarily applies in particular to every case.

I therefore think Mr. Williams is wrong in suggesting that I should have taken 90% rather than an 80% basis for my sorting comparisons.

To illustrate, however, what bearing 70%, 80% and 90% extraction would have on the above comparison of sortiug and non-sorting, I submit the following statement, which shows that the higher the percentage extraction the more favorable becomes the case for sorting:

NON-SORTING.

	Per ton.
No. 1.—70% extraction.	
Working costs	24s
Value	50s
Extraction	35s
Profit	11s

Profit on 4,000,000 tons = £2,200,000. Present value of that amount at 5% c. i. over 22.2 years, £751,520.

	Per Ton.
No. 2—90% extraction.	
Working costs	24s
Value	50s
Extraction	45s
Profit	21s

Profit on 4,000,000 tons = £4,200,000. Present value of that amount at 5% c. i. over 22.2 years, £1,434,720.

SORTING.

	Per Ton.
No. 1—70% extraction.	
Working costs	28s 10½d
Value	60s 00
Extraction	42s 00
Profit	13s 1½d

Profit on 3,200,000 tons = £2,100,000. Present value of that amount at 5% c. i. over 17.7 years, £885,675.

	Per Ton.
No. 2—90% extraction.	
Working costs	28s 10½d
Value	60s 00
Extraction	54s 00
Profit	25s 1½d

Profit on 3,200,000 tons = £4,020,000. Present value of that amount at 5% c. i. over 17.7 years, £1,695,435.

The figures for 80% on the above basis are given in my paper. Summarized, we have the following:

PROFITS—NON-SORTING.

No. 1—70% extraction	£ 751,520
No. 2—80% extraction	1,083,520
No. 3—90% extraction	1,434,720

SORTING TWENTY PER CENT.

No. 1—70% extraction	£ 885,675
No. 2—80% extraction	1,290,585
No. 3—90% extraction	1,695,435

DIFFERENCES IN FAVOR OF SORTING.

No. 1—70% extraction	£134,155
No. 2—80% extraction	207,065
No. 3—90% extraction	260,175

Milling.—Under this head Mr. Williams states that there is every special differentiation of feature in Witwatersrand ores, from the Robinson to the Heriot, necessary to warrant extraordinary variation in the mesh of mill screening, and he cites as an instance the Ferreira Deep, where, after many experiments, 1000 mesh has been finally adopted as the most suitable.

I feel certain that in the case under notice, with the assistance of a simple classifier, after the mill pulp has passed over the plates, and fine grinding and cyaniding of the heavier product, the necessity for reducing to 1000 mesh in the mill could be avoided, while simultaneously the mill capacity would be largely increased and the total extraction quite as high, if not higher.

Mr. Williams says the gold was found to be encased, and that for this reason the finer mesh was employed. At the Meyer and Charlton the same difficulty was met with, and it was remedied by putting in a few settling boxes, the heavy product from which was subjected to cyanide treatment for twice or three times the period adopted for the sands, with very satisfactory results. Fine grinding would doubtless improve these results, and this step will be taken eventually.

From the many investigations made by me into the condition of Central Rand residues, I think the case Mr. Williams cites is one that favors classification or concentration rather than finer screening in the mill, and I think he has confused the virtues of the two operations to the detriment of his results.

We shall only be in a position to definitely state what mesh the mill should be fitted with when we have determined the exact limitations of milling and grinding, and I regret that these two factors have not yet been ascertained, and therefore the point calls for further inquiry.

To Mr. Williams' query, "May not finer crushing be one of the necessary variations?" I say I think not. Fine grinding is what I pin my faith to.

I do not say that differences in mesh may not prove to be necessary, even when we have clearly defined on each particular mine the practical limitations of milling and fine grinding, but I do say that in view of our ignorance of these limitations to-day we cannot claim to have sufficient information on the point to determine definitely what the correct mesh should be. For instance, Mr. Williams uses, as before stated, a very fine mesh at the Ferreira, but I think that in the light of further knowledge on the virtues of milling and fine grinding it is probable that he will ultimately reduce it to something say from 200 to 400. I am certain that, even with fine grinding, the virtues of milling will vary as between a Roodeport ore and say a Central Rand ore, but I am equally certain that we shall never find it necessary to make the mill the means of reducing to anything finer than a 400 mesh.

To-day there is more than one flint mill actually erected on the Rand for the specific purpose of regrinding classified products from the mill, and this is taugible evidence that the whole question of slimiug by this means is to be put to practical proof.

Amalgamation.—Under "Amalgamation" Mr. Williams says that he would like figures to substantiate my statement regarding the percentage of extraction by amalgamation as from the west of the Witwatersrand towards the east, and the following table, grouped in three sections, will, I think, satisfy him on that point:

MONTH OF AUGUST, 1903.	Recovery.
From west going east to the Langlaagte Estate	69.24%
From the Langlaagte to the Geldenhuis Main Reef	63.76%
From the Geldenhuis Main Reef going east	60.97%

If the recovery from the slimes plant be omitted from the calculation, the percentage recovery by amalgamation would be in the same month:

	Recovery.
From the west going east to the Langlaagte Estate	70.35%
From the Langlaagte to the Geldenhuis Main Reef	66.13%
From the Geldenhuis Main Reef going east	63.34%

The amount of mercury used per ton of ore crushed is near .075 ounce.

Slimes.—The operation of our separation at the Van Ryn mines is conducted mainly in one conical-bottomed vat, 35 feet in diameter and 21 feet deep. The whole of the slimed pulp coming from the cyanide plant is led into the center of this vat, and from the bottom of it a product of 20% (dry slime) is continuously taken off and led to the slimes plant. I may say that this product occasionally runs up to about 30%. The original pulp coming into this vat runs about 3%, and it will be seen, therefore, that the bulk of our water is separated in one operation, independently of the slimes—that is to say, that if for any reason the slimes plant should be stopped, our water separation does not in auy way suffer.

At the Bonanza mine the first separation is made by a series of pointed boxes, the under discharge from which carries about 12% of dry slime. This product is then led into the first slimes vat, where further water is separated after settlement of the slime by decantation. If for auy reason the slimes plant should be stopped and out of operation, the only separation of water that is obtained is from the pointed boxes, which, it is obvious, is considerably less efficient than that from our main tank

If 1050-pound stamps were fed with ore not exceeding in average ½-iuch cubes; I believe that, without increasing either the speed or the drop, the capacity of such a battery would very nearly approximate the work done by 1250-pound stamps on ore averaging 3-inch cubes.

Under "preliminary breaking," I suggested that all the ore should be reduced to about ½-inch cubes before entering the mill, and this, I believe, will eventually become general practice, thus doing away with the necessity for the classification referred to.

On West Australian methods the tendency appears to be to slime everything and to treat the pulp after amalgamation by a simple agitation method in one operation. This is surely a less complicated procedure than our existing one. A good deal has yet to be learned of the possibilities of spitzlute work, and upon the acquisition of more definite data on this point will depend the termination of the advantages of sliming everything, as against sliming only a classified portion of the mill pulp.

H. Leupold suggests that sliming to 1600 mesh would be cheaper and just as satisfactory as sliming to 40,000 mesh. I can only say that my experience in my experiments, the results of which I have given you, does not support this view. In West Australia, in using flint mills, it is stated that the larger percentage of the product will pass through a mesh of 220 holes to the linear inch. No screens are used on the machine, and, once it is set, that product must be constant. In practice the slimes are passed through a classifier after leaving the flint mill, and anything closer than about 200 holes to the linear inch is returned to the flint mill.

Mr. Leupold goes on to say that the oscillating copper plates proposed by A. M. Day might be tried with advantage. In my experience thus far, any amalgamated plate such as that suggested shows scouring, and considerable flouring of amalgam and mercury results. The best amalgamator has so far been represented in the stationary plate.

In the matter of agitation, I think that revolving barrels can be dispensed with, and, in some interesting experiments in which the agitation was done in montejus, I have obtained results so satisfactory that it has been decided to dispense with the revolving barrel.

*Abstract Jour. Chem., Met. and Min. Soc., S. A.

Magnetic Separation.*

Written by F. T. SNYDER.

Everyone is familiar with the simple fact that a magnet will pick up small pieces of iron; many persons are familiar with the fact that sufficiently powerful magnets will attract a large number of materials in which the presence of iron is, at least, not in evidence, but few persons realize that the design of magnetic separators and the practice of magnetic separation have developed to a point where it can be stated that there is no material which cannot be moved by magnetism if the commercial conditions under which its movement is desired will permit of the necessary expenditure. For many materials this cost is usually prohibitive, but, as a curiosity, pieces of wood, apples and other things generally considered magnetically inert, have been moved through distances of several inches.

In the early days of magnetic attraction, previous to half a century ago, it was generally thought that the law of magnetic attraction was simple, and even quite recently it has been stated in text-books that the attraction of a magnet for a movable particle varied directly as the strength of the magnet and inversely as the square of the distance. This, in common with the other simple laws of natural phenomena, has proved to be simple only under theoretical conditions which are not secured in practice. However, the law of movement of a free particle in a magnetic field was understood and perfectly formulated at least half a century ago. In such formula the distribution of the field is assumed as known, while it is from this factor that the complications in the theory of magnetic attraction usually occur.

The early types of magnetic separators consisted of a straight-bar permanent magnet, or an equally simple electro-magnet. The material to be separated was either touched by one end of this bar or allowed to fall near it and in that way dragged out from the non-magnetic material. From this were developed uumerous types of machiues, similar in theory but better in mechanical form. Two troubles which developed were, first, the entanglement of non-magnetic material by the material attracted, and second, the question of getting the attracted material off the magnet again so that the magnet could operate continuously. Most of these machines were weak and applied to highly magnetic materials only and as the results were indifferent, the commercial growth of the industry was slow. During this time —that is, in the period of the last twenty years—the question of magnetism has come to be relatively very well understood in connection with the design of dynamo machinery, and as the necessity for magnetic concentration was urged with more and more persistency, it eventually fell into the hands of competeut dynamo designers. The result was magnetic separators of greatly increased power, and from them has developed a knowledge of the design of such separators which makes it possible to-day to build a separator which will handle practically all materials, the limit being that the more difficult the material is to handle the greater will be the cost of the machine, and consequently the less return commercially. This great advance in design was largely due to the conception of a magnetic field as made up of lines of force which are assumed to emerge from a pole piece of one polarity and pass through the air to a pole piece of opposite polarity. In the production of this magnetic field the conditions are similar to those in an electric circuit, the magnetism produced being the equivalent of the current. The magneto-motive force due, in electro-magnets, to the current circulating in the windings of the coil, is the equivalent of the electro-motive force in the electric circuit, while the resistance of the magnetic circuit is analogous to the resistance of the electric circuit. It was early seen that a large portion of the cost of exciting a magnet was due to the resistance of the parts of the magnetic circuit at which the lines of force were compelled to jump through the air, air having a very high magnetic resistance as compared with iron. In an endeavor to reduce this resistance, the air path was shortened by bringing the magnet poles close together. Iu the early types of machines the material to be separated was passed through the field in such a manner that both of the poles were on the same side of the material, so that in falling the material passed through the loops of the lines of force twice. It was this looping of the lines that led to the entanglement of the non-magnetic materials with the magnetic materials, and it was this entanglement that eventually led to the abandonment of this looped field type of machine for the type where the material to be separated passes between the poles and through the magnetic field but once, and, in consequence, escapes entanglement.

The freeing of material which had been attracted was at first secured by means of scrapers, and later by reducing the field at the point where the material was desired to be freed; but it is now generally obtained in the best machines by reversing the magnetism, produciug a neutral point at which all material of whatever attractability is dropped. So well have the principles of the design of a magnetic separator come to be understood that a difference of magnetic susceptibility now offers in many cases a way of concentrating minerals other than the customary way of taking advantage of the difference in specific gravity.

From its highly attractable property and from its low value, which prevented ordinarily any other method of concentration, iron ore has naturally been a special field for magnetic separation. This has been with two specific euds in view—one the enrichment of a low-grade iron ore for the purpose of reducing the freight to a furnace, and also the furnace cost of operation per unit of iron smelted. The other use has been to free the iron from deleterious materials, such as titanium, phosphorus and sulphur. Where these occur in separate crystals which can be liberated by crushing the iron ore, the resulting separation is one which frequently proves commercially feasible. In the case of sulphur, the success depends on the fact that the sulphur compounds usually found in iron are either more or less magnetic than the iron oxides of the ores.

The separation of iron has divided practically into the separation of magnetites—that is, iron oxide, which is naturally magnetic and can be picked up with an ordinary hand maguet—and the hematites and limonites which are less magnetic, usually so feebly magnetic as not to be attracted by a hand magnet.

In the enrichment of hematites the question has divided into two different sorts of separation—one, the separation of high grade hematites from a sandstone in which they occur as a conglomerate, having been deposited as detrital material from older iron beds along with the sand; the other, the separation of siliceous material which was originally deposited at the same time as the iron and usually in the form of intimately entwined crystals.

The question of the physical condition of iron ore with reference to its impurities is one of the more important in the magnetic concentration of such material. One of the first of the questions which are asked by a furnace man when approached on the subject of iron conceutrates is "the amount of fines." If it is uecessary to crush the material to such fine size that most of it will blow out of the top when put into a furnace, the purchase of any cousiderable tonnage of such material is evidently a matter to be approached with cautiou. Briquetting has made material advances, and large experiments are being carried on at present in the smelting of briquetted iron material. It should be noted that this matter of briquetting and the production of fines is entirely a question of the physical character of the ore. Magnetic separators now handle such feebly magnetic materials as hematite in chunks of practically any desired size, separators being constructed to concentrate material up to 1 inch in diameter. The cost of building and operating a separator increases about in proportion to the size of material which it has to handle. It is therefore a commercial matter as to whether the cost of briquetting, or the cost of concentrating at a larger size, outweigh one another. Almost invariably it is cheaper to build a machine capable of handling larger sizes than it is to briquette, as in general briquetting costs more per ton than the cost of separation, including interest, depreciation and royalties on the separator when handling material as large as 1 inch in diameter.

The need of briquetting iron ore for use in a smelting furnace is brought about by the high pressure of the modern blast. If this blast could be eliminated, within certain limits it would be a matter of indifference as to whether the material was coarse or fine. It would still have to be granular enough to permit the escape of the gases generated in the smelting operation. Electric smelting provides the required condition that there need be no blast. The magnetites, being iron oxides, need only be mixed with carbon in the shape of any clean fuel, such as coke or charcoal, and subjected to the heat generated by an electric current, to have the carbon join with the oxygen of the magnetite and escape as carbon monoxide, leaving the iron to be tapped off iu the form of pig. The St. Lawrence magnetites could probably be dredged up and conceutrated wet into an iron ore of high grade and delivered in the Ottawa valley for a cost not to exceed $1 per ton. Their commercial utilization by means of magnetic separatiou would appear to offer the promise of a very considerable industry when taken in connection with smelting by means of the water power of the Dominion.

Of next importance, commercially, from the standpoint of magnetic separation, is the separation of the mixed sulphides of lead, zinc and iron. This so-called "Leadville problem" has existed for many years. There was in this camp a large tonnage of zinc-lead ore which was too high in zinc to permit the lead furnace man treating it without getting into serious difficulty through the choking up of his stack from zinc accretions. and too high in lead and iron to permit the zinc smelter from treating it without the destruction of his retorts through slagging by lead and iron. The specific gravity of the zinc and iron was too close to permit of commercial water separation. Through zinc iuterests who were looking for an additional supply of zinc ore, this problem was attacked along the lines of maguetic separation, and in its solution was secured much of the data which now forms the basis for an established magnetic separation industry. A parallel problem existed at Broken Hill, in New South Wales, Australia. Here the lead and zinc were so intimately mixed that, when crushed to the proper mesh for separation, a large amount of the lead was lost by sliming, and the zinc concentrates which were secured were too low in grade to stand the freights to a European smelting point. Here, as at Leadville, the introduction of magnetic separation has resulted in the utilization of a very large tonnage of what was heretofore waste material. In British Columbia there exists a similar problem. It might be pointed out that there existed two different ways of handling this problem. The mixture of zinc and iron sulphides which may be roasted to reduce the iron sulphide, which normally is almost entirely non-magnetic, to a form of a highly magnetic sulphide, or it may be roasted further to bring the iron to the condition of a magnetic irou oxide, in either of which conditions it may be removed as the magnetic product. Operating in this way the cost of roasting is involved, and au additional loss due to the fact that if such roasting be deferred until the zinc smelter is reached, the sulphur can then be utilized in the manufacture of sulphuric acid. At Leadville and at Broken Hill the ore is uot roasted, it being the zinc that is pulled out as the magnetic product, the iron sulphides remaining behind as the non-magnetic product. There is reason to think that this would be the better commercial way of doing it in British Columbia in those cases where the zinc sulphide is sufficiently ferruginous to permit it. Such is usually the case where the zinc is black, or, as the miners speak of it, "black-jack."

Third in commercial importance has been the separation of manganese. Manganese, as is generally known, is used in the manufacture of Bessemer steel to which it is added in the form of ferro-mangauese or speigeleisen for the purpose of reduciug the oxides formed by overblowing the charge. For the purpose of making ferro-manganese the commercial requirements are for an ore that carries 50% of manganese. The tonnage of ores of this class is rather limited, while there is an enormous tonnage which carries from 5% to 15% of manganese. This is too much manganese to permit the ore being used as au iron ore, and it is not enough manganese to enable the ore to be used for the production of ferro-manganese. The magnetic separator enables the owner producing material of this character, to separate it into two products, one a 50% manganese ore, aud the other an iron ore carrying 2% to 3% in manganese, so making out of an unsalable product, two products, both of which find sale. In this separatiou either the manganese or the hematite may be the more magnetic product, depending on the local peculiarities of the ore handled.

The magnetic separation in which Canada is especially represented is the cleaning of corundum. A commercial sample of Canadian corundum purchased in Chicago was found to contain something over 10% of magnetite. Passing this over a magnetic separator, the magnetite was reduced below 3%, the change representing an increase in the corundum contents from 89% to 97%. Further experiments along this line seem to indicate that if desired, the iron could be sufficiently removed from the aluminum oxide to render corundum a possible ore for the smelting of aluminum.

The attractability of hornblende has been utilized in connection with the concentration of metallic copper. In ores of this character the gangue, which was almost entirely hornblende, was pulled away as a magnetic product from the copper, leaving a copper ore which was sufficiently rich to smelt directly for copper, although the original ore carried less than 1% of copper.

Another interesting separation has been the handling of mica as a magnetic product. This may be utilized in two ways, for the extraction of mica from other material as an impurity and also for the concentration of mica for use in making mica insulating materials.

Of all recent developments of the magnetic separating methods, the more important is the fact that the cost of such separation is now generally below that of the equivalent water concentration, so that even in cases where water concentration is particularly adapted technically, as in the separation of chrome ores from serpentine, the magnetic method still proves the better commercially. It was this very low cost of magnetic separation that enabled concentration to succeed in the enrichment of hematite after water methods had failed commercially. One fact of advantage in magnetic separation is that it can be made, as desired, either wet or dry. It occasionally happens that the freight on moisture contained in an ore shipment to a smelting point is a sufficient item to warrant drying it. Iu this case if the ore is sufficiently dry as it comes from the mine, the maguetic separatiou can be made dry, saving the cost of drying. On the other hand, if moisture in the ore is immaterial, either from freight cousiderations or from the smelter's standpoiut, and it occurs in a wet mine, it is possible to put it through the magnetic separator without drying, shipping the product as it occurs. This is of special importance in counection with the St. Lawrence magnetite sands. The cost of drying that material before separation would

*Abstract Trans. Can. Min. Inst.

probably prohibit its commercial utilization. As it is, such sands can be dredged up by any economical form of suction or dipper dredge and sluiced through a machine with an adequate supply of water, and produce a concentrate which can be drained to less than 15% of water without artificial heat.

As illustrating the results which are being obtained at present by means of magnetic concentration, there are examples of separation on the magnetite ores of Cornwall, Pa., of iron pyrites and talc from magnetite, representing a reduction of sulphur from 21% in the original ore to less than ½% in the cleaned ore. Samples of magnetite extracted from the St. Lawrence sands show an iron content of 69.3% with a trace of titanium, leaving a sand tailings carrying 2.8% iron.

As illustrating the enrichment of hematites, are the separation of hematite and sandstone, producing an iron concentrate carrying 65% in iron and .008% in phosphorus, and a sandstone tails carrying 8% in iron, .04% in phosphorus, showing a most interesting elimination of the phosphorus from the iron compound, and the separation of hematite and jasper, the hematite product carrying 50% iron, jasper 13%.

As illustrating the iron-zinc separation at Leadville, samples are shown, assaying for a zinc product 46% of zinc and 3.2% iron, and for the iron product 37% iron and 7.3% zinc. The equivalent samples for the Broken Hill ores were tails carrying 8% in zinc and heads 48% zinc.

From the manganese industry samples are shown representing the concentration of Utah manganese from silica and gangue, the manganese being enriched from 15% to 41.8%.

From the field of corundum cleaning two samples were shown, one being material at 20 mesh, showing cleaned corundum having .05% of iron and a magnetite which had been taken from the corundum carrying 65% in iron. Corundum at 100 mesh showed only a trace of iron after having been cleaned and produced heads running 63% in iron.

Another sample of the concentration of maguetite was shown in the concentration of black sands from placer workings. In this case the concentration was 20 to 1, ilmenite and some of the rare metals being pulled away from the gold and other sands, leaving a concentrated product which would stand shipment to a smelter.

Pneumatic Hand Drill.

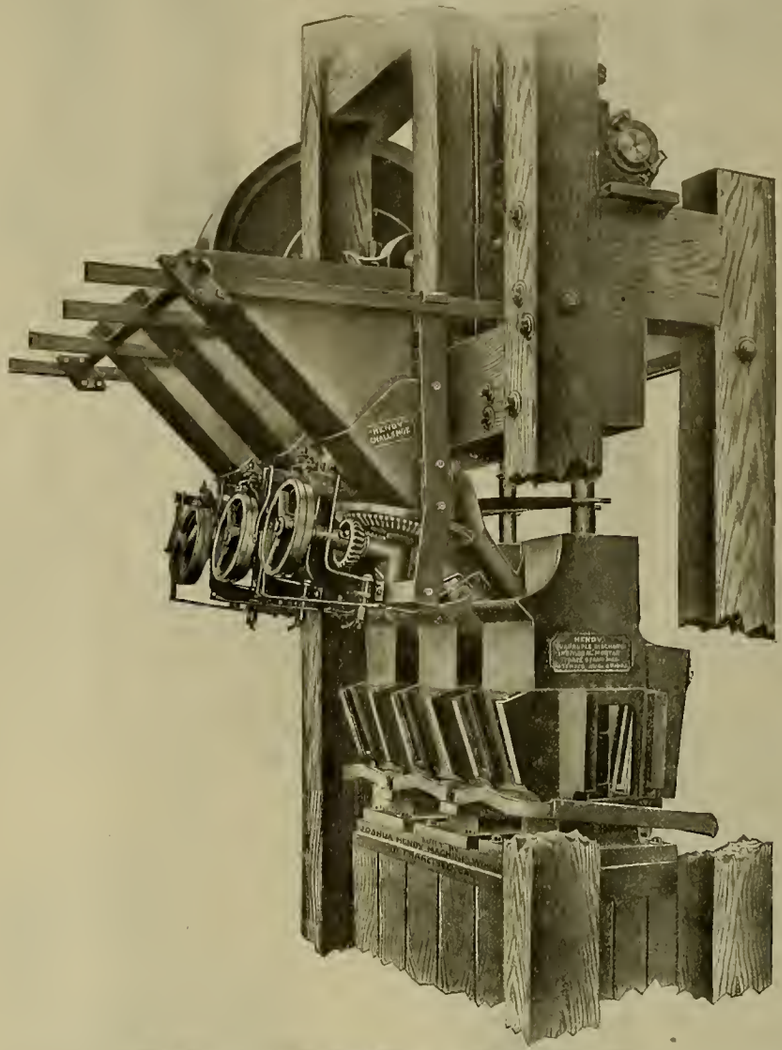
One of the latest devices placed on the market for rock drilling is the Shaw Eclipse air hammer rock drill, illustrated herewith. It is claimed by the manufacturers that this machine, including hammer and drill, weighs but 16½ pounds and requires to operate same but 17 cubic feet of free air per minute at a pressure of 80 to 100 pounds. This machine is portable, and was designed with that idea in view. It can be handled by one man and can be operated without tripod or column. The machine, including column arm and clamp, weighs but 83 pounds. The drill is supplied with an automatic feeder which is released by a ¼-inch valve. By opening this valve, which is attached to an air hose, the air forces the drill against the rock. The hammer is operated by another ¼-inch valve. When this valve is opened it allows the air to enter the machine, which starts the hammer in operation. Then as the hammer forces the drill bit into the rock, the exhaust air from the drill goes through a hole running lengthwise of the drill bit and forces the dirt and dust from the drill hole. This dust is overcome by a water attachment, which consists of a tank 10 inches in diameter and 30 inches high, filled with water. Air is forced into the top of the tank, which gives it pressure. By releasing a ¼-inch valve attached to a water hose (which is also attached to the drill), the water is thrown against the rock and dampens the dust. This attachment can be used or not, as desired by the operator. The machine consists of but four pieces, viz., handle, piston, barrel and nut. No valves or springs are used in the mechauism of the drill. The drill bit, which is known as the "wagon wheel" bit, has fourteen cutting edges. Capacity of the drill depends entirely upon the character of the rock. It is asserted by the manufacturers that this drill, operated by one man, will do as much work in eight hours as ten miuers, or cutting from 100 to 150 feet per day. The machines are being manufactured and sold by the patentee, the C. H. Shaw Pneumatic Tool Co., Thirty-fifth & Wazee Streets, Denver, Colo.

Hand Drill Operating With Water Spray Attachment

Hand Drill Operated Without Water Spray.

The Hendy Suspended Feeder.

The accompanying illustration of the Hendy quadruple discharge individual-mortar 3-stamp mill is familiar to all mining men, but the Hendy improved suspended Challenge ore feeders that are supplied with this mill have not previously been illustrated, and the manufacturers wish to call attention to these feeders as here illustrated. The illustration also shows to advantage the individual mortars that form an important part of the Hendy 3-stamp mill.



The Hendy Triple Discharge Mortars With Suspended Feeders.

As will be seen, these feeders are suspended at the rear of and above the mortars, and are so constructed and placed that they feed automatically and directly to the stamp in each mortar; each feeder is provided with a regulating device, easy of adjustment, to insure suitable and regular feed of ore to each stamp.

A Gasoline Rock Drill.

An innovation in rock drills has been introduced by the Automatic Gasoline Rock Drill Co., of 516 Crossley Building, San Francisco, Cal., in the form of a drill operated by gasoline. The principle upon which the machine works is similar to that which actuates gas engines generally—the explosion of gas in a cylinder which drives the piston forward. The drill is fixed in the usual manner in the chuck, being secured by the customary "U" bolt. The piston of the drill, rotating bar and chuck are all of one piece of steel, being turned down to the proper size and form. The drill has already passed through the early stage of experimentation, and many changes and improvements made since the original drill was turned out The suggestions of practical and experienced drill runners have been solicited and alterations made in accordance with these suggestions, until the drill now runs for long periods, drilling the hardest granite and affording a practical demonstration of the utility of the machine. The necessary provision is made for taking care of the exhaust, and the heat generated by the gas explosions. The chief claim which the manufacturers of this drill make for it, is, that by its use, an expensive compressor plant may be dispensed with.

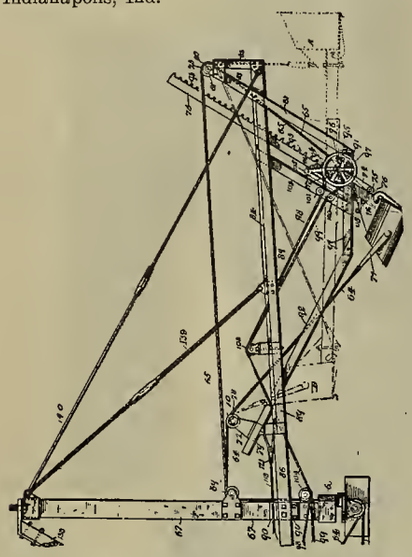
Efforts are being made to have the mint at Denver, Colo., raised to the dignity of a full coinage mint by the first of September. The building is nearing completion and the machinery is ready for shipment as soon as the building is prepared to receive it.

Mining and Metallurgical Patents.

PATENTS ISSUED JUNE 14, 1904.

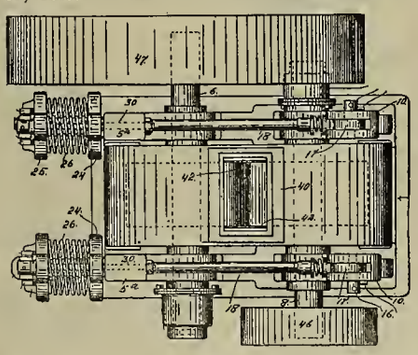
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

EXCAVATING MACHINE.—No. 762,352; J. L. Scanlan, Indianapolis, Ind.



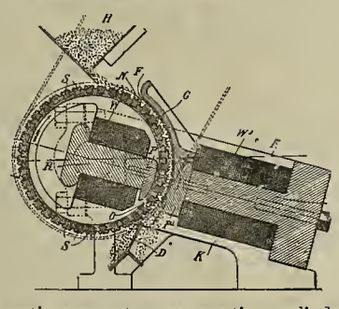
In excavating machine, combination with scoop or dipper, and dipper beam, of revoluble mast inclined upwardly, boom extending from mast, boom comprising two guide members, horizontally extending guides situated beneath and in vertical alinement with upper guide members and between which dipper beam is adapted to work, shaft mounted on lower guides, beam guide pivoted on shaft, pinion and rack on dipper beam whereby dipper beam is traversed in beam guide to elevate or lower scoop, drag ropes for dragging scoop either forwardly from or rearwardly toward revoluble mast.

PULVERIZING ROLLS.—No. 762,859; W. C. Davis, Denver, Colo.



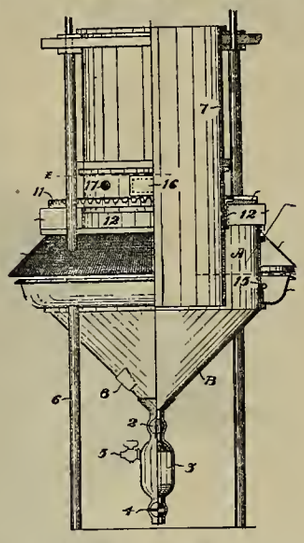
Combination with swinging arms and tension rods, of spindle journaled in upper extremity of each arm and having an eccentric which the eye extremity of arm engages, means for adjusting spindle to throw maximum point of eccentricity out of line with longitudinal axis of rod, collar slidably mounted on each rod adjacent its eye extremity and engaging swinging arm, stop on rod and spring interposed between stop and sliding collar.

APPARATUS FOR MAGNETIC SEPARATION.—No. 762,752; C. Q. Payne, Stamford, Conn.



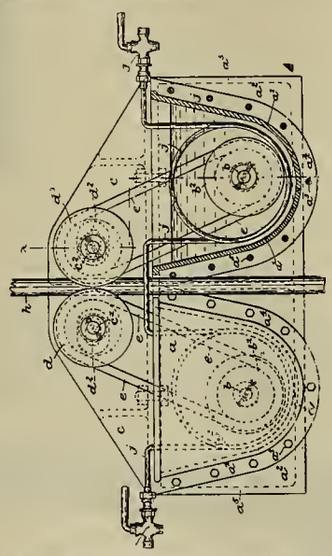
In magnetic separator, separating cylinder movable between two opposing magnetic surfaces, both surfaces being placed below horizontal diameter of cylinder, in combination with means for retaining material in close proximity to cylinder, along considerable segment of cylinder below horizontal diameter and within magnetic field.

GOLD SEPARATING AND RECOVERING APPARATUS.—No. 762,174; W. Laudahn, San Francisco, Cal.



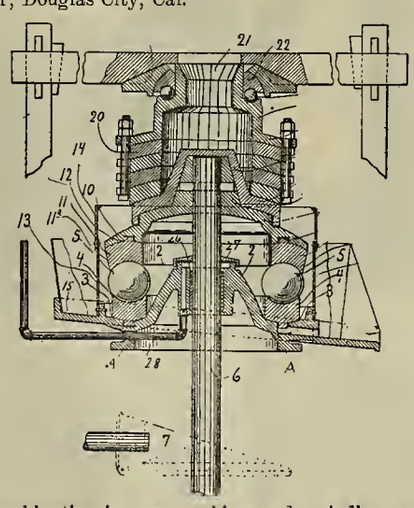
In apparatus of character described, combination of mercury containing chamber having low portion with steeply inclined walls, and means for submerging gold-bearing sand in chamber, receptacle secured to lower end of mercury-containing chamber, inlet and outlet cocks at opposite ends and intermediate air supply cock, conical end of mercury containing chamber having manhole in lower portion through which heavy material may be removed.

APPARATUS FOR AUTOMATICALLY GREASING HOISTING OR HAULING ROPES.—No. 762,329; P. Macadam, near Johannesburg, Transvaal.



In apparatus for greasing hoisting or hauling ropes which travel in vertical direction, combination of two grease tanks arranged to form passage between them, pulley mounted inside each of tanks, two pulleys mounted on adjustable spindles above tanks, and two endless belts arranged round two pairs of pulleys, between which rope passes.

CRUSHING AND GRINDING MILL.—No. 762,580; J. M. Dyer, Douglas City, Cal.

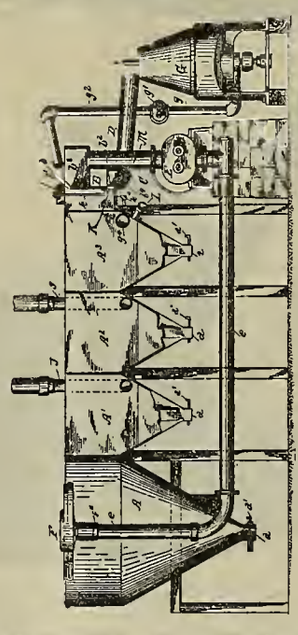


Combination in ore crushing and grinding apparatus, of cone carried by vertically turnable shaft and having spherically curved base flange; cylinder supported thereon and having base concaved to fit cone flange; tubular extension of upper part of cylinder with surrounding grooved raceway; balls fitting raceway; ring surrounding cylinder extension, ring having raceway in its lower surface resting upon balls and upper convex surface; concave plate fitting and movable upon convex surface of riug, and means for moving plate in horizontal plane to tilt cylinder with relation to cone.

UNDERREAMER AND DRILL—No. 762,435; T. A. O'Donnell and A. G. Willard, Los Angeles, Cal.

Underreamer comprising stock provided with two tapering sockets in lower end, vertically slotted wedge-shaped partitions between sockets, and having bolt holes opening from slot axially in line with each other below top of such sockets, such stock being also provided with spring chamber above partition; jaw member provided with tapering shank to fit in one of sockets, aud also provided with shoulder to fit against lower end of stock when tapering shank is seated in its socket, shank being provided with cross head socket in the extended plane of said slot; like jaw member having its shank seated in other socket of stock; cross head to play in slot and having its oppo site ends seated in sockets of shanks, respectively, and having stem extending up into spring chamber; spring in chamber for normally holding up stem, cross head and jaws; spring-pressed bolt normally extending across slot in path of cross head to lock cross head against lowering, bolt having at upper side of its end, beveled portion normally chambered in partition; spring for normally holding bolt in locking position; and bolt-retracting pin mounted in bolt hole and normally projecting from side of stock to be thrown by well casing to bring bolt into position with beveled portion of bolt in path of cross head.

APPARATUS FOR THE CONCENTRATION OF MINERALS BY MEANS OF OIL.—No. 762,774; J. W. Van Meter and M. P. Boss, San Francisco, Cal.



Apparatus for concentrating minerals by means of oil, comprising channel through which oil flows, means for supplying pulp and water to oil at head of channel, means in channel at intervals for drawing off settled gangue and water, means at foot of channel for separating relatively upper and lower portions of oil, and means for returning separated upper portion of oil to head of channel.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ARIZONA.

Coconino County.

(Special Correspondence).—A plant has been built for the Anlta C. Co., near Williams, sufficient to sink to 2000 feet, to which depth it is intended to go. The plant consists of a 90 H. P. steam hoist, a 6-machine compressor, a 40-inch suction blower and a 250-light electric plant. The company is composed of Boston, Mass., men. W. H. Hill is general foreman.

Williams, June 21.

Cochise County.

The Lake Superior & Pittsburg Dev. Co., operating near Bisboe, has been reorganized. The company will increase the size of its two shafts to afford better facilities for handling minerals. Nos. 2 and 3 shafts are at present but one and one-half compartment. To raise these shafts from bottom to top so as to increase the size to four compartments is proposed. The company will put in heavier machinery for hoisting. They are also planning to sink a 1000-foot shaft 500 feet distant from shaft No. 2, and in the direction of the Oliver shaft of the Calumet & Arizona.

Gila County.

Superintendent N. S. Berray of the United Globe M. Co. at Globe says there were shipped last month from the several mines of the company operated 3500 tons of ore. Most of the ore came from the Gray, Josh Billings and Buffalo, and was shipped to the Copper Queen at Bisbee and Douglas, some also going to the Old Dominion. Work at the Gray is at present confined to drifting at 1140 feet. The ore is chalcopyrite, occurring in a lenticular body. The workings on the Gray are said to be the deepest in the district.

Asbestos has been found 20 miles west of Globe by M. L. Shackelford. The fiber is said to be long and fine. The asbestos is found in a dyke of serpentine about 50 feet wide.

Graham County.

The Detroit C. Co. at Morenci has additions under way to its plant. The concentrator, which has a capacity of 500 tons per twenty-four hours, is being doubled. One-half of the plant will be remodeled and increased at a time, while the other half continues in operation, says the Standard. It will require eighteen months to complete the change. The concentrator will have a floor area of 166x240 feet. When remodeled there will be a total of 120 concentrating tables, 40 jigs, Chile mills, 6 sets of rolls 16x42, and 28 revolving screens for sizing. Power to operate this plant will be furnished by gas engines with a total of 600 H. P. in 150 H. P. units. The concentrates will all be handled mechanically. An important feature of the improvement will be separation of the crushing plant from the concentrator. The crushers will occupy a building west of the concentrator and will have capacity of 100 tons per hour, and all the crushing for the day will be done in ten hours. The sampling mill will be located above the concentrator and ore will be conveyed to it from the latter on a belt conveyor 400 feet long. Crusher and sampler will both be operated by electric motors. In concentrator, smelter and converters, gas engines furnish the power, the only exceptions being steam power used on locomotives, mine hoists and at the ice plant. New Mexico coal is used in the manufacture of the gas. All power, with the exception of the 600 H. P. at the concentrator, will be localized at the new power house, about completed near the smelter. At present there is developed there a total of 825 H. P. by gas engines, and this will be increased by 500 H. P., giving a total of 1925 H. P. for both plants. Bins of 2000 tons capacity will be built at the smelter and steel trestles. In this and the concentrator a total of 700 tons of steel will be used.

Maricopa County.

The Vulture mine, near Wickenburg, has been "jumped" by C. L. Kingsley and G. E. Sanders, who allege non-performance of the annual assessment work for 1903. The records of county recorder's office, however, are said to show filing of affidavit on Jan. 4, 1904, for performance of the 1903 annual labor. The first ore from the Vulture mine was worked in 1864 in an arrastra.

It is reported the National C. & G. M. Co. of Arizona has a bond on the Rogers Springs group of copper mines, 30 miles north of Phœnix, for $60,000, and will begin development work on it before July 1st. Manager Fowler says he proposes to develop the property at the rate of 100 feet per month. The National Co. has also located surrounding claims that their holdings may not be interfered with. The company is composed of Eastern men.

Mohave County.

W. Mack, owner of the Ruby group of mines below Bill Williams Fork, on the Colorado river, reports he has made arrangement with B. Blanchard for the sale of the Ruby group, and twenty-five men have been put to work. The mines have been opened to a depth of 200 feet by drifts and shafts and ore is showing, carrying values in gold, silver and copper. There is a pit of tailings at the mill that will pay for reworking it. It is intention of Blanchard to open the mines to a depth of 700 or 800 feet and block out the ore while awaiting the building of the Arizona & California railroad to Parker, a few miles from the group.

Ore is being shipped from Stockton Hill from the Indian Boy mine of the Fletcher Co. to the company's smelter at Needles, Cal. The ore is of lead, carrying values in gold and silver. This will be followed by steady shipments from the other properties of the company. There are twenty-five men at work on the mines and the Star Spangled Banner, Infallible (Indian Boy), Alta and Alpha are showing up. At the Alta, in sinking below the old level, a fine body of lead ore was struck. The shaft in which this ore was found was formerly used for a water shaft and from which practically all the fresh water used on the hill was obtained, says the Mohave Miner. In sinking a shaft below this point on the vein the water was drained from the shaft, which necessitated sinking deeper to get a supply, and it was while doing this work that the ore was opened up. Ore is being taken from the Star Spangled Banner, where a 30-inch body has been opened in the lower drift. In the Infallible the old stopes have been reopened and are producing smelting ore. At the Alpha mine at Layne Springs several men have been put to work and an adit will be run in from below the iron springs to tap the copper body struck in the old workings. It is expected this drift will tap the ore body below the waterline and show the sulphide ores in place. All the copper ores on the dumps will be shipped to the smelter and a road will be built from the mine to Mineral station, on the A. & U. Railroad.

D. Slocum of Monrovia, Cal., who has a bond on the Mossback mine in San Francisco district, near Acmo, will begin work in August with men and machinery. He has put in a hoisting plant.

Yavapai County.

The Pfau G. M. & R. Co. proposes to build a 100-ton reduction plant. The company's properties are 4 miles from Cherry in the Black Hills mountains.

The Bryan quartz claim, 7 miles from Prescott, in Hassayampa district, is owned by C. Wallace of Prescott, who has done 700 feet of development work on it. He reports a strike of ore assaying 2 ounces gold and 140 ounces silver. He had driven a tunnel 475 feet under the mountain on which the Bryan claim is located. When 350 feet from the mouth of the tunnel and 275 feet from the surface, the top of a seam of quartz was cut in the bottom of the tunnel. A winze down about 15 feet on this narrow seam of quartz opened into ore. There is plenty of wood and water on the property and conditions are said to be favorable for working.

The Tiger Gold Co., in the Bradshaw mountains, has been added to the list of producers, says the Prescott Journal-Miner. The claims owned by the company are the Oro Belle, the Grey Eagle and a half interest in the Cleveland, 3 or 4 miles from the Crown King mine, 1½ mile from the Tiger, and a mile from the Eclipse. Development work is being concentrated at two points. One is on a tunnel which starts on the Cleveland ground, and which follows the ledge through it into Grey Eagle ground. This tunnel is in 1150 feet and has been in ore its entire distance in the Grey Eagle claim. The ore body varies in width from 6 to 9 feet, and the ore has value of $10 per ton. It is proposed to continue this tunnel to the south end of the Grey Eagle location. There are numerous workings over the tuunel nearer the surface, and all the ore from these can be taken to the mill through this tunnel. The depth from surface, at face of tunnel, is 700 feet. A shaft is being sunk from the tunnel near point of union of the Grey Eagle and Cleveland claims, the shaft being on the Grey Eagle claim. There are two parallel ledges on the claim, and the shaft is being sunk on an incline between them, and the ground will be crosscut from it to each of the ledges.. The shaft is down 225 feet. It is hoped that at depth of 500 feet permanent water supply will be obtained, by crosscutting from the shaft to each of these ledges. Fifty-five tons of ore per day are treated in the mill. The higher grade and the lower grade ores are mixed so that the ore as it is milled averages $20 per ton. Half of this value is saved on the plates, the other half in concentrates. From May 22 to May 31, four cars of concentrates were shipped, this being the average regular product of the mill.

At the Pickaway mine, 3 miles from Turkey Creek station, southeast of Prescott, owned by Parkor & Co., the shaft is down 100 feet, the depth limit of the whim. A steam engine has been set up for sinking the three-compartment shaft.

CALIFORNIA.

Alameda County.

It is reported negotiations are under way for sale to the Mountain C. Co. of Keswick, Shasta county, of the plant of the San Francisco Chemical Works at Flemings Point, near Berkeley. It is said the copper company seeks to acquire the chemical plant so that it can use the output in connection with its smeltor at Keswick. By doing this it will avoid bringing raw materials used for its purposes from tide water to Keswick and then returning the finished product to tide water. A large amount of money will be thus saved in freight charges. If the deal is closed the plant at Flemings Point will be enlarged. It is reported the copper company is also negotiating for a chemical plant near Martinez, Contra Costa county, which will be consolidated with the one at Berkeley.

Amador County.

(Special Correspondence).—At Electra an additional transformer bank has been put in place. The five 2000-K.W. alternators are generating from 2150 to 2300 volts. This voltage is raised to 17,000 for the Amador and Calaveras county line, and to 40,000 volts for the Bay Counties line. The effective running head with a 3¼-inch nozzle is 560 pounds pressure.

The Oneida mine, near Jackson, is still drifting south on the 1200-foot level, being in 900 feet. On the 2000-foot and 2200-foot levels they are drifting north. Timber is being framed at the surface and put in place as fast as it arrives. The company is spending $1400 a month in timber. They are pumping about 800,000 gallons of water per week. There is no intention of sinking deeper for some time to come. E. Hampton is superintendent and B. C. Austin assistant superintendent.

The Kennedy mine at Jackson is down 2632 feet and the management intends to resume sinking. Superintendent Webb Smith states that there has been no change in the general geology of the vein or country with increase of depth below the 1400-foot level. The ground south of the 60-stamp mill at the East shaft has been graded and excavated and concrete blocks are being built as foundations for the old 40-stamp mill at the North shaft, which is being hauled to the East shaft. This will make a 100-stamp mill equipment at the East shaft.

Jackson, June 21.

(Special Correspondence). — The two No. 160 Griffin mills at the Keystone mine at Amador City have been running over a month. The tests for crushing capacity, wear and tear and power cost have not yet been completed, but it is estimated that each is crushing thirty to thirty-five tons per day. The screenings from the grizzlies are fed to these mills by Hendy Challenge feeders, while the richer rock from the crushers is run through the old 40-stamp mill and the poorer rock through the new 20-stamp mill. If the tests with the Griffin mills prove satisfactory, two more will probably be put in. Compressed air, produced by a 300 H. P. induction motor, is used for hoisting, pumping and drilling. E. Lynch is superintendent.

The 20-stamp mill built by Knight & Co. of Sutter Creek for the Bunker Hill mine, north of Amador City, has been running since February. Noteworthy features are the concrete foundations and retaining walls. The mortars rest on wooden beams bolted to concrete. There is little vibration. Concentrators and stamps are electrically driven from the same prime mover.

Amador City, June 22.

(Special Correspondence).—Operations have begun in the Lincoln mine, catching up the caved portion of the shaft. The Wildman-Mahoney mine will be reopened through the Lincoln shaft, which Superintendent J. Ross, Jr., has men retimbering. The Lincoln workings are partially flooded, and it will probably require several weeks pumping to unwater it. After that is done, drifting southeasterly toward the Mahoney shaft will be resumed.

Sutter Creek, June 22.

At the Madrone mine at Pioneer it is expected to have the mill in operation by July 1.

Calaveras County.

The Arent mine, near Copperopolis, was started up again last week.

The Chris Anderson gravel mine is closed down for enlarging and retimbering the shaft and making ground ready for the mill that will be built. One ton of cemented gravel washed in one sluice-box and a riffle without quicksilver yielded $18. A 20-foot sump is being sunk.

Fresno County.

The Standard Oil Co. has issued for Coalinga field a new scale of prices for crude oil, says the Oil Reporter. In the list of prices which follows oil 22°-24°, Baume gravity has been cut 2½ cents:

Gravity at Temp. 60° F.	Price per Barrel.
22° to 24°, not including 24°	22½c
24° to 25°, not including 25°	30 c
25° to 26°, not including 26°	37½c
26° to 27°, not including 27°	42½c
27° to 28°, not including 28°	47½c
28° and upwards	special contract.

Kern County.

Development work is being done on the Rustler mine, near Randsburg, with J. O'Leary in charge.

The Yellow Aster mills at Randsburg are reported crushing an average of 520 tons of ore per day. There is no scarcity of water, but in view of the probable increase in milling capacity they are developing more water.

Nevada County.

Rosenfeld & Uren are increasing operations at the White Oak and adjoining mines near Nevada City. Superintendent Brockington reports progress in work sinking shafts along the vein to ascertain its length and continuity, pitch, etc. The mine will be operated by electricity and compressed air. A 75 H. P. compressor will be used and the Cornish system of pumping installed, which, with the hoist, will enable the company to sink to depth of 1500 feet. Connections will be made with the power line which has been run across that section for electricity. The shaft which will be started will be sunk on the lodge. From a point 200 feet below the site selected for the machinery a raise will be driven from a tunnel on the ledge, instead of sinking the shaft to that depth. This double work will be done at the same time, giving the company a shaft of the depth mentioned when the machinery is ready for operations. At the White Oak, also operated by Rosenfeld, work continues steadily. The shaft has been sunk 75 feet.

The Blue Ledge G. M. Co. has been incorporated at Nevada City by J. R. Tyrrell, W. T. Jones, J. Coan, W. L. White and P. Bliss. The Blue Ledge mine is in Willow valley, 3 miles above Nevada City. It is a full sized claim, patented, but has been idle for thirty years. Fire destroyed the surface plant. It is said a ledge is shown at base of shaft and in one of the drifts carrying free gold. Manager J. R. Tyrrell of the Blue Ledge M. Co. says he will put a plant on the mine.

Plumas County.

(Special Correspondence).—Dunn Bros. have struck a high-grade shoot of ore in their White Lily quartz mine on North Fork of Feather river, near Seneca, 15 miles from Greenville. They have been operating a 2-stamp triple-discharge mill and are adding six more stamps. The main ore body is 25 feet wide, averaging $8 per ton free gold. The shoot shows 6 inches of specimen rock.

Greenville, June 22.

It is reported Droege Bros. of Covington, Kentucky, have closed the deal for the Standart & McGill mine, near Greenville, together with the mill thereon, built by the Plumas G. M. Co. last year. Droege Bros. also owns the Johnny Bull mine, and have done considerable development work on it. The two properties will be consolidated, the Johnny Bull mine being below and adjoining. By means of a tunnel on the last named the Standart & McGill ledge can be tapped at depth. The sale also includes a one-half interest in the Round Valley Reservoir water right, which will furnish power for operating the machinery.

San Bernardino County.

Drilling the oil wells at Kramer and north of Hinkley is reported progressing. The Hiawatha Co. has struck oil at 1410 feet, but by reason of insufficiency of present machinery, a new rig will be set up before greater depth can be reached. North of Hinkley, near Black's ranch, a well is into shale for 50 feet.

Santa Clara County.

The Manganese M. Co. has been incorporated, with San Francisco as principal place of business, by J. J. and A. Cummings, A. C. James, G. H. Cavanaugh and G. S. Wright, directors. The company purposes to work a group of manganese claims in the Red Mountain district, east of Mount Hamilton, east of San Jose.

Shasta County.

Pugh & Menzel, of the Reno group, near Shasta, have made improvements. ——Manager Schroter has 800 feet of tunnel in the Keno group north of the Mount Shasta mine, near Shasta.——C. H. Behrens has bought the interest of his partner in the Oro Fino mine, near the Mount Shasta, and will put in a gasoline hoist.

——Parmley & Gladwin have opened up the Mountain Lion group, enough to justify erection of a mill, says the Shasta Courier. The group consists of several claims, with ore in sight. The mine is northeast of the Mount Shasta.

The Original Quartz Hill mines, ownod hy the Original Quartz Hill G. M. Co., at Quartz Hill, 5 miles north of Redding, have been reopened and increased operations planned. M. Mariansky is manager, and W. J. O'Donnell is superintendent. Twenty miners are employed. There are a number of drifts on the oro body, the largest heing the main working tunnel and having 100 feet of hacks. Considerable work is being done in this drift, and the ore taken out is shipped to the smelter at Keswick by wagons. Carpenters are building the two ore bins at the mouth of the main tunnel for storage of ore taken out for shipment. Each bin will have capacity of 200 tons. Two rock-breakers, one for each bin, will be set up to crush the rock before it is placed in the bins, from whence it will be loadod hy gravity into the wagons. Application was made hy the company to the board of supervisors of Shasta county for a franchise to build a steam tramway from the Quartz Hill mines to a point on the Sacramento river, near the Keswick bridge, but the franchise was refused. The company, however, has not abandoned the plan for a tramway, and it is thought rights of way can be secured over private property.

Sierra County.

Operations have been resumed at the Columhia gravel mine, near American Hill, above Forest City, says Manager J. M. Harper. Harper had considerable work done at the Columbia last summer and fall and expects to reach the gravel channel before winter sets in. The tunnel will be driven ahead and 400 feet will have to be run before the gravel is reached.

Ore is reported struck in the Elmore mine in Ladies canyon, near Downieville, showing free gold. G. McGee is in charge for the Sovereign G. M. Co. of San Francisco. Considerable development work has been done on the mine, there being a shaft 100 feet deep and several drifts. The ledge is 3 feet in width. Work was discontinued last winter due to lack of machinery to handle the water. It is intended to put in machinery to pump out the shaft and resume development work.

Trinity County.

Superintendent J. Porter, of the Fairview mine, near Trinity Center, says the mine is looking well and further improvements will be added. Ten stamps will be added to the ten now dropping. The mine has a large body of low-grade ore. Macbine drills run by an air compressor will be used in the mine.

Tuolumne County.

(Special Correspondence).—The Kodak mine, 1½ mile from Carters, has been bonded by L. F. Walker, of San Francisco, for a term of three years. Walker will put a mill on the property within ninety days and production and development will be increased.

Carters, June 22.

La Fiesta G. M. Co. has bought the Kanaka mine, 5 miles south of Groveland, together with mill site, 10-stamp mill and 100 inches of the water of Indian creek, also Kanaka No. 2 and the Indemnity mines with all machinery and appliances, says the Banner.

COLORADO.

Chaffee County.

B. Ross of Denver, manager of tbe Homestake M. Co. in Cripple Creek district, is arranging to build a 100-ton concentrating mill at the Sedalia mine, near Salida. Ross is manager of the American C. M. & R. Co., which has bought the Sedalia mine. He says his company intends to begin work on tbe concentrator by July 1st. The Sedalia is a copper mine and is shipping two cars per week to the local sampler.

At a depth of 116 feet a vein of galena has been struck in the Buena Vista tunnel in the Hancock mining district, near Camp Sherrod, says Buena Vista reports. The vein was a blind one. It is 3 feet wide.

Clear Creek County.

(Special Correspondence).—A. B. Montgomery, treasurer of tbe Red Oak G. M. & M. Co., reports a strike in the Scepter tunnel, 2500 feet from the portal, and wbich cuts the vein 700 feet below the surface. The ore assays without lead values $398 per ton. Heretofore most of the ore taken from the Scepter on the Georgetown side of the mountain has been mill dirt, but the ore now being taken out will be shipped direct to the smelter.

Considerable activity is being shown this summer in the upper Clear Creek district and it is expected by the operators this will be a profitable season.

Georgetown, June 19.

At least one, possibly several, cyanide plants will be built in Idaho Springs this summer, says the Record. The Ward mill will be the first to use this process, it being their intention to cyanide the tailings from the mill. On the same vein on Santa Fe mountain is the Coming Nation mine, the owners of which have plans drawn for a cyanide mill, and it is said negotiations are under way for consolidation of several of those low grade Santa Fe propositions and the erection of a large cyanide plant. A cyanide annex is also proposed in connection witb the 1000-ton mill which the Con. Gem M. Co. will build at the mouth of tbe Newhouse tunnel. H. T. McNeil, of Idaho Springs, says the widest field for the process in the district will be as a secondary treatment, as the tailings from the so-called free milling ores and those from a large proportion of the concentrating ores may he profitably worked over by this method.

At Georgetown the Pay Rock Extension M. M. & D. Co. has arranged for resumption of work. Men are being put to work driving the tunnel on tbe Pacific lode, which is in 425 feet. There are 3 inches of solid lead ore exposed. The tunnel is being driven in soutbwesterly direction and it is thought the Pacific lode is an extension of the Pay Rock. The Pay Rock Extension company owns nine claims, three of which are patented. The mine is ready for plant of machinery. A storage tank holding 12,000 gallons of water has been built near Bridal Veil stream and it is estimated there will be sufficient water to run eight power drills. J. H. Robeson is manager and D. W. Hartshorn superintendent.

Fremoot County.

(Special Correspondence).—C. M. Meyer has leased tailings from the United States R & R. Co. of the National mill at Florence, and has put in concentrating tables. He has made several shipments of concentrates.

Florence, June 19.

Gilpin County.

At the Protection shaft of the Roderick Dhu G. M. Co., on Quartz hill, near Central City, operations are carried on steadily and the daily production averages 5 cords (40 tons) which is being hauled by teams to the New York mill at Black Hawk. This tonnage is coming from the 234-foot stope, and the company is getting the same ore chute in shape for stoping in the 334-foot level. At the 400-foot level, after crosscutting 20 feet, they have cut the Roderick Dhu vein, which is 6 feet in width. The company will also ship the entire dump matter, as it carries values. This will add 20 tons daily to the production. The company will put up a shaft building and plant on the Roderick Dhu No. 485, lying to the east, tbe plant to consist of a 10x14 hoisting engine, two 60 H.P. boilers, a 4 drill air compressor and an electric dynamo for lighting the top plants as well as the underground workings. This shaft is of three compartments 8x20 feet and is down 400 feet, and it is intended to sink it 200 feet deeper and continue it down as a two compartment shaft 8x16 feet. This shaft is to be the main or central working shaft of the group. It is connected with the Quartz hill tunnel. Manager J. C. Fleischutz has 25 men employed, but this number will be increased. H. Armfield is superintendent.

The Stanley M. Co. has been incorporated by A. G. Brownlee and W. E. Humphries of Denver, and C. H. Johnson, C. W. Comstock and J. P. H. Cunningham of Pennsylvania. Tbe papers cover the purchase of the Con. Stanley M. Co. and the Salisbury M. Co. holdings, near Idaho Springs. The work of unwatering the shaft is under way. Tbe water was within 190 feet of the collar of the shaft and is 800 feet in depth. The Stanley is equipped with plant of machinery.

The Eldorado M. Co. has been incorporated, with S. T. Harris, H. P. Lowe, J. C. Reagan and H. Maruchi as directors, to operate near Central City.——Eastern owners have started operations on the Gold Nugget property, in Illinois-Central district, under management of A. C. King of Idaho Springs. The water has been lowered in the main shaft, which has a depth of 250 feet, and the work of drifting west is under way at depth of 200 feet.——The New National T. M. Co. expects to resume operations on its Caledonia mine, in Lake district. The shaft is 420 feet deep and the company will sink it 200 feet deeper. They will also start drifting and stoping, and Superintendent G. W. Adams says they have lead concentrating ores to work on. The shaft has been overhauled and there is a 12 H. P. gasoline engine in operation.

W. Mitchell & Sons are putting in equipment for their Gulch mines, near Central City, consisting of a 50 H. P. engine and a 70 H. P. boiler. They have heen taking out smelting ores running $100 per ton and they have a good tonnage of milling ores in the hins ready for shipment.——Local parties have started work in the Hawley Gardner group on Quartz hill, under a lease. W. Nicholas of Central City is superintendent. The work as mapped out will consist in extending the levels at a depth of 700 feet. The property has been idle for several years.——The Blair, formerly the Annex property, in Lake district, is being worked by its Denver owners, and, after crosscutting at a depth of 150 feet, ore has been opened up. At the point where they crosscut there are two veins coming together, which makes 6 feet of vein matter, says the Register-Call, and they are taking out concentrating and smelting ores, the latter showing gray copper and lead.

Lake County.

The Resurrection mill at Leadville is handling nearly its capacity of ore and is turning out a good grade of concentrates. The mine is shipping steadily a small tonnage of ore, but most of the product is being handled in the mill. The numher of men in the Resurrection properties has heen increased. Heretofore the mill bas been supplied with water, which was brought from the gulch to the mill by pumps. The mill is on an eminence on southern slope of the gulch at considerable height above bed of stream and level of lakes in the gulch. The pumping of the water necessary to run the mill has been an expensive feature of the work, and Manager Carnahan has arranged to secure a water supply which would be less costly. It is reported he has water rights in the gulch and is digging a ditch which will carry the water from the head of the main Evans gulch directly to the mill. The route of the ditch lies southward from the water company's reservoir above the Diamond and will carry the water by a natural grade from the base of the Mosquito range to the Resurrection mill.

Montrose County.

A carload of high-grade copper ore was shipped to the smelter last week from the Lasalle copper mine, near Montrose. One piece of 655 pounds was native copper. Another slab of 1000 pounds had to be cut in three pieces to get it out of the collar of the shaft. Mixed with the sbipment were several tons carrying native silver. This shipment was taken out of 11 feet in the shaft.

San Miguel County

An ore strike is reported made on the Lucky group of mines in Bridal Veil basin, near Telluride, owned by Chadwick, White, Adams & Silgenhaus of Telluride. The quartz carries flakes of free gold, mixed with black tellurides. The rich streak is 4 inches thick, but the entire vein of 4 feet is bigh-grade milling gold quartz.

Teller County.

The United G. M. Co. at Cripple Creek, according to the annual report of H. E. Woods, treasurer, made production for the first five months of the year aggregating $283,683.21. Of this $63,337.32 was mined in the Jerry Johnson and the Arapahoe claims, in which the company has a three-sixteenths and two-ninths interest, respectively. Royalties received by the United G. M. Co., exclusive of $2514.38 in bank by stipulation, was $59,360.16. Receipts from this source are increasing, the sums turned in for May being in excess of $16,000. W. Woods is president.

C. Tillery & Co., operating a lease on the C. O. D. property up Poverty gulch, near Cripple Creek, have put two machine drills at work in tbe tenth level 700 feet northwest of the shaft. A paying proposition is reported opened up by Tillery & Co. on the fifth level of the C. O. D. About 250 feet north of the shaft a vein varying in width from 2 to 3 feet has been uncovered from which assays give values of $30 in gold. Bad air has been troublesome.

At a special meeting of the board of directors of the Portland G. M. Co., on the 20tb inst., the action of President J. F. Burns in asking the Federal Court at St. Louis, Mo., for an injunction prohibiting the State authorities from interfering with the operations of the mine was repudiated and the suit declared off. The board also passed a resolution requiring Superintendent Currie of the Portland mine to resume operations as soon as possible witbout employing men affiliated with the Western Federation of Miners. The Portland mine, at Independence, was virtually the Federation's only foothold in the Cripple Creek district at the time of the action. It is expected the mine will be in full operation by the end of the week. A few men were put to work on the 21st inst. The military commission, which determines who may live and work in the Cripple Creek district, met at the Portland shaft bouse to pass on the applications for cards from the Mine Operators' Association, which all miners are required to take out before work is given them.

President C. H. Moyer of the Western Federation of Miners bas been arraigned on the charge of murder hefore a justice of the peace at Cripple Creek.

IDAHO.

Boise County.

E. H. Dewey of Nampa, in speaking of the recent fire on the Checkmate mine at Pearl, says it is intended to fully equip the mill with larger and botter machinery. Men are pumping the water out of the mine.

Elmore County.

There is a 20-stamp mill on the ground for the Mammoth and Rico mines at Black Warrior. Work on tbe road from Rocky Bar to Black Warrior has started. More stamps will be added during the summer.

Idaho County.

(Special Correspondence).—At Buffalo Hump, in Robbins mining district, the largest amount of development work has heen done on the Jumho mine at the extreme south end of the belt on Deer creek. This claim is opened hy three tunnels on the lead, aggregating 2200 feet of work, and connected hy raises. Tunnel No. 4 at the mill level is in 580 feet. The property is equipped with four 5-stamp batteries, two 2-stamp batteries, concentrators, sawmill, electric lighting plant, Gates crusher and cyanide tanks. Water power is used. The lead is 19 feet between walls and three ore shoots bave been opened up, one 250 feet and another 320 feet in length. Tunnel No. 4 will give a depth of 950 feet on the vein.

The Crackerjack mine is developed with two tunnels and 2800 feet of work, and 450 feet of depth has been gained. Two blind leads were cut in the lower tunnel, one 12 feet in width and the other 26 feet, both hearing toward the main ledge. The property is equipped with electric power and a 10-stamp battery.

The Concord M. Co. has sixteen claims at Concord, in the center of the camp. The Ajax has a shaft down 200 feet, with 340 feet of drift north and south, with a lead of ore in sight. Work is heing concentrated on the Motber Lode No. 2. This property shows an ore body 24 feet between walls. Sixty-three feet has been sunk and 2½ feet per shift is being gained in depth. W. Q. Brown is manager.

The Atlas is a nortb extension of the Ajax and is owned by Spokane, Wash., men. It is developed by 850 feet of tunnel and 200 feet of shaft. Drifting is in progress from the 200-foot level and 60 feet have been driven in ore. Tbe tunnel 100 feet above is said to show a continuous ore shoot for its 850 feet.

The Colonel has a tunnel in 380 feet and has 16 feet of high-grade ore. Joining this, between it and the Mother Lode, is the Lost Lake, with 50 feet of shaft showing 16 feet of ledge matter with values in gold and silver.——The Lucky Lad Co. is working on two claims, 1 mile from Hump, and has a shaft down 135 feet, with 320 feet of drifts and crosscuts, showing a lead. The company intends to go on to the 200 level before doing any more drifting. The mine is equipped with a 2-stamp prospecting mill.

At Crystal Lake work is being pushed on the Liberty Bell group of two claims. The tunnel on tbe Rob Roy is in 73 feet and sbows full face of ore.——The Wise Boy is at extreme north end of the belt and has 1800 feet of development work and a 10-stamp mill.——The Oro Fino or Big Buffalo Co. has its tunnel in 885 feet and is making 2 feet per day with one shift.

Beside these properties are a number of prospects partially developed, chief among which comes the Hamilton group, Solo, Mother Lode, San Francisco, Granite, Buffalo Chief, Wall Street, Old Bill, Dewey and Little Giant. The Jumbo has turned out $1200 per stamp per month since it was started, as has also the Crackerjack.

The camp can be reached by wagon road from Stites via Grangeville, the county seat, and thence to Hump, 53 miles in three days, or from Stites via Elk City.

Hump, June 15.

O. Abeling, manager of the Dewey Con. M. & S. Co., operating at Roosevelt, is preparing to put in machinery for a 100-ton cyanide mill to be built this summer. The mill is to be built by the rivor, where the power from the dam is used directly without any intermediate transmission. Excavation for the mill has been carried on this spring. But for losing the dam during the high water of a month ago the work would be further along. The ore will be brought from the mine, which is 200 yards distant, to the mill by a gravity tramway.

F. E. Davis, manager of the Idaho C. M. & S. Co., operating on the Salmon river, near White Bird, has teams hauling the heavy machinery for the company from Stites, where it was stored all winter. There is an air compressor and a

complete outfit for mining. The 90 H. P. boiler was rakon down while the snuw was on tho gruund. A road will he oponed up to take the machinery from the foot of the grade to the property, abuut 4 miles. It is said there is ore on the surfaco which will pay to smelt on both sides of thu river, including tho ground of the Cape Horn, Idaho Con., Cuppor Zone and Salmon River C. Co. properties. Much of tho ore of that section is claimed tu be self-fluxing.

It is estimated that the average cost of freight in Buffalo Hump for the whole year is approximately 7 cents a pound. A guod road into tho camp is needed.

Kootenai County.

Troy, Mont., reports say a coppor strike has been made on the north fork of Callahan creek, 3 miles from the Montana-Idaho State line in Idaho. Excepting to tho trappers who in the winter months visit that sectiou of the Cabinet mountains, tho district is little known. The strike is 10 miles from the B. & B. mine, and 16 miles from Troy, Mont. It is 5 miles from the copper properties owned by the Ross Brothers of Libby, Mont. The strike was made by W. A. Raymond and J. M. Roberts of Troy. They fuund an iron capping on top of a mountain, and following down the sides of this mountain they struck a vein of ore 8 feet wide. As a result of four days' work with prospecting tools they have three tons of ore on the dump, assays of which showed 4¼% copper and two and one-half ounces in silver with some gold. Much of the ore is said to contain native copper. Trail builders are at work cutting a trail from the B. & B. mine, and as soon as this is completed supplies and materials will be taken in and development work started.

Shoshone County.

Secretary of the Interior Hitchcock has allowed the classification as mineral, by the mineral land commission, of over 600,000 acres of land embraced in twenty-seven townships lying south of Wallace, says the Spokesman-Review, reversing the decision of the Cœur d'Alene land office in favor of the land department of the Northern Pacific Railway. Many mines and prospects were located within the territory involved, and had the Secretary of the Interior sustained the findings of the General Land Office, which overruled the classification of the mineral land commission, and held the lands to be non-mineral, every alternate section would have become the property of the railway company, and the mining locations made thereon would have been void. The Secretary of the Interior finds that the hearing before the officers of the Cœur d'Alene land office, which resulted in the mineral classification being rejected, was unauthorized.

Wallace reports say a leaching plant of 250 tons daily capacity is being put in by leasers of the upper workings of the Snowstorm mine. This, with the 50-ton daily shipment to the smelter, will give them an output of 300 tons per day. The leaching plant will go to the owners of the mine at expiration of the lease.——The Champion C. M. Co., near Stevens Peak, has concluded negotiations for sale of the property and operations will he begun by Aug. 1st.——A shaft house is being built on the Evolution mine to replace the one destroyed by fire. The company will continue sinking on the ore in the shaft.

The Alma M. Co. at Mullan has started operations, running a long tunnel. The new compressor and drills are in operation.

Washington County.

Ford Bros. at Black Lakes, near Council, have excavated the site for their cyanide plant at the Gold Coin mine, to be located near the site of the one destroyed by fire last fall. The machinery is being hauled to the mine. The plant will be of 100 tons capacity.

MICHIGAN.

The reports of several of the Lake copper mining companies for the output for month of May is shown below. They show some increase over the April figures, but the changes are small. The Adventure and Mass report decreased outputs. Isle Royale made the largest percentage of increase. The three Copper Range Con. mines show 2269 tons produced in May, as against 2249 tons in April, the increase said to he due wholly to the Champion mine:

Mine.	May.	April.	Since Jan. 1.
Adventure	60	65	265
Calumet	3,250	3,225	16,225
Mass	140	155	750
Osceola	1,265	1,225	5,870
Isle Royale	100	85	452
Tamarack	565	520	3,045
Wolverine	502	502	2,461
Mohawk	508	500⅔	2,203
Atlantic	308	310	1,591
Quincy	1,123	1,119	4,980
Franklin	337	352	1,688
Winona	28	47⅓	202
Baltic) Copper	744	780	3,010
Champion) Range	784	718⅓	3,033
Trimountain.) Con	741	750	2,801

In the Daily Mining Record, H. J. Stovens of Houghton says the mines of Lake Superior region aro making more copper than evor hofore in history of the district. The mines have adjusted their operations to the metal market prices, aud are making money, with few oxceptions. Barring accidents uf a serious nature, ur severe laber troubles, the 1904 production of copper is expected to oxceed 200,000,000 pounds. The all-rail shipments of refined copper continue, owing to tho strike that has tied up lake traffic. The shortage of coal for the operation of the mines remains a disquioting factor. A few cargues have been received and none of the mines or mills have been forced to suspend, oven temporarily, by reason of a shortage of fuel, hut tho availablo supply at local ports is small, and it is imperative that coal be secured during the open season for the requirements of next wiuter and spring. The lako strike has also caused a shortage of mineral supply for tho Buffalo smelter of the Calumet & Hecla C. Co., which ran out of unsmelted mineral several weeks ago.

Houghton County.

The Osceola mine at Opechee, uear Calumet, has begun exploratory work for the southern extension of the Kearsarge lode. The North Kearsarge and South Kearsarge mines of the Osceola Con. C. Co. are the principal producers of that property, hut tho recent development work of the Calumet & Hecla has shown that the Kearsarge lode may possess mineral values on the tract of the Osceola mine proper. The Osceola has a full equipment of mining machiuery on the ground.

The sale of the 1-stamp mill of the Centennial mine, near Calumet, and its dismantling, mark the close of the Schoolcraft-Centennial mine, on which unsuccessful efforts, entailing expenditure of $2,000,000, were made to open paying mines on the Calumet conglomerate, says the Daily Mining Record. The present Centennial mine is opened on the Kearsarge lode and no attention whatever is being paid to the old openings of the Calumet and Osceola beds.

Seven eighths of the production of the Franklin mine, at Hancock, is secured from No. 5 shaft, though some rock is still coming from No. 3 shaft. The second shaft at the Franklin Junior will relieve the pressure on the single shaft now in operation.

The remodeled section of the Hecla mill of the Calumet & Hecla C. Co., at Lake Linden, is reported giving satisfactory results. About three years more will be required tu complete the work of remodeling the other half of the Hecla mill and the 11-stamp Calumet mill.

Keweenaw County.

At the Ahmeek mine at Kearsarge, near Allouez, concrete stringers and ties are being laid for the skip track. The question of linding timber for the mines is reported one of increasing importance, and the cost of mine timber is rising steadily. The forests of pine that covered perhaps half of the upper peninsula of Michigan forty years ago have been reduced to limited patches, and it is now necessary for the mines to secure their heaviest timbers from the Pacific coast. Smaller pine, hemlock and cedar timber is still obtained ou the southern shore of Lake Superior, but the supply is growing smaller. The Calumet & Hecla Co. is making increased use of hardwood timber, and as there are maple and other hard woods remaining within 100 miles of the mines, some relief can be afforded by the partial substitution of hardwood for pine and hemlock. This, however, is hut a temporary relief, and if cement and steel construction can be economically employed in the mines it will solve the problem. Concrete should prove successful for certain uses, but the availability of steel remains to be proved, as the acid mine waters are corrosive.

MONTANA.

Flathead County.

The Cherry Creek M. Co. has been incorporated to operate mining properties in Libby district. Its principal place of business is Seattle, Wash., and the directors are J. Y. Terry, O. C. Jansen and B. Y. Terry of Seattle. The company owns seven placer claims on Big Cherry creek. Each of these claims contains 160 acres. The ground extends up stream from the point where the road from Libby to the Snowshoe mine crosses Cherry creek. The company has made tests of ground. There is an ahundance of water for mining purposes in Cherry creek.

S. D. McCarthy, manager of the Libby Placer M. Co., operating on Libby creek near Libby, reports work progressing. He is working twelve men, eight of whom are on the day shift and four on night shift. They are working ten-hour shifts. The hydraulic hoist was set up in the spring. It will handle five times as muoh rock as the hand-power arrangement used last season. The cleanup will be made in tho fall. They have already added 150 feet of sluice hoxes to the flume.

NEVADA.

Esmeralda County.

C. McCarthy has a bund un the Chiatuvich's Mary mine, tunnel site, mill and cyanide plant, and tho Homestead claim, carrying the apex of the vein, and also a water right, at Silver Peak.

Another rush to Goldfield is on as thu result of reports that high-grade ore has been uncovered in the Jumho mine. The rock is free-milling gold ore. The first n ill at the camp is in operatiun.

Lincoln County.

At Good Springs, near the line of the San Podro Railroad, the ownors of the Red Cloud group of mines are reported producing ore which shows a valuation of $250 por ton, says W. H. Wilson, manager of the Frederick Warde M. Co. The Red Cloud mines promise, says Wilson, to develop into producers of quicksilver. Cinnabar is piled up which carries valucs in gold. It is intended to equip tbe minos with retorts.

Nye County.

F. A. Barrett, of Seattle, Wash., has bought three claims at Lone Mountain, near Tonopah, between tho Nevada-Alpine and Tonopah-Alpine mines. The claims have surface showing of silver-lead ore.

Washoe County.

An engine has heon set up hy W. C. Williams on the Addie C. mine, near Wadsworth. It will he used till the shaft is 400 fect deep.

White Pine County.

Thirty thousand feet of lumber has been ordered for the concentrator to be built at the Ruth mine at Ely.

The Bay State mine at Newlands, 20 miles northeast of Eureka, in White Pine county, has been sold to the Newark M. & M. Co., organized at Boston, Mass., with C. M. Perry of Boston president. T. Robinson of Eureka is manager. He has made arrangements to reopen the mine. The value in the ore is mostly silver.

NEW MEXICO.

Otero County.

H. S. Anderson, G. French and J. H. Eddy, of El Paso, have located soda beds in the sand hills near Alamogordo. They have put in experimental machinery on the deposits and have started to develop them.

Sierra County.

The placers at Shandon are increasing their output of gold, says the New Mexican. Fifty men are at work, several on their own ground, while the others are leasing. The district has produced $8000 in gold since its opening, six months ago. Many farmers have gone to digging gold since the drouth set in, which made it difficult for them to make a living from the farms owing to lack of water for irrigation purposes.

The shaft of the Treasure mine, near Hillsboro, at a depth of 70 feet, has a showing of high-grade ore.——Development work on the Good Hope Bonanza mine, near Hillsboro, has opened a parallel vein that is producing ore. A shipment has been made.——W. H. Williams reports having fmished a satisfactory cleanup after a five weeks' run of Wicks ore at the Porter mill, near Hillsboro.

Valencia County.

(Special Correspondence). — Copperton is a new camp 110 miles west of Albuquerque, in the Zuni mountains, at an altitude of 9200 feet. It was discovered in 1901 by W. J. Skeed, the present manager of the Copperton M. Co. The formations in which the ledges occur are granite, hornblende schist, porphyry and diorite. The ores are copper (principally as carbonate), gold and silver. The country is well timbered. The veins are well defined and vary from 2 feet to 60 feet in width.

The camp needs capital for development. The Copperton M. Co. is sinking a double-compartment shaft on the Compromise claim and has attained a depth of 65 feet, and is crosscutting the vein at 50 feet, which shows copper carbonate. The vein is 65 feet wide at this point. They have also made a strike in the Empress claim, 3 miles east of Copperton, showing 4 feet of copper carbonate.

F. E. Rogers, representing a New York company, has started a 7x9-foot shaft on the Santa Claus claim, 3 miles north of Copperton. It is intended to sink 500 feet, as a prospect drill is said to have cut an 18-foot vein of ore at 285 feet which runs 2½ ounces gold and 12% copper.

Crocker & Schell have made a gold strike assaying $8 in a well-defined vein 4 feet in width.

Whiteside, Jones & Co. have crosscut through 20 feet of carbonate ore, assaying 11% copper, 3½ miles north of Copperton.

Copperton, June 18.

OREGON.

Baker County.

A second power plant is being put in hy tho Beaver M. Co., owning the Baisley-Elkhorn mine, near Sumpter. A dynamo and electrical apparatus have been delivered 1½ mile below the site of the water power plant that runs the compressor. The electrical transmission plant will be put in, and the euergy generated will be delivered either at the compressor or at the mill above. As Pine creek drops rapidly between the compressor site and the site for the electrical plant sufficient head is secured. The Baisley has been delivering air from the compressor plant to the mine for running the pumps, hoists, etc., and found that there was not enough loft for the power drills in the face of the crosscut. As the air line was nearly 1 mile long, frictiun was a material loss. By delivering the electrical current direct to the mine, iu a transmissiun of not to exceed 3 miles, the loss will be slight, and all tho power of the first plant may be utilized for the compressor.

Crook County.

Manager L. Tillotson says he is opening up the ledge on the American Almaden Quicksilver & C. M. Co. claims, near Prineville. The ore carries gold, bituminous matter and 6% quicksilver. The ledge averages 15 feet wide. It is intended to build a plant for reduction of the ores this season. Tho property is 30 miles east of Prineville.

Grant County.

(Special Corrospondence).—Simpson & Graham have a working bond on the Gem mine at Susanville. The owners who had the land patented left it lie idle for several years after uncovering the ore body. —— Stevenson & Spaulding havo completed improvements on tbeir custom mill and it is in full operation.

Heaton Bros. are increasing development work on the Gold Bug mine, in which they havo bought an interest recently and the prospects are so far satisfactory.

D. Briggs is working his placer diggings on Deep creek and expects a heavy cleanup at the end of summer, to which time he expects the water season to last.

The Blue Channel Placer G. M. Co. has suspended drift work for the present, owing to unsatisfactory labor conditions and is devoting its energy to installing hydraulic pipe and giant plant.

Susanville, June 20.

Jackson County.

A deal has been closed at Gold Hill, whereby the Gold Hill Dev. Co., consisting of Milwaukee, Wis., men, has bought the J. J. Houck water and power privileges to conduct mining, manufacturing, etc. H. Schaeffer is manager for the Wisconsin men. It is intended to build a 100-ton smelter that will consume all its fumes and gases. The fuel will come from the company's coal mine in the Meadows district, and all power will be electrical. The smelter will be near the Rogue river mills, on opposite side of river. The company proposes to furnish electrical power for other purposes. The water power will he 8000 H. P. It will be necessary to build a canal 2100 feet long, 50 foet wide, and 8 feet deep, carrying 210,000 cubic feet of water per miaute, with 26-foot constant head, says the Courier. The company has bought mining ground near Gold Hill that it will develop.

Josephine County.

The Comstock G. M. & M. Co. is preparing to increase development work this year. The company has developed quartz mines at Mount Baldy, near Grant's Pass, and also a numher of claims on Canyon creek, near Kerby. J. M. Layman, manager of the company, will superintend operations.

For $50,000, the Gold Standard group of gold and copper claims of H. E. Booth, of Pickett Creek district, have been sold to Cripple Creek, Colo., and Chicago, Ill., men. Thoy will begin development this week. The Gold Standard group embraces eight full claims in one tract, on Pickett creek and Rogue river, 12 miles helow Grants Pass. Development work, in tunnels and drifts, has been done and a body of ore uncovered. Free gold is carried in the quartz, and in some of the veins copper predominates. The several adjoining claims will be operated conjunctively.

W. Gilmore of Medford, operating mines at Grayback mountain, 20 miles east of Waldo, reports a gold strike of high-grade ore. There is said to be a streak 10 inches wide in a vein traced for 2000 feet. The strike is near the California line and on the divide between the Illinois and Klamath rivers, where placer beds were found in early days.

W. P. Cope, former owner of the Yank group of copper and gold claims of the Galice district, has taken charge of the Lucky Cuss group of claims of the Mur-

phy district, near Grants Pass, and will superintend development for the Gold Point M. & M. Co. He is driving a deep tunnel.

The Gold King mine, of Josephine creek, near Grants Pass, is being developed hy W. Roe et al. of Fort Worth, Tex. Development work is heing done under direction of M. Marks.

The Mountain Lion mine, near Grants Pass, has been taken up by J. S. Crawford et al. of Duluth and Minneapolis, Minn. The Mountain Lion has been under development for several years.

S. Bowden, with Spokane and other Washington men, has taken up a copper property near Kerby, on the Illinois river, and is developing it.

Lane County.

G. E. Waggoner of Portland, manager of the Oregon Blue M. Co., operating at Blue River, says preliminary work has begun for building a 10-stamp mill at the company's mine.

Malheur County.

J. F. Meikle, manager of the Black Eagle mine at Malheur City, reports work progressing. The mine is on a porphyry dike 600 feet wide. A 20-stamp mill is running steadily and the values taken out are said to be satisfactory. Prospecting work on a large scale is being done and Meikle is sinking on the ledge. When the depth of the ore is fully tested the company will put on a larger stamp mill. A. Kime is superintendent.

Wallowa County.

La Grande reports say C. Christy has bought an undivided half interest in the S. Lynch placer claims, known as the Klondike and Pioneer. The mines are on the west side of the Imnaha river, 2 miles below the Hassee sheep bridge. Mr. Christy also bought a one-half interest in a water right which flows through the properties and has its source in the Imnaha river.

SOUTH DAKOTA.

Lawrence County.

Work on the plant for the Gilt Edge-Maid M. Co., near Galena, has been started. Excavation work is completed and the material for the structure is on the ground.

The Golden Reward, Dakota and Imperial cyanide plants in Deadwood were at a standstill last week, as a result of the recent flood. Railroads are necessary to these plants, for the delivery of both coal and fuel, and the suspension of railroad business cut the plants off for a time. Some damage was inflicted about the mills hy the high water, but this was not of a serious nature or of great extent. The Hidden Fortune M. Co. cyanide plant, 3 miles below Deadwood, on Whitewood Creek, had a similar experience, and was cut off from fuel and ore. The railroad companies have made repairs and communication will be re-established this week.

Excavations have heen completed for the cyanide mill of the Gilt Edge-Maid M. Co. in Strawberry gulch, near Galena, and the timbers are on the ground for the frame work, most of it coming from Oregon.

Work is progressing and the fourth tunnel is being driven on the Fairview mines, near Mystic. This has reached a length of 115 feet from its portal, and has tapped the 30-foot ledge towards which it was being driven. This ledge, which runs parallel to the main ledge, at the surface has proven a free-milling proposition, assays giving $6. All the work has been in tunnels.

UTAH.

For the lead contained in Utah ores Manager C. W. Whitley of the American S. & R. Co. at Salt Lake City says his company will pay $4.25 per hundred pounds, an advance of 75 cents over the figures that ruled till recently. On the production of lead in the valley last month, which amounted to 8,400,000 pounds, the gain means approximately $30,000, says the Tribune. The advance concerns principally producers of Park City, Summit county. The Daly West last year produced 34,000,000 pounds of lead, the Silver King 33,500,000 pounds, while the others contributed sufficient to create a total of 50,000 tons, for which the producers recoivod $3,500,000. Manager Whitley says owing to conditions existing in the East which had prevented the increase, and the large number of contracts that prevented having expired, the company now finds itself in a position to establish "the new settling price, based upon the actual average weekly selling price of finished, desilverized domestic lead in New York City for lots of fifty tons or more, deliverable within thirty days." Tintic and Bingham districts will also profit by the raise.

Grand County.

The cyanide plant with which the Interstate M. & M. Co. is equipping its properties at Gold Basin, near Basin, will he put in operation hy August 15, says J. H. Clark. The crushers will hegin grinding on ores that afford average of $7.50 gold per ton. The hoilers are being set, and the sawmill is in steady operation.——The Grouse Mountain group, on which W. H. Wheet has been directing work, will also he equipped with a mill this season, the management having blocked out ore of milling quality.——E. Borene and partner report having found the lode from which the float scattered over Wilson mesa has issued. The ledge has been followed to a depth of 30 feet.

Iron County.

With the water under control and the management again taking out ore on the 300-foot level of the Johnny mine at Stateline, ten stamps are crushing daily twenty-seven tons of ore. With the larger pump in position and the element which has retarded developments under control, the opening of the lower workings is expected to progress.

Juab County.

The Uncle Sam mines of Tintic district, near Eureka, during the year that closed on the 7th inst. marketed ores of the value of $61,693.33, and begins its new year with a cash balance of $10,483.94, without reference to a consignment of four carloads of ore from which $4000 will be derived, says the report of Manager J. Chipman. The mine has not only been productive of considerable high-grade ore, hut it has supplied the mill with a steady volume of second class rock. In concluding his report Manager Chipman says the mines are in about the same condition for producing as they have been for the past year. However, one of the leasers has opened up a shoot of rich ore in the Humbug mine. This part of the property is being worked on lease by four separate companies of lessees. So far the company has found that leasing is profitable, and Manager Chipman thinks that hereafter the leasing of the Humbug will prove more profitable than the working of the property by the Uncle Sam Co., providing the work is done under a competent superintendent, who visits the mine daily and who knows the condition the mine should be kept in and sees that it is kept in that condition.

Piute County.

The mining districts surrounding Marysvale are being worked. The Bully Boy and Webster leases are making shipments. Merriam & Tinsman are lessees. The ore runs in lead, gold and silver values.

Sevier County.

The Wild Bill group of mines, near Richfield, has been made the foundation for Chicago M. & M. Co., incorporated by F. T. McGurrin of Salt Lake City, T. Keeley of Chicago, Ill., M. Cullen, E. Keeley, P. Ryan and C. Hennessey directors. The Wild Bill group of mines has been productive of ore and will be further developed.

Summit County.

Park City reports say No. 2 hoist on the Ontario mine, near there, was destroyed by fire on the 20th inst., throwing 200 men out of employment and causing a loss of $60,000.

Manager C. L. Rood of the Daly, Ontario and Naildriver mines at Park City reports work progressing on the properties under his control. The quicksilver deposits are being profitably worked. At the Daly, work in the shaft is progressing, the water having been pumped out last week. No further trouble is anticipated from the surface water. Regarding resumption of work in the Federal tunnel, Rood states no definite steps have as yet been taken. Development work goes steadily ahead at the Naildriver. The power house near the mouth of the Ontario tunnel, which furnishes the city with light, will be moved farther down the canyon. Since the new mill started up the demand for electricity has been greater than it was before, and the local plant and the one in question have been running to full capacity. By moving the plant farther down the canyon, a greater fall of water can be obtained and the capacity of the works will be doubled. This will insure more power at the mill, and for the Mazeppa and Ontario mines.

Utah County.

The Tidal Wave M. & M. Co. has been incorporated at Provo. The company owns ten claims midway between Provo and Springville and 1 mile east of the county road. The incorporators are J. & W. A. Pierce, G. Elliott, D. Christensen, J. M. Pierce, R. Skelton and A. L. Booth. The property has been worked off and on for two years and a half. Assays show values in lead, gold and silver.

Washington County.

A deal was made last week by which a one-third interest in the Little Johnny group of mines, 18 miles west of St. George, passed to F. Higgins, who already owned a third. The remainder is held by A. Empey of Dixie. The Little Johnny is a copper prospect in early stage of development. A couple of shafts have been sunk—one 63 feet and the other 40 feet—and a crosscut 50 feet below is showing 100 feet of ledge matter.

WASHINGTON.

Ferry County.

Work will be resumed on the Quilp mine at Republic this summer, says E. L. Tate of Spokane, manager. The Quilp Co. wants to get a contract with some smelter for at least 10,000 tons of ore, to be delivered as fast as the company can mine it, and wants to get such a contract before work is resumed.

WYOMING.

Albany County.

E. P. Kester, of Towanda, Pa., and W. J. Greevy, of Omaha, Neb., interested in the American C. Co., of Albany county, report work progressing on the company's holdings 40 miles west of Laramie. Other property interests in that section, including the Cuprite and the Maud M. mines, in which W. Benton and T. M. B. Hicks are interested, also the Keystone mine, Blue Jay and the Florence, together with the mill privilege on the Keystone ground, which has passed into tho hands of the Ideal M. & I. Co., are being operated. The Laramie, Hahn's Peak Pacific Railroad Co., when completed, will do much toward the development of the section of country in which are situated these mines. The company is laying rails and it is expected at least 33 miles of the road will be built and in operation by October 1st next.

The Rambler mine and smelting works at Rambler, near the Colorado line south of Laramie, are to be reopened this week by the Greene Co. of Chicago, Ill. The mine and smelter have been closed down for six months. Ore from mines in the Pearl, Colo., district will also be treated at the Rambler smelter.

Bighorn County.

Ore shipments from the Sunrise iron mines to the smelters of the Colorado Fuel & Iron Co. at Pueblo, Colo., have been resumed via the Colorado & Southern Railroad. These shipments ceased after the flood on May 20. Four trainloads of ore will go from Sunrise to Pueblo each week.

Carbon County.

R. Deal et al. have incorporated the Alameda M. Co. to develop tbe Alameda group of three claims south of the Home Fraction and Charter Oak mines, 5 miles from Grand Encampment. R. Deal is president, J. C. Rankin vice-president and P. J. Winters secretary. The principal work has been done on the Alameda, where a shaft has been sunk 30 feet and a tunnel driven 85 feet. On the Bessie claim a shaft has been sunk 20 feet and on the May Bell a 30-foot tunnel. The company expects to develop the group by extending the Alameda tunnel to 480 feet, which will give a vertical depth of 350 feet. From this tunnel the lead, 12 feet wide on the surface, will be worked. Values are in gold.

FOREIGN.

AUSTRALIA.

Western Australia.

On the 1600-foot level of the Lake View Consols mine at Kalgoorlie recent developments have shown tellurides in the ore. This is said to be the first occurrence of telluride found below the 1200-foot level. The self-dumping skips are in successful operation and the new mill has been completed.

BRITISH COLUMBIA.

Vanconver Island.

(Special Correspondence).—During the month of May the Tyee C. Co.'s smelter ran eighteen days and 4040 tons of Tyee ore were smelted, giving a return, after deduction of freight and refining charges, of $47,028.

Duncan's Station, June 18.

CANADA.

Ontario.

Wabigoon reports say mining work is increasing in the Dryden belt. J. Herrington has put men to work to resume operations on the property of the Ideal M. Co. of Detroit, Mich.——Manager Halstead of the Summit Lake G. M. Co. at the Little Master mine says he has been overseeing a number of alterations on the surface and mining operations have been resumed. Instead of sinking the main shaft at once to 300 feet, it has been decided to crosscut at 150 feet each way to explore the other voins, particularly the black quartz vein.

The reduction works and docks, near Tunnel island, Rat Portage, have been sold by the Dominion G. M. Co. to the Traverse City G. Reef Co., an Arizona company. They own properties on the Lake of the Woods, and propose to take the ore there for treatment. They have already a large quantity of ore on the dump.

MEXICO.

Chihuahua.

At Parral the Parral M. Co. is crushing and treating seventy tons daily.——The Guggenheim Exploration Co. has started work on its Veta Grande mine in Minas Nuevas district, the work being in charge of E. Stalknecht.——W. H. Mealy of Monterey is preparing to start work on a group of mining properties at El Portrero, 16 miles south of Parral.

S. Lawrence and G. B. Jacobs have started operations on the Dolores mine in Santa Eulalia, on which they have a lease and option. Lumber and materials have been shipped out and work begun to set up a crusher of forty tons daily capacity, and a hand jigging apparatus for concentration of the ore. The crusher and jig will be run by power from a gasoline engine. The values are in the lead with a quartz gangue. The Dolores mine adjoins tbe San Antonio mine of the American S. & R. Co.

The Santa Eulalia Ex. Co. at Santa Eulalia, R. D. Jackson, manager, is down on its shaft 350 feet. The work has been proceeding slowly, as it has all been done by hand. A site for the machinery and air compressor plant has been made and machine drills will be in use next month. In the meantime, ore is being taken out through the shaft of the American S. & R. Co. as heretofore.

Durango.

At Topia deep mining is under way, particularly in the Madrugodo mine, owned by the Miller & Sibley Co. of Bradford, Pa. The company has run a tunnel 1 mile in length and has struck a vein with a body of ore at 1800 feet in depth. It is to this camp, near the Sinaloa border and 6000 feet above sea level, that a railroad is proposed from the coast. It is a well mineralized district, held back by lack of transportation facilities.

Guanajuato.

It is reported New York and Pennsylvania men have bought La Lue silver-gold mine near Siloas for $300,000 (Mexican). The purchasing company is headed by C. V. Culver of New York City. It is claimed the company will build a 100-ton capacity mill.

Jalisco.

A boiler with capacity of 80 H. P. has been put in at the plant of the Keystone C. S. Co. at Tapalpa and the plant will be run to full capacity. Besides the smelter, the Keystone Co. operates a concentrating plant and stamp mill. A. L. Waters is manager.

Oaxaca.

O. Land, manager of the Santa Fe M. & M. Co. of Oaxaca, reports the mining industry showing satisfactory progress in the State of Oaxaca. Tbe city of Oaxaca is at an elevation of 5000 feet, which gives it a pleasant climate the year round. There are several mines in the State that are making regular shipments of ore to Aguascalientes, the United States and Swansea, Wales. Considerable English capital has gone into the mines there and these companies ship their oro by way of Vera Cruz to Wales. There has also been a large amout of capital placed in the mines of the State.—— The Paris mine, owned by Detroit, Mich., men, has a 20-stamp mill running on free milling ore. In addition to the development of the smelters, there are several short lines of railroad that are being built there, which will open up new agricultural and mining sections and prove feeders to the lines already in existence. One of these lines will be 25 miles in length when built and has been under construction for two years. The line is within 2 kilometers (1¼ mile) of being completed. This line will open up mineral camps in which there is a possibility of a smelter being built. This line is being constructed west of Ocotlan and the ultimate destination is said to be the Pacific coast.——The Santa Fe M. & M. Co. has bought forty pertenencias of ground of free milling ore. The Santa Fe mine, which is one of the properties, is an "antigua" Spanish mine. No great depths have been reached on any of the properties in that section, the deepest working being about 380 feet.

Puebla.

A group of gold and silver mines, near Tetela de Ocampo, has been bought by the Compania de Mexico, Ltd., and machinery will be put in.

Sonora.

It is stated that La Brisca M. Co., near Magdalena, will put in an electric plant to light and run their works. A telephone or telegraph line will be put up to connect with Magdalena.

G. B. Earnshaw has taken over the Cerro Colorado mine, near Altar, 50 miles southwest from Santa Ana, and is prepar-

ing to operate the property. A 50-stamp mill will be built. The Cerro Colorado is a low-grade gold proposition, said to be well developed.

Vera Cruz.

A company organized under the laws of Delaware has a tract of land in the State of Vera Cruz and has sunk several wells at El Caguas. Oil is reported as having been found in paying quantities, although the wells have only been dug and not drilled. Drilling will be started, writes W. W. Canada, United States Consul at Vera Cruz.

Zacatecas.

L. Breidenbach of Monterey is preparing to put up a plant at Zacatecas, for treatment of 600,000 tons of ore on a dump of an old mine in that camp.

Commercial Paragraphs.

H. C. PARMELEE has bought the interest of S. B. Weld in the firm of Parmelee & Weld, chemists and assayers, Denver, Colo.

REDFIELD DRILL CO., Denver, Colo., report shipping one of their hand-power rock drills to Grants Pass, Or., and one to Los Angeles, Cal.

J. A. TRAYLOR, 509 Equitable Building, Denver, Colo., is representing through the Western States the Hodge Iron Co. of Houghton, Mich.

THE Chicago office of the Nernst Lamp Co., in charge of A. E. Fleming as district manager, has been removed from 638 National Life building, La Salle street, to 99 East Lake street.

RAND DRILL CO. of New York is sending out a mailing card which is a novelty. It is in the shape of the new "Imperial" hammer, the address being written on the barrel and a 1 cent stamp fitting into the handle. On the reverse side are a few suggestive lines.

S. W. TRAYLOR of New York has closed a contract for the Colorado Iron Works Co. of Denver, Colo., for a 75-ton rolling and concentrating mill at Silverton, Colo., for the Ruby Basin Mine & Tunnel Co. Eight of the new Traylor centri-pact screens will be installed.

S. W. TRAYLOR, engineer and designer of smelting and concentrating plants, stamp mills, etc., has organized the Traylor Engineering Co. for the manufacture and sale of his recently patented Traylor centri-pact screen. The company is now equipping a plant in Newark, N. J., for the manufacture of this screen, and will have offices at 118 Liberty street, New York City.

THE authorities in charge of the 300,000 H. P. plant at the St. Louis Exposition have installed a large No. 3 Cross oil filter manufactured by the Burt Mfg. Co. of Akron, Ohio. The Cross oil filter has also been ordered by the C. H. Bradley Co. of Pittsburg, Pa., for use in connection with their exhibit at the fair. Likewise the Buckeye Engine Co. of Salem, Ohio, and the De Laval Steam Turbine Co. of Trenton, N. J., have ordered No. 3 American filters, to be used at the fair in connection with their exhibits.

THE Canadian Rand Drill Co., Sherbrooke, Quebec, reports having closed with the Canadian Westinghouse Co. of Hamilton, Ontario, for a Rand-Corliss compound air compressor. This machine is designed to furnish air for the various pneumatic appliances throughout the works, and is to be driven by a Westinghouse motor through a Morse chain drive. The International Coal & Coke Co., Coleman, Alberta, have placed an order with the Canadian Rand Drill Co. for a 300 H. P., steam driven, Rand duplex compressor.

THE Tetrault improved concentrating table has been in operation the past three months at the custom mill of the Progressive Concentrating & M. Co., of Boulder, Colo., writes that company. The table is 6 feet by 10 feet long and has a capacity of 15 tons per day. They say the machines are making a saving of 85% to 93½% on test runs of from 5 to 100-ton lots. Further information can be obtained from the manufacturers of the tables, the Progressive Concentrating & M. Co., E. C. Pohle, president, and A. Tetrault, superintendent, Boulder, Colo.

Obituary.

J. G. MEIGGS, an American engineer, died at London, Eng., on the 21st inst. Deceased was born in New England seventy-seven years ago. He left the United States for Peru, where, with his brother, Henry Meiggs, they built the Oroya railway. Since living in London, Meiggs built several important railroads in Argentina.

Personal.

W. H. KINNON has returned to Denver, Colo., from Bland, N. M.

DR. F. WILDER has been appointed State Geologist of Iowa.

W. H. BRAY, a mine manager of Nevada City, Cal., is in San Francisco, Cal.

J. H. WEBER of Chicago, Ill., is in San Francisco, Cal., on mining business.

F. C. COX of Phœnix, Ariz., is in San Francisco, Cal., on mining business.

F. F. BULLEN, a mining man of Victoria, B. C., is in San Francisco, Cal.

J. MOLDER has resigned as superintendent of the Home C. Co., at Morenci, Ariz.

R. W. HINTON is superintendent at the Velvet concentrator, near Rossland, B. C.

R. T. HILL is now consulting geologist Greene Con. Copper Co., Cananea, Mexico.

A. H. BROWN, a mine owner of Kennett, Shasta county, Cal., is in San Francisco, Cal.

B. M. PATTISON is now superintendent Shattuck-Arizona Copper Co., Bisbee, Ariz.

C. M. MEYER of New York City is at Florence, Colo., conducting milling operations.

C. M. FUELLER of Denver, Colo., has been examining mining property at Silver Cliff, Colo.

WEBB SMITH, superintendent of the Kennedy mine at Jackson, Cal., is in San Francisco, Cal.

N. L. JENKINS is superintendent of the Home C. Co., at Morenci, Ariz., vice J. Molder resigned.

J. F. MEIKLE, manager of the Black Eagle mine, at Malheur, Or., is visiting in Los Angeles, Cal.

J. CHALMERS of Denver, Colo., has returned there from a professional trip to Rinconada, N. M.

J. H. KINKEAD, superintendent of the Kentuck mine at Virginia City, Nev., is in San Francisco, Cal.

W. H. HILL, formerly of Prescott, Ariz., is general foreman of the Anita C. Co., near Williams, Ariz.

G. W. RYALL of Baltimore, Md., has returned East from an examination of mining interests in Sonora, Mex.

G. P. DILLMAN of San Francisco, Cal., is in Chicago, Ill., on his return from a trip through the Eastern States.

E. T. WALLACE, a mine owner of Yreka, Siskiyou county, Cal., is in San Francisco, Cal., on mining business.

W. J. MAGEE, of Sutter Creek, Cal., is general manager of the South Eureka Mining Co., near Sutter Creek, Cal.

A. R. MIGNON, owner of La Bonanza and Guadalupe mines at Etzatlan, Jalisco, Mexico, is visiting in Ft. Worth, Texas.

SUPERINTENDENT W. E. SHARON of the Crown Point, Belcher et al. mines at Virginia City, Nev., is in St. Louis, Mo.

W. P. COPE is superintendent of the Lucky Cuss mines of the Gold Point M. & M. Co., near Murphy, Josephine county, Or.

ALBERT TRITTENBACH, superintendent of the Dutch mine at Quartz, Tuolumne county, Cal., is in San Francisco, Cal.

EMERSON GEE, who has been in Mexico for the last two months on mine examinations, has returned to Los Angeles, Cal.

JOHN DERN of Salt Lake City, Utah, is president and manager of the Uncle Sam Con. M. Co., operating in Tintic district, Utah.

P. L. YOUNG, M. E., is in San Francisco, Cal., from Chilo, South America, and is going to Dawson City, Yukon Territory.

T. ROBINSON of Eureka, Nev., is manager of the Bay State mine of the Newark M. & M. Co., at Newark, White Pine county, Nev.

J. HOOPER is superintendent of the Mitchell copper mines in the Huachuca mountains, near Bisbee, Ariz., vice J. Piper, resigned.

H. DEC. RICHARDS has returned to San Francisco, Cal., from a trip to Mexican mines. He will soon leave for his mines in Amador Co., Cal.

R. STUART BROWNE of San Francisco, Cal., has gone to Placer county, Cal., to report on a cyanlding proposition. He will return about July 1st.

R. J. COLEMAN, president of the company operating the Lluvia de Oro mines, Choix, Sinaloa, Mex., has returned from a short trip to Denver, Colo.

R. G. COLLINS has resigned as mechanical superintendent at the Washoe smelter at Anaconda, Mont., and will go to Chicago, Ill., where he will be connected with a steel company.

GEORGE D. JAMES of Denver is in the vicinity of Frisco and Curtin, Summit county, Colo., on professional business for Chicago and Kansas City interests and will return to Denver shortly.

G. H. ARLETT, at Chihuahua City, Chihuahua, Mexico, has closed his assay office and chemical laboratory and will take charge of the mining operations of G. W. Boyce and his several companies in Mexico.

J. PIPER, who has been in charge of developments at the Mitchell mines in the Huachuca mountains, near Bisbee, Ariz., has resigned to accept the superintendency of the Hartford iron mine, in northern Michigan, one of the properties of the Oliver Iron M. Co.

Trade Treatises.

"Oil vs. Grease" is the title of a neat pamphlet issued by the Joseph Dixon Graphite Co., of Jersey City, N. J., in which is set forth the advantages of the lubricants made by that firm.

The Crocker-Wheeler Co. of Ampere, N. J., has issued Bullotin No. 45, descriptive of the electric plant of the Government printing office at Washington, D. C. It is profusely and handsomely illustrated and shows another of the varied uses of electricity in the industries.

The Dean Bros. Steam Pump Works of Indianapolis, Ind., have just issued catalogue No. 44, illustrating and describing their various forms of pumps and air compressors, large and small, for varied uses, together with carefully prepared tables for the use of those making use of this class of machinery.

The Dixon Graphite Co. of Jersey City, N. J., have issued two interesting little pamphlets entitled "Dixon's Graphite Cup Greases" and "Dixon's Ticonderoga Graphite Grease," respectively. They treat of the various forms of lubricant manufactured by that company and the means of applying them.

Supplement No. 2 to catalogue 77, issued by Arthur Koppel, 66-68 Broad street, New York City, N. Y., applies solely to Baldwin locomotives. By an arrangement with the Baldwin Locomotive Works he announces his ability to furnish Baldwin locomotives of all classes and sizes, narrow or standard gauge, and for all kinds of motive power at standard prices. A copy of the catalogue will be sent to any address.

Advance sheets of catalogue No. 36 constitute Compressor Catalogue No. 35 from the Ingersoll-Sergeant Drill Co., and is in itself a compendium of down-to-date depiction of this form of power appliance. It is mostly high-class illustrations, with a little reference. For the first time appears a portraiture of the new works at Phillipsburg, N. J. The great Corliss air compressor operated by the Homestake M. Co., Lead, South Dakota, is shown, as are the electric-driven air compressors of the St. Louis, Mo., Transit Co. A copy of this catalogue will be sent on request by addressing the Ingersoll-Sergeant Drill Co., 26 Cortlandt street, New York, N. Y.

Books Received.

Bulletin No. 1 of the fourth series of the Geological Survey of Ohio, Edward Orton, Jr., State Geologist, has made its appearance. It is largely devoted to the geology and production of natural gas and petroleum in that State.

"The Copper Handbook," for 1904, by Horace J. Stevens, has been received. This annual is devoted exclusively to the copper mining industry of the world, and has been published for four years. It takes up the history, geology, chemistry, mineralogy and metallurgy of copper, also the uses and commercial standing of the metal. Numerous copper deposits are technically described and the technology of the business is interesting and valuable. Price, bound in buckram, $5, prepaid, Horace J. Stevens, Houghton, Mich.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING JUNE 4, 1904

762,511.—SCRIP METER—C. E. Beach, Oakland, Cal.
762,375.—REMOVING SNOW—D. W. A. Beaudette, San Bernardino, Cal.
762,377.—VALVE GEAR—S. L. Berry, Nogales, Ariz.
762,378.—WAIST HOLDER—F. S. Boedefeld, S. F.
762,574.—IGNITER—A. J. Bradley, Oakland, Cal.
702,379.—TROLLEY WHEEL—J. S. Briggs, Los Angeles, Cal.
762,576.—WASH BOILER—J. L. & J. L. Brobst, San Mateo, Cal.
762,580.—CRUSHING MILL—J. M. Dyer, Douglas City, Cal.
702,395.—BALING PRESS—W. Eisenhauer, Spokane, Wash.
762,581.—SELF ADJUSTING WAIST—Louise Fogus, S. F.
762,476.—FROST PREVENTER—J. W. Fulton, Pomona, Cal.
762,708.—SPARKING DEVICE—R. B. Hain, Los Angeles, Cal.
762,406.—VALVE—S. S. Herrick, S. F.
762,585.—HARVESTER—F. S. Holley, Stockton, Cal.
762,588.—STOVE—S. W. Jackson, Selma, Cal.
762,416.—SEPARATOR—R. W. Jessup, S. F.
762 637.—ANIMAL EXTERMINATOR—J. O. Johnson, Visalia, Cal.
762,728.—FOUNTAIN PEN—J. W. Langdon, Walla Walla, Wash.
762,729.—DOOR OPENER—T. E. Lee, Chulavista, Cal.
762,425.—ELECTRICAL BATTERY—J. R. Lord, S. F.
762,546.—REFERENCE DEVICE—A. H. Merrill, Florence, Cal.
762,835.—GATE OPENER—H. C. Morgan, Eugene, Or.
762,595.—SASH LOCK—J. H. Moskow, S. F.
762,435.—UNDERREAMER—O'Donnell & Willard, Los Angeles, Cal.
762,553.—CALIPERS—P. S. Palmer, Spokane, Wash.
762,862—FIRE ARMS—R. M. G. Phillips, Los Angeles, Cal.
762,556.—WRENCH—C. U. Reams, Suisun, Cal.
762,660.—OIL BURNER—L. A. Schulze, S. F.
762,490.—PILE—E. A. Smith, Colby, Wash.
762,601.—STORING OIL—A. J. Smithson, Portland, Or.
762,499.—VACUUM LIFTER—J. H. Sprague, Seattle, Wash.
762,447.—EXPLOSIVE—E. Steele, Mill Valley, Cal.
762,448.—ROTARY ENGINE—A. T. Stimson, Eureka, Cal.
762,772.—COAT—F. Terramorse, S. F.
762,506.—AXLE NUT—A. Uren, Seattle, Wash.
762,774.—CONCENTRATOR—Van Meter & Boss, S. F.
762,781.—VEHICLE—J. S. Walker, Anderson, Cal.
768,448.—UNDERREAMER—A. Willard, Los Angeles, Cal.
762,790.—WORKING SHIPS—W. Williams, Oakland, Cal.
762,793.—BOTTLE—C. M. Young, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SKIRT AND WAIST HOLDER.—No. 762,378. June 14, 1904. F. S. Boedefeld, San Francisco, Cal. This invention relates to improvements in means for holding the skirt and waist or bodice portions of women's garments in position. Its object is to provide a simple device which may be quickly secured to or removed from the garments, which will be adjustable to the movements of the wearer, and which will not strain nor tear the parts to be held together

SASH LOCK.—No. 762,595. June 14, 1904. J. H. Moskow, San Francisco, Cal. The object of this invention is to provide a cheap, simple, durable and attractive device which may be attached to either side of any sash to lock two sashes together and prevent their rattling, and which will permit the upper and lower sashes to be locked together, either when closed or when opened, and when so locked together in any desired open position the size of the opening cannot be enlarged by any one on the outside.

COATS.—No. 762,772. June 14, 1904. F. Terramorse, San Francisco, Cal. This invention consists in such a combination and arrangement of the coat with foldable flaps that when used as a walking coat it will have the usual shape of such coat; but when the wearer desires to ride horseback, and it is necessary that the lower part of the coat be extended to accommodate itself to the changed position of the wearer, flaps are so attached that they may be extended and arranged for that purpose.

WRENCH.—No. 762,556. June 14, 1904. C. U. Reams, Suisun, Cal. The object of this invention is to provide a wrench of simple construction which may be easily and quickly engaged with a pipe or a nut which is readily adjustable to a variety of sizes of pipes or nuts which may be operated in a confined space and which may be successively actuated without being removed from pipe or nut.

COMBINATION DIVIDER AND CALIPER.—No. 762,553. June 14, 1904. P. S. Palmer, Spokane, Wash. This invention relates to an improved combination tool, and particularly to a combined adjustable divider and caliper with means for determining instantly the center of a circle or a point midway between the ends of the caliper or divider.

TRAVELING HARVESTER.—No. 762,585. June 14, 1904. F. S. Holley, Stockton, Cal. This machine is designed for cutting, threshing and cleaning grain, and said machine is mounted upon wheels and adapted to travel over the field in which the grain stands, being propelled either by animal or mechanical power. The invention consists in a means for changing the position of one bearing wheel relative to the other in such a manner that the threshing and cleaning mechanism of the apparatus may be maintained substantially level in a direction transverse to the line of travel and when the machine is traveling upon sidehills or inclined ground which would otherwise throw the said mechanism out of level.

Latest Market Reports.

SAN FRANCISCO, June 24, 1904.

METALS.

SILVER.—Per oz., Troy: London, 25⅜d (standard ounce, 925 fine); New York, bar silver, 55¾c, refined (1000 fine); San Francisco, 55¼c; Mexican dollars, 46½c San Francisco, 45½c New York.

COPPER.—New York: Standard, $12.75; Lake, 1 to 3 casks, $12.75; Electrolytic, 1 to 3 casks, $12.50; Casting, 1 to 3 casks, $12.25; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £56 7s 6d spot per ton.

There is no material change in copper prices from last week. The market remains quiet, and it seems difficult to predict the immediate future of the metal.

LEAD.—New York, $4.50; Salt Lake City, $3.50; St. Louis, $4.25 San Francisco, $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5¼c; pig, $4.85. London: £11 10s ℔ long ton.

SPELTER.—New York, $4.87½; St. Louis, $5.00; London, £21 17s 6d ℔ ton; San Francisco, ton lots, 6¾c; 100-lb. lots, 7c.

In the Missouri-Kansas zinc field the shipments are said to have exceeded the output last week by 1000 tons, thus reducing the surplus. It is thought there will be no cut in prices by ore buyers. There is a demand for the high-grade ores—as high as $38.50 per ton being reported for 63% ore. The market price of the metal shows a slight advance.

TIN.—New York, pig, $25.50@25.75; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 29½c; bar tin, ℔ lb., 30@32½c. London, £116 17s 6d spot.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $19.00 ℔ Troy oz. Platinum ware, 75@82c ℔ gram.

QUICKSILVER.—New York, $44.50@45.50, large lots; London, £8 San Francisco, local, $43@43.50 ℔ flask of 75 lbs.; Denver, $46.00. Export, $43.00@43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 31½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 17.75c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb., .04c.

NICKEL.—New York, 40@47c ℔ lb.; ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $13.10@13.35; gray forge, $12.00; San Francisco, bar, 3c ℔ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $23.00@23.00; open hearth billets, $23.00@23.00; San Francisco, bar, 7c to 12c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½c ℔ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6½c; do. in kegs, 7c.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4 and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $1.25 country, $1.25 city. ℔ bbl.

CEMENT.—Imported, $2.15@2.65 ℔ bbl.; California carload lots, $2.10 f. o. b. at works; small lots, $2.45 ℔ bbl. in sacks, 4 sacks to bbl., 10c for each sack returned.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 7¾c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8¼c; 100-lb. lots, 10½c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ℔ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3¼c ℔ lb.; Cal. s. soda, bbls., $1.20@1.40 ℔ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5½@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.00; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $11.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $11.50, long ton.

BONE ASH.—Extra No. 1, 5@6c ℔ lb. No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb., 7c; less than 500 lbs., 7¼c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ℔ lb.

BORAX.—Concentrated, 6@7c ℔ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ℔ lb., 60c.

SODIUM.—Metal, ℔ lb., 50c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

ALUMINUM.—No. 1., 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ℔ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SITUATIONS WANTED.

A COMPETENT ASSAYER AND MILL MAN, School of Mines graduate, with over five years' practical experience, knowledge of Spanish, desires any position leading to advancement. Address "Experience," care of this office.

AN EXPERIENCED CHEMIST, ASSAYER AND Mill Man desires position. Address H. T. S., this office.

ASSAYER, WITH KNOWLEDGE OF BOOKkeeping, wants position with mine or mill. Address J. L., this office.

EXPERIENCED ASSAYER DESIRES POSItion with mining and milling company. Thoroughly competent in hullion, control and analytical work. Best of references. Address "Bullion," care of this office.

EXPERT MINE FOREMAN WANTS POSITION. Competent to handle extra difficult conditions underground. Address "Limestone," Room 602, 330 Market St., S. F.

MANAGER OR SUPERINTENDENT FOR A gold, silver or copper property; 20 years' experience in different parts of the country. Al reference. Can furnish any bond. Mexico preferred. Address D., this office.

MILL AND CYANIDE SUPERINTENDENT wants position. Thoroughly understands milling of gold ores and the cyaniding of same. Good assayer. Address D. A., this office.

MINE SUPERINTENDENT IS OPEN TO ENgagement with a live company. Thoroughly understands his business. Address B. R., this office.

STEAM AND ELECTRICAL ENGINEER wishes position. Has had 15 years' experience and has general mechanical ability. Best of references. Can come at once. Understands both alternating and direct current machinery and construction. Address H. K., care of this office.

WANTED, POSITION AS SUPERINTENDENT of mine and mill; amalgamation and concentration; competent assayer and analyst; good references. Address "Vanner," care of this office.

WANTED—POSITION AS MANAGER OR Superintendent of mining property. Gold and silver with concentration, or free milling, preferred. Have been a large operator for twenty years, having mined, milled or handled $13,000,000 of ore. Have experienced captains and mill men at immediate command. References and unquestioned standing. Address G, Box 1338, Denver, Colo.

YOUNG MAN EXPERIENCED IN MINE BOOKkeeping, time-keeping, shorthand and typewriting, desires work. Knowledge of Spanish. References. Address C. A. J., 320 Haight St., San Francisco, Cal.

WANTED.

PARTNER WITH SOME MINING KNOWLedge and $2000 working capital wanted in ore shipping and brokerage business. Highest references given. Address M. M., care of Mining and Scientific Press.

FOR SALE.

FOR SALE—ATTENTION MINING MEN! A first-class group of copper and gold prospects. Several hundred feet of work on property. A good proposition for a company. Phoenix Eastern R. R. runs through the property; 1600-foot siding on the ground. Plenty of water and wood. For particulars, write to JOHN S. COCHRAN, Kelvin, Arizona.

FOR SALE—No. 3 Buff & Berger Mountain Transit complete, with new level rod, in perfect order.

Address, or call, C. A. LUCKHARDT CO., 71 Stevenson St., San Francisco.

For Sale—Attention Mining Men!

A first-class quartz mining proposition in northern Trinity County. Width of ledge, 18 inches; average value per ton, $80—$45 per ton free milling; good title; within few miles of good wagon road; 280-foot tunnel on ground; abundance of water and timber.

Write for transcript and particulars to P. O. BOX 6. RED BLUFF, CAL.

DEPARTMENT OF THE INTERIOR, U. S. Geological Survey, Washington, D. C., May 26, 1904. Sealed proposals, in duplicate, will be received at the office of the United States Reclamation Service, at Reno, Nevada, until 2 o'clock P. M., July 15, 1904, for the construction of about 37 miles of main distributing canals, involving about 1,500,000 cubic yards of earthwork, with diverting dam, regulating gates, spillways, falls, weirs, and bridges, for the diversion and conveyance of about 1,800 cubic feet of water per second from Carson River at a point about 4 miles west of Leetville, Nevada, to irrigable lands in Carson Sink Valley. Bids will be received on (A) Excavation and embankment for one or more divisions or all the work. (B) Headworks. (C) Falls, spillways, weirs, lateral headgates, and pipe drains. (D) Highway bridges. Specifications, form of proposal and particulars may be obtained after May 26, 1904, by application to L. H. Taylor, Reno, Nevada, and to the Chief Engineer of the Reclamation Service, Washington, D. C., at whose offices the plans may be inspected. Each bid must be accompanied by a certified check of $1,000, payable to the Secretary of the Interior, as a guaranty that the bidders will, if successful, promptly execute a satisfactory contract and furnish bond in the sum of 20 per cent for the faithful performance of the work. The right is reserved to reject any or all bids, to waive technical defects, or to accept one part of a bid and reject the other, as the interest of the service may require. Proposals must be marked, "Proposals for Distributing Canals, Truckee-Carson Project, Nevada." Bidders are invited to be present. THOS. RYAN, Acting Secretary.

QUARTZ SCREENS

A specialty. Round slot or burred slot holes. Cast Steel or American planished Iron, Zinc, Copper, Brass or Tin Screens for all purposes. CALIFORNIA PERFORATING SCREEN CO., N. E. cor. Fremont and Howard Sts., San Francisco.

CYANIDE TANKS ERECTED.—Having been engaged in erecting steel Cyanide Tanks for the past six years, and having erected tanks at the following well-known plants—Ymir, B. C., San Sebastian of C. A., Octave of Arizona, Seal of Gold of San Bernardino, Cal.—which in each instance have given perfect satisfaction, always using the labor at hand and thereby making a great saving to the company in traveling expenses for skilled labor, I am prepared to make engagements for further work. Can furnish the best of references as to ability and workmanship. Address Box 25, this office.

HELP WANTED.

WANTED—AN EXPERIENCED SALESMAN to handle Rock Drills for prominent makers of mining machinery. Address Mining and Scientific Press, 1164 Monadnock Bldg., Chicago, Ill.

WANTED AT ONCE, A PRACTICAL ALL round Miner and Mill Man for gold mine now being developed in South America, Republic of Colombia. Climate good. Must speak Spanish and be able to handle peon labor. Must thoroughly understand cyaniding and other modern methods and be competent to take entire charge of mine at times in absence of superintendent. Must not be a drinking man, but a pusher. Young man with technical education and Western experience preferred. Good references required. Chance to advance. Address, stating salary expected with full particulars, South American Development Co., R. 410 Ft. Dearborn Bldg., Chicago, Ills.

DO YOU REALIZE there is a big waste of oil in your plant, which means money wasted?

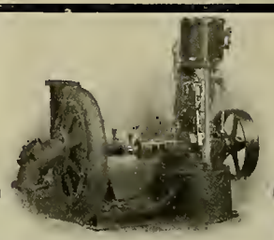
DO YOU REALIZE that with a

CROSS OIL FILTER

there will be no oil wasted, which means SAVING 50% IN THE COST OF OIL? Stop the waste to-day—order a CROSS OIL FILTER. We send it on thirty days' trial. If unsatisfactory, return.

"The Cross Oil Filters are giving good satisfaction." W.Va. Pulp & Paper Co., Piedmont, W.Va.

THE BURT MFG. CO.,
Largest Mfrs. Oil Filters in the World,
221 Main St., Akron, Ohio, U. S. A.
Supplied also by Oil Companies, Engine Builders and Power Contractors.



Ohmen High Speed Engines

For direct connection to Dynamos, Blowers, Pumps, etc. Large bearings. Noiseless operation. Least attention. Generating sets furnished complete; adapted to mine lighting.

Ohmen Engine W'ks, San Francisco, California.

Ajax Drill Sharpener

A comparison of the cost of sharpening drills by hand as compared with sharpening with the AJAX DRILL SHARPENER, at the Homestake Mine, South Dakota:

	BLACKSMITHS.	HELPERS.
Highland, - - -	2—$ 7 00	2—$ 6 00
400 Level, - - -	1— 3 50	1— 3 00
600 Level, - - -	4— 14 00	4— 12 00
700 Level, - - -	3— 10 50	3— 9 00
	$35 00	$30 00
		$65 00

1 Machine—Air to Run Same, - - -	$ 2 00
2 Blacksmiths, $7.00; Help rs, $6.00, - -	- 13 00
2 Blacksmiths Sharpening Block Hole Steel, -	- 7 00
2 Extra Tool Packers, - - - - -	- 6 00
720 Pounds Coke, - - - - - -	- 4 75
Firebrick to Repair Furnace, - - -	- 20
	$32 95

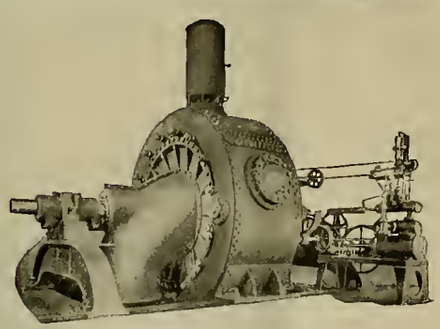
Saving per Day, - - - - $39.25
Savings per Six Months, - $7163.12½

These machines are sold subject to acceptance after thirty days' satisfactory trial run. They are certainly worth the investigation of any one having use for them.

WRITE US FOR CIRCULARS AND PRICES.

Harron, Rickard & McCone,

21-23 Fremont Street, SAN FRANCISCO, CAL.



SAMSON TURBINE

The illustration shows the large NIAGARA design, HORIZONTAL SHAFT TURBINES recently installed by us for the TELLURIDE POWER TRANSMISSION CO. power station, Logan, Utah. Tests conducted by competent engineers developed as follows:

Head.	Gateage.	Speed.	H. P.	Generator Eff'cy.	Turbine Eff'cy.
211.5 ft.	1-2	400 r. p. m.	1038	.952%	.738%
209.7 ft.	3-4	400 r. p. m.	1560	.965%	.8359%
208.9 ft.	Full	400 r. p. m.	1677	.967%	.8057%

These results have never been equaled by any turbine of the Horizontal Shaft Design, operating under equally HIGH HEADS. The test was made after turbines were installed to position, direct coupled to Generators. Francis' weirs and formulæ for discharge were used. The original test reports on file at our offices. These turbines are all fitted with our SAMSON BALANCED GATES.

Write Dept. "AA" for catalog.

JAMES LEFFEL & CO., SPRINGFIELD, OHIO, U. S. A.

HARRON, RICKARD & McCONE, San Francisco, Cal., Sales Agents for California, Nevada and Arizona.

CONCENTRATION OF ORES BY OIL.

FOR PARTICULARS, APPLY TO THE ORE CONCENTRATION SYNDICATE, Ltd.
4 BROAD STREET PLACE, LONDON, E. C.
(Testing Works 50 Tons Daily Capacity.)

CANADIAN ORE CONCENTRATION, LTD.
SALISBURY HOUSE, LONDON, E. C. TESTING WORKS, ROSSLAND, B. C.
F. H. PRENTISS, Crocker Building, San Francisco.

ELMORE PROCESS:

The Practical Working Details have been established and Plants aggregating 750 tons daily capacity have been erected or are on order.

LEGAL PROCEEDINGS WILL BE IMMEDIATELY INSTITUTED AGAINST ANYONE ERECTING PLANTS IN INFRINGEMENT OF OUR PROCESS AND APPARATUS PATENTS.

Exposition as an Advertisement 335
*Exposition, California Exhibit at 393
*Exposition, Compressed Air Power Plant at 97
Exposition, Mining and Metallurgy at 361
Exposition, Power Cost at 257
Philippines at 413
*State Buildings at 8
Stocks 108
Stock Selling 327
*Stoker, Mechanical 269
Stoking, Mechanical vs. Hand 181
Stone, Artificial 80
Stopes, Ore Delivery From 280
Stoping Wide Veins 311
Wide Veins, Cost of 433
Witbmut Timbers 160, 392
Storage Bins 225
Storms, W. H 1, 4, 25, 40, 193
*Strainer for Drive Wheels 300
Stream Velocities in Cross Sections 316
Strike of Vein 79
Of Veins and Mineral Zones 191
Structural Steel, Preservative Paints on 425
Subscriptions 108
*Subterranean Rivers, Raising 415
Suction Hose of Sinking Pump 109
Sullivan Machinery Co. 16, 33, 189, 206, 222, 308, 324, 340
Sulphate of Iron, Tank for 425
Sulphate, Mine Roasting, Sulphuric Acid From, Process, Potter 343, 361
Sulphides, Roasting of, for Concentration 144
Sulphurets, Cyaniding of 2, 92, 109, 160
Gold Bearing, Cyaniding ..... 230, 244, 261, 283, 270, 289.
Sulphuric Acid 144
*Acid, Manufacture of 109, 232
Acid, Pyrite Mined for 311
Sulphur in Pyrites 22, 109
Sumpter, Or., Metal Sample 176
Specimens 394
Survey Field Notes 327
Surveys, Mine Patent 19, 77, 79, 310
*Suspended Feeder, Hendy 431
Sweetland, E. J 346
Swelling of Rocks on Decay 37
Syphon, Inverted 37
Syria, Oil Engine Wanted at Beirut 340
System of Fusing Ores for Assaying 162
Premium 407
Systems of Shop Cost Keeping 22

T

Table of Weight of Cast Steel 42
Tables, Canvas 213, 229
Tailings as Mine Filling 176
Assay of 343
Sizing and Concentrating 392
Weight of 160
Talcose Ores, Cyaniding 392
Tally for Ore Cars, Automatic 327
Tank, Air Capacity of 279
For Iron Sulphate 425
*For Jig 248
*Hydraulic Cyanide 39
Tanks for Iron Sulphate Solution in Chlorination Plant 241
*Tappet for Shafts of Ore Stamp Mills 183
Striking of by Cam 130
Tasmania's Mines 16, 33, 52, 237, 323, 405
Taxing Unpatented Mining Locations 160, 225
Taylor Iron & Steel Co 340
Technical Education, Where it Counts 191
Telluride Ores, Assaying 286
Ores, Gold in 241
Ores in Cripple Creek, Colo 327
Tellurides, Specific Gravities of 295
Tellurium 176
In Copper 109
Temaxcaltepec, Mex., Rock Specimen 126
Temperature, "Critical" 279
In Steam Pipes 366
Tennessee Mines 50, 187
*Tensioning a Circular Saw 135
"Tentadura" 279
Tenth Annual Report of the Portland G. M. Co., Cripple Creek, Colo 112
Tepustette, Lower Cal., Iron Mines 192
Test for Silver in Ores 92
Testing Machine Drills 497
Ores for Cyanide Treatment 6, 23, 43
Tetrahedrite 126
Tetrault Concentrator 437
Texas Mines 86, 139, 220, 291
*Thawing Dynamite 243
Thenry, Rhomhoehedral 392
Thew Automatic Shovel Co 254
Thomas, K 133, 258, 259
Thompson, F. W 215
"Throw" of Fault 176
Tiles of Portland Cement and Sawdust 22
Timber Decay 295
*Framing 350
Framing, Dovetail System 295
Framing Machine 376
Measuring 279
*Sawing Machine 183
Sloping Without 392
*Timbering in Stopes 181
Timbers in Shaft, Size of 360
Mining 60
Mining, Size of 144
Mining Without 175
Time, Economize 326
Tin, Melting Point 56
Notes on 197
Plate Industry 44
Associated With Copper and Gold 56
Ore in South Dakota 61
Production 103
Screens, Burning 56
Tinstone, With Tourmaline 343
Title to Unpatented Claims 224
*To Determine the Horse Power of Gas Engines 194
Tombstone, Ariz., Rock Sample 311
Tonopah District, Nev 364
Topographic Work in Western States 427
Torrential Streams, Artificial Barriers in 207
Tourmaline With Tinstone 343
Track Grade for Tramming 20, 392
Trade Mark Litigation 141
*Transformer Connections 95
Transition Curve, Cornu's Spiral as ..... 266, 267, 268, 269.
*Transportation From Mine to Mill 361
*Mountain 309
*Of Ore Underground 81, 98
Of Ore Underground, by Water 392
Transvaal, Chinese Labor for 55, 125
Geology of 150
Traps for Mercury 37
Traylor Engineering Co 437
Traylor, J. A 437
*Treating Copper Ores, Process of 66, 131, 334
*Ores, Furnace for 415
*Ores, Mattes, Etc., Method of 200
*Ores, Mechanism for 28
*Process, Ore 318
Refractory Ores, Method for 151
Treatment of Low-Grade Copper Ores 45
of Slimes 62
*Trench Digger 302
Trend of Ore Shoot 376
Trend of Vein 79
Trenton Iron Works 16, 89
Trespass and Removal of Ore 109
*Trials of Rock Drills for Air Consumption 414
Triassic Age, Rocks 241
Tripod for Machine Drills 192
Tripoli 311
*Trommel, Giant 398
Tucson, Ariz., Mineral Samples 126
Tuff 75
Tungsten Ore Market 311
Ores of 425
Tunnel Driving Through Adjoining Claim 56, 392
*Enterprise in Colorado 18, 21
*Method 248
Mines 160
Rights 75, 164
Simplon 132, 365
To Develop Gravel Channel 408
Tunnels Under Hudson River, N. Y 109
Under Adjoining Ground 164
Turbine Water Wheels 192
Turquoise 39
*Two-Belt Conveyor, Ridgway 365
Two-Post Head Frame Construction 192
Tyler, W. S., & Co 33, 52, 72
*Types of Mill Concentration 22
*Typical California Quartz Mill 58
